III. When, I say, that the *Chyle* is driven out of the *Stomach* into the *Guts*, I do not thereby own any Expelling Faculty residing in the *Stomach*, as the *Antients* did suppose, this being done by the *Animal Spirits* flowing through the *Nerves* into the *Membrans* of the *Stomach*, and drawing them together. And forasmuch as these *Membrans* of the *Stomach* do immediately infold and embrace the *Chyle*, in a healthful state of the *Body*, the said *Liquor* must of necessity be expelled through the *Lower Orifice* of the *Stomach*, into the *Guts*, as is manifest from a *Bladder* filled with *water*, the neck of it being left open; for as soon as you press this *Bladder* with your *Hands*, the *water* gusheth out immediately at the *Neck*. Moreover, the pressure of the neighbouring parts, as of the *Liver*, *Spleen*, *Guts*, *Midriff*, the *Pancreas*, or *Sweet-bread*, and especially of the three last, contribute much to this Expulsion: for the *Midriff* is driven downwards by constant *Inspiration*, and pusheth upon the *Stomach* that lies under it, as may be seen in the cutting up of *Living Beasts*.

IV. And forasmuch as it is observed that a *Body* cannot be nourished, as long as the *Blood* continually flows from it, but that on the contrary it wastes and consumes; we may well conclude, that *Blood* concurs to the *Nourishment* of the *Body*, and that it is a *Substance*, which acquires another nature, so as to supply those parts that are dissipated; and turn to *Excrement*.

V. Which Change the *Antient Physicians* explained, by saying, that when the *Blood* was come to the utmost parts of the *Branches* of the *Capillary Veins*, it sweat through them in the form of a *Dew*, which afterwards turned into *Substance* not unlike to *Glew*, of a mean consistence; which *Glew* substance was then attracted by the several parts of the *Body*, according to their several needs. So as that the *Flesh* attracted those *particles* that were most proper to be changed into *Flesh*; the *Bones*, the most fit to be turned to *Bones*; and that the same *Attraction* and *Assimilation* was performed by the help of 2 *Faculties*, the one whereof they called the *Attractive*, and the other the *Assimilative Faculty*.

VI. But forasmuch as there is no such *Attraction* in our *Bodies*; and that our parts are not endued with any knowledge whereby they might be able to dis-

tinguish such *particles* of the *Blood* as are like and fit for them, from those that are otherwise; this opinion seems to be very contrary to Reason. Neither do they make out, how the *Venal* and *Arterial Blood* comes to be changed into *Dew*, and thence into a *Glew*; neither can they demonstrate what those wonder-working *Attractive* and *Assimilative Faculties* are, they do so much talk of.

We say therefore, that the *Nutrition* of *Mans Body* is thus performed. The *Blood* being come forth from the *Heart*, wherein it hath received its utmost perfection, is driven towards the ends of the *Arteries*. For as soon as the *Arteries* become dilated, and as it were blown up, the small *particles* of the *Blood* they contain, run against the roots of some *Filaments*, which proceeding from the *Extremities* of the *Branches* of the *Arteries*, do constitute the *Bones*, *Flesh*, *Skins*, *Nerves*, *Brain* and the other solid *Members*, according as they are in themselves of a several *Figure* or *Texture*, and thus have the force to drive them a little forwards, and to take up their places. And then as soon as the said *Arteries* fall again, they leave the *particles* of *Blood* in the several places wherein they are, which abiding there, are by this means united to the part they touch. Now supposing this to be the *Body* of an *Infant* or a *Youth*, the matter whereof is very soft, and its *Pores* readily dilatable, if the *particles* of *Blood*, which are pushed out of the *Arteries* for the restoring of the solid *Parts*, be somewhat greater than those, into whose room they come, or if it happen that 2 or 3 *particles* crowd into one place, the *Body* by this means must needs grow and encrease.

But this apposition of *Parts* chiefly proceeds from the diversity of *Figures*, that is, as well in the several *Particles* of *Blood*, as in the *Pores* of the parts of the *Body*: for by this means it is, that when the *Blood* is driven into the *Parts*, some of the said *particles* are more fit to stop in these *Pores*, and others again in others; where being variously complicated and figured, they become immediately united with the *Substance* of the *Parts*, and wholly changed into their nature: whereas those *particles*, which because of their peculiar *configuration*, are not fit to adhere or cleave to these or the other *Pores*, are driven further to others; till at last the residue of the *Blood*, whose *particles* were not adapted to enter any of the *Pores*, are remanded through the *Veins* to the *Heart*, there to be further digested, and to acquire a new *Attitude* for their union with the several parts of the *Body*.

Yet we must not imagine that *Blood*, as it is *Blood*, doth nourish; for the *red particles* of *Blood* do not nourish our *Body*, but only the *Chylous parts* that are in it: for if the *Blood*, as such, did nourish our *Bodies*, then it must certainly perform this function to the *Heart* it self, and the *Lungs* which are so near to it; for the *Coronary Artery* of the *Heart*, as soon as it is got out from it, doth presently, by a retrograde motion, return to it again. Thus also in the *Lungs*, the *Blood* takes but a very short course. So that it cannot be otherwise, but that these 2 parts, must have the *Blood* dashing against them with more force, than it doth against any of the other parts of the *Body*: If therefore in any part *nutrition* were performed by the *Blood*

A a a

drop-

VII. How Nutrition and Growth are performed.

VIII. How the Parts of the Aliment become changed into Parts of our Body.

IX. Blood, as Blood, doth not nourish.

dropping out of the *Vessels*, the same must surely happen here, seeing that the *Blood* hath more force to enter upon them, by opening the small *Orifices* of the *Vessels*. But we do not see it does so in either of these parts; for we find the *Substance* of the *Heart* and *Lungs* in a natural and sound state, not moistened with extravasated *Blood*, but with a certain clear moisture.

Nay what is more, it is evident that the *Blood* never comes out of its *Vessels*, without causing some *Disease* or other; for if this happens in the *Lungs*, it causeth the *spitting of Blood*, and if in other parts, *Swellings* and other *Diseases*.

X. The *Physicians* of old were of opinion that the *Chyle*, being by the *Branches* of the *Vena Porta* sucked out of the *Stomach* and *Guts*, were by them carried to the *Liver*. But our Modern *Anatomists* demonstrate that the *Chyle* is driven through the *Lacteal Veins* only to the *Subclavial*, and more particularly *GASPER ASELLIUS*, in the dissection he made of a *Dog*, whom before he had ordered to be well fed, in the year 1622. which discovery hath been further improved by others, who have found that the *Lacteal Veins*, filled with a *Milky Juice*, are *Vessels* different from the *Mesaraick Veins*: forasmuch as in *Living Animals* they appear distinct from the *Mesaraicks* which are *Red*, if the dissection be administered 4 hours after the *Animal* hath been fed, that is, at the time when the distribution of the *Chyle* is made; for after that time they disappear again. But however tho' these be empty, they always appear like so many *Strings* or *Fibres*, and are never found fill'd with *Blood*.

XI. Neither doth the smallness of the *Lacteal Veins* in the least embarrass this opinion, for this was designed so on purpose by the *Provident Care* of *Nature*, to prevent the more gross and earthly parts of the *Chyle* from entering into them, as also that the *Chyle* through them might be, by degrees and leisurely distributed according to the necessity or requirings of the *Body*, and the more easily changed into *Blood* in the *Heart*, by that new disposition of parts it acquires by passing through it, and the *Effervescence* it undergoes there. For as the whiteness of *Snow*, and the colours of other *Bodies*, proceed only from the *texture* and *Position* of the *Parts*: So the *Blood* derives its *Redness* only from that position of parts, which it obtains by its frequent passing through the *Heart*.

XII. The *Reasons* that induce us to admit the use of the *Lacteal Veins* are; First, Because the *Chyle*, which is of a *White Colour*, cannot by the *Mesaraick Veins* be conveyed to the common *Ocean*, because they are manifestly filled with the *Blood*; whereas the *Lacteal Veins* are *white*, that is, of the colour of the *Chyle* that passes through them. 2ly. The *Lacteal Veins* do never appear till after the *Body* hath been fed, and only about the time when the food begins to be distributed; which is a strong argument to persuade us, that the *Chyle* passeth through them. 3ly. The quantity of the *milky liquor* that is in these *Veins*, may be increased, by pressing the *Guts*, whilst they are as yet full of *Chyle*.

XIII. The *Chyle* therefore being duly prepared, passeth through the *Guts*, where the *Alimentary Parts* are separated from the unprofitable and excremental,

tal, and thence run into the *Lacteal* or *Milky Veins*, which carry the said *Liquor* into the *Common Receptacle*: From whence 2 other *Vessels* convey it through the *Thorax* or *Chest*, near the *Backbone*, up to the *Subclavial branches* of the *Vena Cava*, and there empty themselves.

Another Point to be examin'd is, how the *Birth* is nourished in the *Mother's Womb*; since it cannot take in its *Food* wholly by the *Mouth*, but at first rather by *Apposition*, and afterwards by the *Navel*. For the situation and disposition of its *Parts* will not admit of this, seeing that the whole *Body* lies crowded together, and hath its *Mouth* shut up between its *Knees*. And tho' as soon as it is born, it reacheth to the *Mother's* or *Nurses Breast*; yet is this only the effect of *Natures Providence*, which as it teacheth the *Birth* to fetch its *breath*; so likewise she directs it, where to meet with *Food*.

But that the *Birth* receives its Nourishment by the *Navel*, may be proved from the *Courses* of *Women*, which generally cease in those that are with *Child*, because the *Blood* is then defrauded of the *Chyle* and its *Nutritious Juice*, which at that time is kept in the *Womb* for the Nourishment of the *Birth*. And for the same Reason, as soon as the *Birth* is born, the *Breasts* are fill'd with *Milk*; because the *Juice* which before was employed to feed the *Birth*, mounts up to the *Breasts*, where it is changed into a *white Liquor*. And this is further confirmed by those *Women* who do not *Suckle* their *Children*, for these perceive the *Milk* to return from the *Breast* to their *Womb*, where it is evacuated. To which may be added, that if the *Birth* in the *Womb* were nourished by the *Mouth*, it seems that it should also *breath*; which it is impossible it should do, as long as it is in the *Womb*. Yea further, should the *Infant* open his *Mouth* in the *Womb*, it would be in danger of being choaked with the *Liquor* wherein it swims. So that it is very probable, that the *Birth*, when it is perfected, is only, at least chiefly nourished by the *Umbilical Vessels*.

Now forasmuch as *Man* feeds on *Flesh*, *Fish*, *Herbs* and *Fruits*, it may be enquir'd which of these is his most *Natural Food*. Indeed if we examine the matter strictly, the feeding on *Flesh* doth not seem *Natural* to him; yea, if we consider the *Instruments* he makes use of in *Eating*, we shall find it contrary to the intent of *Nature*. For we find that those *Animals* that feed upon *Flesh*, as *Wolves*, *Lions*, and the like, have their *Fore-Teeth* long, sharp, and at some distance from each other; because *Flesh* cannot well be prepared for the digestion in the *Stomach*, without such *Instruments* as may pierce deep into the *Substance* of it, and pluck it to pieces. Whereas those *Animals* that feed upon *Herbs*, as *Sheep*, *Oxen*, *Horses*, &c. have short *Teeth*, which are ranged close together; whence it may be easily guess'd, that *Man* who is furnish'd with such like *Teeth*, was designed to feed chiefly on *Herbs* and *Fruits*.

This is further confirmed by the Example of *Children*, who following the *Instinct* of *Nature*, do prefer *Fruits* before *Flesh*: For *Nature* not being as yet debauch'd in them, they manifest by their *Choice*, what *Food* she design'd for them. So that it is not to be question'd, but that if *Children*,

XIV.

The Birth is not wholly nourished in the Womb by the Mouth.

XV.

But by the Umbilical Vessels.

XVI.

Flesh is not the Natural Food of Man.

XVII.

Children love Fruits more than Flesh.

aren, as soon as they are weaned, should be kept from the eating of *Flesh*, they would the more strongly desire *Fruits*, and choose them before all other *Food* whatsoever.

XVIII.
The Eating
of *Flesh*
was un-
known to
the first
Men.

This Intent of *Nature* may further be illustrated from the Custom of the first Men that lived in the *World*, who fed only upon *Fruits*. And accordingly the *Holy Scriptures* assure us, that the eating of *Flesh* was not permitted till after the *Flood*. If it be Objected, that some men have been found in the *World*, that have fed upon *flesh*, as the Savages of *Brasile*, &c. it may be easily answer'd, that these did not follow the guidance of *Nature*, but their own depraved Lusts and Affections, which prompted them, not only to the eating of *Flesh*, but even to the devouring of *Mans Flesh*.

XIX.
Nature de-
monstrates
the same,
by denying
us Instru-
ments ne-
cessary for
the Eating
of *Flesh*.

Moreover, had *Nature* intended *Flesh* to be our nourishment, she would without doubt have furnish'd us with *Instruments* fit for that purpose, nor have put us to the shift of making use of *Knives*, which other *Carnivorous Animals* do not stand in need of. Besides, why have we such an aversion to *Raw flesh*, and cannot endure to taste of it till it be prepared by *Fire*; but only to shew, that *Flesh* is not our *Natural food*, being only introduc'd by *Lust*, which hath quite changed our *Nature* from its *Primigenial Inclination* and *Temper*.

XX.
Man would
be every
whit as
strong, if
he liv'd
only on
Herbs and
Fruits.

Neither let any Man object here, That *Man* would be much weaker, if he should confine himself to feed on *Herbs* and *Fruits* only; for we see that *Horses* and *Bulls* are very strong and hardy *Animals*, which yet feed upon nothing but *Herbs*, and *Corn* or *Pulse*. How swift is a *Stag*, how lively vigorous and long Liv'd; and this only by feeding on the *Grass of the Field*? So that I should be easily induc'd to believe, that in case a *Man* were brought up like a *Beast* in the *Fields*, he would not be inferiour to *Stags* in running, nor to *Apes* in climbing of *Trees*; which his delicate and tender Education do now make him unfit for.

CHAP. VI.

How the Motion of the Heart, Arteries and Muscles, are performed in the Body of Man.

I.
What the
Heart, Ar-
teries and
Veins are.

WE may gather from what hath been said, that the *Heart* is nothing else, but a *Body*, consisting of *Musculous Fibres*, into whose Substance are inserted *Arteries*, *Veins*, *Nerves*, and *Lymphatick Vessels*. An *Artery* is a *Vessel* or *Pipe* proceeding from the *Heart*, fitted for the containing and conveying of *Blood*. A *Vein* is another sort of a long and round *Vessel*, hollow like a *Pipe*, with a single and lasting Coat, woven together of all sorts of *Fibres*. There are 2 *Veins* which proceed from the *Heart*, and in their coming out from it separate themselves, and are called by several Names: The *Vena Cava*, or *Hollow Vein*, proceeding from the *Right Ventricle* of the *Heart*, and from thence mounting strait to the *Brain*, is called the *Jugular Vein*, which under the *Armpits* divides it self into 2 branches, called the *Axillary Veins*, or *Subclavial*; and going downwards, it becomes also divided, and sends a large branch to the *Liver*; and this is the *Vena Porta*,

so called, which being divided into very small branches, loseth it self in the *Liver*. The other *Vein* being derived from the *Left Ventricle* of the *Heart*, is called *Pulmonalis*, or the *Lung-Vein*; because it is distributed through the *Lungs*; the use of it being to convey the *Blood* back from the *Lungs*, by means of the *Ear-lapper* of the *Heart*, into the *Heart* again.

We perceive many motions in the *Body* of *Man*, which the ignorant *Common People* do attribute to the *Soul*; for they seeing that a *Dead Body*, after the *Souls* departure, is deprived of all motion, conclude all motion to proceed from the *Soul*. But we shall easily be convinc'd of this Error, by observing the *Nature of Flame*, which notwithstanding that it is *Inanimate*, is in continual motion; even to that degree, as to exceed the agitation that is perceived in *Animated Bodies*.

But not to concern our selves about the Opinions of the *Vulgar*, we conclude *Heat* to be the *Bodily Principle* of all our motions; seeing that *Death* is caused by nothing else, but the loss of our *Native Heat*; or the destruction of some Principal part of our *Body*. Wherefore when the *Soul* becomes separated from the *Body*, this doth not proceed from any defect of the *Soul*; but because the *Heat* vanisheth, or because some of the *Organs* are destroy'd and spoil'd. For as long as we live, there is a *Heat*, or rather *Fire* in our *Hearts*; but such a one as is without *Light*, (and not much unlike to that whereby new *Wine* grows hot and ferments) which we make the *Principle* of all the motions that are in the *Body*.

There be 2 *Ventricles* in the *Heart*, FF, to which 4 *Pipes* or *Channels* do answer: To the *Right Ventricle* GG, the *Vena Cava* AB answers, into which all the other *Veins* empty themselves, as into their common *Receptacle*; and the *Arterial Vein* D, which proceeding from the *Heart*, divides it self into divers branches in the *Lungs*. To the *Left Ventricle* HH, as many *Channels* do belong, viz. the *Venal Artery* E, which riseth from the *Lungs*, and the *Great Artery* called also *Aorta* C, which being derived from the *Heart*, doth divide it self into many *Rivulets*, throughout the whole *Body*.

They who are acquainted with the *Works* of Dr. HARVEY, know that the *Blood* runs out of the *Vena Cava* AB, into the *Right Ventricle* of the *Heart* GG, and from thence is carried to the *Lungs* through the *Arterial Vein* D; and afterwards returns from the *Lungs* into the *Left Ventricle* of the *Heart* HH, through the *Venal Artery* E; and last of all, after these *Circulations*, is conveyed into the *Great Artery* C, which carries the *Blood* throughout the whole *Body*. These things being explained thus in few words:

I say, That the motion of the *Heart* proceeds from the *Dilatation* of the *Blood* that passeth through it; Which effect of *Dilatation* is to be ascribed to the *Fire* which lies hid in the *Heart*, which rarefies the *Blood* as soon as it enters into the *Ventricle* of it; by which rarefaction and expansion of the *Blood*, the *Mouths* of the *Vessels* are opened, and the *Blood* is conveyed thence; upon which evacuation other *Blood* enters the *Heart*, to supply the place of that which is run out; which rarefying in like manner causes the

II.
All Motion
in Man,
doth not
proceed
from his
Soul.

III.
Heat is the
Cause of
all our
Motions.

V.
The Blood
runs
throughout
the whole
Body.

VI.
The Cause
of the
Motion of
the Heart,
is the
Bloods di-
latation.

Heart to swell. And from this only proceeds the motion of the Heart and the Pulse or beating of the Arteries; which is as often repeated, as any fresh Blood enters into the Ventricles of the Heart.

VII.
There is more Heat in the Heart, than in any other part of the Body.

For we are to observe, that as long as an Animal lives, there is more heat in the Heart, than in any other part of the Body; as also that the Nature of the Blood is such, as that upon the least overheating, it becomes immediately dilated and rarefied, whence the motion of the Heart and the Pulse of the Arteries do proceed.

VIII.
How the Heart and Arteries are moved.

For the better understanding whereof, we are to observe that the Pulse or Beating of the Arteries is chiefly promoted by 11 little Skins, which like so many little Floodgates or Doors, do open and shut the Orifices of the 4 Vessels that answer to the 2 Ventricles of the Heart. For at the same moment that one of these Pulses ceaseth, and another is at hand, these Valves in the Orifices of the two Arteries are exactly shut, and those that are in the Orifices of the 2 Veins are opened; so that it cannot be otherwise, but that at the same time 2 parts of Blood must run out of these Veins, one into the one, and the other into the other Ventricle of the Heart. Whereupon these 2 portions of Blood, being both of them rarefied, and consequently taking up a greater Space, they shut the Valves that are in the Orifices of the 2 Veins, and so hinder any more Blood to fall down into the Heart; and at the same time do push against and open the Valves of the two Arteries, and swiftly rush into them, by which means both the Heart, and all the Arteries of the whole Body are blown up. But this rarefied Blood becomes presently condens'd again, or penetrates into other parts of the Body. And by this means the Heart and Arteries fall flat again, the Valves in the entrance of the 2 Arteries are shut up, and those that are in the Orifices of the 2 Veins are opened, and give passage to 2 other portions of Blood, which cause the Heart and Arteries to be blown up again.

IX.
The Heart and the Arteries beat at one and the same time.

Having thus discover'd the Cause of the Pulse, it may be easily conceiv'd that the Heart and Arteries must beat both together; for tho' Blood be a fluid Body, yet forasmuch as it is contained in the Veins and Arteries, it is to be consider'd as a Continuous Body. For as when one end of a Continuous Body, such as a Stick is, is moved, the other end is moved likewise, in the very same moment; in like manner a fluid Body that is contain'd in a Pipe or Channel, if any part of it be moved, the whole must needs be moved also: Which the Boys in their play do evidence, who whilst they push forwards the Water that is at one end of the Spout, they make it gush out at the other. Moreover, all the Arteries that are in the Body are continued and joyn'd together, and do all of them rise from the Aorta; so that upon the least determination of Motion that is impress'd upon this beginning of the Arteries, all of them must be made partakers of the same.

X.
The Animal Spirits derive their Original from this Cause.

From this Dilatation of the Blood in the Heart, the Animal Spirits take their Original. For seeing that the Blood is made of the Chyle, and that the Chyle is nothing else, but a company of the more subtil Particles of the Aliment that have been dissolved in the Stomach, separated by means of the

Orifices of the Lacteal Veins, and from thence carried to the Heart: It cannot be question'd, but that the Chyle and Blood, by frequently passing through the Heart, must attain to that great degree of Subtily, as to resemble the Particles of those Bodies, which the Chymists, after fermentation, and several digestions and cohobations, do distill into Spirit, and bring over the Helm. These Spirits move upwards towards the Brain, because the Great Artery G, by which the Blood is carried up out of the Heart, tends directly that way. But being in great quantity, and not all of them alike pure, the more Subtil of them only do enter the Brain. So that the Animal Spirits are the purest portion of the Blood, subtilized by the heat of the Heart, and of that extream Swiftnes, as to resemble the volatile Particles of Flame. For the Spirits are in a continual agitation, and never cease from Motion.

Now in order to our understanding of the manner how our Members are moved, we are to take notice, that the Nerves, which are the Conduits of the Spirits, do proceed from the Brain and the Pith of the Back bone, and end in many strings or filaments, which penetrate into the fleshy part, and help to constitute a Muscle: For these 2 Parts, viz. Flesh and Nerves do chiefly constitute the Essence of a Muscle. Which appears from hence, that many Muscles are found in the Body, in which nothing else is to be seen, besides the Nerve and the Musculous flesh; as the Muscles of the Eyes, Forehead, Temples, Bladder, &c.

The Muscles therefore are parts of the Body, that are fastned to others more solid, consisting of a loose and porous Flesh, and of a Membran that surrounds them; which, when the Nerves do reach, (to make use of the words of GALEN, Lib. 1. de motu Musculorum, Cap. 1.) they become variously cut and divided, till at last being altogether scattered into thin and skinny Fibres, they are woven through the whole body of the Muscle, &c. For the Nerves are no other than so many Channels, which convey the Spirit, and are endued with Pores and Valves, that open themselves towards the Cavity of the Muscles; so as that when once the Spirit is let in, they do hinder it from returning back again. It is necessary therefore, that the Muscles being blown up by the Animal Spirits, should be dilated in breadth, and contracted in length, and thus move the part to which they are fastned by way of Traction or Drawing.

The Muscles which GALEN calls the Instruments of Motion, are all of them alike; but differing in quantity, situation, and figure. With respect to their Dimension some are Thick, as the 2 that are called Vast ones; others Thin, as the slender Muscle that bends the Leg or Shin-bone. Some are Long, as the strait Muscle of the Abdomen, and the Abductor of the Leg; others Short, as the Pyramidal Muscles at the bottom of the Abdomen. Some Broad, as the oblique and transverse Muscles of the Abdomen; others Narrow, as the Muscles of the Fingers and Toes. As to their situation, some are on high, others below; some on the Right-hand, others on the Left, &c. As to their figure, some resemble a Lizard, others a Thorn-back, others a Mouse: Some are three-corner'd, some four, some five; others are Round, Pyramidal, and the like.

There

XIV.
The Parts
whereof
the Muscles
do consist.

There are 3 Parts commonly assigned to a Muscle, the Head, Belly and Tail: By the Head of the Muscle, Anatomists understands that end, towards which the Contraction tends. Most Muscles have but one Head, tho' there be some that have two, and others three. By the Name of the Tail, they understand that end of the Muscle which is inserted in the part that is to be moved. And by the Belly they denote the middle part of the Muscle, which appears more swell'd like unto Flesh. Some Muscles have but one Belly, others two; as the Muscle which fluts the lower Jaw-bone, and that of the Bone Hyoides, which are therefore called Double-bellied Muscles, as those that have three Bellies are called Three-Bellied.

XV.
A descrip-
tion of the
Half Ner-
vous Mus-
cle.

This may happen several ways, the first whereof is, when the fleshy Fibres of 2 Muscles do directly meet one another, and by this means form one Tendon; as it happens in the Muscle called Semi-nervosus, or Half-sinewy, which is represented by the Figure, in which the fibres of the 2 Muscles A B, and B C, meeting one another directly, do by this their meeting form one common Tendon E B.

Figure
63.

XVI.
The descrip-
tion of a
two-headed
Muscle.

The second manner is, when the Fibres of 2 or more Muscles, meeting each other obliquely, confound their Tendons, and of 2 make 1; as it happens in the Two-headed Muscle of the Arm, as also in the Deltoides, which are represented by the Figure, wherein the Fibres of the 2 Muscles A B, and D C, do meet obliquely, and confounding their 2 Tendons, make one of it, viz. the Tendon E F.

Figure
64.

XVII.
The Muscle
of the
lower Jaw-
bone.

The third manner is, when the Fibres of two Muscles falling upon the two opposite sides of one common Tendon, continue parallel to each other; as it happens in the Digastrick or Two-bellied Muscle, which moves the Lower Jaw-bone, and which is represented by the Figure, in which the Fibres of the Muscles D C, and B A, falling upon the two opposite sides of the Tendon F E, continue in a Parallel position to each other.

Figure
65.

XVIII.
The Mathe-
matical
effect of a
Muscle.

There are some modern Philosophers, who endeavour to make out, that the effect of any Muscle is meerly Mathematical, and demonstrable from the Principles of that Science. For seeing that there is a threefold Dimension, viz. Length, Breadth, and Depth, and that the figure of a Muscle is terminated by these, it follows, that all Muscles, that lye upon the Bones, when they are contracted, do increase as much in breadth and depth, as they lose in length; that is, attain to a greater prominence of their Bodily bulk; whereas, when they are extended, they cover a greater part of the Body. Which they demonstrate thus: Let there be a Parallelogram A B C D, representing the Two-headed Muscle in its state of Extension, and the Square B E G F, equal to it, representing the said Muscle in its state of Contraction. They say, that the Contracted Muscle in the second Figure, is every whit as large as the Extended Muscle in the first Figure: And because the Square of the Muscle B E G F, is equal to the Parallelogram A B C D, therefore they infer, that the surface of the Muscle is the same in both of the Positions, and that the Part G D, changed into breadth, is proportion'd to the Line A D, which determines the Local motion.

Figure
66.

The motion therefore of our Members is owing to the Muscles, which is when some of them are Contracted, and others Extended; for no part of the Body can be reduc'd to a less Extension, but that at the same time it must draw up to it that part to which it is joyned. Now that one Muscle is rather contracted than another, proceeds from the Communication of Spirits. For that Muscle is contracted that hath most Spirits, as there are fewer Spirits in that which continues extended, and for this Reason appears longer and thinner.

When it is said, That the Spirits which proceed from the Brain, do assist the motion of the Muscles; this is not so to be understood, as if they alone were sufficient to perform this, but that they determine the Spirits that are contained in all the Nerves of our Body, to tend to one part, more than towards another; or because they open the Orifices, through which many other Spirits may flow to one part, and by blowing up the same contract it.

From whence we may gather, That our Soul doth not immediately move our Members, but only direct the Spirits that flow from the Heart, through the Brain into the Muscles, and determine them to such and such motions. For the Spirits are indifferent of themselves, and may with the same facility be applied to several Actions. Wherefore all motions that are performed in us, without the command of our Will; as Walking, the Concoction of our Food, Singing, and other such like Actions, which are done without our advertence, are not performed by the Soul, but only proceed from the disposition of our Organs, and influence of the Spirits. So that all our Actions, our Thoughts only excepted, do agree with and resemble those that we see in Brutes, and have one and the same Principle.

C H A P. VII.

Of the Circulation of the Blood.

FROM what hath been now said, no small difficulty ariseth; viz. if the Blood flow out of the Vena Cava into the Right Ventricle of the Heart, and from thence into the Arterial Vein, and out of it into the Venal Artery, and thence into the Left Cavity of the Heart, until it rush out into the Great Artery; whence then shall we suppose, that such great store of Blood can be furnish'd? Or, how comes it to pass, that the rest of the Veins that empty themselves into the Vena Cava, are not exhausted? Or, that the Arteries are not over distended; into which the Blood from the Heart runs?

This Difficulty will disappear, if we consider that the Veins and Arteries are like so many Rivulets in our Body, in which the Blood runs along, beginning its motion, as hath been said, from the Right Ventricle of the Heart, and after various windings falling into the same again; so as that its motion is nothing else, but a continual Circulation. For the Blood which is contained in the Arteries and Veins of the whole Body, by turns continually rushing forth from the Heart, is driven along through the Arteries into the Veins, and out of

them again returns into the *Vena Cava*, the Branches whereof are dispersed throughout the whole *Body*.

III.
The Con-
traction of
the Arteries,
promotes the
motion of
the Blood.

The Spontaneous Contraction of the *Vessels*, which are full of *Blood*, doth very much promote that vehement force, whereby the *Blood* from the motion of the *Heart*, is driven all along through the *Arteries* and *Veins*. For by means thereof, with the help of *Subtil matter*, which forceth the narrow *Pores* of the *Fibres*, the sides of the *Vessels* come nearer together, by which means the *Liquor* contained in them is still driven further, and runs with a greater Force, as coming from a larger Space which it hath near the *Heart*, into the narrower *Arteries*: According as we see it happens in a *Hogs-Bladder*, which being fill'd with the *Breath* that is blown into it, is no sooner removed from the *Mouth*, but the Spontaneous Contraction of the Sides of the *Bladder* do drive out the greatest part of the *Air*.

IV.
Reasons
proving
the Circu-
lation of
the Blood.

This *Circulation* was first discover'd by *Anatomists*, from the communication there is between the *Heart* and the *Lungs*. For they found there was the same quantity of *Blood* in the *Venal Artery*, as in the *Left Ventricle* of the *Heart*, which they concluded could not be so, except that the *Blood* were strained through the *Arteries* into the *Veins*, not by the *Anastomoses* or *Inoculations* of the *Arteries* and *Veins*, but by means of the porous *Substance* of the *Solid Parts*. They observed also, that in the *Hearts* of *Fishes* which want *Lungs*, they could not find a *Left Ventricle*, because there is no necessity in them to have the *Blood* transfused out of the *Heart* into the *Lungs*. But they clearly make out, that such a *Circulation* is necessary in *Man*, as well to preserve the *Heat* of his *Body*, as to the production of the several *Humours* thereof. For how could it be otherwise, but that the outward parts of the *Body* must be congealed with *Cold*, if *New Blood* did not continually come to them, communicating the *heat* it brings along with it from the *Heart*? For conceive we the *heat* that is in the *Heart* to be never so great, yet would it not be sufficient to warm the *Members* that are so remote from it, except fresh *Blood* did continually flow to them, to repair their lost *heat*. Yea, it could not be otherwise, but that the *Blood* which is cold of its own Nature, must needs stagnate and be coagulated in the *Parts*, in case it did not continually return to the *Heart*, there to recruit its *heat*, and borrow new *Spirits*.

V.
Nutrition
cannot be
performed,
without the
Circulation
of the
Blood.

Moreover, how could our *Bodies* be nourished, if the *Blood* did not continually flow to all the *Parts* of it? And except some *Particles* of the *Blood* passing through the ends of the *Arteries* became joyned to the *Body*, entering into the place of those which they juttle out? How otherwise could our *Food* be digested in our *Stomachs*, and turned into *Chyle*, if there were not a virtue in our *Stomachs* proceeding from the *Heart* through the *Arteries*, which did promote their dissolution? Moreover, all these Particulars may be confirmed from what before hath been said, concerning the Production of the *Spirits*, which being the most *Subtil* parts of the *Blood*, mount from the *Heart* to the *Brain* through the *Great Artery*, and being afterwards diffus'd into the *Muscles* by the help of the *Nerves*, impart motion to the *Body*. Which *Sallies* of the *Spirits* could not be, if the *Great*

Artery did not by a *Right Line* ascend from the *Heart* to the *Brain*.

To this also may be added the Practice of *Chirurgeons*, who when they go about to let any one *Blood*, make a *Ligature* about the *Arm*, above the *Orifices* of the *Vein*, towards the *Shoulder*, that the *Blood* may gush forth more freely; because the *Ligature* hinders the passage of the *Blood*, and doth not suffer it to pass beyond the *Ligature*: For tho' it cannot hinder the *Blood* from continuing its course, yet it cannot hinder but that fresh *Blood* still comes out of the *Artery* to the *Hand*, and from the *Hand* to the opening of the *Vein*; because the *Arteries* lye under the *Veins*, and by reason of the Hardness of their *Coats*, cannot be compress'd without great Force. To which may be also added, that the *Blood* which proceeds from the *Heart*, through the *Arteries*, doth rush with greater force towards the *Hand*, than it returns from the *Hand* through the *Veins* to the *Heart*; because the *Blood* flows more slowly in the *Veins*, than in the *Arteries*; forasmuch as that which is in the *Arteries* hath but very lately been heated and rarefied in the *Heart*, whereas that which runs in the *Veins*, doth in time grow cold, and consequently moves more slowly.

In like manner therefore, as there is in the *Greater World* a continual Course of the *Waters* that return from the *Sea* through *Subterranean Channels*; and of those that run towards the *Sea*, by the *Rivers*: So in the *Little World*, *Man*, there is a perpetual *Circulation* of the *Blood* through the *Arteries* and *Veins*. The *Arteries* carry the *Blood* from the *Heart* to the *Members*; and the *Veins* return the same *Blood* again from the *Members* to the *Heart*: So that the *Circulation* of the *Blood* is nothing else, but the perpetual Motion of the same *Liquor*, passing from the *Heart* through the *Arteries*, and returning through the *Veins* to the *Heart*.

You will Object, That if the *Blood* be circulated throughout the whole *Body* 100 or 200 times (as some suppose) through all the *Arteries* and *Veins* to the *Heart*, there seems to be no reason why the *Blood* that is in the *Veins*, should be unlike to that which is in the *Arteries*; whereas we find it is so. For the *Arterial Blood* appears more lively and florid; whereas that of the *Veins* is more dull, and of a blackish Colour, which difference would not be, if the same *Blood* did run through the *Arteries* and *Veins*.

I Answer, That this difference of the *Blood* is, because that *Blood*, which is contained in the *Arteries*, hath before passed through the *Heart*, and keeps the same Qualities which it hath got there. Whereas the *Blood* that is contained in the *Veins*, is not so pure, as containing besides the *Blood*, which flows to them from the *Arteries*, another *Liquor*, communicated to them from the *Guts*. To which we may add, that the *Blood* is not so hot in the *Veins*, as in the *Arteries*; because the *Veins* are at a greater distance from the *Heart*, than the *Arteries*, which only is sufficient to make it very different from that which is in the *Veins*; because nothing is so easily changed, as the *Blood* is: As is evident in that as soon as it is got out of the *Veins*, the *Air* immediately corrupts it, so that it degenerates into another *Substance*.

It may be you'll Object in the *Second* place, that *Agues* only return at certain days; whereas supposing the continual *Circulation* of the *Blood*, they would

would recur more frequently, viz. as often as the Blood returns to the Heart.

XL
Answer.

To which may be Answer'd, That the Matter of Agues is not lodged in the Veins, according to the Opinion of some Physicians, but in some Cavities of the Body; where it continues till it comes to maturity, and be made fit to be mingled with the Blood. And according as it doth sooner or later arrive to this Maturity, it causeth either a Quotidian, Tertian, or Quartan Ague: And irregular Agues happen, when the said Matter, shut up in these Cavities, doth too much distend it self, and by its dilatation opens the Pores, so that by this means it wholly or in great part evaporates: For the Pores being once open'd, it is a hard matter to shut them again, before that much Matter is got out by them.

XII.
How long
the Circu-
lation of
the Blood
lasts in the
Body of
Man.

But some or other, it may be, will enquire, how long this Circulation lasts?

I Answer, That this may in some sort be gueſt at from the Quantity of the Blood, which at every Pulse of the Heart flows into the Great Artery; and by determining the Quantity of Blood contained in the whole Body. For if we suppose that at every Pulse of the Heart, one Dram of Blood enters into the Aorta, out of the Left Ventricle, and do then take an exact account of the number of Pulses, we shall easily infer, that if these Pulses be 64 times repeated in one Minute (as it hath been observed in a Man of a middle Age and Temperament) there will be 3840 of them in one Hours time. Whence it follows, that every Day 32160 Drams of Blood pass through the Ventricles of the Heart in one Day, which added together make 700 Pounds of Blood. But since there is not so much Blood in the Body of Man, nor scarcely above 10 Pounds, we must conclude that the whole Mass of Blood circulates through the Heart 72 times every Day, and that consequently it passeth out of the Heart into the Arteries, and from the Arteries to all the Parts of the Body thrice in one Hours time.

XIII.
How the
Blood Cir-
culates in
the Birth,
whilst it is
yet shut up
in the
Womb.

It remains now, that we explain how that the Circulation of the Blood through the Heart is performed in the Birth, whilst it is shut up in the Womb: For seeing that the Infant doth not breathe in the Womb, as shall be said in the next Chapter, its Lungs lye still without motion, and consequently admit no Blood at all. There are therefore 2 branches found in the Birth, by means whereof this Defect is made up: The former whereof springeth from the Vena Cava, 2 or 3 Fingers breadth above the Midriff, and is inserted into the Vein of the Lungs near the Left Ventricle of the Heart, which the Blood presently enters, and after its Fermentation, or Effervescence there, is through the Aorta distributed throughout the whole Body; but the remaining portion thereof ascends farther through the Vena Cava, and enters the Right Ventricle of the Heart; from whence, after Fermentation, it proceeds into the Artery of the Lungs, out of which, near to its egress out of the Heart, another small Channel ariseth, which runs strait to the Great Artery, and into it pours forth the Blood that comes from the Right Ventricle of the Heart, to the end it may be distributed throughout the whole Body. So that because the Blood cannot pass through the Lungs, therefore that which enters the Left Ventricle of

the Heart, passeth into the Right; and thus by these Channels, the want of the passage through the Lungs, is made up. But after that the Child is born, these 2 Channels are stop't up, as being of no further use; the Circulation of the Blood being now performed through the midst of the Lungs.

CHAP. VIII.

Concerning Respiration.

Forasmuch as the Life of Man consists in the continual Motion of the Blood, and an Animal is said to live as long as the Alimentary Juice runs through the Heart, and from thence is driven to the other Parts; it is apparent that Respiration is necessary for the maintaining thereof, without which neither the Beating of the Heart, nor the flowing of the Blood can be performed. Hence it is that we commonly use the word Expiring for Dying; and that ARISTOTLE declares, that the Life of Man consists in the drawing and breathing out of the Spirit. For seeing that the Heart is heated by continual motion, Respiration is necessary for the Ventilating thereof, and for the Cooling of the Blood, to prevent it from being over-heated or inflam'd. Respiration therefore is the Alternative Expansion and Contraction of the Thorax or Chest, by which the Air is conveyed through the Wind-pipe to the Lungs, as well to cool the Blood contained in the Veins thereof, as afterwards to expel the said Air, together with the smutty Vapours: The Chest, Midriff, and Abdomen, as so many Muscles assisting to this Motion.

Respiration is twofold, Voluntary or Spontaneous: Voluntary is that whereby the Soul, by its Cogitation and Will, determining the motion of the Animal Spirits into the Muscles, which serve for Respiration and Expiration, doth by turns enlarge and contract the Breast. Spontaneous Respiration is that which is performed by us when we are asleep, or think of something else, from the conformation of the Nerves, which assist Respiration; whereby the Animal Spirits, without any determination of our Thoughts, flow into the Muscles, design'd for Inspiration and Expiration.

There be 2 Parts that constitute Respiration, viz. Inspiration and Expiration. Inspiration is that Action, whereby the Chest becomes dilated upon the entrance of the Air: Expiration is that Action, whereby the Thorax, or Chest, becomes compressed upon the Expulsion of the Air, together with the Vapours. So that the Breast derives its Dilatation and Contraction from this twofold Motion; its Dilatation, when its Parts are extended beyond its Natural amplitude; and its Contraction, when of themselves they return to their former Natural situation.

When the Air enters the Breast in Respiration, this Motion doth not proceed from the fear or admitting a Vacuum, neither must we imagine, that the Air of it self runs thither without being driven; but forasmuch as by the Dilatation of the Breast, the Air which is about the Breast and the Abdomen, is easily thrust out of its place, because of its Fluidity; neither is there any other place to receive that Air, but that which is made for it by

to avoid a
Vacuum.

by the *Dilatation* of the *Breast*; by this means it comes to pass that the *Air* which is driven away by the *Breast*, doth push forwards that which is about the *Mouth* and *Nostrils*, and drives it down the *Wind-pipe* into the *Lungs*. And thus as much *Air* is driven into the *Lungs*, as the *Breast* and *Abdomen* by their *Dilatation* do thrust away from them; so that here must be conceived a whole Circle of moved Bodies, according to that *Axiom* of *Natural Philosophy*, that *Every Motion is performed Circularly*. Now that the *Air* enters into the *Lungs*, because it is driven away by the *Breast*, is manifest in a *Dead Body*, where tho' the *Mouth* and *Nostrils* be open; yet the *breath* doth not enter into the Hollow of the *Breast*, because there is no Cause by which the *Air* might be driven thither. And the same we our selves experience, when after having breath'd out the *Air*, we keep our *Chest* for some Moments contracted: For in this state we are very sensible that the *Air* doth not in the least press upon us to enter into our *Lungs*, as long as we keep our *Breasts* in that posture.

V.
Respiration is performed by the help of the Muscles of the Chest, and the Abdomen.

Figure 67.

VI.
The manner how Spontaneous Respiration is excited at first.

VII.
The Reason of Spontaneous Expiration.

Respiration therefore is performed by the *Action* of the *Muscles* of the *Chest* and the *Abdomen*, which by extending and contracting of our *Body*, determine the *Air* to its *Ingress* and *Egress*. For there be 2 *Muscles* H and L, which by turns are blown up by the *Animal Spirits*, and fall again, and which by their *Ingress* and *Egress* do continually maintain the *Dilatation* and *Contraction* of the *Lungs*. For they are so disposed, as that when the one of them, viz. H is blown up or swells, the Space wherein the *Lungs* are contained, becomes dilated, whereupon the *Air* enters into them through the *Mouth* and *Nostrils*; and whilst the other L swells, the said Space is compressed, and then the *Air* is thrust out by the same ways: In like manner as the *Air* enters into a pair of *Bellows*, when the sides thereof are distended, and upon their being closed, is driven out again.

The *Animal Spirits* therefore being conveyed out of the *Ventricles* of the *Brain*, through the interposed *Pith* of the *Back-bone* into 2 *Nerves*, through the *Valves* C D, are sent in more abundance, and with greater force into the *Nerve* C G A, which serves for *Inspiration*; forasmuch as the same is supposed to be more large and open. And thus the *Valve* or *Flap* G, being in the midst of both *Nerves* is shut, and hinders the *Animal Spirits* from removing out of the *Muscle* H, into another passage K; and at the same time the other *Valve* F, of the opposite *Nerve* D F B, is opened, by which the *Spirits* pass out of the *Muscle* L, into the *Muscle* H; which together with those which flow from the *Brain* into the *Nerve* C G A, do enlarge the *Body*, and drive the neighbouring *Air* into the *Lungs*.

And thus is *Respiration* performed, and lasts as long as the *Muscle* H, being swell'd by the affluence of *Animal Spirits*, doth hinder the *Ingress* of other *Spirits*, and being straitned by the *Membran* 1, 2, 3, wherewith it is covered, as well as by its *Spontaneous Contraction*, is compressed to that degree, that the *Animal Spirits* rushing forth, by reason of their too great quantity, out of that *Muscle*, do open the *Valve* G, and passing through it into the *Muscle*, they together with other *Spirits* flowing from the *Brain* dilate it, and straightning

the *Breast* expel the *Air* out of it. And after this manner it is, that *Spontaneous Respiration* and *Expiration* is performed in us, either when we are asleep or awake.

But forasmuch as the *Lungs* have neither *Fibres* nor *Muscles*, without which no part of the *Body* is moved, we are to enquire what that is which effects this *Rising* and *Falling* of the *Lungs*. For as a pair of *Bellows* is distended or compressed with the *Hand*; so a like Cause must be assigned, which dilates and compresseth the *Lungs*: This upon Enquiry we shall find to be the *Midriff*. For it is a thing whereof every one is aware, when he feels that motion whereby his whole *Abdomen* is lifted up at every *Inspiration*, that at an equal Interval of time, the *Gristles* of his *Ribs* are drawn inwards; because the *Midriff*, by its middle part, presseth the *Stomach* and *Guts* downwards, and at the same time doth attract or draw inward, the *Gristles* to which its Extream parts are fastned, by reason of the *tension* or stretching of its Middle part. Moreover we find, that when we have fed plentifully, our *Respiration* is more swift, but withal not so strong and vigorous: And the same thing we Experience, when the *Air* we take in is thick and fill'd with gross *Vapours*. Forasmuch as in the former case, the *Midriff*, because of the overfulness of the *Stomach*, cannot dilate it self, as it was wont to do, and therefore endeavours to compensate the diminution of this *Dilatation*, by the frequency of her *Respirations*. And in the latter case, the *Lungs* are so clog'd with the gross *Air* they have drawn in, that not being able to cast it out again, they are forc'd to continue distended; and so it happens that the *Midriff*, not being able to return to its first State, is put upon a more frequent *Reciprocation* of its Motion.

This may be further confirm'd from *Wounds* of the *Chest*: For as soon as that is pierced, immediately the *Lungs* fall flat, the *Midriff* still continuing its motion upwards and downwards, and attracting the *Gristles*, and moving them, as it did before the said *Wound* was inflicted: So that we cannot say, that the *Lungs* do perform the Function of *Respiration*, but that they are only as Concomitants, inasmuch as complying with, or following the motion of the *Midriff*, they take in the *Air*, and presently after being contracted, expel the same, together with the smutty *Vapours* that arise from the *Blood*. Yea, it hath often been observ'd, that some Men who have had their *Lungs* in a manner wholly consumed; yet have never been troubled with any considerable difficulty of *Breathing*; which could never have been, in case the *Lungs* were the principal and primary Instrument of *Respiration*.

Many are the Uses of *Respiration*: First, For the *Cooling* of the *Blood*; for except the *Blood* that flows from the *Right Ventricle* of the *Heart*, through the *Arterial Vein*, be refrigerated by the *Air* taken in by *Respiration*, and be condensed again, before it enters the *Left Ventricle* of the *Heart*, it cannot be fit Fuel to that *Fire* which lies hid in the *Heart*, nor maintain it.

The Second use is, That the *Air* which goes out from the *Heart*, carries along with it some Particles, which are as it were the *Smoke* and *Soot* of the *Blood*, and conveys the same through the

VIII.
The Midriff is the Primary Cause of the Motion of Respiration.

IX.
Wounds in the Chest prove the great influence the Midriff has on Respiration.

X.
Of the manifold use of Respiration.

the *Arterial Vein*, from the *Right Ventricle* of the *Heart*. For the *Lungs* are as it were a *Sieve*, by the help whereof the *Filt* is separated, and those *Humours* sent away which would choke the *Heart*, should they continue mingled with the *Blood*. *Respiration* therefore clears and purifies the *Blood*, that it may be fit to enter the *Left Ventricle* of the *Heart*; and without hindrance be transmitted to the *Aorta*. Wherefore *Respiration* is of absolute Necessity to the *Life of Man*, so that when that is stopt or hindered he must *dye*. And therefore *HIPPOCRATES* saith: *We may live for some days without Meat or Drink; but when once the passages of our Breath are stopt, we cannot continue one Hour*. Moreover, when all other *Actions* admit *Intervals of Rest*, *Respiration* alone is that *Action* which in *Animals* never ceaseth. For seeing that the *Animal Life* chiefly consists in the *motions* of the *Blood*, or at least necessarily depends on the same it is evident, that upon the ceasing of *Respiration*, the *Blood* cannot pass from the *Right* to the *Left Ventricle* of the *Heart*; whereupon the *motion* of the *Blood*, which is of such absolute necessity to the maintaining of *Life*, must cease likewise.

XI. If you Object here, That *Infants* live in their *Mothers Womb* without *Respiration*: I Answer, That *Nature* hath taken another way to secure the *Life* of the *Infant* in his *Mothers Womb*, by taking care that the *Blood*, which hath been heated and rarefied in the *Heart*, should not any more return thither again, but in a very small quantity. For since the passage of the *Lungs*, because of their compact consistence, is intercepted or shut up, the *Blood* is conveyed another way, out of the *Right Ventricle* of the *Heart* into the *Left*, viz. through the *Body* of the *Vena Cava*, out of which there is a passage opened into the *Venal Artery*, which is commonly call'd the *Oval Hole*; and another out of the *Arterial Vein*, into the *Great Artery*; through which Passages the *Blood* is forced to take its course. But as soon as the *Infant* is born, the *Blood* enters through the *Artery* and *Vein* of the *Lungs*, either because these *Vessels* of the *Lungs* are wider than those other *Passages*, and afford it a more free Ingress; or because the *Passage* of the *Oval Hole*, and the *Arterial Channel*, begin to be obstructed by degrees, and turn to a *Ligament*.

XII. And for the same Cause it seems, that *Ducks*, *Didappers*, *Geese*, and other *Aquatick Animals*, do live for some time under *Water*, without *Respiration*; because those *Passages*, I have but now mentioned, are not wholly stopt up in them, but either by their daily using of them, or by reason of the *Natural disposition* of the *Parts* in those *Animals*, do continue open, and cannot without some difficulty be obstructed or abolished. And we may with great probability attribute to the same Cause what *Historians* relate of some *Divers*, that would continue for *Hours* together under the *Water*, viz. that by a singular *Priviledge* of *Nature*, these two *Passages* continued open in them, so as that the *Blood* could pass through them, as it did before they were born. Yea, we have the *Relation* of some dissected *Bodies*, in which these have been found open, so as that the *Blood* could freely pass through them.

CHAP. IX. Of the Growth and Decease of the Body of Man; of the Temperaments and the Differences of Age.

A Body is said to be nourished, when the *Particles* of *Aliment* being turned into *Chyle*, do preserve and maintain it in the same state wherein it is; but it is said to grow, when these *Particles* are in such abundance joyned to it, as that thereby its *bulk* increaseth. Thus *Mans Body* is said to grow, when *Particles* of a new *Substance* are added to those which before made up its *bulk*, or *magnitude*, exceeding in quantity what it loseth by continual *Transpiration*. For seeing that all the *Parts* of our *Body*, the *Bones* only excepted, are soft, their *Pores* consequently are easily dilatable; and therefore whensoever more prepared *Aliment* is joyned to them, than their *Narrowness* can contain, consequently that *Body* must increase in *bulk*.

How this is done we shall easily understand, by following the *Blood* from its *Fountain*, the *Heart*, and observing the several turnings it takes in the *Body*. Conceive we therefore the *Blood* that hath been rarefied with the *Heat*, or *Fire* that is in the *Heart*, rushing forth thence through the *Aorta* towards the *Brain*, and some small portion of it entering the *Capillary Arteries*, and insinuating it self into all the infinite *Pores* of their *Membrans*, which are opened at every *Pulse* or beating of the *Heart*. Conceive we also these *Pores*, to be so exceeding narrow, that the *Particles* of *Blood* cannot range up and down in them, but are forced to pass strait forwards, so that touching one another, they do no longer compose a *Liquid Body*, but rather several slender *Threads*; such as the *Fibres* or *Strings* of *Flesh* are. This supposed, we shall easily apprehend that a *Body* is then said to be *Nourished*, when the dissipation of one *Fibre* of the *Fleshy parts*, is made good by an equal portion of *Matter*; and to *grow* or *increase*, when more *Matter* is joyned to it, than was dissipated. As we see that *Bread* swells to a greater *bulk*, when its *Pores* take in more *Milk* or *Wine*, than the quantity of *Air* was, which either of these *Bodies* have driven out of them.

The *Decrease* or *Diminution* of the *Body*, is caused either upon the defect of *Food*, or when the *Aliment* is unfit to enter the *Pores*; or when the *Natural heat* is too weak to drive the *Food* to the ends of the *Fibres*, and by this means restore the dissipated *Substance* of the *Body*; as it happens in *Old Men*: Or when the *Heat* is too strong, as in those that are of a *Cholerick Complexion*: Or when the *Texture* of the *Body* is such, as that it cannot admit the *Alimental Juice* into its *Pores*.

The *Body* of *Man* is observ'd to grow till the years of 21 or 22; for seeing that until that term, the *Bones* are not yet arrived to their utmost degree of *Hardness*, and that the other parts of the *Body* are readily penetrable, the *Aliment* accordingly is readily received into the *Pores* of them; and though for many years after this, the *Body* may spread in *breadth*, yet at last it ceaseth from any further growth, because the *Parts* of the *Body*, by reason of a continual access of fresh

IV.
The Body
of Man
grows till
the Age of
One and
twenty.

liments grow so hard in process of time, that its Pores can no longer be extended or dilated, nor any thing further be added to it.

V. The Body of Man being a compound of different parts, Physicians have attributed to it a Temperament consisting of several Humours, viz. Blood, Phlegm, Choler and Melancholy; which are distinguished by their native qualities. For the Blood in the Veins and Arteries is hot and moist; Phlegm cold and moist; Choler hot and dry; and Melancholy dry and cold. So that a Man whose Temperament is hot and moist, is esteemed of a Sanguine Complexion; he that is of a hot and dry, Cholorick; and so of the rest. For all Men are not of the same Temperament, but differ according to the Predominance of one or more of these humours, and accordingly are inclin'd to various Passions and Inclinations.

VI. Persons of a Sanguine Temperament, have quick and lively Bodies, a Ruddy Colour in their Faces, they are little thoughtful or serious, but inclin'd to Jesting, Singing, Complaisance and all manner of Merriment; and much addicted to Lust and Pleasure. They have a great, full and moderate Pulse; which makes Youths that abound with Blood to be facetious, good natur'd, plump and of a Ruddy Complexion, and subject to Inflammations and other Diseases proceeding from a surplus of Blood.

VII. Cholorick Persons, or such in whom the Gall abounds, are of a hot and hasty Temper, and like Straw or Stubble do easily take Fire, and are suddenly kindled with Anger and Indignation, but do not keep their Anger long, being soon reconciled. They are much subject to Tertian Agues, the Yellow Jaundise and Fluxes of the Belly, these Diseases proceeding from the Depravation of the Gall.

VIII. Those of a Melancholy Complexion are not so readily provoked to Anger; but being once provoked, are not easily appeased. They have a small and slow Pulse, narrow Veins, and a sad and dark Aspect. The diseases they are most subject to are Schirrous Swellings, Quartan Agues, the Piles, Hypochondriacal Melancholy, and other Distempers of the Spleen.

IX. Phlegmatick Persons being of a cold and moist Temperature, are not troubled with any vehement Passions, neither are greatly moved about any outward things; and therefore are Slow, Sleepy, Lazy, and not at all inclin'd to be Angry: They are subject to daily Phlegmatick Tumours, Winds and the Dropsie.

X. The parts of the Body also have their particular Temperament; for the Heart is the hottest of all other parts, as having in it a continual Fire, which is fed and maintained by the never-ceasing Afflux of the Blood. The most moist part is the Brain, which the continual Defluxions proceeding from it, are a pregnant witness of, being caused by those Vapours, which continually ascending to the Brain, are there condensed. The Bones are the most cold and dryest parts of the Body, forasmuch as their particles are without all motion, and their Pores are only filled with Air or Subtil Matter.

XI. The difference of the several Ages of Mans Life doth likewise depend on a variety of Temperament; and are more in Man than in other Animals. By the name of Age we understand such a

part of the Life of Man, wherein by reason of the mixture of Heat and Cold in his Body and their acting upon each other, the Temperament of it undergoes a sensible alteration. These Ages are distinguished into Childhood, or the Age of Stripling, the Age of Young Men, Manly Age, and Old Age.

The Age of Childhood in Boys reacheth to their 14th year, and in Girls to their 12th. The Bodies of Children are in a manner of an equal Temperature between Heat and Moisture; for tho' the Heat and moisture of their Bodies exceeds that of Men, yet they are said to be temperate, as being such as best agree with their state. BOYS and GIRLS begin to breed Teeth when they are a year and an half old; and when they are about 7, change their first Teeth for new ones.

The next Age is Youth, which extends to the 25th year. This Age is more Temperate than Childhood, as wherein the Heat doth not so much prey upon and dissipate the moisture, and the moisture less clogs the Heat. Youths are most desirous of Liberty, and accordingly as soon as they are got from under the Inspection of their Parents and Masters, they are apt to run into great Excess, by betaking themselves to their Lusts and Pleasures. As being persuaded that they are now wholly at their own dispose, and at full and absolute liberty to do whatsoever they please.

Next to Youth follows that which is called the Age of Young Men, which reacheth from 25 to 35, and is the flourishing Age of Man, wherein Heat and Driness do predominate; the watry Humour being much wasted in the foregoing years, and the Oily Particles more intricately mixed together, do make the Heat stronger, and preserve the Animal Spirits better. Accordingly Young Men are more hot than Youths, and violently carried to Venery. As to the Temper of their minds they are Restless, Rash and precipitant in their Judgment, neglecting present good things, and reaching out to those that are Future.

Next follows Manly Age, which from 35 extends it self to 50. In this Age the Natural Heat, and Agitation of the Spirits begins to be lessened; but yet the Body is not so exhausted, as that the natural Faculties grow faint and weak, seeing that every part is ready and fit to exert the Functions and Actions of Life.

Last of all comes Old Age which is Dry and Cold; the former part whereof called Viridis by the Learned, reacheth from the year 50 to 60, during which, many Old Men are yet pretty lively and vigorous; the Middle is from 60 to 70, during which term the Spirits are few and weak, and can but languidly perform their functions. The Senses grow dull and weak, the strength and vigor of the Body languisheth. And the last is that which is called Decrepit Age, which completing the Dryness and Coldness of the Body, brings in Death, the end and conclusion of them all.

C H A P. X.

Of the Senses in General.

I.
What the
Senses are.

TH O' all things in the *Body of Man* be full of wonder, and most proper to raise our minds in Gratitude to Glorify our Creator; yet doth nothing more lowly proclaim his Power and Goodness, than the variety of our Senses, which are those Affections or Cogitations by which we perceive External Bodies. For the Senses are nothing else but Perceptions of the Mind, that are the consequences of several Motions made in the Brain; our nature being such, that by occasion of these motions, produced in our Organs, several Ideas and Figures of the things are represented to us.

II.
What an
Organ is,
and how
manifest
they are.

An Organ is that part of the Body, which receives the impulse or action of the Object; or is that Natural Instrument by means whereof an Animal perceives something. Some Organs are External, which have their Inlets in the outward part of the Body, as the Eyes, Nostrils, Ears and the Nerves that are joined to them; Others Internal, which lie hid in the inward parts of the Body, as the Brain, the Spirits, the Pineal Kernel.

III.
How the
Senses per-
form their
Functions
in the Body.

For seeing that our whole Skin and Flesh, whereof the outward Habit of our Bodies do consist, are interwoven with several Twigs and Tendrils of the Nerves, when these are distended by the Animal Spirits rushing into them, they are easily put into motion by the least jostling of outward Bodies: which motions according as they are grateful or hurtful to the Bodies in which they are excited, do exhibit variety of sensations to the Soul. As for Example, because Tangible Objects touch our Bodies, they produce a motion in the Organ, by the Help of the Nerves, the Extremities, whereof are extended throughout the whole Body, which motion being immediately carried to the Brain, and thence communicated to the Soul, which is intimately present to it, doth variously affect the same according to the diversity of the Nerves, and structure of the Organ.

IV.
There be
three De-
grees of
Sensation.

This will appear more clearly, by considering these three degrees in every sensation: the First when the Organ is affected by forrein Bodies; or when the Impression is made by the object it self, which being received into the Organ of Sense, carries the Type or Character of the sensible thing along with it; and this is nothing else but the Agitation of the Particles of that Organ, with some variety of Position and Figure proceeding from that Agitation. And this first degree is common to Men with Brute Beasts. The Second is the Perception of the Soul, heeding or attending to that motion, which immediately follows upon the former degree, because of the intimate presence of the Soul to the Organ so moved. The Third comprehends all those Judgments, which we form by occasion of these motions. Which Progress, if it be well heeded, it will be manifest, that all Bodily Objects are therefore only perceived by us, forasmuch as they move the Nerves that assist such and such Organs.

V.
The Three
Degrees of
Sensation
illustrated
by an Ex-
ample.

As for Example, when I see a Stone, or any other Object, it is because the Light reflected from the Stone moves my Eye: for nothing else proceeds from the Objects to our Senses but motion only,

or an Impression. Which motion is readily conveyed from the Bottom of the Eye through the Optick Nerve, or its small Fibres to the Brain, and Seat of the Soul; upon which impression immediately follows our perception of Light or Colour; and then the Judgment whereby the Soul concludes the thing to be of such and such a Colour.

For from the variety of the Motions that are made in the Organs, and conveyed to that part of the Brain, from whence the Nerves proceed, divers Senses are produced. Thus by the force of the motions that are made in that part of our Brain, whence the Optick Nerves do proceed, we are affected with the Sense of Light, and by the variety of those motions, with that of colour. Thus by the motion of the Nerves that belong to our Ears, we perceive Sounds; and by those that are dispersed through our Tongues, divers Tastes, Relishes and Savours. And the same may be said of the perceptions of Titillation, Pain, Hunger, Cold, &c. all of them depending on the motion of the Nerves.

For seeing that the Ventricles of the Brain are perpetually filled and distended by the Animal Spirits, as we see that the Sails of Ships, are blown up and stretched by the wind: And since in the midst of the Brain we find that Kernel placed, which is called by Physicians, Conarion, or the Pine-Apple-like-kernel (of which more hereafter) being surrounded every way with the Animal Spirits, there is no agitation so small or inconsiderable that can happen to the small Fibres or Filaments of the Nerves, but that it must be communicated to the Brain, and consequently be impressed on the Animal Spirits contained in it; and by means of them to the foresaid Kernel, and consequently to the Soul whose Residence it is. For so we are taught by Learned Men, that we never feel, or are sensible indeed, except we feel, that is, perceive, that we feel. And thus ARISTOTLE himself tells us Problem 33 Sect. 11. that Sense, when it is separate from Understanding, is only insensible labour, whence it is said that the Mind sees, the Mind hears.

We may conclude therefore that our Soul doth not stand in need of any sensible Species proceeding from the Objects, to make it capable of Sense, the motions impressed upon the Body from without being sufficient for this purpose, as may be proved by manifold Experience: For when a Man is hit on the Eye, he perceives flashes of Light, tho' indeed he be in the Dark, and cannot discern any Objects. Whence it is evident, that this Sense is only to be ascribed to that violent agitation impressed upon the Organ of Sight. And something not unlike to this happens to those, who having for some time fixed their Eyes upon the Sun, upon turning their backs upon it, or shutting their Eyes, think they see a vast variety and mixture of Colours. The cause whereof is the concussion of the Strings or Fibres of the Optick Nerve.

Whence we may be convinc'd of that palpable Error of the Peripateticks, who suppose the Sound that is received into the Ear, to be in the Air, or in the Sounding Body: And in like manner, that Light and Colour are in the Flame, and in a Wall or other Object; because they do not feel a Sound, Light, and Colours in themselves, as they feel Pain and Tickling; supporting their Opinion also with this

VI.

The Diversity or Variety of our Senses, proceeds from the Difference of our Nerves.

IX.

All Motions are conveyed to the Brain.

VII.

All Motions are conveyed to the Brain.

IX.

All Motions are conveyed to the Brain.

VIII.

Our Senses are no more than Motions.

VIX.

All Motions are conveyed to the Brain.

IX.

The Error of the Peripateticks about the Cause of Sense.

Ar-

Argument, That the Colours that are seen, appear to us much bigger than our selves.

X.
This com-
mon Error
refuted.

But that these *Arguments* are of no force in this case will appear, if we consider, that we have a *sense* of many things which are without us, and which we judge to be much greater than we our selves are; tho' there be nothing without us that effects such *Sensations* in us. For *Mad-men*, and such as are in a high *Fever*, do sometimes see, or think they see many *Appearances* or *Representations*, which are not imprest upon their *Eyes* from without. In like manner it frequently happens when we are *asleep*, that we think we hear *Sounds*, or see *Colours*, after the same manner as we do when we are *awake*; and then attribute that *Sound*, and those *Colours*, to *External Objects*, and imagine them to be much greater than they are; when indeed there is nothing without us, to which we can attribute them.

XI.
There is no
Necessity
for our
admitting
of Inten-
tional
Species.

Neither is there any thing that obligeth us to admit such *Images* as these, for the Explication of the *Sense* of *Seeing*, or any other; since we find that there are many things that can produce *Affections* and *Commotions* in our *Souls*, which have no likeness at all with the *Objects* they signify: As when *Words* spoken, or committed to *Paper*, represent the *Slaughter of Men*, *Destruction of Cities*, or *Storms at Sea*; or excite the *Affections* of *Love* or *Hatred*: Which *Representations* or *Thoughts* bear no resemblance at all with the things they signify.

XII.
Because
they are
not Intelli-
gible.

Besides these *Species* (which are commonly called *Intentional*) are so obscure, that the Nature of them cannot be understood: For they are not *Corporeal* or *Divisible*, seeing they are found whole and entire in every least part of the *Subject* or *Medium*. And if they be *Indivisible*, as most suppose them, and of an ambiguous Nature between *Body* and *Spirit*; how come they to move our *Senses*, yea, and sometimes hurt them too? Or how can they represent *Extended Beings*, being without *Extension* themselves?

XIII.
Neither is
the Cause
of them
intelligible.

Neither is the *Original* or *Cause* of these *Images* less obscure, than they themselves are: For how can we suppose that *Suggish Bodies* can by *Emanation* send forth such excellent *Forms*? Nothing being more wonderful or inexplicable, than how such *Spiritual Forms* should continually be procreated by *Terrestrial Bodies*, or flow from them. Besides, by what *Chariots* or *Vehicles* are they conveyed to us? Do they come solitary to us from the *Object*? Or are they diffused and multiplied by *Propagation*, and that in a *Moment* of *Time*?

XIV.
The Senses
are in the
Soul.

Wherefore tho' every one (as *DES CARTES* saith, in the beginning of his *Treatise of Light*) be apt to persuade himself, that the *Idea's* which we have in our *Thoughts*, are like the *Objects* from whence they proceed; yet can I find no Reason, to assure my self thereof: But on the contrary do meet with many *Experiments*, that may make us to question it. For if *Words* that signify nothing of themselves, but only from Custom and Human Institution, are sufficient to make us conceive many things, wherewith they bear no resemblance at all: Why may not *Nature* as well appoint a *Sign*, which may make us to have the *Sense of Light*; tho' indeed, it contain nothing that is like that *Sense*? Don't we find, that in this manner she

hath appointed *Laughter* and *Tears*, whereby we may read *Joy* or *Sorrow* in the *Faces* of *Men*? But you'll say, That our *Ears* make us sensible of nothing but the *Sound* of *Words*, and that it is our *Soul* only which remembers what these *Words* signify, that does represent the same signification unto us at the same time. To which I Reply, That it is our *Soul* also that represents to us the *Idea* of *Light*, as often as the *Action* which signifies the same, doth touch our *Eye*.

Neither is it less difficult to explain, how these *Images* can flow from the *Objects*. For what *virtue* is there in them, to produce these *Species*? Or how shall they be received into the *Organs* of the *Outward Senses*, and from thence be conveyed through the *Nerves* to the *Brain*? If the *Species* be received by the *Sense*, how is it that it is not known or perceived by it, since every thing that represents ought to the *Knowing Faculty*, is objectively related to it, forasmuch as it supplies the room of the thing it represents?

None of these things were ever yet fully explained by those, who so much cry up *Sensible Species*; nor ever will be, as I suppose. Besides, how will they go about to explicate the *Sense* of *Pain* and *Tickling* by the help of these *Images*? The *Point* of a *Sword*, for Example, is thrust into a *Body*, which causeth a dissolution of *Parts*, whereupon *Pain* follows: Where shall we be able to find either in the *Sword*, or the *Division* of the *Body*, any *Species* that is in the least like the *Sensation* of *Pain*, that follows thereupon? What *Analogy* hath the application of our *Hand* with the *Sense* of *Titillation*? Conclude we therefore boldly, that *Pain*, and all other *Sensations*, are therefore excited in us; because the *Parts* of our *Body*, by the *Touch* or *contact* of another *Body*, are locally moved; which *motion* of the *Nerves*, if it be moderate produceth *Titillation*; but if violent, *Pain*.

Moreover, what is *Light*, but the *motion* of the *Subtil* and *Athereal matter*, which shakes and agitates the little *Nerves* of the *Retina* or *Network membran* or *coat* of the *Eyes*? What is *Sound*, but the *motion* of the *Air*, which strikes the *Drum* or *Organ* of *Hearing*? Forasmuch therefore as divers *Objects* variously strike the *Organs*, it can be no otherwise, but that the *Soul*, which is placed in the middle of the *Brain*, must by means thereof perceive the differences of *Sensible things*: Somewhat in like manner as a *Blind-man*, by the *motion* of his *Stick*, can discern or distinguish a *Stone* from *Sand*, and *Earth* from *Water*. Because there is nothing, besides *Motion*, which can strike the *Organs* of the *Senses*, or affect the *Mind* it self.

Sense (by which word nothing else is understood, but a *Faculty* of perceiving *Sensible Objects*) is fivefold, viz. *Feeling*, *Tasting*, *Smelling*, *Hearing* and *Seeing*, according to the diversity of *Objects* that move the *Nerves* of the several *Organs*; and the variety of the *Organs* themselves, and the *modes* or manner of their being affected therewith. Which cannot but happen, if the *Organ* that is affected be sound and whole, with a sufficient distance of the *Object* from the *Organ*, and a fit *Medium*. By defect of the first of these, the *Sense* often mistakes in those that have the *Yellow Jaundies*, or *Agues*: For want of the second, the

XVIII.
Of the
five
Senses.

Object cannot be discerned, if it touch the *Organ*: And by failure of the *third*, the *Sight* that perceives *Objects* through a misty *Air*, or partly through the *Water*, and partly through the *Air*, is very apt to mistake the true Modifications of them.

XIX. The *Senses* are also commonly divided into Internal and External. The *Internal* are 2, viz. the *Common Sense* or *Phantasie*, and *Memory*. The *External* are the 5 already spoken of, and are called *External*, because they are produced in us by the help of outward *Organs*: Tho' indeed, if we will speak accurately, all these 5 *Senses*, called *External*, are *Internal*, forasmuch as it is the *Soul* alone, which residing in the *Brain*, *Sees*, *Hears*, *Tastes*, &c. It may also be said, that there is but one only *External Sense*, viz. that of *Feeling*; because no *Sense* can be without *Contact* and *Local motion*. Thus, if we would *taste* any thing, it is necessary that the *Food* should touch the *Nerves* subservient to that *Sense*, that so the said *motion* may be conveyed to the *Brain*, or the *Common Organ of Sense*; and the same may be said of all other *Senses*.

CHAP. XI.

That the *Senses* are an Effect of the *Nerves*; and that the *Soul of Man* only feels, forasmuch as it resides in the *Brain*.

I. How the *Nerves* conduce to the forming of the *Senses*; and how the *Soul* rules in the *Brain*.
THO' it sufficiently appears from the foregoing Chapter what *Sense* is, and how by the Ministry of the *Nerves* *External Objects* are communicated to us; yet it remains still for us to enquire, how the *Nerves* perform this; and why the *Senses* rather have their residence in the *Brain*, than in any other part of the *Body*. Both which, tho' they be different Points, I shall comprehend in this Chapter.

II. In the first place, we are to take notice, that the *Nerves* are *Vessels* fitted for the containing and conveying of *Spirits*, proceeding from the *Pith* within the *Brain*. Secondly, That there are 3 things to be considered of in the *Nerves*; First, The *thin Skins* wherein they are wrapt or cover'd, which proceeding from the *Coats* or *Membranes* that encompass the *Brain*, are dispersed throughout the *Body* into small branches like *Pipes*. Secondly, That their *Inward Substance*, which is divided into very fine *filaments* or *Strings*, do reach from the *Brain*, whence they take their rise, to the utmost Parts of the *Body*, with which these *Nervous filaments* are interwoven. Lastly, The *Animal Spirits*, which like a *Wind*, or most subtil *Air*, rushing through these little *Pipes*, do move the *Muscles*, by way of *Inflation* or blowing of them up. It remains now that we say something, how those *Strings* or *Capillaments* which are within the *Tubes* of the *Nerves*, are subservient to *Sensation*.

III. Which will not be difficult to understand, if we suppose that these *Capillaments* do reach to the *Extremities* of all the *Members*, that are capable of any *sense*; so that if any part of those *Members*, to which the *Nerve* is fastned, be never so little stirr'd, at the same Moment that part of the *Brain* from whence that *Nerve* proceeds, must be

moved also. Which we may Experience in a stretched-out *Rope*, whereof if the one end be touched, the other must be moved at the same time. So that all the diversity of Impressions that are made upon the *Brain*, do arise from the *Nerves*, which carry the various *Qualities* of the *Objects* along with them.

We must therefore imagine, that those small *Filaments* that are derived from the inmost *Recesses* of the *Brain*, and constitute the *Pith* or *Marrow* of the *Nerves*, are so disposed in all those Parts that are the *Organ* of any *Sense*, as that they may be most easily and readily moved by the *Objects* of those *Senses*. And that whensoever those *Filaments* are never so little moved, they draw those parts of the *Brain*, whence they proceed, and at the same time open the *Orifices* of some *Pores*, that are in the inward Surface of the *Brain*, through which the *Animal Spirits* in the *Ventricles* of the *Brain*, begin immediately to direct their course, and through them rush into the *Nerves* and *Muscles* that are the *Instruments* of those *Motions*, that are altogether like them that are excited in us, when our *Senses* are so and so affected.

As to the second Particular, viz. That the *Soul of Man* doth feel, that is, sensibly perceive all things; not as it is in the *Organs* of the *External Senses*, but only inasmuch as it is in the *Brain*, which is the *Center* and *Rise* of all the *Nerves*, this is evident from *Examples* and *Reason*. For when we see *Light*, or hear a *Sound*, we must not imagine that the *Soul* exerts this Act of *Sensation* in the *Eye* or the *Ear*; but that it perceives these things in its own place or seat, by means of the *Nerves* that reach from those parts to the *Brain*. For if the *Soul* did see in the *Eye*, and hear in the *Ear*, since both these *Organs* are double, there must needs follow a double perception of one and the same *Object*, at the same time: And since the contrary is most evident, it follows, that the *Soul* feels only in that part of the *Body* where the 2 *Impressions*, which proceed from one *Object*, through the double *Organs* of the *Senses*, are united again into one, before they affect the *Soul*.

This may be confirmed from manifold *Experiments*: For we find by daily Experience, that the *Vapours* which ascend from our *Stomach* to the *Brain*, and being condens'd there, do obstruct the passages through which the *Animal Spirits* have their course, do deprive a *Man* of the Power of *Sensation*. We find also that *Diseases*, which affect the *Brain*, or *Wounds* that are inflicted in it, do destroy the *Senses*; as is manifest in those that are struck with the *Apoplexy*. In like manner in *Frenzies*, wherein the *Imagination* is spoiled, Remedies are applied to the *Head*, which would be very foolishly done, if the *Senses* had their Residence in any other part of the *Body*. Hence it is that they who are seiz'd with the *Apoplexy*, are immediately deprived of all their *Senses*, so as not to be sensible, tho' they be lash'd with *Knives* or prick'd with *Pins*. And for the same Reason it is, that Persons that have their Attention fix'd upon any thing, do not take notice of things that are done in their presence; because the *Soul* residing in the *Brain*, is otherwise taken up, so as not to take notice of the things that are offer'd unto it.

IV. How the *Body* is excited from *External Objects*, to move itself.

V. The *Soul of Man* hath its Residence in the *Brain*.

VI. Proved from the Experiment of *Vapours* and *Wounds*.

VII. But no more convincing Argument can be al-
 ledg'd to prove, that the Soul doth sensibly per-
 ceive in the midst of the Brain, than that which
 is taken from the *Vertigo*, in which all *External*
Objects seem to move round; whereas indeed there
 is no such motion, neither in the *Objects* them-
 selves, nor in the *Outward Senses*; but it proceeds
 only from the *Spirits* in the Brain, being so
 moved, which affecting the Soul, it rashly attri-
 butes the said *Circular motion* to the *Objects* that
 are about it.

VIII. Moreover, they that are earnestly busie about
 Serious Matters, or are wearied with long Study,
 are sensible of a Pain in their Head; which I my
 self, after a little Study, frequently Experience:
 Which would not be so, if the Soul had not its
 Residence in the Brain, and did imagine and feel
 there. Besides, it sometimes happens that Pain
 seems to be felt in that part which is cut off from
 the Body; according to what *DES CARTES*
 tells us of a Girl that had her Arm cut off, who
 afterwards complain'd of a pain she felt in her
Fingers. Which could not proceed from any
 other Cause, but because the Nerves, which came
 from the Brain to the Hand, upon the cutting off
 of her Arm, reacht no further than her Elbow,
 where being affected after the same manner, as
 they used to be when her Hand was yet pained,
 made her suppose, that she felt the same pain she
 formerly felt in her *Fingers*. For such is the Na-
 ture of our Body, that no part of it can be moved
 by another, which is a little distant from it; but
 that it must be moved in like manner by those
 Parts that come between. As is manifest in a
 Rope, the End whereof may as well be pull'd
 or hal'd by that Part which is nearest to the midst,
 as by the other End opposite to it.

IX. In like manner it sometimes happens, that after
 having leaned long upon our Elbow, we are sen-
 sible of a Numness in our Little Finger; because
 the Nerve which ends in that Finger, being too
 much prest upon, doth affect the Organ of the
 Common Sense, as if the Finger it self were so
 prest. For we are wont to affix the Sense of Pain
 to that part, which is wont to be moved by the
 Objects, and wherein the stretched Fibres of the
 Nerves are terminated.

X. Wherefore it is necessary, that the Soul have its
 Residence in that part of the Brain, to which the
 Filaments of our Nerves do reach; to the end
 that it may take care for the Security of all the
 parts of the Body, and may have timely notice of,
 and provide for any Casualties that happen to the
 Body. For tho' all the Changes of the Fibres,
 consist only in some certain motions, which com-
 monly do only gradually differ; yet must the Soul
 consider them as Changes that are Essentially dis-
 tinct, and that forasmuch as they cause so great
 an Alteration in the Body to which it is joyned.
 For the Motion, by Example, that causeth Pain,
 tho' it frequently differ but little from that Motion,
 the effect whereof is *Ticillation*: Yet, because by
 the former some of the Fibres of the Body may be
 pluck'd out of their places, or broken, whereas
 the latter is an Argument of the firm and entire
 Constitution of our Body, so it is that the Soul ap-
 prehends these 2 motions, as being essentially distin-
 guish'd. As to what particular part of the Brain
 the Soul hath chosen for its Residence, shall

be declared in the next Part of these Institu-
 tions.

But you'l say, It cannot be denied, but that we
 see with our Eyes, and feel pain in our Feet: Why
 then should we say, that the Function of Sense is
 only performed in the Brain, and not rather in
 these outward Organs of our Bodies?

True it is, that the Impression that is made by
 the Object, is begun in the Organs of the outward
 Senses; but it is not perfected or compleated there.
 We see with our Eyes, forasmuch as the Impressions
 of Light and Colour are made upon them: But
 all this while the Action of the Soul, whereby this
 Impression is perceived, is exerted in the more par-
 ticular and chief Residence of the Soul; as will
 appear more plainly in what follows.

CHAP. XII.

Of the Senses in particular; and first of
 the Touch.

Tho' the Touch be but a Dull Sense, and with
 respect to its Action be Inferiour to the other
 Senses, yet we must first of all handle it; not
 only because it is the most necessary Sense, but also
 the most common, as being to be found in every
 Animal, how imperfect soever, and diffused
 throughout all the Parts of our Body. That it is
 more Common than the rest of the Senses, appears
 in this, that the other Senses are nothing else, but
 several Species of Touching; which tho' they be
 perfect and exquisit, yet cannot their Functions be
 understood, but with some proportion to the
 Function of the Touch. For no Organ of our
 Body can be moved, without another Body touching
 it. Besides, the Touch, like the other Senses, is not
 tyed to one particular part of the Body, but is
 found in all the Nervous, Fibrous, and Membra-
 nous parts of it. For it is communicated to the
 whole Body, as a Cap-a-pee Armour, to receive
 the Attacks and Impressions of all Sensible Qualities.
 It is also very necessary for the defence of Life,
 and the avoiding of Dangers, which our Bodies are
 obnoxious to from External Objects. For the
 Touch is as it were our Monitor, advising us what
 we are to avoid; and what we are to do in these,
 or the other Circumstances.

The Touch therefore, as it is distinguish'd from
 the rest of the Senses, may be defined, An outward
 Sense that is most common and necessary, by means
 whereof an Animal doth receive Tangible Quali-
 ties.

And thus the Touch, as it is taken in a larger
 Sense, may be distinguish'd into Internal and Ex-
 ternal: That being the Inward Sense of Touching,
 which is performed in the Inward Organ; for
 seeing that the Nerves and Fibres, which are the
 Organs of these Senses, are dispersed within,
 as well as on the outside of the Body, accordingly
 there is an inward as well as an outward Sense of
 feeling. And therefore the Veins, Arteries, Mem-
 brans, and their appendages the Coats are partakers
 of this Sense. Thus the Pain which we feel in our
 Guts, and in other fibrous parts, belongs to this
 Inward Touch. For this Sense is excited upon
 every least motion that is made in any fibrous part,
 supposing it to be strong enough to be conveyed to
 the Brain.

IV. The Organ of Feeling is neither the *Flesh*, nor the *Membrans*, nor the *Skin*; but the *Nerves* and their *Filaments*, dispersed throughout the whole *Body*. For this *Sense* is excited, as oft as the *Nerves* and their *Filaments*, being shaken with more force than ordinary, do communicate their agitation to those parts of the *Brain* they more particularly relate to; as we see it happens in a stretched *Cord*, which being shaken at one end, immediately imparts its motion to the other.

V. Our Modern Anatomists fix the Organ of Feeling either in the *Skin*, the whole *Substance* whereof is *Nervous*, or in some *Bodies* that lye between the *Skin* and the *Cuticle*, which with MALPIGHIUS they call the *Sinewy*, or *Nervous Nipples of the Skin*, which they take to be the primary and immediate Organ of the *Touch*; because these little *Nipples* or *Prominences* are found to be more in number, and larger in those parts of the *Body* that are endued with the most exquisite *Touch*, as the *Palm* of the *Hands*, and the *Ends* of the *Fingers*, than in the other parts. MALPIGHIUS first discover'd these in the *Feet* of a *Lamb*, *Hog*, and other *Animals*; for as soon as their *Hoofs* are pull'd off, certain little *Bodies* do appear extended in length, and reaching to the *Surface*: So that *Hoofs* and *Nails* seem to be nothing else, than the appendages of the *Cuticle*, and of the *Nervous Nipples*, which being pull'd out do leave certain hollow *Pipes* behind them.

VI. These *Nipples* are not only discover'd by the help of a *Microscope*, but also by the bare *Eye*, in the extream parts of the *Nostrils* of some *Animals*; as of an *Ox*, *Swine*, &c. And that the Organ of Feeling is chiefly to be plac'd in these *Nipples*, MALPIGHIUS with reason conjectures, because they are nothing else but a propagation of the *Nerves* and *Tendons*, proceeding from the *Fibres* of the *Muscles*. And forasmuch as the *Touch* is performed, as well as all the other *Senses*, by the *Nerves* and *Fibres* of the *Tendons*, it seems that no more proper Organ of the *Touch* can be assigned: Forasmuch as according to STENO's Observation, the *Skin* is for the most part nothing else, but a *Texture* of *Nerves*, *Arteries*, and *Veins*.

VII. The Causes or Objects of the forefaid Affections, which the Schoolmen call *Sensible Qualities*, are *Heat* and *Cold*, *Moisture* and *Driness*, *Hardness* and *Softness*, *Heaviness* and *Lightness*, *Smoothness* and *Roughness*, *Titillation* and *Pleasure*; and other *Modifications* of the *Body*, which produce some change of *Motion*, *Texture* and *Figure* in them. For all Objects indifferently cannot affect the *Touch*, but it is requisite that the Affection be considerable, and such as to make it self sensible. For seeing that the *Nerves*, which are the Organs of this *Sense*, are of some Bigness, they cannot be moved by very little *Bodies*; because, according to an Axiom in Natural Philosophy, a *Body* greater in Extension being at Rest, hath by so much the greater force to resist a less. Which is the Reason that we do not feel the continual *Steam* and *Emanation* of little *Bodies*; for tho' they pass through our *Skin*, yet because their *Littleness* is such that they cannot sufficiently shake the *Nerves*, neither are they able to make any impression upon the Organ of Feeling. And the same also is to be said with respect to the other *Senses*.

But to the end we may more clearly understand how this *Sense* comes to be exerted, we must call to mind, what hath been said in the foregoing Chapter, viz. that some *Strings* or *Filaments* proceeding from the *Brain*, are dispersed throughout all the parts of our *Body*, and that these constitute the *Nerves*, which being filled with the *Animal Spirits*, are stretched out like so many *Cords*, which are diffused throughout the whole *Body*. Which *Nerves* whenever they are somewhat forceably shaken, immediately draw the parts of the *Brain*; as when a *Rope* is pull'd, the *Bell* which is at the end of it sounds immediately; and by this means the *Soul*, which resides in the *Brain*, receives a sense of the thing which hath moved the *Nerves*. Thus when we put our *Hand* to the *Fire*, the particles thereof being swiftly moved, are of sufficient force to agitate the *Skin* that covers the *Hand*, and consequently the *Nerves* that reach from the *Hand* to the *Brain*, and thereby to make the *Soul* to perceive the sense of *Pain*. For such is the near Relation between the *Brain* and all the *Nerves* diffus'd through the *Body*, that the *Soul* by their means receives the Impression of *External Bodies*. Thus we can distinguish several *Bodies*, by means of a *Stick* held in our *Hands*, and reaching to the *Bodies* we would distinguish, as *Stones*, *Clay*, *Metals* and the like. Yea there are some persons born blind, who only by their *Touch* can distinguish the several sorts of polish'd *Marble*, and the various impressions of *Coin*. And for the same reason it is why any motion on the *Lips* is so very sensible, viz. the great tenderness of the *Skin* that covers them, which makes the *Fibres* of those *Nerves* that constitute it to be easily shaken and moved, as before hath been said of a stretched *Cord*.

It may be you will object that the *Nerves* are not so stretched, as a *Rope* or *Cord* is. I grant it, yet doth not this hinder the instance of a *Cord* to be very proper here, since it is not needful that in a similitude all things should be the same. Now a *Cord* and a *Nerve* agree exactly in this, that as when one end of a *Cord* is touch'd, the other is shaken; so when any *Nerve* in the *Body* is moved, the motion is immediately conveyed to the *Brain*. For tho' the *Nerves* be not so much stretched as a *Cord*, yet their apt disposition for the communication of motion, fully makes amends for that want of *Tension* in them.

But if it be so that the *Sense* of Feeling is performed by the *Nerves* derived from the *Brain*, it may be queried whence so many species of Feeling do arise: For tho' there be many *Nerves* in the *Body* of Man, and manifold *Tangible Qualities*, yet there are no different *Nerves* made use of, for the producing of these different Affections: for the very same *Nerves* that produce *Pain*, cause the sense of *Pleasure* also, and so of the rest; but the same *Nerves* receive the impulse of the several Objects, being sometimes moved by these, and at other times by others.

I Answer, That this Diversity proceeds from the difference of the Objects that affect and move the *Nerves*, much like the strings of a *Lute* which give a different sound, according to the different touches of him that plays upon it. Thus when the insensible parts of any *Body*, variously agitated, are more swiftly moved than the Particles of

VIII.
How the
Sense of
Feeling is
performed.

IX.
An Object
on Answered.

X.
Whence the
Difference
of the Touch
proceeds,
seeing
that the
Nerves are
the same.

XI.
This difference
proceeds from
the Diversity
of the
Objects.

our *Body*, our *Soul* perceives *Heat*, but if more slowly, then we are made sensible of *Cold*. Hence it is that what to an *Ethiopian* seems *cold*, to a *Scythian* appears *hot*. The same thing is likewise experienced by those that enter in *Bathes* distinguished by several degrees of *Heat*: for having continued some time in a luke-warm *Bath*, to prepare themselves to endure a very hot *Bath*, when they go back out of the *hot Bath* to the luke-warm *Bath*, that which before seemed *hot* to them at their first entrance, feels now *cold* to them.

XII.
What is
the Cause
of Pain and
Pleasure.

When the small *filaments* of the *Nerves* are pushed against, or drawn with so great violence, that they are broken and rent from the Member to which they were fastened, the *Soul* is made sensible of *Pain*; but when the said *filaments* are not broken, but moved without receiving any hurt, the *Soul* perceives a kind of *Bodily Pleasure*, which is called *Titillation*; which tho' with respect to its cause, it seems to differ but little from *Pain*, yet doth it produce a quite contrary effect. So when the *particles* that terminate a *Body*, do with an even *surface* press the *Skin*, the *Soul* apprehends it to be *smooth* and *polished*; but if the *surface* of the *thing* be uneven, then it perceives it to be *rough* and *rugged*. In like manner when *Bodies* are strongly born downwards, they represent to the *Soul* the *sense* of *Heaviness*; but when they do but gently tend downwards, they afford the *Soul* the perception of *Lightness*. When the *Particles* of a *Body* are so disposed as to resist the motion of our *Hand* or other *Members* of our *Body*, the *Soul* perceives the quality of *Hardness*; whereas when the *Particles* of any *Body* are so moved, as not to stop or resist the *Bodies* that meet them; the *sense* of *Fluidity* is imparted to it. And the same is to be said of all the other *qualities* that belong to the *touch* or *sense* of *Feeling*, which the *Soul* perceives differently according to the variety of the modes whereby the *Nervous Fibres* are affected.

XIII.
How it
comes to
pass that
since the
Touch hath
so many
Objects,
it is not
manifest.

Another Difficulty may be started here, viz. how the *sense* of *Feeling* can be said to be one only *sense*, seeing it hath so many *Tangible Qualities* for its *Object*. For if the *Senses* be distinguished from each other by their *Objects*, why may not the *Sense* of *Feeling* be said to be manifold, because it hath so many different *qualities* for its *Objects*?

XIV.
Answer to
the Question.

Notwithstanding all this, we must conclude the *Touch* or *Sense* of *Feeling* to be but one: for tho' the *Tangible Qualities* do differ, according to the various *Modifications* of *Bodies*, yet they agree all in this general Notion, that by means of the *Nerves* they move the *sense* of *Feeling*. As the *sense* of *Seeing* is not said to be double or twofold, because it hath for its *objects* *Light* and *Colours*, which are expressed by 2 different *names*; nor the *sense* of *Tasting*, tho' the *Tongue*, which is the *Organ* of it be affected with various *Tastes* or *Relishes*. Besides, the *Senses* are not only distinguished by their *Objects*, but also by the *Organs* and *Modes* whereby they are affected. And forasmuch as all *Tangible Qualities* agree in this, that they impress the same Affection upon the *Organ*, and that the whole difference of them depends on the Diversity of this Impression, it is evident that the *Touch* must be looked upon as being only one *Sense*, and not many.

The *sense* of *Feeling* is sometimes deceived, as when *Women* that are subject to the *Fits* of the *Mother*, complain of an extreme *cold* in their *Heads*. And thus also places under ground, appear to us very *cold* in the *Summer* time, and in the *Winter* warm; when as indeed upon making a tryal with a *Weather-glass*, we shall find that there is no such change in the *Temperature* of the *Place*.

XV.

ceptions of
the Touch,
instanced.

CHAP. XIII.

Of the Sense of Tasting.

THE *Tast* is an *External Sense*, whereby an *Animal*, with the help of his *Tongue* and *Palat*, which are furnished with the *Nerves* subservient to this *Sense*, perceives the several differences of *Tastes* and *Savours*. Or according to others, the *Tast* is a sensation, by means whereof, after that the *Savoury Object* hath made a due impression of it self upon the prominent and porous little *Nipples* of the *Tongue*, the *Soul* residing in the *Brain*, perceives and judges of the difference of the *Savour* or *Relish*. For according to the sentiment of our Modern *Anatomists* the *Organs* of *Tast* are the foresaid prominent and porous *Nipples* of the *Tongue*, or small *Strings* which proceed from its inmost *membran*.

The *Tast*, hath some affinity with the *Touch*; and if we will believe *ARISTOTLE*, it is but a species of it. For whereas in the other *Senses*, the *Organs* are affected by their *Objects* at a distance, and are agitated by little *Bodies* flowing from them, the *Organ* of the *Tast*, requires an intimate contact with its *Object*, and cannot be moved by it at a distance. Yet there is this difference betwixt these *Senses*, that the *Organ* of the *Tast* is more intimately penetrated by the *savoury Object*, which more deeply insinuates its self into the *Fibres* thereof, than *Tangible Objects* enter the *Skin*. Hence it is that we see that persons who are over-tired, or that are fallen into a swoon, do presently revive, upon the drinking of a Draught of *Wine*; and *Men* that are like to die, are strangely recovered by taking some of the *Cordial* that is called the *Imperial Water*: which strange effects are only to be attributed to this, because the *Particles* of *Wine* and the *Imperial Water* dive deep into the *Pores* of the *Tongue*, and mingling with the *Spirits* do greatly revive them.

Moreover these *Senses* differ also, First by reason of their several *Organs*: For the *Organ* of *Taste*, is not like that of the *Touch*, diffused throughout all the *Fibrous parts* of the *Body*, but throughout one part only, viz. the *Tongue*; which alone is affected by *Savoury Objects*. Secondly, According to the *Disposition* that may be found in the said *Organ*: Thus a *Tongue* that is dry and without *Moisture*, toucheth dry things, but perceives no manner of *Tast* in them. Thirdly, Thick and whole *Bodies* affect the *Organ* of *Feeling*; whereas that of the *Tast* cannot be impressed upon but by thin and liquid *Bodies*, or such as are divided into small *parts*: and for this Reason *Pills* that are swallowed whole communicate no *Tast* to the *Tongue* or *Palate*, or very little, and that only because some of the *particles*, in gliding over the *Tongue*, are dissolved.

I.
What the
Tast is.

II.
Wherein
the Touch
and Taste
do agree
and differ.

III.
Two other
ways
whereby
these Sen-
ses do differ.

The

IV. The Organ of the Taste is the Tongue, as well as the Inward and Spungy part of the Palate, because the surface of them both is full of those innumerable Nipples before mentioned. As concerning the Tongue it is evident, that being of a soft, loose and spungy substance, it is most proper to receive Savoury Bodies, mixed with some moisture. And accordingly we experience that if we touch any Savoury Matter with the tip of our Tongue only, we perceive the Taste of it: for the Nerves of the fifth and seventh Conjugation terminate in the Tongue, which being inserted into 9 or 10 Muscles, become the Instruments of various Motions. For besides the Functions of Speaking and Singing, this Organ of the Tongue is of great use towards the moistning, mixing and swallowing of the Meat. All these Muscles divide the Tongue longwise into 2 parts, by means of a certain Tendinous String, so as that this Organ, as well as those of the other senses, seems to be Double. Now that not only the Tongue, but also the upper part of the Throat or Palate is the Instrument of Tasting, is very manifest, for when any savoury meat passeth towards the Gullet in order to its being swallowed, we perceive the Taste thereof, tho' it never touched our Tongue in the inward part of our Palate (which some call the swallow) forasmuch as its Flesh is Spungy, and very proper to admit the Particles of Savoury Bodies.

V. Now to the end that these Particles may penetrate the Pores of the Tongue, and pass through the Texture of the Fibres, some moisture is required for to steep, resolve, melt and convey them. Hence Nature hath so provided, that the Mouth where the Food is chewed, hath a continual moisture attending it, by means whereof, as a Menstruum, the Particles of Sapid Bodies are melted, and conveyed into the Organ. For as we find that an Herb being bruised with a Pestle, or any other Instrument in a Wooden Dish or Bowl, doth with its Liquor penetrate the Wood, and insinuate it self into its Pores; as is evident from the Smell and Savour of the Herb that remains in the Bowl: in like manner our Food being minced in our Mouths, by the help of our Teeth into small pieces, and steeped in our Spittle, doth easily affect the little Nerves of our Tongue, and is conveyed to the inmost parts thereof. And therefore Salt before it can affect the Tongue and be tasted, must be melted with some moisture; neither can Pepper be tasted except it be first steeped in, or mingled with the Spittle that is in the Mouth: for dry Bodies, without the Vehicle of moisture, cannot be conveyed to the inmost Recesses of this Organ.

VI. From what hath been said, it may easily be understood, how the sense of Tasting is performed, viz. when any savoury matter, being, as it were macerated with the Spittle, is conveyed into the spungy substance of the Tongue, and in its passage doth after divers manners affect the Nerves inserted into the Tongue, by vellicating, biting, striking, tickling, wringing and stirring the same. Which different Affections are carried from the Organ to the Brain, where they make a different impression on the Mind, according to the diversity of the motion of the Fibres of the Organ. So that now it remains only to be explained whence the great variety of Tastes and Savours doth proceed.

Which will easily be done, if we remember that the Faculty of perceiving Tastes in us, is not unlike to that whereby we are sensible of Pain; that is, to the actuating of this Power nothing else is required, but that the savoury Bodies do move the slender filaments of the Nerves of the Tongue, or the prominent Nipples before mentioned, in such a manner, as Nature hath ordained for the effecting of the sense of Tasting. In like manner as to the production of the sense of Pain it is sufficient, that the Nerves subservient to the Touch be moved after such a particular manner: So that all the difference of savoury Bodies doth depend on the Thickness, Figure and Motion of their Parts. This may be evidenced by some instances; for let us suppose the foresaid Fibres of the Tongue to be agitated 4 several ways, viz. by Salt, Vinegar, or any other sour Liquor, Common Water and Brandy, so as that the Soul thence is stirred up to perceive 4 distinct Tastes. We shall easily conceive that Salt doth therefore prick, and as it were cut the Organ, because it consists of long, stiff and various corner'd Particles, which with their points prick the small Fibres of the Tongue, and enter the same without the least bending or plying. Vinegar applied to the Organ, doth as it were slash and cut it, and by compression somewhat contract it, because the particles thereof by entering obliquely into the Nerves, do slash the thin particles thereof, and dashing against the thicker parts they become bended, and so enter the pores slantingly. Common Water doth not enter the pores of the Tongue at all, and therefore doth neither prick nor pierce it, because its particles do only softly flow upon the Tongue, and lying sideways, because of their easie pliability and bending, are scarcely perceptible by the Taste, and therefore Water is lookt upon as insipid. Brandy doth bite and vellicate the Tongue, because the particles thereof penetrate most deeply, and are most swiftly moved. And the like account may be given of all other savoury Bodies, which according to the different disposition of their parts, can make different impressions upon the Organ of Tasting.

The difference of Tastes may also be caused by the Organ; for the various Texture and Disposition of the Tongue, may occasion a difference in the Taste of things. Thus persons that have a more fine and tender Organ, take delight in delicate Savours and Tastes; whereas those whose Instrument of Tasting is more gross, delight in more coarse viands and less exquisite Tastes. Thus Country People generally delight in coarse and Salt Meats; whereas Children are pleased with Sugar and sweet things. The reason is, because the Fibres of the Nerves are more fine and subtil in Children, and therefore are easily moved with a sweet Taste: whereas those of Rusticks are more gross and stiff, upon which nothing but strong and sharp things can make any impression. Wherefore it is no wonder to see that the Food which pleaseth the Palate of one Man, doth disgust another; because of the different disposition of the Organ in them both.

Yea it frequently happens that the same person, who at one time is pleased with some kind of Meats, may at another have an aversion against them; and we commonly experience, that those things which are most grateful to our Palates when we are Hungry and Thirsty, become unpleasant

VII. Whence the Diversity of Savours and Relishes doth arise.

VIII. The Difference of Tastes may proceed also from the Variety of the Organ.

pleasant to us when we are full and satiated, and this because of some change in the *Texture* of the *Organ*, the *Savoury particles* not affecting the *Tongue* and *Palat* in the same manner, when the *Pores* of it are more straitned, than when they are dilated and more open.

IX.
Why some
loath those
Viands
which be-
fore they
desired.

Hence it is that *Old men* do loath some sorts of *Meat*, which they most delighted in when they were *Youths*; and that some Persons, after having accustom'd themselves to some sort of *Food*, are greatly delighted therewith, tho' before they loathed and could not endure it. Even because either the *Organ* in process of time grows dryer; or else, for that by *Custom*, and the frequent use of some sorts of *Diet*, some *folds* are formed in the *Organ*, which easily admit the *particles* of the *Meat*, which before they could not receive. The said variety of *Taste* may also proceed from the *Tongue*, being ting'd with the *Savour* of some *Salt*, *Bitter*, or *Sour matter*, which hath not been effac'd by the eating of some *Sweet thing*, or by the *drinking* of a large draught of *Liquor*; for the Eating of *Sweet-meats*, and especially *Drinking*, doth so resolve the hard and longish *particles* of *Salt*, the crooked *particles* of *Bitter things*, and the cutting *particles* of *Sour things*, as to carry them along with it: And therefore it is that *Drink tastes* more grateful after the eating of *Sour things*, and more delightfully affects the *Tongue*.

X.
Deceptions
of the Taste,
and the
Causes of
them.

Sometimes the *Taste* happens to be mistaken, not about the Affection impress'd upon the *Organ*, but about the Cause from whence it proceeds. Thus they who are sick of the *Jaundies*, are not mistaken in that they suppose themselves to perceive a bitter *taste*; for they do so, because the *Gall* is mingled with their *Spittle*; but they are deceived in attributing that bitter *Taste* to the *Food* they eat: In the same manner as they suppose the *Objects* they behold to be *yellow*, when indeed it is the *Gall* that depraves their *Organ*, and makes all the *Objects* they behold to appear of that Colour. And in like manner, sometimes our *Meat* seems to *taste* bitter to us, whereas indeed the said sense of *Bitterness* proceeds either from some *Humour*, wherewith the *Tongue* or *Palat* is tinged; or from the *Vitiating* of the *Nerves*, that are assistant to the *Fibres* of the *Tongue*. Yea, it happens sometimes, that we seem to perceive a *Taste*, without receiving any *food*, which cannot proceed from any other Cause, but from the *fluxion* of some *Humour* that hath such a kind of *taste*, or from some fault in the *Blood*, that is conveyed to the *Organ* of *Tasting*; as may be demonstrated by many Examples.

CHAP. XIV.

Of the Sense of Smelling.

I.
Why Beasts
excel Men
in the
Sense of
Smelling.

IT is certain, that *Man* is Inferiour to many *Beasts*, as to the exquisiteness of the *Sense* of *Smelling*: For *Beasts*, when they light upon any unknown *food*, do presently, by the Quickness of their *Scent*, discover the *Qualities* thereof, Nature thereby preventing those *Mischiefs* which otherwise might be the effect of their *Voracity*, by their too greedily devouring things hurtful to them, if they were not assisted with such an *Exquisite Scent*, which discovers to them the *Suitableness* or *Unsuitableness* of the *Food* to their

several *Natures*. By this Quickness of their *Sense* of *Smelling* they hunt out their *Prey*, tho' at a considerable distance from them, and tho' never so cunningly hid; according to the Relations we have in *Story* of *Ravens*, *Vulturs*, and *Apes*. Thus *Dogs*, by the Vivacity of this *Sense* pursue their *Game*, and follow the Steps of their *Masters*, tho' far out of their sight. *Tigers*, by the help of their quick *Scent*, pursue those that have robb'd them of their *Whelps*; and *Cats* find their way home, from whence they have been carried many Miles in a close shut-up *Basket*.

Now this *Sense* is more dull in *Man*; not only, as some suppose, because he abuseth this Faculty, and fills himself with the *Vapours* of too great variety of *Meats*: But either, because his *Organ* is not of such an *Exact Texture*; or because his *Brain* is too moist, and so dulls and clogs the force of the *Odorous Steams*, by entangling the *particles* thereof, and hindring them from entering the *Pores* of the *Nostrils*. And for the same reason it is that we can smell nothing under *Water*, because the *Nostrils* being stop'd with *Water*, cannot admit the *Air* that conveys the *Odorous Exhalations*. Hence it is that they that have their *Heads* stuffed with a *Cold*, in a great measure lose their *Sense* of *Smelling* for that time; because the *Pores* that should admit the *Odorous Exhalations* are filled with the *Rheum*.

The *Scent*, or *Smelling*, is an *External Sense*, whereby an *Animal*, with the help of his *Nostrils*, which are furnish'd with very subtil *Fibres*, receives all manner of *Smells*. In all *Smelling* there is first a Collection of *Odours*, the Instrument whereof is the double Cavity of the *Nostrils*: In the Next place, the Sensation of the collected *Odour*, is propagated by means of some most subtil *Fibres*: And, Lastly, this *Sense* is terminated and completed by the agitation of the *Nerves* and *Spirits*, in the *Conarion* or *Pine Apple-like Kernel*.

The *Anatomists* differ in their Opinions about the *Organ* of this *Sense*: For some of them make the *Processus Mammillares*, so called, to discharge this *Function*, which others attribute to the *Nostrils*. The *Processus Mammillares*, are 2 little bunches or protuberances of the *Brain*, in which 2 *Conduits* or *Passages* of the same *Substance* are terminated. However, these do not seem to be the *Organ* of *Smelling*; because both these *Mammillary Processus* are a portion of the *Brain* it self, consisting of the *Pith* or *Marrow* of it: Now, no *Physicians* ever owned the *Brain* to be the *Organ* of the *External Senses*. Besides, according to what we have before declared, the *Nerves* and *Fibres* are the *Organs* of the *External Senses*; but these *Processus* are too soft to be accounted *Nerves*; neither did ever any, that I know of, account them so. Moreover, if we place the *Smelling Faculty* in both these *Processus*, why do not we always perceive some *smell* or other, seeing that the *Air* continually flows to the *Brain*, with which the *Odorous Steams* are always mingled; but this contradicts Experience. It remains therefore, that we place the *Organ* of this *Sense* in the *Nostrils*, that is, in some very subtil *Fibres*, derived from the bottom of the *Brain* to the *Nerves*, which are not distinct from the *Nerves* that assist the *Sense* of *Tasting*, save only in this, that they

This Plate is humbly

full S.^r Comport Fitch
Mascall in Kent Baronet,
Thomas Fitch of the said
Deceased, by Ann his
of Richard Comport
tleman, deceased.
Dedicated by Richard Blome.

To the Right Hon. the Lord
of the Treasury, &c.
I have the honor to acknowledge
the receipt of your letter of the
10th inst. in relation to the
proposed alterations in the
mode of appointing the
Judges of the Admiralty,
and in reply to inform you
that the same have been
forwarded to the proper
authorities for their
consideration.

do not pass through the *Skull*, wherewith the *Brain* is cover'd; and that the *Fibres* also are more subtil and fine, than those that are affected by *Savoury Objects*.

V. *The Organ of Smelling* is in the *Nostrils*; for who doth not experience that in them he *Smells*, that is, perceives the Affection that is imprest by *Odorous Objects*? To which we may add, that forasmuch as this is a most subtil Affection, as being imprest by that most fine *Steam* wherein the *Odour* is diffused, it doth not seem possible to be performed in any *Bone*, *Gristle*, or *Thick Membran*, and consequently that it can no where so properly be performed, as in this fine *Texture* of the *Nervous Fibres*.

VI. *Why those that are flat Nos'd do not smell well.* Whence it is that those who have their *Nostrils* flattened or beaten down by any *bruise* or *fall*, have but a weak or dull *Sense* of *Smelling*; because the *Nerves* design'd for this Function are too much compressed in the upper-part of the *Nostrils*, and cannot give a free passage to the *Odorous Exhalations*. And on the contrary, *Dogs*, *Hares*, and other *Animals*, that excel in this *Sense*, have many little *Pipes* in the thin *membran* of their *Nostrils*, through which these *Odorous Exhalations* are freely transmitted.

VII. *How the Sense of Smelling is performed.* The *Sense* of *Smelling* therefore is effected, when the most thin *Particles* of *Bodies* flying in the *Air*, I mean such only as are Subtil and Brisk enough for this purpose, do strike, tickle and vibrate the most thin *fibres* of the *Organ*, and affect it after various manners. The *Hollowness* of the *Nostrils* is a great help and advantage to the perception of *Odours*, especially if the said *Cavity* be wide at the Entrance, because then the *Odoriferous Particles* are more readily conveyed to the *Brain*. For the *Cavity* of the *Nostrils*, is like a *Chimney* or *Funnel*, through which the *Odorous Particles* do ascend, and being gather'd together, do penetrate the winding of the *Nostrils*. Wherefore they that have long *Nostrils*, have a more quick *Scent* than others; because they attract more of the *Odorous Steams*, whereby the *Sensation* becomes more strong and vigorous.

VIII. *Air is necessary for the conveying of the Odorous Exhalations.* The *Sense* of *Smelling* cannot be performed without *Air*, wherewith the *Odoriferous particles* being mingled, they are drawn in by the *Nostrils*. For *Air* is the most proper *Medium* for the diffusion of *Odours*; not only because it is of absolute necessity to *Respiration*, but also because the *Odour* is both further and more easily diffused and transmitted thereby. Accordingly we see, that the stench of *Carkasses* is mostly carried towards that part whither the *Air* is driven by the *Wind*. For this is the Nature of this, as well as of all the other *Senses*, that except the *Organ* it self be struck upon, no *Sensation* is effected; for the *Organ* of *Smelling*, must be struck with the same Force wherewith the *Air* is drawn in. For the *Air* being the Vehicle of the *Odoriferous Exhalation*, a good part of it is let down into the *Wind-pipe*, whilst the other more affecting a straight motion, enters the *Nostrils*, and dasheth against the *Organ* of *Smelling*; which *Odoriferous Steam* is so long perceived, as the *Air* is drawn in by the *Nostrils*, and ceaseth to be felt, when it is breath'd out again. The Reason whereof is, because the *Pipes* and *Passages* in the *Nostrils*, which are opened by

drawing-in of the *Breath*, and the Entrances whereof are towards the end of the *Nose*, are shut again upon the breathing-out of the *Air*, and consequently it is necessary that thereupon the *Sense* of *Smelling* should be intermitted, and all sensible Impression upon the *Organ* cease. Whence it is easily understood, why one that hath a *stinking Breath* doth not perceive the *smell* of it himself, whilst he breaths it out through his *Nostrils*; because the hollow *Passages* of the *Nostrils* are shut up, and *Odours* cannot be received contrary to the Course or Grain of the *Fibres*.

The *Odoriferous matter* cannot be perceived, except it be at some distance from the *Nostrils*; because when there is a due Distance, the *Terrestrial Particles*, which are always in great abundance mixed with the *Air*, are the more easily dissipated and dispersed: As a *Sword* must be unsheathed before it can do any Execution; and an *Arrow* must be taken out of the *Quiver*, before it can make a wound. For the abundance of *Evaporations* do too much agitate the *Nerves*, subservient to the *Sense* of *Smelling*, and by stopping up their *Pores*, hinder the supervening *Steams* from penetrating them. Hence it is, that an *Odour* that comes from far, is more grateful and pleasant, because those *Heterogeneous* and *Grosser particles*, which are mixed with the *Odoriferous steam*, do by degrees sink downwards, leaving the rest pure and unmixed; which entering the *Nostrils*, produce a purer and more refined *Scent*.

Forasmuch therefore as every *Odour* is a *Steam*, which exhaling from the *Odoriferous Body*, and being diffused through the *Air*, doth move the *Organ* of *Smelling* in the *Nostrils*, after a certain determinate manner, and with Force enough, it may be easily understood, what is the chief Cause of the variety of *Odours*. For seeing that these *Steams* consist of almost innumerable *Filaments* (of which we have an Example in the *Steam* of a *Candle* newly extinguish'd) which may be variously crooked and bent, it cannot be question'd but that according to the variety of their *Particles*, they do more or less move the *Odoratory Nerves*, and thereby give occasion to the *Soul*, of perceiving great diversity of *Odours*: So as that those *steams* produce grateful and sweet *Odours*, whose Motions are very moderate, and duly temper'd together; and those on the contrary produce loathsome *Smells*, which are more vehemently agitated, or else whose Motion is too dull and slow. For those *Bodies* that do not strike the *Organ*, and in some sort press upon it, cannot excite the *Sense* of *Smelling*.

That we may be deceived in the *sense* of *Smelling*, is evident from divers instances. For *CARDAN* in his 8th Book de *Varietate Rerum*, Chap. 43. declares, that he always perceived the *Smell* of something or other in his *Nostrils*, as sometimes the smell of *Flesh*, sometimes that of *Frankincense*, and at other times the smell of some other thing. *LEWIS XI.* in his *melancholy fits*, conceited that every thing that was about him had an ill smell. There was also a French Poet that was a very melancholy Man, who being sick of a *Fever*, and persuaded by his *Physicians* to have his *Temples* anointed with *Unguentum Populeum* to make him sleep, conceived such an aversion for it, that for many years after he imagined that every thing

IX. *The Odorous Object is to be at some distance from the Organ.*

X. *What a Smell or Odour is, and whence diversity of Odours doth proceed.*

XI. *Deceptions of the sense of Smelling.*

that was about him, smelt of it. There have been some persons likewise (as BARTHOLINE informs us, *Hist. Nat. Centur.* 4.) that could smell things that smelt well, but not such as did stink, or had an ill smell. The same Author tells us of an Apothecary, who had lost this sense, by the too frequent use of Camphire. And SCOTTUS *Phys. Curios. Cap.* 33. gives us an account of a Woman, who never could smell any thing.

CHAP. XV.

Of the Sense of Hearing.

I.
What the
Sense of
Hearing is.

HAVING spoken of the Senses of Feeling, Tasting and Smelling, we next proceed to handle that of Hearing. Now Hearing is an External Sense, whereby an Animal, with the help of his Ears, and the Nerves implanted in the Cavities thereof, receives Sounds. Or more plainly, Hearing is that Sensation, whereby from a due motion of the small Fibres of the Auditory Nerves, imprest upon the Ears, and conveyed to the Brain, or common Sense, the Soul perceives Sounds, and judgeth of them. For Hearing, as well as every other Sensation, is founded upon the help and mutual concurrence of Soul and Body. For in this Sense the Presence and Action of the Soul is required; because when the Soul is otherwise employ'd, the Excitation of Sounds signifies nothing to it, tho' they be never so loud and violent; for then tho' the Ears be open, yet no sense is perceived, because of the inadvertence, and want of Attention in the Mind.

II.
The Usefulness
of this
Sense.

This Sense is more Excellent than any of the foregoing, and is equally necessary to Man, and other Animals. For seeing that many things at a distance might attack Animals, to their great hurt and prejudice, except they were timely forewarned of them, Nature hath furnisht them with this Sense of Hearing, whereby they are forewarned to avoid things inimical, and to prosecute such are grateful and suitable to them. Moreover Hearing is of the Highest and most Necessary use to Man for the accomplishing of his Mind, as ARISTOTLE speaks in his *Treatise, De Sens. & Sensili Cap.* 10. For seeing, saith he, that in this short term of life that is allowed us here, we have not leisure enough to search into the nature of all things, this Sense gives us the advantage of being instructed, by listning to the informations of Learned Men, whereby we are taught our Duties, and how we are to behave our selves, not only in a Civil Society, but also in our private and Household concerns. For by the Company and Conversation of Learned Men, we attain the knowledge of Sciences, and are admonished how we may become both Wise and Prudent.

III.
The parts
that belong
to the Organ
of
Hearing.

Before we can thoroughly understand by what means this Sense is produced, it will be necessary for us to know the structure of its Organ, and the principal parts that compose it. The outward Lappet of the Ear, which is formed by Nature for the collecting of the sound, and receiving its first impulse, consists of the flap or lappet and the Gristle of the Ear; this part, which hath a pretty large compass, is by degrees straitned, till it ends in the Hollow of the Ear. Next after this

outward Cavity follows the Passage, or Auditory Cave, which is crooked and turned into several windings, to the end that the sound, which is carried with the Air, may be encreased by insinuating it self into them. This Winding Hole leads to a most thin and dry Membran, which is terminated by, or enclosed with a Bony Circle, which is commonly called the Drum of the Ear, because it obliquely admits the impulse of the Air, being struck with the sound. To this part 3 small Bones and a Muscle are joined, viz. the Hammer, the Anvil and Stirrup, which all 3 hang together; for the Hammer is jointed into the Anvil, and the Anvil into the Stapes or Stirrup. The Cave wherein the foresaid little Bones are found, is by some called Concha or the Shell, and by others Pelvis or the Basin; which is large enough, and in a manner of a round figure, and leads to a vast number of little Cavities. Which Cave, with all its annexed Cavities is not empty, but filled with Air, which some call Inborn, but wrongly, forasmuch as it is frequently changed, as appears from the free and open passage the Air hath to them.

These things premised, it will not be difficult to understand in what part of the Ear Hearing is produced. For it is apparent, that it cannot be effected in its outward Cavity, because the outward Ear is only like a Funnel, through which the shaken Air may the more freely enter into the Auditory passage; neither is this Sense performed in the Auditory Cave or Hole, seeing that the same seems only to have been framed by Nature, for the conveying of the sound, and for the perpetual out-flowing of the steam. Neither is it effected by the little Bones, for seeing that they want Nerves which are the Organs of all the Senses, neither can they be supposed to transmit the sound to the Brain. It remains therefore, that the same be performed in the Auditory Nerves that are latent in the said little Cavities, there being 2 Nerves hid within the said Cavities, which receive all the shakings and agitations of the adjacent Air; by means whereof the representation of sound is communicated to the Soul. For the Air by shaking the Membran of the Drum, doth at the same time move the 3 linked Bones, to which these Nerves are joined: which tremulous impulse being conveyed to the Brain, by the help of the foresaid Nerves, do give an occasion to the Mind, of conceiving the Idea of Sound.

Sound is a tremulous and waving motion of the Air, whereby some part of the Air, being whirled into certain Circles, is most swiftly waved this way and that way. These Circles are framed by the Body that strikes or shakes the Air, as a Bell, a String, or a Tongue, much after the same manner as we find that Circles are formed in the Water when Stones are cast into it, which at first are small, and afterwards swell greater, one part of the beaten Water, driving and pushing on the other. And like as these Circles tend more towards that part whither the stream of the River tends; so the Wind carries the Sound towards that part, whither it drives the Air. Yea as oft as the Wind, being hindred in its course by meeting with some solid Body, is forced to make a Circle, by waving backwards and forwards (as the water makes a Whirlpool, when ever it is hindred in its

Instruments
the Sense of
Hearing is
performed.

V.
What
Sound is,
and how it
is formed.

strait progress) so often is the sound heard, which operation is little different from that which forms an *Eccho*.

VI. *Whence the variety of Sounds doth arise.* The Differences of Sounds proceed from the Diversity of motion, as well in the sounding Body, as of the Air that is agitated thereby. For that the Strings of a Cittern do give so much a sharper and quicker sound, the more that they are stretched, and wound up higher; and the lower and duller, as they are less stretched; is only because the motion of Cords that are high wound is more swift, and consequently impresseth a swifter motion on the Air, than that which is but slack. And therefore the sound is said to be shrill and sharp, when the shakings or beatings of the Air, be more frequently reciprocated, and the Organ more swiftly struck by them: and it is accounted a low or Deep sound, when the Vibrations of the Air are less frequent, and the Organ is more leisurely struck with the impulses thereof. So that all the Difference there is betwixt a high and Deep sound is this, that in a High or Sharp sound the parts of the Air beat more frequently and fast upon the Organ, whereas in the Base or Deep Sound, the Concussions admit of longer Intervals; as is evident in a shorter string wound up to the same Height, and of the same Thickness, compared with a longer, because the former will yield a more high or shrill sound than the latter, forasmuch as it affords more frequent Vibrations, and beats the Air and Ear with quicker repeated strokes.

VII. *The Causes of the Harshness and Sweetness of Sounds.* In like manner we find a sound to be either harsher or sweeter, according as the Beatings or Wavings of it are more or less equal. For if the surface of the Body, whence the Sound or Air is reflected, or driven back, be rough and rugged, the sound is more harsh: For the ruggedness of the surface, causeth some particles of the Air to be pulst away sooner, and others later, as passing through an unequal space; wherefore it is necessary that some of them must come to the Ear sooner than others. And for this Cause it is that a Trumpet that is not very polished and smooth, doth give forth a more harsh sound. Whereas a grateful and pleasant sound consists in the equality of every Undulation of the Air, beating against the Ear, because in this case that whole portion of the Air, arrives at the Organ, at the same time, and strikes it with an even motion.

VIII. *The Air is the Medium that transmits Sounds.* The Air is acknowledged by all Philosophers to be the Vehicle of Sounds, which proceeding by a waving motion from the Sonorous Body, doth impress that Affection upon the Organ, which is called the Act of Hearing: For since the Air is in continual motion, it is easily determined by the Body that is stricken, to produce a sound in us. I am not ignorant that some famous Modern Authors are of opinion, that the whole Atmosphere of the Air is not the medium for the transmitting of sounds, but only the most pure part of it; founding their Sentiment upon this Experiment, that every sound, be it great or small, whether it be carried before or against the Wind, yet doth always, in an equal measure of time, pass through an equal space of place, which could not happen so if it were conveyed by the undulating motion of the entire Body of the Air.

IX. *The Sound sooner or later arrives* But I cannot altogether assent to this assertion; for tho' a sound may be heard by 2 Men, standing

ing at an equal distance from the Center, at the same time, notwithstanding that the Air blow violently, yet cannot it be inferred from thence, that the sound doth not depend upon the Undulation of the Air. For tho' it be true, that a Body that is swiftly moved, cannot be carried by that which is more slowly moved; yet is that Body to be excepted from this general maxim, which upholds and supports another. For let us suppose, that whilst a Globe doth move upon a Table, the Table also with a very slow motion moves towards it, it cannot be questioned but that in this case the Globe doth participate of the motion of the Table: In like manner those small particles of the Air, which convey the sound, must more leisurely transmit the same to the Ear, if the Wind be contrary. But that 2 Men in an equal distance from the Center, do both hear the sound at the same time, this is to be imputed to the sound it self, which being most swift in its motion, the difference of time seems to be insensible.

X. *A Sound is better heard with the wind than against it.* Moreover, they who alledge the forefaid Experiment, do acknowledge, that the sound is heard fuller and plainer by him to whom the sound is conveyed by the Wind, than to him to whom it comes against it. If this be true, we know that the Wind cannot make a greater sound, except it carry the particles of sound along with it, which it cannot do without moving them; neither can it move them, but that it must accelerate or hasten them, and cause it to come more swiftly to the Ear. Let us conclude therefore, that Sonorous Bodies do shake the whole circumambient Air, or rather determine it, as being already in motion, to tend to some particular part. And therefore that not only the thin and subtil Air, is the vehicle of the sound, but also that which is thick and full of vapours. This manifestly appears in the Pneumatick Engine, for when the Air is wholly drawn out of it, the motion of a Watch can scarcely be heard in it. Which Experiment doth evidently demonstrate, that the gross Air doth conduce much to the conveying of the sound, and promotes its propagation.

XI. *How an Eccho is formed.* Forasmuch therefore as the sound is diffused, as it were along every line, from the Center of a Sphere, towards the Circumference, it may so happen that the particles of Air, that are on their way to convey the sound to others, may meet a hard Body, and being unable to penetrate or agitate the same, are forced to turn back and be reflected, and to rebound their motion to those parts whence they had received it, and those again to others, and so on. By which means it comes to pass that the same sound is heard again, being several times repeated, which is called an *Eccho*. For Sound as well as Light, is subject to Reflexion, and when-ever a smooth and hollow hard body is interpos'd, it rebounds; but yet with this difference, that a sound, because of the slowness of its motion, cannot advance far in one Moment, but wants a longer space of time for its diffusion. And therefore the further the person that receives the sound is distant, from that Body that reflects it, the more time the voice in rebounding takes up: whereas the Light in one moment of time reflects from several Bodies, and enlightens many places at once. If the sound meet with divers Bodies, at different distances from each other, that are proper to rebound it, there follow many Reiterations of the

the same Voice, viz. when the former sound being vanisht in the neighbouring Air, another is formed by the Air that is more remote; which being afterwards beaten back from Opaque and Hard Bodies at a greater distance, doth again shake the neighbouring Air, and that either once only, or more frequently. Yea an *Eccho* sometimes happens in Bodies that are very near, as in the Tiles of Houses; as when a Voice directed from a high place, and level with the Tiles of the Houses, enters the hollow that is under the said Tiles, and from thence rebounds towards the Speaker, whence it proceeded.

XII.
The Hearing
is subject to
some Deceptions.

Many mistakes may happen to the Sense of Hearing, as well as to the other Senses, which are not imputed to the inward Affection it self, but to the Cause of it. Thus a *Buzzing Sound*, or Noise in the Ear, which is commonly attributed to the External Object, hath no other cause, but that some part of the Steam, or the inclosed Air, or a swelling in the Muscles of the Ear, affecting the Organ of Hearing, stirs up some undulating motions: wherefore it is that Sick People, because of some corruption of their Blood, or by reason of some Excrements that cause an obstruction in the Ear, do frequently complain of this noise in their Ears. Another mistake or Deception in the Sense of Hearing is, when upon cutting off of the Lappet of the Ear, the Sound is received like to Water running down from on High; for when this outward Shell or Hollow is taken away, the Sound enters straight into the Auditory Cave, and wants that due determination it should receive from the outward part of the Ear: For the Ear-lappet, as before said, was framed by Nature, for the collecting or gathering of the Sound; wherefore when that is wanting, the Sound immediately enters into the Basin, as if it came from several parts, as it happens in the noise of running Water. Neither are we to forget that mistake, which we are sensible of when we stop our Ear, for then we perceive a kind of tremulous Buzzing or Noise, as if the Air did roil about in the Ear; the reason whereof can be no other but this, that the Steam is continually passing out of the Ear, which being hindered from coming out, it pulseth against the Organ of Hearing, whence this noise doth arise, which we suppose to be inward.

As I was not long since with some Friends going upon the Thames, between the two Churches of Fulham and Putney, it hapned they were ringing Fulham-Bells, the sound whereof was so rebounded from the opposite Church, that it seemed equally to proceed from both places; neither was it ealie for us to determin whence it came, so that we had various disputes about this Deception, being much affected with the Diversion it gave us.

C H A P. XVI.

Of the Eye.

I.
What the
Eye is.

Forasmuch as the Eye, is the Organ of Sight, and that within the Recess or Hollow thereof, the Images of the several Objects are represented, we shall never be able throughly to understand how Vision or Sight is effected, without describing the disposition and structure of its parts. The Eye, therefore, is the outward Organ of Sight,

through the Transparent parts whereof the Rays of Light pass, till they arrive at the Net-work-coat or Membran, and there variously moving the small Capillaments of the Nerves, suitable to the variety of Objects whence they proceed, do represent or portray the Image of the Object. The Inward Organ of this Sense are the Optick Nerves, which reach from the Net-work-like-membran to the Brain, and receiving the motion from the said Membran, convey it to the common Seat of the Senses.

And to the end we may more exactly apprehend all these particulars, suppose we an Eye cut through in the midst, but yet with that Art, as that all the several Humors contained therein, keep the same place they had before, without any part of them being spilt; and then it would appear to be of the same structure, as it is represented in this Scheme, wherein D B, C B D, set forth its round Figure, that marked B C B, being the forepart of it, and B A B, the other part, which is enclosed within the Bone of the Head.

B C B, is a hard and thick Membran, which the Physicians call the Horny Coat of the Eye, being, as it were the Vessel and Receptacle to contain all the other parts of the Eye; and this part is transparent, and more prominent or convex than the Remainder, to which the Rainbow, so called, belongs, which almost is of different colours in all Men. It sticks out forwards, because if it were more flat, the Beams which slantingly touch its surface, would scarcely ever reach the Bottom of the Eye, through the entrance of the Apple thereof; so that we should only perceive a very small part of the Hemisphere at one cast of the Eye.

D E F, is a thinner Membran, stretched out like a Hanging or Tapestry, and is called the Tunica Uvea or Grape-like Coat, for that it is perforated like a Grape when the Steele is pluckt out of it. In this Membran or Coat is a small hole, the Apple of the Eye, in the midst of the Rainbow, marked out by the Letters F F, called in Latin Pupilla, because in it a Baby or little Image is represented by the Rays that are reflected from the surface of the Eye, to every one that looks upon the Eye of another. The Apple of the Eye, in a Man, appears Black, because that part of the Coroides, or the Grape-like Coat, which answers to it, is of that colour. The contexture of Fibres rang'd in a circle, and which outwardly is placed about the hole of the Apple of the Eye, being diversified with various colours, is called the Rainbow.

N N, are many black Filaments, called Processus Ciliares, which do every way surround, and gird in a certain soft and transparent Body, called the Crystalline Humour, and keep it suspended in the midst of them.

The space contained betwixt E K E, is filled with another transparent Humour, which is therefore called the Watry Humour, because in all respects it is like Water. This Humour gives the Round Figure to the Eye, refracts the admitted Beams, and in this disposition imparts them to the Crystalline Humour. The Eye continually receives of this humour by some particular Vessels which are in the Sclerotica, which is a part of the Horny Coat or Membran, and which are inserted into it, near to the Apple of the Eye, whence it

VI.
The Watry Humour.

X.
The Optick Nerve.

XI.
Why the Surface of the Coat of the Eye is black.

XII.
The Six Muscles of the Eye.

it is that when the *Horny membran* is pierced, and the *Watry Humour* by this means is spilt, and let out, the said loss may be repair'd in the time of a few *Hours*.

VII.
The Cry-
stallin
Humour.

The Mid-part L, is a certain transparent *Sub-stance*, rather of the figure of a *Lentil*, than *Spher-ical*; for the greatest part of it is cover'd by the *Rainbow*, and the Fore-part of the greater *Round*, is less than the other, and the Hind-part of the lesser *Round*, is the biggest. It is because of its *Compactness* and some appearing *Hardness*, called the *Icy Humour*, but more commonly the *Crystallin*. This *Humour* is white, like *Starch*, and is of the consistence of *Wax*, which melts, and may be compress'd, but cannot be spilt.

VIII.
The Glassy
Humour.

The remaining Hollow of the Eye G M I, is taken up by a *whitish Humour*, more transparent than the *Crystallin* or *Watry*, and of a mean consistence betwixt them both; because it can more easily be contracted and displayed; and yet it is not so liquid, or thin and flowing, as the *Watry Humour*. It is commonly called the *Albumineous* and *Glassy Humour*, because it hath the consistence and colour of the White of an *Egg*, and is trans- parent like *Glass*. This *Humour* rests upon the *Network-like Membran*, and contains in it self the *Crystallin*; it is enclosed in a very thin *Membran*, which keeps it from spilling.

IX.
The Cry-
stallin Hu-
mour caus-
eth much
the same
Refraction
of the
Rays, as
Glass doth.

Experience informs us, that the *Crystallin Hu- mour* causeth much the same *Refraction*, as *Glass* and *Crystal* doth; and that the two other *Hu- mours* produce somewhat a less *Refraction*, and much about the same as *Common Water*: So that the *Rays of Light* pass more easily through the *Crystallin Humour*, than through the two other *Humours*; and yet more easily through these, than through the *Air*.

X.
The Optick
Nerve.

H Z, is the *Optick Nerve*, which takes its rise from the *Hinder-part* of the *Brain*, not far from the beginning of the *Back-bone*, the *Capillaments* whereof G H I, being disperst throughout the whole Space A B H, do cover the whole bottom of the *Eye*, constituting a sort of a most fine *Net*, which from its *Expansion* is called *Retiformis*, or *Net-work like*, and *Retina* by *Physicians*. Now these *Capillaments*, by means of the *Convex figure* of the *Eye*, and of the *Crystallin Humour*, do collect the *Beams*, and communicate the *motion* they have received to the *Brain*, and present it to the *Soul* that resides there.

XI.
Why the
Surface of
the Coats
of the Eye
is black.

My design is not to reckon up here all the *Coats* that enclose the *Eye*, seeing that the knowledge of them doth not conduce to the understanding of the *Sense of Seeing*; and therefore shall only take notice, that the *surface* of these *Coats* is wholly obscure and black in those *Parts* that face the bot- tom of the *Eye*; and this, to the end that the *Rays* which fall upon the *Net-like Coat* G H I, and from thence are are reflected to the *Grape-like Coat*, might be extinguish'd by that *Blackness*, lest being again reflected to the *Retina*, or *Net- like Coat*, they should disturb and confound the *Sight*.

XII.
The six
Muscles
of the
Eye.

O O, are six *Muscles*, outwardly fastned to the *Eye*, by the help whereof it can readily move it self every way. Of these *Muscles* 4 are called *Direct*, whereof the first lifts the *Eye* upwards, the second turns it downwards, the third draws it towards the *Nose*, and the fourth withdraws it

to the opposite part from the *Nose*. The other 2 are called *Oblique* or *Slanting*, because they en- compass and surround the *Eye*; for with the one of them the *Eye* is enabled to give a slanting or oblique *Cast*, and with the other it is rolled round.

When the *Right Muscle*, which is above the *Eye*, is fill'd with *Animal Spirits*, the *Eye* looks up; and the 3 other *Muscles* being fill'd in like manner by turns, assist it sometimes to look down- wards, and sometimes to turn it to the *Right* or *Left*. Besides, it is evident by the situation of these *Muscles*, that when all of them are shortned, they at the same time alter the figure of the *Eye*, by making it more flat than it was be- fore.

That part of the *Eye*, which is marked B C B, is of a *Convex figure*, to the end that the *Rays* proceeding from the *Objects*, which of themselves have not force enough to enter the *Apple* of the *Eye* F F, might be united by a various *Refraction*, and by this means might have force enough strongly to move the *Hairy-strings* of the *Optick Nerve* H Z. For the *Refraction* which is made in the *Crystallin Humour* L, procures strength and dis- tinction to the *Sight*.

Besides, this is to be observed, that the *Apple of the Eye* is liable to *Contraction* and *Dilatation*, according as the *Objects*, to which the *Eye* is di- rected, are nearer or farther off; or more or less enlightned; or according as the *Beholder* doth more intently or carelessly view the *Object*. For this *Coat* hath the power to dilate or narrow it self like a *Muscle*, and by this means to enlarge or contract the *Apple of the Eye*, viz. by stinting the entring of the *Rays*, and by causing more or less to pass through it.

Wherefore this *motion* may be called *Voluntary*, tho' for the most part it happen without our At- tention; for it doth nevertheless depend on our *Will*, or on those *motions* which do accompany the *Will* or desire of throughly beholding any *Objects*. In like manner as the *motion* of the *Lips* and *Tongue*, conducing to the formation of *Voices*, is called *Voluntary*; because it is consequent to our intention of *Speaking*, tho' we do not mind, yea, and are ignorant also, what kind of *motion* every Letter requires.

CHAP. XVII.

Of Colours.

FORasmuch as *Colours* are the *Objects* of *Seeing*, we are to consider what they are, and wherein their *Nature* doth consist, before we undertake the *Explication* of the *Sense of Seeing*. We suppose therefore in the *First* place, that no *Colour* can appear without *Light*, and that conse- quently *Colours* are nothing else but certain *Alte- rations* or *Modifications* that happen to the *Light*. Secondly, that even *Transparent Bodies* also, appear distinguish'd with various *Colours*, if the *Light* that falls upon them be variously reflected to the *Eye* of the *Beholder*. As may be seen in a *Round Ball* of *Glass* fill'd with *Water*, in the *Bubbles* that *Children* sport themselves with, in a *Prism*, in the *Rain-bow*, and in other *Bodies*.

XIII.
How the
Right or
Direct
Muscles
serve to
move the
Eye.

XIV.
Why the
Apple of
the Eye is
of a Con-
vex figure.

XV.
The Apple
of the Eye
can be
contracted
and dila-
ted.

XVI.
The Motion
of the
Apple of
the Eye is
voluntary.

i.
Colour is
nothing
else, but a
Modifica-
tion of
Light.

We

II.
What Light
and the
Beams
thereof are.

We must also suppose the *Light* to be the *Action* of a *Subtil matter*, the Parts whereof, as so many small *Pellets*, do roll continually through the *Pores* of *Earthly Bodies*: So that there are innumerable *Rays* or *strait Lines* by which this *Action* is communicated, which proceed from the several Points of a *Lucid Body*, and reach to the several Parts of the *Body* which they enlighten.

III.
That in-
numerable
Rays pro-
ceed from
every
Point.

For we are to conceive, that there is no *surface*, how polish'd and smooth soever it may appear to the *Eye*, but is really rough and unequal; so that every Point assignable in the outside of the most smooth *Body*, is to be imagined like a little *Hillock* or *Prominence*, from whence innumerable *Beams* may be dispersed round about. For otherwise, if the *surface* of any *Body* were altogether polish'd and smooth, it could not shed the *Rays* round about, but only directly to the opposite side; so that the *Object* would only reflect such direct and *Parallel Rays*, as could only reach to the *Eye* obliquely or slantingly placed.

IV.
The Rays
of Light
may be
reflected
after di-
vers man-
ners.

Moreover we are to take notice, that tho' the *Rays* pass strait along through *Transparent Bodies*, yet they are easily turned aside by others they meet with; much after the same manner as a *Ball* struck against a *Wall*, rebounds variously, according to the difference of the *Surfaces* it lights against. For it rebounds otherwise from a *plain* and even *Surface*, than from a *crooked*; and otherwise from a *hard*, than from a *soft*: For being struck against a *soft Body*, it loseth its *motion*; whereas lighting upon a *hard*, it rebounds immediately.

V.
The Rays,
besides
their mo-
tion in
right Lines,
may also
be moved
round.

Lastly, We are to take notice, that as a *Ball*, besides its *motion* whereby it tends from the *Hand* to the *Wall* in a right *Line*, and from thence rebounds elsewhere, is capable also of being moved round its own *Center*: So likewise the *Rays* of *Light* cannot only move to *Right Lines*, but may be so reverberated by the *Bodies* they light upon, as to take upon them a *Circular motion*, wholly in the same manner as a *Ball* struck by a *Racket*, rebounds against the floor or ground.

VI.
What Co-
lours are.

From what hath been said, it follows, that *Colours* are not in the *Colour'd Bodies*, but are only such a disposition, which either swallows up the *Rays* of *Light*, or variously reflects them to the *Eye*, and according to the diversity of this *motion*, doth differently affect the most subtil *Organs* of the *Sight*, and by this means produce a *Sense* of *Colours* in us. So that *Colours*, as they are assignable to *Bodies*, are nothing else, but different *Modes*, according to which *Bodies* receive the *Beams* of *Light*, and either drown them, or with great variety reflect them to the *Eye*.

VII.
Wherein
the Nature
of Colours
doth con-
sist.

Let us suppose therefore, that there are some *Bodies*, which when they are struck with the *Beams* of *Light*, do choak them, and break all their force; and such are those that are of a *Black Colour*, which is common to them, and *Darkness*. That there are also other *Bodies* that reflect the *Beams*, some of them in the same manner as they receive them, viz. such *Bodies*, whose *Surface* being exactly polish'd, serve for *Looking-Glasses*. Others, which reflect them confusedly this way and that way; and again, that amongst these some reflect these *Rays* so, as that the *Action* of *Reflection* is not spoiled by any the least alteration, viz. those *Bodies* that are of a *white Colour*. And

that others again produce a *Change* like to that which happens to the *motion* of a *Ball* that is struck with a slanting *Stroak* of a *Racket*; and such are the *Bodies* that are of a *Red, Yellow, Blue,* or other *Colour*.

For when the *Rays* of *Light* are sent forth from a *Lucid Body*, the *Globuli* of the *second Element*, which constitute those *Rays*, are either evenly or unevenly driven forwards, and whirl'd about by a different *Proportion*; because of the various *Nature* and *Constitution* of the *Bodies* they meet with. And from this proportion of their direct *Motion* and *Circumvolution*, all *Modifications* of *Light*, or *Colours* do proceed. This is evident in *Transparent Bodies*, in which many *Colours* do appear, whereof no other Cause can be assigned, besides those different *Modes*, according to which the *Beams* of *Light* are admitted. As may be seen in the *Rainbow*, *Peacocks-Tails*, and in the *Necks* of *Doves*; forasmuch as these *Colours* cannot be said to be any thing else, but the *Light* it self received in the outward-parts, and so or so reflected and conveyed to our *Eyes*. For all the *Particles* of *Light*, that enter a *Transparent Body*, are not drowned or swallowed up of it, but many of them rebound, which by means of various *Reflection* and *Refraction* reaching our *Eye*, do produce in us the *Sense* of *Colours*.

This will appear clearly to us in the *Prism* M N P, 2 of the *Surfaces* whereof, M N, and N P, are entirely plain or flat, and so inclined the one towards the other, as to constitute an *Angle* of about 30 or 40 Degrees; and therefore if the *Rays* of the *Sun* A B C, that *light* perpendicularly upon the *Surface* N P, do penetrate or pierce it obliquely about the *Hole* D E, which exhibits a *Shadow* at both parts of the said *Hole*, to the *Rays* D F, and E H, passing through it; it is manifest by Experience, that the *Rays* passing obliquely through that *Hole*, from the *Glass* into the *Air* will be refracted, and reaching the *Surface* H G F, (which we suppose to be *White*) they will exhibit divers *Colours* from H to F, and that in this order: In the first place they will represent a *Blew* or *Violet Colour* about H; then a *Green*; in the 3d place, a *White* about G; 4thly, a *Yellow*; and 5thly, a *Red Colour* about F.

Now what happens in this Production of divers *Colours*, but only this, that the *Globuli* of those *Rays*, which after the same manner of Inclination, falling upon the lower *Surface* of the *Prism* N P, on the Left hand towards D N, have a *Shadow*, caused by the slow motion of the *Globuli* of the 2d Element; whereas on the Right, towards E P, they have a *Light*, caused by the swift motion of the said *Globuli*; which causes them to move more swiftly about their own *Centers*, than they do in a *Right Line*.

For the better understanding whereof, let us suppose a *Ball* 1, 2, 3, 4, so struck from V to X, as Figure to proceed only in a right motion, and that 2 of its Sides 1 and 3, with equal swiftness fall down to the *Surface* of the *Water* Y Y, where the motion of the Side 3, which reacheth that *Surface* before the other, is retarded, that of the Side 1 being not changed at all; whereupon the whole *Ball* begins to roll about, according to the order of the Figures 1, 2, 3. Now this *Circumrotation* will be much swifter, than its progress, in case the *Ball* S, being

VIII.
Colour is
nothing
else, but a

being moved more slowly than it, and lying beneath it, about the part of the Ball 3 2, chance to stop its progress; and that Ball Q, plac'd above it, about the part 4 1, being more swiftly moved, do forceably push it forwards, and by this means make its rolling about to be much more swift than its Progress. But if the Ball 1 2 3 4, falling slantingly from V, on the surface of the Water Y Y, towards X, and first touching it with its Point 3, do roll about slowly, according to the order of the Numbers 1 2 3 4: I say, if this suppos'd, it have on the Side 1 the Ball R, moved more slowly than it self, and thereby hindring its whirling round; and on the Side 3, it have oppos'd to it the Ball T, more swiftly moved than it self, it will by this its more swift motion retard the Ball 1 2 3 4, striving to whirl it self about, according to the Series of the foresaid Numbers, and so will make its Circumrotation much more slow, than its progress.

IX.
Whence the
difference
of Colours
doth arise.

Figure
69.

These things being well observed, we shall easily understand, that by how much nearer the Rays of Light, passing through the Hole D E, do approach to the Left Shadow D, by so much greater will be the whirling about of the Globuli of the 2d Element, than their Progress: Whereas the nearer they approach to the Right Shadow E, they are whirled about so much more slowly, than they move fore-right. We understand likewise, that those Globuli which intersect the middle of that Light about G, have an Equal proportion of Retardation or Acceleration of their Circumrotation and Proceßion. And seeing that we find the White colour represented there, we must conclude that Whiteness consists in that Proportion: But that the Nature of the other Colours, as of Blue, Yellow, Green, Red, consists in the different swiftness or slowness of their whirling about, exceeding that of their Proceß, or moving forwards.

X.
All Colours
are true
Colours,
and none
only appa-
rent.

I am not ignorant, that most Men distinguish these Colours from true ones, and call them Apparent only; but these do not seem to understand the genuine Nature of Colours, which consists only in this, that they appear and are conspicuous. For it is a contradiction, that any thing should appear and be false. All Colours therefore are the effect of Light, variously reflected from the Surface of Bodies, suitable to the situation of their outside Particles, their whole difference consisting in the various Modes of receiving it, and reflecting it to our Eyes. Thus we call that a Black Body, which extinguisheth and choaks the Rays of Light; and therefore Black Bodies carry a resemblance of Darkeness. Blue Colour, which approacheth to the Nature of Black, is that which reflects only a few Rays: And 'tis for this Reason, that Sea-water, where it is deep and transparent, appears of a Bluish Colour; because there are but a few Rays reflected from its Surface, and none of those that penetrate the Substance of it, do return.

XI.
What a
White Body
is.

A White Body is that, which reflects the Rays to the Eyes, in the same order as it receives them. Of this colour are all those Opake Bodies, whose Surface is so rough and rugged, that it reflects from all Sides the Rays it hath received parallel. So that in order to our having the Representation of a White Colour, we must receive many Rays from the Object; whereas for to see a Black Co-

lour, we must receive none at all. And therefore the Nature of Blackness must consist in a property which Black Objects have, to drown and mortifie the Beams they have received, as we have mention'd before. So that we may conclude, that those are Black Bodies, whose Surface is proper to extinguish and quash the Rays of Light; and that those are White, whose Surface hath the Property to diminish the Light, by reflecting it from all sides.

But some may Object, that Black and White Marble consist, in a manner, of the same parts, so that if one of them swallows or extinguisheth the Light, the other ought to do so likewise; and consequently, that the variety of Colours is not well grounded upon the Variety of Objects, which do variously reflect the Rays of the Sun.

XII.
Wherein
the differ-
ence be-
tween
Black and
White
Marble
doth consist.

To which we Answer, That true it is, that Black and White Marble do, in a manner, consist of the same Parts; but yet in the Black there are some soft Parts, which by taking in or swallowing the Light, produce a Black Colour. For Black and White Marble may be compared to a Pumice-Stone, whose Pores are filled with a kind of Oily Matter, and the White to a Pumice-Stone that is only fill'd with Air. For it may easily be understood, that when particles of Sand dash against this latter, they will rebound presently; but not from the former, because the Oily Matter, that fills its Pores, doth quash their motion, and in a manner swallow them.

That is a Red Body, which in reflecting the Rays of Light, makes the Particles thereof to whirl strongly about their own Centers, in like manner as a Ball turns round by being struck against the Earth, or with the slanting stroak of a Racket. Yellow, Purple and Green Colours, proceed, as hath already been said, from this various Rotation of the Particles about their Center. So that the Particles of the Subtil Matter, that constitute a Yellow colour, are more slowly whirld about, than those that make a Red: And those that make a Green, more slowly than those that constitute a Yellow colour. And the Purple colour is nothing else, but mixture of a Blue with a Red colour, which imparts its brightness to the former.

XIII.
What is
Red Colour
it.

From all which we may conclude, That Colour is nothing else, but Light Modified; for it is evident, that a Coloured Object cannot of it self affect the Sight, as being for the most part immoveable, or at least not reaching the Eye, where it is perceived; neither can any thing be thought of that moves the Eye at that time, but only the Light reflected from the Body seen.

XIV.
Colour is
nothing
else, but
modified
Light.

CHAP. XVIII.

Of the Sense of Seeing.

The last in order of all the outward Senses, and the most Excellent of them, is the Sight; whether we consider the Object of it, or the manner whereby Objects are conveyed to the Seeing Faculty. For Sight is a Sensation proceeding from a due and various motion of the Optick Nerve, made in the bottom of the Eye, by the Rays of Light coming from an Object, and from thence conveyed to the Brain; by means whereof the Soul perceives the illuminated thing, together with its Quantity, Quality, and Modifications.

I.
What the
Sense of
Seeing is.

G g g g

The

The Sense of Seeing begins indeed in the Eye, but is perfected no where but in the Brain, where the Soul is affected with the Impressions of visible Objects.

II.
What the
Object of
Sight is,
and how
many-fold.

The proper Object of Sight is every thing whereby the Eye becomes affected and changed, in order to the production of Sensation: And this Object is twofold, viz. Light and Colour; for these 2 cannot be perceived by any Sense but that of Seeing. And tho' some reckon up 5 several Species of common Objects, viz. Motion, Quiet, Number, Figure and Magnitude; yet to speak accurately, Light only is the Object of Sight, whether the same proceed from the Lucid Body, through a transparent Medium, and so retain its own name; or whether it be reflected from Opaque Bodies, and represent the Image of them; or whether in its reflexion, it be this or the other way refracted, and so affect the Eye, under the name and Species of Colour.

III.
The Order
of things
to be hand-
led in this
Article.

Forasmuch therefore as Vision or Sight follows from the Action of the Object, upon the inward and outward Organs; and since it is necessary that visible things should convey some Images to the Eye, and from thence to the Brain, Our Business will be in this Chapter to enquire; First, How, and in what manner Rays do proceed from the Objects. Secondly, How Objects imprint their Images upon the Organ; and Thirdly, How these Images are communicated to the Brain.

IV.
What Rays
are to be
considered
in Vision,
or with re-
spect to the
Sense of
Seeing.

As to the First of these, we are to observe, that all the Rays that reach the Apple of the Eye, one of them always proceeds from the Object that is directly opposite to the said Apple, which passing through the middle of it, penetrates directly, and without any Refraction to the bottom of the Eye, or the middle of the Net-like Coat. And this Ray is commonly called the Axis of Seeing, or the Optick Axis. It is also called Perpendicular, because it enters straight into the Apple of the Eye; whereas the other Rays which recede from this middle Ray, tho' they enter the Apple, yet it is only slantingly or obliquely. So that the Cone, whose Axis, is the Axis of Vision, is the straightest of all, the others being more oblique, as they farther recede from it. This will be more clearly apprehended by the Figure.

VIX
Figure
71.

Let therefore K be the Eye before described, and the Object T R X. Now it is evident that Rays proceed from every point of this visible object. But forasmuch as those Rays only concur to the Sense of Seeing, that enter the Apple of the Eye, therefore we are only to consider those Beams which fall upon that part of the Horny Membran, which directly answer to the Apple. Wherefore since our business here is to enquire what the Rays are, whereby the point R, doth affect the bottom of the Eye, we shall only here consider those which proceed from that point, viz. R N, R L, and the middlemost between these two, drawn from R to S.

And because the Middle Ray R S, is perpendicular to the surface or outside of the Eye, therefore neither doth it suffer any Refraction by passing from the Air, into the Watry Humour, but passeth straight from R to S; for seeing that it falls perpendicularly upon the other intermediate parts of the Eye; it is necessary that it be directed in like manner to S.

But forasmuch as the Ray R N, doth not alight perpendicularly on the surface of the Eye, and being to pass from the Air into the Water, it is manifest that therefore it must suffer a Refraction, by approaching to the Perpendicular R S, and seeing that this Ray is not Perpendicular, whilst it passeth out of the Watry Humour, into a Harder Body, viz. the Crystalline Humour, it must a second time be refracted, and from thence entering into the Glassie Humour, which is softer, it must again be turned aside; and thus still approaching nearer to the Perpendicular R S, after many Refractions, it arrives at the point S. The same is also to be said of the Ray R S, which after having undergone some Refractions, joins it self to the 2 other Rays, that are united in the point S. And thus it appears how the Object R, acts after the same manner upon the Bottom of the Eye, as if it sent forth one Ray only, that might perform the same, which all those Beams do that are contained between F F.

From what hath been said it will appear, what happens to those Rays, which from another point T, enter the Eye. For all the Beams that enter the Eye must undergo such Refractions, as that they may all of them be terminated and united in the point V. And therefore we may say, that the Points T R X, and any other intermediate ones, do all of them send their Rays, in a manner into one and the same Point of the Bottom of the Eye; and on the other hand, that every point of the Bottom of the Eye, receives only the impression of one Point of the Object. So that it happens, when ever we have a mind clearly and distinctly to view any Object, that we direct our Sight, or the Axis of Vision to every part of it successively, and so take a particular view of the whole surface.

Tho' the Rays only that proceed from Objects directly turn'd towards the Apple of the Eye, by passing through it, penetrate to the bottom of the Eye, yet may there be several other collections of the Rays, according to the different disposition of the Organ. As appears in Old Men, who have only a confus'd Image of Objects that are near them: And on the other hand, those that look Asquint, and have prominent Eyes, do more distinctly see things near at hand, and less exactly, such as are at a greater distance. The Reason of which difference is, because the Eye is of such a make or constitution, that according to the different distance of the Objects we have a mind to view, it may be extended, and so become flatter. Thus when we direct our Sight to any Object, that is too far distant, to be distinctly perceived by us, according to the ordinary constitution of our Eye, the Eye by means of the 4 direct or straight Muscles, is made plain or flat, because all of them draw it downwards to the bottom of the hollow wherein the Eye is placed; by which means the Retina approacheth near enough to the Crystalline Humour, to be present to the new Collection of Rays which proceed from one Point of the distant Object. And on the other hand, when we have a mind to direct our Sight to an Object that is too near to us, then our Eye becomes dilated by the help of the 2 Oblique Muscles that do encompass it, and being blown up or swell'd, by the introduced Spirits do press the Eye; whereby it comes to

V.
Rays flow-
ing from
divers
points of an
Object, fall
upon so
many points
of the Re-
tina, or
Net-like
Membran.

VI.
How the
disposition
of the Eye
comes to be
changed.

to pass, that the *space* which is between the *Cry-*
stalline Humour and the *Retina*, becomes large
enough for the *Rays*, which proceed from the
Point of the near *Object*, to be again collected and
united in the *Retina*.

VII. *Why Old Men see things that are near them, confusedly, and Squint-Ey'd persons, things that are far from them.*
Old Men therefore cannot exactly perceive *Ob-*
jects that are too near them, because their *Humours*
begin to dry up, and their *Bodies* waste and grow
leaner, whereby the Convexity of the *Horny* and
CrySTALLINE Humours is diminished and so grows
flatter, by which means the *Eye* becomes some-
what broader than it was in time of *Youth*. Now
this alteration of the Parts of the *Eye*, doth not
suffer the *Rays* proceeding from a near *Object*, and
constituting the sides of *Cones*, to unite in the *Re-*
tina it self, but make them pass on as if they would
unite beyond it. Whereas those who see *Squint*,

and have prominent *Eyes*, do but imperfectly be-
hold things at a distance; for their *Eyes* being
longer and protuberant, the *Rays* that proceed
from one point of the distant *Object*, do meet be-
fore they come to the *Retina*, and afterwards
spreading themselves, fall only upon a little part
of the bottom of the *Eye*. And therefore those
who have such prominent *Eyes*, do approach the
Object to their *Organ*, to advance the too short
points of the visive *Cones* to the *Retina*. For the
nearer a thing is approached to the *Eye*, so much
the more are the *Rays* thereof turn'd aside, and
constitute shorter *Visive Pyramids* or *Cones*. But
Old Men remove the *Object* farther from their *Eye*,
that by making the points of the *Cones* longer, they
may reach the *Retina*.

VIII. *Convex Spectacles are of most use to Old Men, as Concave Spectacles to Squint-Ey'd persons.*
Hence it appears, that *Convex Spectacles* are
most useful for Old Men; as on the contrary, *Con-*
cave Spectacles are most helpful to such as are
Squint Ey'd. For seeing that the former stand in
need of having the *Rays* contracted, to the end
that the points of the *Cones* may be brought to
the *Retina*, this is effected by a *Convex Spectacle*:
but whereas the latter stand in need of a greater
dilatation of the *Rays*, thereby to advance the
Cusps of the *Cones* towards the *Retina*, this is ef-
fected by a *Concave Spectacle*. For by the in-
terposing of a *Convex Glass*, the *Rays* which be-
fore went to the *Rainbow*, and further, are by
this means gathered into the *Apple of the Eye*, so
that *Rays* are now received by the *Eye* from those
parts that were hid before, and those which before
were joined together, by the interposition of them,
are made distant from each other, and consequent-
ly represent the whole *Object* bigger than indeed it
is. But by the interposing of a *Concave Glass*,
many *Rays*, which before entred the *Apple*, are
thrust outwards to the *Rainbow*, or more outward
parts; so that those parts which were separate be-
fore, do now unite, and by means of this contra-
ction represent the whole *Object* less than it is.

IX. *How the Object forms its Image in the Eye.*
As to the second, viz. the forming of the *Image*
of the *Object* in the *Organ*, it will not at all be
difficult to conceive how this is done, supposing
we do well apprehend that the *Object* acts only
upon one point of the bottom of the *Eye*, viz. up-
on that which is directly opposite to it; and so
likewise that one only point of the *Retina*, viz.
the middlemost is affected by that one point of the
Object. For the *Rays* that proceed from External
Objects, at the bottom of the *Eye*, act upon some
Latitude of the *Optick Nerve*, which as to the

Figure doth as much resemble it, as the *Linea-*
ments of an Excellent *Painter*, drawn in a *Picture*;
can be like him. Besides, there is another reason
for this latitude of the *Retina* being like the *Object*,
viz. because it receives so many impressions in all
its parts, as there are different *Colours* or different
degrees of *Light*, in all the parts of the *Object*.
And because the name of an *Image* or *Likeness*
is attributed to that thing, which hath some
resemblance with the thing it expresseth;
therefore we may well give this name to the
Latitude of the *Retina*, on which all the *Rays*
proceeding from the *Object* do fall; and conse-
quently may affirm, that the *Object* doth pour-
tray its similitude or *Image* in the bottom of the
Eye.

Neither are we to look for any more perfect
likeness between the *Object* we behold, and its
Image, than there is between the *Objects* and *Ima-*
ges, that appear in a darkned Room, where only
one little hole is left for the *Rays* of *Light* to
enter, which are received at a convenient distance
upon white Paper or a Sheet. For tho' in this
case the *Images* of the *Objects* be very exactly de-
lineated, and their *Qualities* sufficiently exprest,
yet they appear invert, so that the right parts of
the *Object* are left in the *Image*, and those which
were uppermost in the *Object*, are neathermost in
the *Image*. As appears in the *Figure* before re-
presented, where we find Y, which is on the left
side, represents X, which is at the Right; and V,
which is at the Right, T, which is at the Left.
But how this comes about shall be shewed in the
next Chapter.

As to the Third thing to be resolved how the
Resemblances of *Bodies* are conveyed from the *Eye*
to the *Brain*, this also will be easily apprehended, if
we consider that these *Representations* portrayed in
the *Eye*, and admitted to the place of the Extre-
mities of the *Capillaments*, which compose the
Optick Nerves are so impress, as that the *Rays*
touch those *Capillaments*, not according to their
whole length, but only with their extremities.
And because this impression which is made at the
end of every *Capillament*, reacheth to the other,
it cannot be otherwise, but that the whole *Image*
of the *Object* must be conveyed to that place,
where these *Capillaments* are terminated, that is,
within the substance of the *Brain*. The *Rays*
therefore that flow from the *Body* X, to the *Eye*,
touch the end of some of the *Capillaments* of the
Retina or the *Optick Nerve*, at the point Y, and
those that come from the *Body* R, do in the point
S, touch the Extremity of some other *Capillament*;
and those that proceed from the *Body* T, the end
of another V, and so on. And since *Light* is no-
thing else but *Motion*, or a propension to *Motion*,
it is evident that all the *Rays* that are come from
X R T, being of force enough to move the *Ca-*
pillaments Y S V, are consequently of force e-
nough to move the *Brain*. By which means an
Image is again formed in the inward surface of
the *Brain*, which faceth the Cavities thereof: For
by the word *Image* nothing else is understood
here, than the various *Motions* of the Parts of
the *Brain*, and so likewise those represented in a
Looking Glass, at the Bottom of the *Eye*, &c. are
nothing else but such kind of motions.

But

X. *This Image is not in all things like unto the Object.*

XI. *How the Images of the Objects arrive at the Brain.*

XII.
How it
comes to
pass that
only one
Sensation
is percei-
ved in the
Brain.

XIII.
Answer.

But it may be you will enquire, how it comes to pass that the *Images* proceeding from *External things*, and entering the *Brain*, do not exhibit these two, but one only *Object*, when yet there be 2 *Optick Nerves* which equally convey the *motion* impress'd upon them?

To this I answer, that there is a certain *Kernel*, in the midst of the *Ventricles* of the *Brain*, called *Conarion*, in which the 2 *Images*, proceeding from both the *Eyes*, are united, by means of those *Spirits* that fill the *Cavities* of the *Brain*. And this *Kernel* is called the *Residence* of the *Common Sense*, because the *Soul* immediately exerciseth its operations in it. When therefore at any time we behold an *Object*, by Example a *Flower*, the *Light* that is reflected from it, doth delineate 2 *Pictures* or *Resemblances* in each of our *Eyes*, and these draw 2 others, by the help of the *Optick Nerves*, in the inward surface of the *Brain*; which *Representations* being conveyed to this *Kernel*, do meet there, and are united; which *Kernel* consequently acting upon the *Soul*, represents to it the *Image* of that *Flower*.

XIV.
Why we
assert this
Kernel to
be in the
Midst of the
Brain.

Neither do we without good ground assert this *Kernel* to be in the midst of the *Brain*, as being the *Principal Seat* of the *Soul*, where all *Sensations* are performed. For we find that all the other parts of the *Brain* are double; as we have 2 *Eyes* to see with, 2 *Ears* to hear, and 2 *Hands* to handle, and the same may be said of the rest of the *Organs* of our *Senses*; and yet we see but one *Object*, and hear but one *Sound*, &c. wherefore it is necessary that both these *Images*, or rather *Motions* proceeding from 2 *Organs*, should meet together in one place, before they be considered by the *Soul*. Neither is any such single part to be found in all the *Brain*, besides this *Kernel*, which is placed in the very midst of the *Ventricles* of the *Brain*, and consequently is surrounded by the *Spirits*, and therefore may well be accounted the seat of *Common Sense*, that is, of *Cogitation*, and therefore also of the *Soul* it self.

CHAP. XIX.

How Vision, or the Sense of Seeing is performed.

I.
The Soul
feels or is
sensible by
means of
the motion
of the
Nerves.

HAVING thus explained how the *Light* is transmitted through the *Humours* of the *Eye*; how *Objects* communicate their *Images* to the *Organ*, and how the said *Images* enter the *Brain*; it remains now that we explain, how this *Image*, communicated to the *Brain*, doth produce that *Sensation* in us, whereby we are said to *See*; and in the next place what are the *Causes* of the *Clarity* and distinction of our *Sight*; and Lastly, how the *Qualities* of *Objects*, viz. their *Situation*, *Distance*, *Magnitude*, *Figure*, *Motion* or *Rest*, are thereby discerned. Now that we may the better understand how this *Spiritual Image* is delineated in us, we are to call to mind, what hath been before handled Chap. X. §. 6. viz. that such is the *Nature* of our *Soul*, that by the force of those *Motions*, which are impress'd on that part of the *Brain*, whence the thin *Capillaments*, or *Hair-like Springs* of the *Retina* derive their *Original*, various *Sensations* are excited; so that the whole difference of them depends on the various *motion*

which every part of the *Object* doth excite. Thus the *Soul*, by occasion of some *motions* that are made in the *Nerves* which belong to the *Ears*, perceives *Sounds*; and by means of the *motion* of those *Nerves*, that assist the *Organ* of *Tasting*, and act immediately upon our *Soul*, the *Sense* of *Taste* is stirr'd up in us, and so of the rest.

For these *Impressions* are nothing else, but various *motions* of the parts of the *Brain*, and of the *Animal Spirits*, affecting the *Glandula Pinealis* or *Pine-Apple-like Kernel*; to which when the *Soul* of *Man* attends, he discerns visible *Objects*, tho' these *motions* are not like the *Objects* which they represent. Just after the same manner as one that walks in the *Dark*, or is *blind*, distinguisheth *Objects* by means of a *Stick*, tho' neither the *Stick*, nor its *Motion* bear the *Image* of them. Or as *Words written* or *spoken*, serve to convey the knowledge of things to us, tho' they be no *resemblances* of the *things* they bring to our *Minds*.

It is manifest therefore, that the *light* of any thing will be more clear and lively, according as there are more *Rays* proceeding from the *Object*, and entering the *Eye*: For by this means the impression made upon the *Capillaments* of the *Optick Nerve* is the stronger. The largeness of the *Apple of the Eye*, conduceth also to this purpose, by giving way to many *Rays*, proceeding from the same point of the *Object*, to enter the *Eye*, in order to the representing of its *Image* in the bottom thereof. Hence it is that we dilate and open the *Apple* of our *Eye* more in viewing a distant *Object*, than one that is near us; because then more *Rays* enter the *Eye* from the several points of it, than when we do straiten it and make it less. And for this reason it is that remote *Objects*, appear more clearly to us, than such as are very near to us, and the *Colours* of those appear more lively, but of these more dull and weak.

As to the *Distinction* of *Sight*, whereby the parts of the *Object* are discerned in their proper *Place*, *Situation*, *Figure* and *Colour*, it is certain that the same proceeds from the *Refraction* of *Rays*. Now to the end that the *Sight* of any *Object* may be very distinct, and admit of no confusion at all, it is necessary that all the *Rays*, which from the same point of the *Object*, are directed to the same point of the *Horny Membran*, be so refracted, as that they may at last meet and be united in the point of the bottom of the *Eye*. But seeing that this doth not happen, save only in those *Rays*, which proceed from that point of the *Object*, in which the *Axis* of *Vision* is terminated, it so happens that at that time, we can only have a distinct *Sensation* of that part, and of the rest a confused and indistinct view.

The other cause of *Distinct Vision*, depends on the *Capillaments* of the *Optick Nerve*; for seeing that we cannot discern the parts of *Bodies* we do behold, but only inasmuch as they are distinguish'd by *Colour*, and that the distinct perception of these *Bodies*, doth not only depend upon this, that all the *Rays* which proceed from the several points of *Bodies*, do in the bottom of the *Eye* meet in about so many other points; but is also caused by the multitude of the *Filaments* of the *Optick Nerve*,

Extremities, or Ends whereof are contained in that space, which the *Image* at the bottom of the *Eye*

II.
What the
Images of
Objects are.

III.
How it
comes to
pass that
some Objects
appear
more clear-
ly than
others.

IV.
What is
the Cause
of the Di-
stinction of
Vision.

V.
The other
Cause of
Distinct
Seeing.

Eye doth take up; it follows that there must be so many ends of these *Capillaments*, as there are sensible parts in the *Object*, that reflect their *Rays*. For if the *Rays* proceeding from 2 different parts of the *Object*, should meet in 2 divers points of the same *Filament* separately, it would be the same as if they met in the same *Point*, because they could not move that one *Filament* after 2 several manners. Whence it is that *Fields*, in the *Summer-time*, abounding with *Red* or *Yellow Flowers* that grow amongst the *Grass*, do seem to be wholly *Red* or *Yellow*; because both the *Grass* and *Flowers* acting together upon one and the same *Capillament*, the *Flowers* which are of a more lively *Colour*, do only appear to the *Eye*, because that *Filament*, at that time only follows the motion, which the *Flowers* impress upon it.

VI. *How the Situation of the Object comes to be discerned.*
The situation of *Bodies* is not perceived by any Representation or other *Action*, proceeding from them, but only by the Impulse, coming from a certain *Region* or quarter, to some particular part of the *Brain*. For the *Object* seems to be situate in that part, from whence the *Rays* come that affect the *Eye*. Thus we suppose the *Candle A C*, to be placed in such a quarter, because the *Eye B D E*, doth from thence receive the *Rays* that make an Impression upon it, which Impression gives occasion to the *Soul* to judge that the *Candle A C*, takes up such a situation amongst other *Bodies*. For the knowledge of the situation of any thing depends only on the situation of the particles of the *Brain*, from whence the *Filaments* of the *Nerves* do arise: But forasmuch as those *Filaments* are diversly affected by *Bodies* in different places, because of their various disposition, the *Soul* by their peculiar motion, discerns their different situations. Thus when we turn our *Head* or *Eye* this way or that way, the *Soul* is put in mind of that thing, by the Change which the *Nerves* inserted in the *Muscles* subservient to that *Motion*, do effect in our *Brain*. For when the *Eye B D E* sees the *Candle A C*, the *Soul* may know the situation of the said *Candle*, because the *Nerves* of the *Eye* partake of another disposition, than if it lookt another way.

VII. *Why the Image of an Object is turn'd upside down in the Eye.*
Nevertheless it is to be observed, that tho' *Objects* be perceived in their natural situation; yet their *Images* are turned upside down in the *Eye*. The reason whereof is, because but one of those *Rays* that enter the *Eye* being *Perpendicular*, and *Direct*, and the rest, because of the straitness of the *Apple* of the *Eye* entering obliquely, it happens that the *Oblique Ray A B*, proceeding from the upper part of the *Candle*, and the *Ray, C D*, flowing from its lower, do intercept one another, so that the lower part *C*, of the *Candle*, is represented at the bottom of the *Eye* upwards about *D*, and the upper part *A*, of the *Candle* appears about *B*, by which means the *Candle* is delineated in the *Eye* inverted. This any one can make an Experiment of, by taking the *Eye* of an *Animal*, devided of all its *Membrans* and *Muscles* besides the *Retina*; for supposing that this *Eye* be placed before the little hole of a *Darkened Room*, and the *Candle A C*, be set opposit to it, if then standing in the *Room* we look into the bottom of the *Eye*, we shall see the *Image* turn'd upside down.

VIII. *Things at a great distance*
This inversion of the *Image* in the *Eye*, is the cause why things appear by so much higher as

they are farther from us; because *Rays* that proceed from things near to us, do reach the upper parts of the *Eye* or *Retina*; whereas those that flow from *Objects* far distant, do come to the lower part of the *Eye*: And consequently it is necessary, that the former should appear Higher, and these latter Lower.

The Distance of *Objects* is discerned by the various motions that change the *Figure* of the *Eye*: For when we behold things at a Distance, the *Apple of the Eye* becomes more dilated, and the *Crystalline Humour* is somewhat withdrawn towards the *Retina*, and by this means the *Figure* of the *Eye* becomes more Round: whereas, when we view *Objects* that are near to us, the opening of the *Apple of the Eye* is lessened, and the *Crystalline Humour* contracted, and thrust outwards, by which means the *Eye* becomes more extended in length. And whilst we thus change the *Figure* of our *Eye*, according to the various situation of the *Object*, an alteration consequently happens in the parts of the *Brain*, Nature having so ordered it, that the *Soul* thereby might be informed of the distance of the *Object*.

The Distance also of *Objects* may be discerned by the distinct or confused Representation of them, and so likewise by the strength or weakness of the *Light*. Thus when we know the Bulk of a *Body* beforehand, its distinct *Figure*, and the Liveliness of its *Colour*, this knowledge will help us to know the distance of it. The Interposition also of many *Bodies* between us, and those *Bodies* which we behold, conduceth not a little to the perceiving of their Distance; because the distance we imagine there is between them, serves us for a measure whereby to take the distance of the *Objects* we are viewing. Thus when the *Moon* is very high raised above the surface of the *Earth*, it seems nearer to us when no visible *Bodies* interpose between us and it, than when many *Terrestrial Bodies* intervene: The strength also and weakness of the *Light* are of use to inform us of the Distance of *Objects*: For *Bodies* illustrated with a weak *Light*, are apprehended to be at a greater distance, and those things to be nearer to us which are seen distinctly, and under a strong and vigorous collustration. And therefore it is that towards *Night*, or in misty Weather, things that are near appear as if they were at a distance from us.

By perceiving the Situation and Distance of every *Object*, we are informed of the Bulk and Bigness of it: Thus when the *Rays* from *A* and *C*, are decussated, or intersect one another at the *Apple of the Eye E*, the *Objects Angle of Vision* being known, the *Soul* by this Impression, being informed of the length of these *Rays*, easily discerns the Quantity of the line *A C*, which is the Magnitude of the thing. So that if ever the *Mind* mistake in judging of the Bulk of any thing, it is only because it hath not rightly perceived the distance of it. As it happens to a person, who not being able to conceive the great distance there is between the *Sun* and the *Earth*, will never know the true Magnitude of the *Sun*. And this is the Reason why the *Sun* and *Moon*, when they are nearest to the *Horizon*, appear bigger than when they are farther from it; which doth not happen because they sometime appear under a greater, and at other time under a less Angle, but because they are judged to

IX. *How the Distance of things is perceived.*

X. *Other ways of discerning the Distance of Objects.*

XI. *How the Bulk of the Object is perceived.*

be at a greater distance. For our *Modern Astronomers*, who have measur'd the *Angle* under which the *Sun* or *Moon* appear at their *Rising* and *Setting*, find it to be the same with that under which it appears about the *Meridian*.

XII.
How the
Figure of
Objects is
perceived.

We judge of the *figure* of any *Object*, from the knowledge or opinion we have of the *situation* of the different *Parts* of it, and not at all from the likeness of the *Images*, that are delineated in the *Eye*; forasmuch as those *Images* are often *Elliptical*, and of an *oblong Square*, which represent to us *Objects* that are perfectly *Round* and *Equilateral Squares*. Thus *Square Objects*, that are at a great distance from us appear *Round*, because the great distance of the *Angles* obliterates the *Jettings-out* and *Unevenness* of the *Object*. In like manner, *Round* or *Concave Bodies* appear with flat and even *Surfaces*, because the *rising* or *depression* of any of the *Parts*, by reason of the great distance, escapes the *Eye*. Thus he who beholds the *Sun*, doth not discern it to be round, but flat, tho' indeed the middle parts thereof be nearer to our *Eyes*, than those that are towards the *Edges*: but so vast is the distance between the *Sun* and our *Eye*, that the foresaid proximity of the middle *Parts*, is not at all considerable or perceptible.

XIII.
How the
Motion or
Rest of
Bodies is
perceived.

Lastly, *Motion* is perceived when the *Images* of *Objects* imprest on the *Eye*, do run through several *Spaces* in the *Retina*, and successively answer to other *Images* of *Objects*; which we look upon as *immoveable*. Or when the *Eye* is fain to turn itself, that it may continue to have the *Sight* of the *Object*. So likewise the *Rest* of *Visible* things is perceived, when the *Eye* continuing without *Motion*, the *Images* represented in the *Retina* are at *Rest*, and continue to have the same *Respect* to another *Object*, which is consider'd as without *motion*.

XIV.
There must
be a due
Distance
betwixt
the Object
and the
Eye.

Figure
73.

Moreover it is to be observed, that in order to the due and right *seeing* of any *Object*, there is required a due distance, to the end that the many *Rays* that proceed from the several *Points* of the *Object*, may meet together in every least part of the *Retina*. As likewise, that the *Image* of the *Object*, may be represented in the bottom of the *Eye* sufficiently great and perceptible. Otherwise if the *Object*, for Example D, be too near, the *Rays* that proceed from it, as A B C, will enter so obliquely into the *Convex Surface* of the *Eye* A C, that the *Retina* E cannot be affected by them, as not being sufficiently gathered together. Wherefore since the meeting of the *Rays* is only in F, it is no wonder if no perceptible *Image* of the *Object* be delineated in the bottom of the *Eye*. Forasmuch as the *Action* of *Seeing* cannot be performed, except the *Rays* entering the *Apple* of the *Eye*, and being refracted at their meeting with the *Membrans* and *Humours*, strike upon the *Retina*, and impress the *Image* of the *Object* upon it.

XV.
The too
great di-
stance of
the Object
produceth
only an
obscure
Vision.

But when the *Object* is at too great a distance, the contrary happens; for seeing that then only a few *Rays* proceed from every *Point* of the *Object*, and that those that come from them, do too much approach to a *Parallelism*, it so happens that they are united before they reach the *Retina*; and presently after separating themselves again from that *Point* of their meeting, cannot sufficiently move

or agitate the *Retina*; whereupon only an obscure *Image* of the *Object* is represented. By Example, If the *Object* A be supposed to be far distant from the *Organ*, it is evident that only a few *Rays* will flow from each *Point* of it; and that the *Rays* A B, A C, A D, proceeding from each *Point* of it, by their inclining too much to a *Parallelism*, will unite about E, before they come to the *Retina* F. Whence it will follow, that either a too little *Image* of the *Object* will be drawn at the bottom of the *Eye*, or none at all.

Figure
74.

To prevent this defect, a *Telescope* or *Prospective Glass* is employ'd (that is, an Instrument whereby the *Visive Faculty* is assisted to discern *Objects*, that are at a great distance distinctly) which consists of 2 *Glasses*, viz. a *Convex* and a *Concave*: For by the first of these the *Rays* are so gather'd, that before the union or coition of *Cones* like to those which are produced by the *Eye*, the *Concave* intervenes, which by somewhat dilating of these *Cones*, doth advance their *Points* or *Cusps*, and renders them more distinct; so that being received into the *Apple* of the *Eye* after *decussation*, they again meet in the *Retina*, and according to the proportion of the *Convexity*, represent the thing greater. Wherefore, if such an Instrument be duly applied to the *Eye*, it makes the *Rays* that are gather'd about E, and afterwards scatter'd again in the *Retina* F, become gather'd in it, by means of the *convexity* of the *Eye*, and so produce a distinct and exact *Vision* or *Sight*. For the *Telescope*, by reason of its great *Pupil*, makes the *Object* to be seen by many *Rays*, and because of the *Convex* figure of the outward *Glass*, which congregates the *Rays*, it appears under a greater *Angle* of *Vision*. This Instrument causeth also a great *decussation* of the *Rays*, which enter the *Round* outward Extremity of the *Tube*, towards the *Retina*; and by this means a great Representation or *Image* of the *Object*, is delineated in the *Eye*, so that things at a distance appear great and distinct.

XVI.
What a
Telescope
or Prospe-
ctive-Glass
is, and how
Objects at
a distance
are percei-
ved by it.

How liable we are to be deceived by our *Sight*, as well as by our other *Senses*, will be evident to us by considering the manner how all our *Sensations* are formed, and more particularly that of *Seeing*. For hence it is, that some *Objects* appear more clearly to us than others; and that their *Place*, *Situation*, *Figure*, and *Colours*, are not always distinctly represented; that their *Bulk* seems sometimes greater, and at other times less; yea, and sometimes they are altogether *invisible*, especially those *Parts* that make their *Essential constitution*. In the *Bud* of a *Tulip-Root*, with a *Microscope*, we may easily discover the *Leaves*, which afterwards turn *Green*, those which are to compose the *Flower* it self, and that little *Triangular* part which contains the *Seed*, with the 6 little *Pillars* that surround it, at the bottom of the *Tulip*. And the same may be said of the *Bud* of a *Mustard-Seed*, of the *Kernel* of an *Apple*, and generally of all sorts of *Trees* and *Plants*: For tho' nothing of all this can be perceived by the *Eyes*, no not when assisted by a *Microscope*; yet we may with confidence conclude that they are all contain'd in the *Bud* of their *Seeds*. This may also appear in little *Animals*, as in the *Mites* that breed in rotten *Cheese*, and those little *Worms* that gnaw the *Skin*, and cause the

XVII.
Of the
Deception
of the
Sight.

the hands to *itch*, which have all of them *Organical Bodies*, as well as any other *Animals*. And as we see in the *Bud* of a *Root* of the *Tulip*, the whole *Flower*, so likewise we may perceive in the *Treadle* of an *Egg*, which the *Hen* hath not yet fit upon, a *Pullet*, which it may be is wholly formed. So likewise *Frogs* may be perceiv'd in the *Spawn* of *Frogs*. To which add what *Malbranche* asserts, that probably there are infinite *Trees* in one only *Bud*, and that all the *Plants*, and all the *Bodies* of *Man* and *Animals* that shall ever be, have been produc'd from the beginning of the *World*. Now it is certain, that all these things cannot be perceived by our unassisted *Eyes*; yea, and that the greatest part of them cannot be perceived with the help of the most excellent *Microscopes*: And much less by our other *Senses*, which the *Sight* excels in order, dignity and extent. Neither must this seem any whit strange unto us, forasmuch as it is only the *Surface* of *Bodies* that affects our *Senses*, and that it is not their whole *Surface* neither that is capable of affecting our *Senses*, but those *Parts* only of it that are big enough to move the *Fibres* of the *Nerves*. And forasmuch as those *Parts* which make up the *Essential Constitution* of the *Body*, are very often too small to move the *Fibres* of the *Nerves*, that belong to the *Organs* of *Sensation*; it must follow that they are hid from us, and that the *Object* which we perceive, may be quite different from what it appears to be.

CHAP. XX.

Of Waking, Sleep, and Dreams.

I.
How Sleep
is distin-
guish'd
from Waking.

NEXT after the *Senses*, it seems proper to treat of *Waking* and *Sleep*, forasmuch as by these their *Operations* and *Cessations* are determin'd. For *Waking* is the free Exercise of the *Senses*, depending on the uninterrupted influence of the *Spirits* into the *Organs*. And therefore those things which increase the *Animal Spirits*, or do more strongly agitate them, are the Cause of *Waking* or *Watchfulness*. *Sleep* is a *Binding* of the *Senses*, proceeding from the want of *Spirits*. Wherefore those things which diminish the *Spirits*, or foreflow their motion, provoke *Sleep*. So that *Waking* and *Sleeping* differ no otherwise, than as *Loosing* and *Binding*, or as the *Flowing* or *Standing still* of the *Water* that is in a *River*. For if we give heed to our own Experience, we know nothing else of *Waking*, save that it is such a state, wherein we hear the *Voices* of those that speak to us, see visible *Objects*, are moved by the things that touch us, and are sensible otherways of those thing whereof our *Nature* is capable. And as to *Sleep*, we experience it to be a state opposite to this, and wherein we are not excited by the *Objects* wont to strike our *Senses*, but our *Body* rests as depriv'd of all motion.

II.
Wherein
the State
of Waking
or Watch-
fulness
consists.

To the end therefore, that we may be able to give an account of both these States, we are to observe, that the state of *Waking* consists in this, That the *Animal Spirits* (which as was said before, are the most lively parts of the *Blood*) being in great abundance in the *Brain*, are easily determin'd by the *Glandula Pinealis*, to flow into the *Nerves*, and fill them so, that all their *Capilla-*

ments are kept stretched or distended, and separate from one another. For supposing this affluence of the *Spirits* in the *Brain*, if any *Object* acts upon our *Body*, it may be easily conceived, that the *Capillaments* of the *Nerves*, that terminate towards that Part, will convey the motion they have received, to that very part of the *Brain*, which immediately stirs up the *Soul* to *Sensation*. For it cannot be difficult for us to imagine, that the *Animal Spirits*, which are then determin'd towards certain *Muscles*, cause those *Parts* of the *Body*, in which the *Muscles* are inserted to be moved. So that *Waking* or *Watchfulness* is nothing else, but the *Dilatation* of the *Animal Spirits* in the *Brain*, and throughout all the *Nerves*, whereby the *Organs* of the *Senses* are at full liberty to transmit the motions of the *Objects* to the *Common Sense*, placed in the midst of the *Brain*.

Watching may be effected by many Causes. III. First, By those things which thin the *Blood*, or which over-heat it, and by agitating it too much, increase the *Animal Spirits*. Secondly, By things which open the *Plexus Choroides* of the *Arteries*, and so make way for the *Spirits* to enter into the *Nerves*. Thirdly, By things that stir and agitate the *Body* over-much, and by making the motion of the *Blood* more swift, occasion a greater Briskness and Liveliness in the *Body*. Fourthly, By Moderate *Sleep* or *Rest*, which recruit the strength of the *Body*, and make it with more agility and cheerfulness to perform its Task.

Sleep being the State that is opposite to *Watching*, and wherein the outward *Senses* are bound up, and cease from their Functions, we shall easily understand how it is effected, by assigning a different disposition to the *Brain*, from that which *Watching* doth produce. Forasmuch therefore as the State of *Waking* doth consist in the great abundance of the *Animal Spirits*, which replenish the *Ventricles* of the *Brain*, and the *Pores* of the *Nerves*: *Sleep* on the contrary must consist in a deficiency and want of the said *Spirits*, which causeth the *Pores*, through which the *Animal Spirits* are wont to flow into the *Nerves*, to grow limber and cling together, and being no longer distended by the copious afflux of the *Spirits*, to be shut up. For where this Obstruction happens, the *Animal Spirits*, which before were contained in the *Nerves*, are dissipated; and there being no other in a readiness to supply their places, the *Filaments* of the *Nerves* cling together: So that if in this State an *Object* should act upon any part of our *Body*, yet can it not transmit that Impression to the *Brain*, and consequently no *Sensation* can result from thence. Besides, the *Muscles* being then empty and void of *Spirits*, become limber and flagging, and so cannot be of any use for the motion of the *Members* to which they belong; nor keep the *Body* in an upright posture, any more than if they were quite vanish'd. And accordingly in *Sleep*, the *Body* lies along, the *Eyebrows* fall, the *Head* nods, the *Knees* fail, and all the *Senses* cease from their Actions. And therefore *Sleep* is nothing else, but a relaxation of the *Ventricles* of the *Brain*, and a flagging of the *Nerves*, proceeding from the want of *Animal Spirits*, whereby the *Organs* of *Sense* are at a stand, and unfit to convey the motions of the *Objects*.

III.
The Causes
of Waking
or Watch-
ing.

IV.
Wherein
the State
of Sleep
consists.

Objects to the Brain, and to the Common Sense.

V.
The Opini-
on of the
Peripate-
ticks con-
cerning
Sleep.

But whence this Effect doth proceed, and what that Band is, whereby the *Actions*, as well of the *Inward* as *Outward Senses*, are supprest and bound up, is not so easie to determine. 'Tis a common Opinion amongst *Philosophers*, especially those that follow *Aristotle*, That *Sleep* is caused by the *Vapours* proceeding from the *Chyle* and other *Humours* working in the *Stomach*; which being afterwards condensed, cloud the *Brain*, and cause *Drowziness* and *Dulness*.

VI.
This Opini-
on reje-
cted by
those that
hold the
Circulation
of the
Blood.

But this Opinion is not approv'd of by them, who hold the *Circulation of Blood*. For these cannot discover, by what ways these *Vapours* elevated from the *Stomach*, should through so many of the *Inward parts* and *Bony prisons*, as through so many *Obstacles*, be carried up to the *Brain*; forasmuch as their Opinion is, that the most part of those *Humours* that moisten the *Brain*, is transmitted through the *Arteries*, and immediately communicated to it from the *Mass* of *Blood*. Besides, if *Sleep* be owing to the *Vapours* that arise from the *Stomach*, why is it not always consequent to the taking in of *Food*; and why is not *Watching* always the Effect of our abstaining from *Meat*? When yet we frequently experience the contrary, that many times with an *Empty Stomach* we fall into a *Deep Sleep*; and when we have eaten freely are inclin'd to be watchful. Moreover, *Children* are apt to fall asleep, by *Weariness*, *Singing*, *Darkness*, and the *Rocking in a Cradle*; and yet none of these contain any thing of these *Vapours*, that are suppos'd so necessary for the causing of *Sleep*. To which may be added, that if a *Ligature* be put upon the *Inward Jugular Arteries* or *Veins* of any person, he will presently fall asleep; which is the Reason that those who are hanged, seem to themselves, as it were, to fall asleep, as soon as they are turn'd off.

VII.
The true
Cause of
Sleep.

Wherefore the Cause of *Sleep* is not to be attributed, to the *Fumes* and *Vapours* that arise from the *Stomach*; but rather to the deficiency of the *Animal Spirits*, or the diminution of their motion. For *Opium*, *Poppy*, *Mandrakes*, and other such like *Sleep-provoking Medicaments*, do not produce their Effects by raising copious *Exhalations* from the *Chyle* to the *Brain*; but because they hinder the motion of the *Spirits* that way, and by their *Fuliginous Humour* stop the *Spirits* that are contained in the *Brain*, from being conveyed to the outward *Membrans*. And accordingly *gross Meats*, and *hard of Digestion*, which opprest the *Stomach*, commonly cause *Sleep* and *Drowziness*; because they do fix and dull the *Spirits* contained in the *Stomach*, and by the consent and correspondence there is between that part and the *Brain*, make the *Spirits* there more dull and heavy.

VIII.
During
Sleep, our
Blood is
hotter than
when we
are awake.

But yet forasmuch as the *Spirits* can never be without a considerable degree of *Agitation*, and can never be so far dulled, as to be destitute of all motion, it must follow that not being now employ'd to keep the *Body* awake, they must needs increase the motion of the *Blood* wherewith they are mingled; and therefore we find, that the *Body* is much hotter whilst asleep, than when awake. For we find, that in the Coldest Weather in the *Winter*, our *Bodies* are very hot when asleep, but are no

sooner awake, but we need *Fire*, or some strong and violent Exercise to preserve us from being sensible of extream *Cold*, and the rigour of the *Weather*.

Sleep is discust either by force, or of it self: The former way is, when the *Organ* of any of the *Senses* is so struck, that the imprest motion arrives at the *Brain*; because by this means the *Spirits* that are in the *Brain* may be so agitated, that joyning themselves with others that are carried that way, they may produce *Waking*. And *Sleep* ends of it self, when the *Animal Spirits*, which the *Blood* doth produce whilst we are asleep, are in such abundance conveyed to the *Brain*, that opening the *Passages* of the *Nerves*, and rushing into them, they distend the *Filaments* thereof, and by this means give the *Soul* occasion to perceive the several *Objects* that touch and affect the *Body*.

The *Imaginations* of those who are asleep, are called *Dreams*, when the *Soul*, while the *Body* is asleep, apprehends things, and discourseth of them, as if it were awake. Now this happens, when during *Sleep* the *Animal Spirits* enter these *Foot-steps*, that were before imprest on the *Brain*, moving some *Parts* thereof in the same manner, as they are wont to be moved by the presence of an *Object*, acting upon the *Organ* of the *Senses*.

For notwithstanding that in *Sleep*, the greatest part of the *Pores* or *Passages* of the *Brain*, are stop't up by a thick *Vapour*, or rather *Humour*; and that the *Fibres*, by reason of this Obstruction, become less active, especially those by which the affection, or imprest motion, is conveyed from the outward *Sense* to the inward, and from the *Plexus Choroides*, to the bottom of the *Brain*, and *Original* of the *Nerves*; yet the rest may notwithstanding this discharge their Function, at least in part; which is the Cause why *Imaginations* are easily excited in us whilst we are asleep, by the least motion or impression from the *Blood*, *Gall*, or *Pblegm*, or of those *Vapours* that are the Cause of the foresaid Obstructions, which make the *Fibres* so torpid and unactive. And this is the reason why things are but confusedly represented to us, whilst we are asleep.

The difference and great variety of *Dreams*, proceeds first from the variety of the *Foot-steps* of former motions imprest upon the *Brain*. Thus we find frequently, that the things wherewith we have mostly entertained our *Thoughts* in the *Day-time*, are apt to be represented to us in *Dreams* by *Night*. Secondly, From the peculiar temperament and complexion of the *Body*, and the difference of *Meat* and *Drink*, whence the *Spirits* are generated. Thus *Persons* of a *Cholerick Temperament* dream of *Quarrels*, *Fightings*, *Fires*, &c. *Phlegmatick Persons*, of *Water-floods*, *Drowning*, &c. Thirdly, From *Custom*; which being a kind of second *Nature*, hath its effect upon us even during *Sleep*.

Forasmuch as the *Parts* of the *Brain*, which have been before moved by the outward *Action* of the *Object*, are more easily moved than those that have been in continual *Rest*: Therefore it commonly happens that the *Animal Spirits* push against them; so that we seldom dream of any other things, but such as we have perceived by some

Sense

Sense or other whilst we were awake. And accordingly we find but little difference between the things we behold waking, and those which appear to us in Dreams; and that there is much the same succession of our Imaginations in our Dreams, as when we are awake, which tho' they seem sometimes incoherent, yet is there commonly some hidden connexion between them.

XIV.
How it comes to pass that our Dreams are sometimes strange and irregular.

But because the Objects that are represented to us whilst we are awake, are in great number, and may variously affect the same parts of the Brain, it would be strange, if in the interval that is between Sleeping and Waking, the Spirits that are continually ranging through the Pores of the Brain should not promiscuously move some of the parts of it, that is, partly as they were moved at the presence of one Object, and partly as they were at the presence of another: and by this means it may come to pass that the Soul may perceive a monstrous representation, as of a Goat with a Lions Head, or the like; so that we have no reason to look for any Connexion or Order in our Dreams.

CHAP. XXI.

Of the Appetite of Hunger and Thirst.

XI.
Why Hunger and Thirst are called Natural Appetites or Desires.

Seeing that Hunger and Thirst are perceived after the same manner, as the other Senses, viz. by the Ministry of the Nerves, which like so many fine Threads proceed from the Brain to the Stomach and Gullet; it seems convenient that having spoken of the Senses, we should now proceed to explain what Hunger and Thirst is. Which 2 affections, are commonly called Natural Appetites, because they suppose a Compound of Soul and Body, and are generally accompanied with a desire to Eat and Drink.

II.
Aristotle's Opinion concerning Hunger and Thirst.

ARISTOTLE defines Hunger to be a desire of that which is hot and dry; but does not take notice whence this Appetite doth arise, nor how it comes to be stirred up; nor do I believe that any of his Qualities will be able to explicate the nature thereof. For we find that Infants and other new born Animals desire Milk; but who will say that the Appetite to Milk is only the desire of that which is dry? Or shall we say that Animals when they desire Herbs and Fruits, are carried out with an Appetite to that which is Hot and Dry, when a moisture can be separated from them, which far surpasseth their dry substance in quantity? Again, how can Hunger be said to be the Appetite of that which is hot and Dry, seeing that Herbs and Fruits, according to all that we can perceive by them, have more cold than heat in them?

III.
What Hunger is, and how it is caused.

Hunger therefore is nothing else but a Sense arising in the Ventricle, from an Acid Juice twitching the Nerves thereof. For as the various motions of the Optick Nerve, makes the Soul to perceive and discern all the varieties of Light and Colours; so there is nothing that can produce the sense of Hunger, but the motion of some Nerves inserted into the bottom of the Stomach. For the better understanding how this is done, we are to take notice that when the Stomach is empty of Food, the Juice or Liquor which is wont to flow out of the Arteries into the Stomach, and there to

mingle with the Food, finding no matter to work upon, twitcheth the Nerves of the Stomach, which motion being conveyed to the Brain, stirs up the Sense of Hunger.

Some Physicians are of opinion, that this Liquor is conveyed into the Stomach by Veins from the Spleen: But that they are mistaken herein, is evident by this Experiment, that when a Ligature is made on the Vas Breve, the Vessel that lies between the Spleen and the Stomach, that part of it which is betwixt the Ligature and the Stomach swells, whereas the other part grows flag and empty; which is a plain evidence that some liquor is conveyed by the said Vessel from the Stomach to the Spleen, and not from the Spleen to the Stomach. Moreover, the Valvule that are in the Vas Breve venosum, do oppose the transmission of any liquor from the Spleen to the Stomach, because all of them lead towards the Spleen. Whence it is manifest that something is transmitted from the Stomach to the Spleen, but not the contrary way.

IV.
No Liquor is conveyed out of the Spleen into the Stomach.

Now this Liquor which causeth the sense of Hunger is soure and sharp, as being the off-spring of Choler and Melancholy, and which therefore lighting on the bottom of the Stomach, cannot but twitch and prick the membrans whereof it doth consist. Hence it is commonly observed, that Melancholy Persons are great Eaters, because this Juice is more soure in them, than in others, by which means the Food is soon consumed thereby, as Metals are in Aqua Fortis, and other acid Spirits, and the Guts egg'd on to a ready Evacuation.

V.
The Nature of the Liquor that flows out of the Arteries.

And on the contrary it sometimes happens, that persons who have not eaten of a good while, yet have no sense of Hunger, nor any desire to Eat, as it is frequently so with Phlegmatick Persons. Because this Juice by some obstruction or other is hindered from entering into the Stomach, or because it is too thin and weak, so that the Stomach is not sensible of the weak impression it makes upon it; or because its force is blunted by some cold and clammy Humour, or because there is but little of this sharp Humour conveyed to the Stomach. For it is always one or other of these causes that occasions the want of Appetite to Food, and more especially in Sick People.

VI.
Why some Persons are very sensible of Hunger.

And on the other hand there are some persons that are troubled with continual Hunger, and who like Dogs are ever Ravenous, and never satisfied; because so great quantity of this sharp Humour is conveyed to their Stomachs, that all their Food thereby is made soure, so that their Stomach is continually twitched, and solicited to desire more Food, the former being readily evacuated downwards, or else cast up by Vomit. And thus it comes to pass, that some of this Humour is sometimes transmitted to the Vena Lactea, and continually besiegeth the Stomach.

VII.
Of Persons that are troubled with a Dogs hunger, as it is called.

But if this sharp Humour, lodging in the bottom of the Stomach, be of such a Temperament, as to have a peculiar force to dissolve some Food sooner than other, then it will be apt to stir up the Appetite of one sort of Meat rather than another. Hence some Women eat Coals, Chalk, Quick-lime and the like. Now the cause of this variety of this soure Humour may be, because in the first Months of Conception, the Mouth of the Womb

VIII.
The Irregular Appetite of Women with Child.

being stopt, that the *Superfluous Blood* cannot be evacuated as formerly, by this means the *Humours* of the *Body* are corrupted, and being conveyed to the *Stomach*, produce an irregular *Appetite*. And therefore some *Physicians* are of opinion, that when the *Melancholy Humour* is deprav'd in *Women*, they long for *Quick-lime*, *Coals*, &c. when *fourre Phlegm* abounds in them they desire *fourre things*; and when *Gall* predominates, *Bacon*, *Suet* and such like. And it is from the same Cause that young *Girls* that are troubled with the *Green-Sickness*, as we commonly call it, do take a liking to strange and unnatural sorts of *Food*, such as *Coals*, *Chalk*, *Leather*, &c. because their *Blood* for want of due evacuations grows sharper than ordinary, and consequently the *Humour*, which is derived out of the *Blood* into the *Stomach*, partaking of the same Quality, more violently twitches the *Nerves* thereof, and that after a peculiar manner, according to the various constitution of the *Blood* in every Individual.

IX. This discovers to us the mistake of the *Peripateticks*, who suppose the *Stomach* to be like a *Kitchen*, where the *Food* is concocted and digested by heat only: whereas we find that there is but a moderate heat in the *Stomach*, and yet that even *Bones* are consumed and digested in it, as in the *Stomach* of a *Dog*, which if they should be boild for some Months together in a *Pot* with a very strong *Fire*, would never undergo any such change, as we find they do in the *Stomach*. Besides, *Historians*, and particularly *P. Bressano* in his *Relation of New France*, tell us of most ravenous and devouring *Fishes*, which do readily digest the hardest *Bodies* and turn them into *Liquor*, whose *Stomachs* notwithstanding are so cold, that one can scarcely endure to touch them; which is an incontestable Argument, that the dissolution of *Food* in the *Stomach* is not to be attributed to heat, but to the fore said acid *Juice* in the *Stomach*, which dissolves our *Food*, as some acid *Spirits* do *Metals*.

X. *Thirst* is a Desire of *Drink*, caused by the dryness of the *Throat* and *Gullet*, or the Heat of the *Stomach*, commonly called *Heart-burning*, or a *Salt Savour* sticking to the *Tongue*. By the name of *Drink* we understand every sort of *liquor*, that is not *Salt*, *Fat* or too bitter, for *Salt*, *Fat* and *Bitter Liquors* do rather inflame the *Thirst* than allay it.

XI. To be informed of the Cause of *Thirst*, and that *Driness* which is sometimes in the *Mouth*, *Tongue* and *Palate*, we are to consider that the moisture which continually ascends from the *Stomach* to the *Gullet*, in the form of a thick and moist *Vapor*, for the moistning of those parts, when at any time it is over agitated or heated, it doth so dry the *Swallow*, and at the same time so affect the *Nerves*, as to excite in the *Soul* the *Appetite* of *Thirst*. So that there is a greater difference between the *Vapor* which provokes *Thirst*, and that *Liquor* which produceth *Hunger*, than there is between *Sweat*, and that which exhales from the whole *Body* by insensible *Transpiration*.

XII. *ARISTOTLE* was of opinion that *Natural Thirst* was the *Appetite* or desire of something that is moist and cold. But this doth not seem probable; for tho' *Thirst* seem to be a desire of something that is moist, in order to dissolve, di-

lute and macerate the *Food* we have taken, and turn it into *Juice*; yet there is no need it should be cold rather than *Hot*; forasmuch as any moisture doth extinguish *Fire* be it hot or cold. But whether it be more conducing to health to use *Cold* or *Hot Drink* is not so easily determinable, because of the different *Temperaments* of *Bodies*. Only we find by Experience, that the drinking of some extream cold liquor is very hurtful to the *Body*, whereas it is seldom known that any hurt accrues to us, by the using of hot drink.

Thirst is caused several ways, as either presently after we have eaten, because of the driness of our *Food*, which like a *Spong*, drinks up the moisture of our *Stomach*; or when our *Throat* is heated by the effusion of *Gall*, eating of high seasoned Meats, &c. or from some *Salt Humour* conveyed to that part, whence not only the imagination of drinking is awakened, but also an inordinate desire thereof, by which means some persons long for *Vinegar*, *Urin*, *Stinking Water*, &c.

XIII. Of the Different Causes of Thirst.

CHAP. XXII.

Of the Common Sense, Imagination, and Memory.

THE Common Sense, Imagination and Memory, are called the *Inferiour Faculties* of the *Soul*, as being attributed to it, because of its intimate union with the *Body*; whereas the *Understanding* and *Will* are styled its *Superiour Faculties*, because they appertain to the *Soul*, simply considered, and without any respect had to its Relation with the *Body*. But as these latter are not Beings distinct from the *Soul* it self, but only *Modes* of it: So neither are the former any thing else but different modifications thereof, arising from its intimate union with the *Body*. Thus the *Soul*, forasmuch as it perceives all the motions imparted to the *Brain* from the outward *Organs* of the *Senses*, is called the *Common Sense*; with respect to its long retaining and preserving the same perceptions, it is called *Memory*; and forasmuch as it variously compounds and divides the same, it is called *Imagination*. In like manner, with respect to its desiring or having an aversion by reason of the Objects that are represented by those perceptions, it is called the *Sensitive Appetite*; as the *Locomotive* or moving *Faculty* is attributed to it forasmuch as it commands the *Animal Spirits*, and by their means variously moves the *Members* of the *Body* according to its pleasure. So that these *Faculties* are indeed nothing else, but outward modifications, or ways of our considering the *Soul*, which makes it no more to differ from it self, than *Number* and *Duration* makes those things to differ that are numbered or do endure; and consequently the difference there is betwixt the *Soul* and its *Faculties*, is only a Distinction of *Reason*, that is, a notional distinction.

Seeing therefore that our *Bodily Members* are devoid of *Sense*, and that the *Soul* alone is endued with that *Faculty*, it remains for us to examine, what inward instrument the *Soul* makes use of for the perception of things, and how the *Species* or representations of *Objects* are conveyed to it. For the motion of the outward *Organ*, is only performed in the *Brain*, because there the *Soul*

I. The Soul is not really distinguished from its Faculties.

II. What the Common Sense is and how the same is exerted.

exerciseth its Functions. Wherefore this Sense is called the *Common Sense*, because it receives all the *Species* of the outward Senses, and so reacheth their *Objects*. For when we represent to our selves any *Object*, as for Example, a *Man*, we do not only seem to behold the colour of his *Face*, and *stature* of his *Body*; but also to smell the *Odours* he is us'd to have about him, to hear him *speak*, to taste the *Food* he eats, and to feel the *Softness* or *Roughness* of the *Cloaths* he wears. For from what hath been said already, it cannot be question'd, but that the *Brain* is the *Organ* of the inward Sense, forasmuch as the *Nerves* proceed from it, as *Threads* from a *Distaff*, whereby the *motions* of the outward Senses are transmitted.

III. Yet is not the whole *Brain* the *Seat* of this Inward Sense, but only some part of it; for otherwise the *Optick Nerves*, and the *Pith of the Back-bone*, as being of the same Substance with the *Brain*, would be the Residence of the Inward Sense. Now this peculiar place of the *Souls Residence*, is the *Conarion*, or *Glandula Pinealis*, a certain *Kernel*, resembling a *Pine-Apple*, placed in the midst of the *Ventricles* of the *Brain*, and surrounded with the *Arteries* of the *Plexus Choroides*. The Reason why we take this *Kernel* to be the peculiar *Seat* of the *Soul* is, because this part of the *Brain* is *single*, and *one only*. For whereas all the *Organs* of the Senses are *double*; there can be no Reason given, why we should not perceive two *Objects* instead of one; but only because both these Impressions are transmitted to a certain part of the *Brain*, which is *single* and *one only*, wherein both are conjoin'd. Furthermore, it is also requisite that that part should be *moveable*, to the end that the *Soul* by agitating of it immediately, might be able to send the *Animal Spirits* into some certain *Muscles*, rather than into others. And forasmuch as this *Kernel* is only supported by very small *Arteries* that encompass it, it is certain that the least thing will be sufficient to put it into motion. And therefore we conclude, that this inmost part of the *Brain* is the *Seat of the Soul*, in which it exerts its operations of *Understanding* and *Willing* of whatsoever proceeds from the *Body*, or tends towards it.

IV. Accordingly the *Common Sense* may be described to be an *Internal Sense*, whereby all the *Objects* of the *External Senses* are perceived and united in the midst of the *Brain*, as the common *Center* of all Impressions. Or the *Common Sense* is nothing else, but the concurrence of all motions made by the *Objects* upon the *Nerves*, in the *Conarion*, happening at the same time that the *Objects* move the Senses.

V. Neither doth the *Smallness* of this *Kernel* hinder its being the *Instrument* of the *Common Sense*; but on the contrary, those Persons are the most stupid in whom this *Kernel*, because of its bigness, is not so readily moved; and those the most witty and apprehensive in whom this *Kernel* is less, because it is so much the more easily moved: And tho' it were much less than it is, yet would it be big enough with respect to the several *Points* of the *Ventricles*, and to the *Pipes* of the *Nerves*.

VI. The *Foot-steps* of *absent Objects*, which are laid up in that simple and pliable Substance, by the assistance of the *Nerves*, are called *Species* and

Phantasms, by *Philosophers*. They preserve the memory of things before perceived by us, and represent them to us, as oft as we think of them.

Phantasie or *Imagination*, is nothing else, but a certain application of the *Knowing Faculty* to the *Body* (*viz.* the *Brain*) which is intimately present to it. Or it is an *Internal Sense*, whereby the *absent Objects* of the *External Senses* are represented present to the *Brain*, by reason of the *Foot-steps* of former Impressions. For the *Species* of the *Imagination* make us to conceive the *Image* of these things as present to the *Eye* of our *Mind*. For when we do imagine any *Object*, the *Soul* turns it self to the *Body*, there to behold the *Image* or *Representation* which it apprehends, as intimately present to its *Thoughts*.

But here ariseth a Difficulty. For if it be so that the *Imagination* be performed in the *Brain*, how comes it to act upon distant *Bodies*? as it happens in some *White-Women* that bring forth *Blacks*, and *Blacks* that bring forth *White Children*? And in those spots or marks which *Longing-Women* impress upon their *Children*; or that an *Adulterous Woman* brings forth *Children*, that are like her *absent Husband*?

This Difficulty will be easily resolved, if we suppose that the *Imagination* hath not only a great force over the *Brain*, but also over the whole *Body*; for seeing that the *Nerves*, as so many *Strings*, are extended throughout the whole *Body*, they readily convey the *Animal Spirits* from the *Brain* to the *Muscles*, together with the *Affection* impress'd on the *Brain*. And by the same means the *Imagination* moves the *Humours* of the *Body*, and by this different agitation of the *Humours*, the *Blood* becomes alter'd, and consequently the *Skin* and colour of the *Hairs* also become changed. Yea, without this change or alteration of the *Blood*, some *Impression* may be conveyed through the *Arteries* of the *Woman* that is with *Child*, to some certain part of the *Birth* in the *Womb*, and leave a *Mark* there. See my *Natural History*, concerning *Man*, Chap. VI.

Memory is that *Faculty* of the *Soul*, which repeats things perceived by former Sensations; or it is the calling to mind of known and past things. And differs from the *Imagination* only in this, that from the *Foot-steps* of former Impressions on the *Brain*, it doth represent as present to it self, *Objects* that were formerly offer'd to it: Whereas *Memory* consists in this, that the *Pores* of the *Brain*, through which the *Spirits*, determin'd by the *Pine-Apple-like Kernel*, have pass'd, are thereby become dilated, and consequently more fit to admit the same *Spirits*, repassing that way another time.

And accordingly *Memory* is twofold, *viz.* *Intellectual* and *Animal*. *Intellectual* is that which belongs to *Angels* and *Souls*, by means whereof they can represent to themselves, the *Thoughts* they formerly have had concerning *Spiritual things*; and this kind of *Memory* doth not stand in need of any *Bodily assistance*. The *Animal Memory* is that which is common to us with *Brutes*, and is performed by means of the *Brain*, and the *Foot-steps* impress'd upon it. For *Sensual* or *Corporeal Memory* imports nothing else, but a certain facility remaining in the *Pores* of the *Ventricles* of the *Brain*, to open themselves again, by reason of their having been

VII. What Imagination is.

VIII. The strength of the Imagination.

IX. Wherein the Nature of the Memory doth consist.

X. Memory is either Intellectual or Animal.

been before opened by the *Animal Spirits*. Or, to speak more clearly, the Foot-steps of the *Animal Memory* are those, which the passage of the *Animal Spirits* hath left betwixt the *Fibres* of the *Brain*, through which they have passed before, so as to go out by the said *Pores* again, as they at first enter'd in by them; by which means it comes to pass, that these *Spirits* do more easily enter these *Pores*, than others; as *Paper* that hath been once folded, is more apt to run into the same Folds that hath been formerly made in it.

XI.
How the
Foot-steps
of Memory
are formed
in the
Brain.

Figure
75.

To understand how this is done, we are to imagine, that after that the *Spirits* that go forth from the *Glandula Pinealis H*, have left some impression of a *Species*, or some particular Foot-steps of their passage, they do pass from thence through the Points 2, 4, 6, 8, and into the like *Pores* and *Intervals* as are found betwixt the *Filaments*, whereof the portion of the *Brain EE* doth consist. Which *Spirits* have the power of dilating the said *Intervals* in some sort; as likewise of folding and diversly disposing of the *Filaments*, against which they push in their passage, according to their different motions, and the various openings of the *Pipes* through which they pass; that there also they may impress *Figures* like to those of the *Objects*.

XII.
How they
are trans-
mitted to
the Brain.

We are to conceive therefore, that the *Figure* impress'd by the *Object AB, CD*, upon the *Fibres* of the *Optick Nerve*, which it moves or agitates in the Surface of the *Retina 1, 3, 5, 7*, must delineate another *Figure* like it self, in the inward Surface of the *Ventricles of the Brain 2, 4, 6, 8*, where the said *Fibres* are terminated: Whence it comes to pass, that the *Animal Spirits*, which reside in the *Kernel H*, must more swiftly pass out of the *Pores*, that answer to them, than they did before; and that too in the same form or figure of the opening. And thus their Course produceth another like to it upon the *Glandula H*, which is that Form to which the *Thoughts* of the *Soul*, which depend on the *Body*, are immediately linked.

XIII.
How these
Foot-steps
of the
Memory
are pro-
duced.

But yet the *Spirits*, which make their way through the Passage 2, 4, 6, 8, though they may be of some force to dilate the passages of the *Fibres* a little; yet they have not power enough at the first stroak, to impress their figures upon the *Fibres*, which are in the Substance of the *Brain*, with so much facility or perfection, but by degrees perform the same more accurately, according as the *Action* of the *Spirits* is either stronger, more lasting, or more frequently repeated. Whence it follows also, that these *Figures* are not so easily obliterated, but do abide there: So that by means of them, *Species*, that at any other time have been impress'd upon this *Kernel*, may a long while after be again represented or formed there, even tho' the *Objects* be absent. And tho' these Passages should afterwards chance to be shut up again, yet they still retain a greater facility or readiness to be open'd, than other Neighbouring passages that were never yet opened. As if many *Needles* should pierce the stretched piece of *Linnen A*, the Holes which the said *Needles* had made in it, would remain open, even after that the *Needles* be taken away: Or, if they should be closed, yet there would some signs thereof remain in the *Cloth*, which might very easily be opened again. And it is to be noted, that if only some of these *Holes* should be open'd

Figure
76.

again: As for Example *a*, and *b*, this would be sufficient to make others of them, such as *c*, and *d*, to be dilated again at the same moment of time; especially if all the foresaid *Holes* had been often open'd, and that all of them had been usually opened together. Yea, there is a greater facility or readiness in the *Pores* of the inward Substance of the *Ventricles* of the *Brain*, of opening themselves upon the like *Action*, than there can be in the *Linnen Cloth*; for that whilst the *Spirits* do again open some of those Passages, the said *Spirits*, because they are diffused every way, do in some sort follow the same Track (in the same manner as we see that the *Sound* or *Wind* follows the motion of *Running-Waters*) and by this means do open the Passages again that are about them, because of the easiness they find to enter in by them.

Moreover, we are to take notice, that in case only some Passages were opened, after the same manner others would also be opened at the same time; especially if they had been frequently opened before, and all of them together. Thus when 2 *Objects* have delineated their *Species*, and that the 2 Ranges of the *Spirits*, that have framed them, be somewhere joyned in the Substance of the *Brain*, it is sufficient if one of them only be brought to the *Pine-Apple-like Kernel*, for the stirring up again of the said *Actions*, which had their rise from them both. As when we have seen the *Nose* and *Eyes* of any *Face*, we readily apprehend the *Mouth*, *Forehead*, and other parts of it, and imagine them as present to us, because we are never us'd to see any of these Parts by it self, but all of them together.

From what hath been said, we may easily apprehend, that the *Brain* ought not to be over moist or soft, that it may the better retain the *Species* impress'd upon it. Thus we see that *New-born Children*, whose *Brain* is in a manner altogether watry, cannot retain any impression that is made upon it; and for the same Reason it is, that tho' *Children* afterwards do with ease enough learn things by *Heart*, yet they as easily forget them again. Whereas on the contrary, those who have harder and drier *Brains*, do long retain the Marks once impress'd upon them, but cannot without difficulty receive any new Impressions. Hence it is that very *Old Men*, because of the *Driness* of their *Brain*, become wholly deprived of their *Memory*, neither can retain ought of those things that are committed to them; and yet are very retentive of those things they have long since committed to their *Memories*; because their *Brain* being grown hard, doth more firmly preserve the Impressions made there.

CHAP. XXIII.

Of Health and Sickness.

Health is nothing else, but that State of an *Animal*, wherein all its Powers can discharge their Functions, as they ought. Or, it is a certain disposition of *Body*, and *Harmony* of its parts, whereby its fitted forth, exerting and performing of all Actions, according to the Laws of Nature. For as *Harmony* in *Musick* consists in an agreeable concert of *Sounds*, whilst every one ob-

What
Health is.

serves such a degree of *Depth* and *Height*, that it doth not go beyond, or fall short of a due proportion: So we call that a State of *Health*, when every *Humour* and *Quality* observes that exact degree of *Intention* and *Remission* that they never exceed in, or fall short of a congruous proportion. Hence GALEN in his first Book of the preservation of *Health*, defines *Health* to be such a constitution of *Body*, in which we are neither sensible of any Pain, neither are we hindered in any of the functions of *Life*: And that therefore those *Men* are to be accounted *Healthful*, who without any pain or impediment can perform all the necessary functions of *Life*.

II. There are 2 things more especially that concur to the constituting of *Health*, viz. a due Temperament of the *Humours*, and composition of the parts. By the name of Temperament we understand a certain mixture or Union, according to which the *Natural Functions* are well and duly performed. And consequently the distemperature of the *Humours*, as the Excess of *Choler*, *Pblegm* or *Melancholy* do spoil *Health*, and hinder the use of our *Natural Faculties*. A congruous constitution or composition of the *Parts*, consists in a due Number, Magnitude, Situation, Figure and Connexion of the several *Parts* and *Organs*, and such a disposition of the *Fibres*, as the *Natural Faculties* stand in need of to discharge their several Functions.

III. Physicians commonly distinguish *Health* into that which is *Best* and *Absolute*, which consists in a manner in an indivisible point, from which, if there be never so small a varying or deviation, the same is esteemed to be a *Sickness* or *Disease*; and the Other which is also perfect, tho' probably it may admit of some excess or defect, but not so great, as that it can be accounted for a *Sickness*, tho' it may cause some little hinderance in the natural functions, or cause some inconsiderable Pain. The former of these States of *Health* is not to be found in *Nature*, and can only be conceived in our *Minds*: Tho', as GALEN saith, it may serve for a *Rule*, by which we may measure or compute the greater or less degrees of *Health*. The Latter is attributed to every *Man*, and is not found in a lower degree except it be accidentally. For *Nature* always affects that which is best; and if at any time it cannot effect what it intends, yet it always performs the best it can.

IV. Many things are conducive to the preserving of the *Health*. First the *AIR*, which being taken in by the *Mouth* and *Nostrils*, enters the *Body*, and is necessary to rid the *Blood* of fuliginous streams by means of the *Lungs*; which should it not be continually done, as well the Branches of the *Venal Artery* as of the *Arterial Vein* would be obstructed, and not only *Health*, but also our *Life* would be in danger.

Secondly, Care is to be taken about our *FOOD*; for seeing that we stand in need of *Food* to repair and restore the *Consumption* made by our *Inward Heat*, we are to mind that it be taken in such Quantity, Manner, Time and Place as may be most conducive to the *Health* of our *Bodies*. For neither must it be taken in so small a Quantity, as to famish or weaken our *Bodies*; nor so copiously, as thereby to overcharge our *Stomachs*; nor

so frequently, as to disturb the *Digestion* of the *Food*, we have last taken; nor so seldom, as to defraud our *Stomachs* of their due allowance.

Thirdly, The Retention and Voiding, or Excretion of our *ALIMENTS*; for seeing that the purest and best of the *Food* must be changed into the Substance of the *Body* that is fed, it is of absolute necessity that it be retained in the *Body*: And since it cannot be so pure, but that it must contain some *Heterogeneous Parts*, the same must be voided, lest by overlong stay in the *Body* it should putrify, and disturb the *Oeconomy* thereof.

Fourthly, Moderate EXERCISE; for motion is a great help to excite *Heat*, and to open those obstructions, which hinder corporal Functions. But yet on the other hand, overviolent and unseasonable Exercise, wastes the *Body*, and by disturbing the inward *Oeconomy*, frequently is the cause of *Diseases*.

Fifthly, REST; for seeing that as long as we are awake, the *Spirits* continually course it through the *Organs* of our *Body*, this causeth *Weariness*, which must be restored by *Rest* and *Sleep*. Wherefore whenever we watch too long, our *Spirits* become dissipated, the strength of our *Body* weakened, our concoction is hindered, and our whole *Body*, and more especially our *Brain*, is thereby dried.

Sixthly, moderate PASSIONS and AFFECTIONS, especially those of *Joy* and *Cheerfulness*, which promote and help the motion of our *Spirits*, and cherish and recreate all congruous functions. But of all things, nothing is more conducive to *Health*, than for every *Man* to take heed to himself, and carefully examin what he finds *Good* or *Hurtful* to him, endeavouring always to avoid the one, and procure the other, and to use it in due time and manner. And accordingly CICERO tells us in the 4th. Book of his Offices, *Health* is maintained by the knowledge of ones own *Body*, and by making observation of those things, which are wont to be *Good* or *Hurtful* for us, as also by continual Temperance and Continence throughout the whole course of our *Lives*, together with the care to keep our *Bodies* neat and cleanly.

SICKNESS on the contrary is such a State of the parts of our *Body*, whereby they are hindered from the due performance of their Functions. And therefore whatsoever overthrows the Temperament of the fore said *Humours*, or the composition of the *Parts*, is called *Sickness*. Tho' *Sickness* doth attack the whole *Man*, yet doth it only consist in the *Body*; because those Distempers which seem to affect the *Soul*, are only some consequences of *Bodily Sickness*; as appears manifestly in that as soon as the *Body* is cured, the griefs and uneasiness that were found in the *Soul* do immediately cease, and no longer afflict it.

Sickness is commonly divided into two General Heads, viz. into *Sickness* of the Similar and Dissimilar Parts. *Sickness* of the Similar Parts, is called a *Distemper*, when it is such as that it sensibly hurts our *bodily Actions*, as when any *Quality*, by Example, that of *Heat* or *Cold* doth exceed. And this *Distemperature* is either Manifest or Hidden. Manifest is that wherein the Qualities that exceed are known. Hidden, when

K k k

V. What Sickness is, and that it only resides in the Body

VI. Of the two General Heads of Sickness.

by reason of the ignorance of the exorbitant Qualities, the cause of the Distemper cannot be found out.

VII.
Diseases
of the Dis-
similar or
Organical
Parts.

The other kind or General Head of Diseases is of the Organical Parts, which are said to be vicious or faulty, with respect to their Conformation; or with respect to their Magnitude, when they are either greater or less than they ought to be; or with regard to their Number, when therein they exceed, or are defective; or as to their situation, when they are not rightly placed; or as to their Figure, when it is not such as it ought to be; or with respect to their Connexion, when they are at too great distance from each other, or if they be overmuch crowded together, stretched, compressed, loosened, or grown too stiff.

VIII.
Some Dis-
eases afflict
only some
parts, o-
thers the
whole Body.

There is also another Division of Diseases into Universal and Particular: Universal Diseases are such as afflict the whole Body, as Agues and Fevers. Others Particular, which only affect one part of the Body, as the Brain, Lungs, Throat. But to the end that we may be able to understand the chief Diseases of the Body, we shall consider them in the following Order.

IX.
Pain of the
Head, or
Headach.

The First Disease, and which hath its seat in the Membrans of the Head, is the HEADACH, which is a Pain, or troublesome Sensation of the Head, proceeding from the Exorbitant Figures of the Blood, which spoil the Temperament thereof. For when the Animal Spirits, being too violently agitated by reason of a too Choleric and Glewy Arterial Dew, are driven through the Arteries, to the Head, and the Filaments and Membrans of the Brain, they forthwith disorderly twitch, corrode, prick and cut the same, and finding the pores through which they would make their way, not corresponding with them in Greatness and Figure, they by their force slit them up, and thereby produce an exquisit pain in the Head. Hence in the cure of this Disease there is made use of Blood-letting, and other things conducing to the changing of the Distemper of the Blood, and to drive away the sharp particles, which are got into the most sensible Membrans of the Brain. Purging Medicines are also used, whereof some are more proper to expel these, and others, other particles; such as are Aqueous and Oleous Medicaments, which also stop the too swift motion of the Animal Spirits in the Blood.

X.
Phrensy.

PHRENSY or Raving is a violent agitation of the Brain and Membrans thereof, caused by the excessive heat of the Blood, and its being filled with sharp and other malignant particles, which entering the Pores and Membrans of the Brain, do frequently cause an Inflammation there. Which then happens when Triangular Particles light upon Round Pores, whereupon in every such Pore, there are left three little spaces, because of the threefold surface, for the filling up of which spaces, the subtil matter presseth in with more abundance, by the rushing in whereof the Parts and Humours become agitated and disturbed. Whereupon the Glandula Pinealis is no longer in a condition to discharge its function, because these Animal Spirits are no longer subject to any Rule, but as Refractory Soldiers and Deserters, cast off the Yoke, and course it up and down without Rule or Discipline. Wherefore Opiates are commended for the cure of this Disease, which both reduce

the Raging Spirits to rest and composure, by closing up the Nerves, as it were, with Bird-lime, and stop the irregular motion of the sharp particles, which before did cut the Fibres, and little Branches of the Nerves, that those Fibres, which before were stretched out like Cords, do run together into twisted Knots and Bunches, which Knots stop the passage of the Spirits through the Nerves, and so hinders them from being transmitted to all the parts of the Body, and consequently from discharging the wonted functions. Refrigerating or Cooling Medicaments are likewise of use in this distemper; as for Example, the Chymical Preparation called Nitrum Perlutum, which being dissolved in Water, is found to be of very good use in this case, because it fixeth the Spirits and the Blood, and at the same time opens Obstructions; as also Distill'd Vinegar, Antimony Diaphoretick, and Powder of Pearl, Coral, &c.

MELANCHOLY which is commonly defined to be a Doating, without a Fever or Raving; is a Delirium or Doating, proceeding from the sadness of the Patient, whereby the Animal Spirits are moved more slowly than they are wont. This distemper of the Blood, is commonly the product of a vicious Sour Humour in the Blood, by means whereof the Animal Spirits are darkened and condensed, which roving through the former footsteps left in the Brain, and rebounding from them, represent the same Images to the Soul; and accordingly Melancholy Persons think the things they have once conceived to be always present with them. Wherefore Alterating Remedies are much used in this Disease, and particularly such as abound with much Volatil Salt, as all Spirituous Matters do, as by Example, the Juice of Betony, Scurvygrass, Brooklime, Chickweed and such like, by means whereof the Ropy and viscous distemperature of the Blood is amended.

MADNESS is another kind of Doating, accompanied with great Rage and Alienation of Mind, without a Fever, proceeding from the irregular motion of the Animal Spirits being inflamed, and turned into a fiery Nature. For the Spirits being excited by some outward cause, and inflamed, range about through the Brain, but more especially about the Glandula Pinealis, and rushing like Lightning into the Brain and Muscles, do put the Glandula out of the Souls command, which being deluded by these Spirits, and deprived of all her command over the Body, can no longer guide or govern it; whence proceed so many undecent Gestures, Fightings, Quarrels, Bawlings, &c. In order to the stopping of this Effervescence of the Blood, ponderous Remedies are made use of, as Lapis Prunella, Saccharum Saturni, or Sugar of Lead, Crabs Eyes, Laudanum Opiatum, Sanguis Draconis, &c. Decoctions also made of some ponderous sorts of Wood, are profitable in this case, as which by their heavy and hard Particles, do stop the motion of the Blood.

LETHARGY is an irresistible inclination to Sleep, accompanied with great forgetfulness, caused by an Obstruction of the Pores of the Brain, by a thick and gross Humour, and the want of Animal Spirits. This Disease is also in a great measure caused by Steams and Vapours that are mingled with a Slimy, Ropy Dew, which being condensed into Water overwhelm the Brain, and the

XI.
Melancholy.

XII.
Madness.

XIII.
Lethargy.

the Soul together with it. And accordingly this Disease is cured by Volatil and Aromatical Remedies which restore the Spirits, and by their volatility open the Pores, and cut the Viscid or Slimy Matter: Such as are all Spirituous Matters, all Volatil Salts, especially such as are Aromatical and Oleous, also the Wood Guajacum and Sassafras, the Roots of Masterwort, the Herbs, Balm, Betony, Organy, Sage, Marjoram, Thyme, Rosemary, &c.

XIV.
Coma Vigil, or the Waking Drowsie Disease.

COMA VIGIL or the Waking Drowsie, is a Distemper accompanied with a strong Inclination to Sleep, wherein the Patient lies drowsing with his Eyes shut, without being able to fall asleep. This Disease is caused by too great a dilatation of the Pores of the Brain, from the too much inflamed and agitated Animal Spirits. Wherefore in this Sickneß it is necessary to purge the inflamed Choler, which puts the Blood into a violent Fermentation; and to correct the said Humour by Acids. For the best way to cure this Disease is by such Remedies as do allay and assuage the sharpness of the Humour, and Cordials that restore strength, as also by Sudorificks, which volatilizing those sharp particles, drive them by sweat out of the Body.

XV.
Cataleptis.

CATALEPTIS is a suddain Detention or Immobility of the Body, accompanied with a weakening of the Senses, whereby the Patient retains the same figure of the parts of his Body, which he had in the first moment when he was seized with this Distemper. This Dreadful Disease is not caused by a freezing of the Animal Spirits, and the Humours that are in the Body, or from a Vapour that congeals the Spirits, as the Galanists do suppose, seeing that no such thing can happen to the Spirits, but because the Animal Spirits are no more subject to the command and guidance of the Soul, by reason of the Obstruction of the Glandula Pinealis, and therefore cannot move the parts as they used to do. So that the Cause of this Distemper is no other, but the Obstruction of either side of this Kernel. Wherefore for the taking away of this Obstruction, and to restore the Animal Spirits to their Due and Regular Motion, Volatil Salts are prescribed, and Cephalicks, or Medicaments appropriated to strengthen the Brain, and the Glandula Pinealis in particular, the proper seat of the Soul. Strong Motions and Frictions, or Rubbings of the Body are commended with hot and course Linnen Cloath.

XVI.
The Vertigo.

THE VERTIGO is a Sickneß wherein all Objects about us seem to turn round, caused by the undue circular motion of the Animal Spirits. Because in this Distemper the Humours and Blood are so tossed and agitated, that by their irregular motion they affect the Roots of the Nerves, and pressing and crowding upon one another, make it appear as if all Visible Bodies turned round. Which crowding and compression proceeds frequently from the Depravation, and sometimes from the Abundance of Blood. And consequently the cure of this Disease is commonly undertaken by Spirituous Medicines that remove Obstructions, by Cephalick and Aromatical Balsams. But if this Disease be caused by an over-great abundance of Blood, then the breathing of a Vein is necessary; if from some depraved Juice lurk-

ing in the Stomach, Vomits are most proper, as also Marmelad of Quinces, Bisket and Crusts of Bread to correct the said vitiated Sharp Humours.

EPILEPSY or the Falling Sickneß, is a convulsive motion of all the Parts of the Body, more especially of the Hands and Feet, accompanied with a deprivation of the Inward and Outward Senses. This Disease proceeds from a Depravation of the Blood, and an Obstruction in the Solid Parts, caused by square figured Particles, which afflict the Nerves with their Angles, which way soever they apply to them; as also by hooked particles, which being once fastned in the Fibres of the Nerves, cannot so readily be disintangled thence. For the smoothing, and infolding of which particles, the Decoctions of several sorts of Wood, and other Cephalicks are made use of; whereby the sharpness of the Humours is blunted, and the points of the particles smoothed, as may be seen in a Knife, Sword, Needle, &c.

XVII.
The Epilepsy, or Falling Sickneß.

APOPLEXY is a suddain ceasing of all Animal Actions, viz. Sense and Motion, with the Hurt of the Principal Faculties, proceeding from an over-great Dilatation and opening of the Pores of the Brain, and the Plexus Choroides. For by this means is often caused a total Obstruction of the Brain, which is the Beginning or Rise of the Nerves, by a foreign Humour flowing into the Brain, which stops up the way for the Animal Spirits, whereupon all the Members of the Body flag, and become immoveable; as Sails fall flat, and hang limber, when the Wind fails, that before distended them. According to this notion of this Disease, liberal Blood-letting is very conducive in that Apoplexy, which is caused by too great abundance of Blood; and a more moderate Blood-letting in that which proceeds from abundance of Phlegm. Rubbing of the parts with Hot Cloaths are also commended, and with Spirituous Liquors; for by these the Animal Spirits are excited, and the clogging matter that obstructs the Nerves is by this means the better removed. Gentle Glisters are also of good use in the beginning of this Distemper, and afterwards such as are more strong and vehement.

XVIII.
Apoplexy.

THE PALSIE is a Privation of Sense and Motion, either throughout the whole Body, which is less frequent, or in some Members only proceeding from the want or weakness of the Animal Spirits. For where the Spirits are either altogether wanting, or not in sufficient Quantity, the Nerves and Muscles become limber and flaggy, by which means Sense and Motion, either altogether cease, or are remarkably weakened. Wherefore in order to the Cure of this Distemper Physicians take away a little Blood, to free the Passages from Obstructions, and afterwards exhibit Medicaments proper to correct the thickness and clamminess of the Blood, and to make it more thin and fluid; such as are altering and inciding Cephalicks and Aromatics appropriated to the Brain and Nerves. This done, the Pores of the Brain, and Pipes of the Nerves may be opened by Sudorificks, especially such as consist of hard and stiff parts; viz. Sassafras, Guajacum, Sarsaparilla, &c. to the decoctions whereof some Salt of Tartar may be added, for to make the extraction the stronger by opening of the Pores of the said Woods.

XIX.
The Palsie.

XX. **CONVULSION**, commonly call'd the Cramp, is an involuntary, continual and painful Contraction of the Muscles, proceeding from a tough, cold and thick Windy Vapour, puffing up and distending the Parts. To the removing of this Distemper, are made use of all Medicaments that open Obstructions and break Wind, whether inward or outward, Volatile Salts, and all Cephalicks.

XXI. **THE NIGHT-MARE**, is a great diminution of the Animal motion, and of those parts that are serviceable to the forming of the Voice and Respiration, and more especially the Nerves called Phrenici and Recurrentes, proceeding from the want of the Influx of Spirits, with the false Imagination of an Heavy weight lying upon one, in the appearance of some frightful Spectre. For whenever during Sleep, the Spirits do not flow freely into the Muscles, then such a Motion is produc'd, as whereby the Soul judgeth some great Burthen to lye upon it, which hinders the free motion of the Midriff. Now this sense of being strangled or choak'd is occasion'd, by reason of the Spirits being hindred from their free ingress into the Muscles of the Throat, which thereupon flag and fall down, and so produce this Sense of Strangulation. In this Disease, the use of Volatile Salts is much commended, especially joyned with Spirituous means; and so likewise Aromatics, and other Medicaments, proper to incide and attenuate, and consequently to open the Obstructions of the Pores of the Midriff.

XXII. **A CATARRH** or Rheum is an Effusion of the sharp particles of the Blood, or serous part of it, in every part of the Body, being because of its long stay there coagulated, and producing a pain in the Part either with, or without a swelling. For when the due and regular mixture and consistence of the Blood is spoiled by Serous and Pituitous matter, many sharp particles are cast out into the Glandulous parts, which by their acrimony, and other manifold malignity twitch the Membrans, whereupon follow frequent Sneezing, troublesome Coughing and Hoarseness. In the beginning of this distemper, mild Catharticks are much commended, as Pilule de Succino and other Aloeticks; Blisters also, and Issues, and Scarifications are commended in order to the Evacuation of the serous peccant Humour. Moreover all Oleous and Fat things are of good use in this case, because that by the softness of their parts, they do infold and blunt the sharp points of Heterogeneous saline particles in the Blood; as likewise thick and Earthly Medicaments as Crabs Eyes, Terra Sigillata, common Bole, &c. because these are proper to file and rub off the sharp corners of Salts.

XXIII. Having thus handled the Diseases and Distempers of the Head, we next proceed to consider those of the Breast or Chest, and here we shall in the first place Treat of that Distemper commonly called a Cough, which is a more frequent, uneven and Loud expiration or out-breathing, whereby a great part of Spirits bursting forth violently, endeavour to cast forth some sharp, and troublesome Excrements, caused by the sharp, and pricking particles of the Blood, which by the Circulation of the Humours, are carried into the Muscles design'd for inspiration or expiration, and being there in greater quantity than ordinary, do painfully twitch the Parts, and stir up a Convulsive motion. For

the sharp particles like so many Knives or Prickles, being entred into the substance of the Lungs and the Fibres of the Branches of the Windpipe, do necessarily produce a kind of Convulsion, viz. a Cough. Wherefore, in order to the blunting of these sharp pointed Particles sweet things are commended, and Opiats, which do also allay the sharpness of the Humour. Vinegar of Squills is also of good use, especially where the Patient is troubled with tough Phlegm. And for a Purge Mercurius Dulcis is commended, because it doth cut Phlegm and evacuate it.

ASTHMA, or Tisick, is a difficult and thick fetching of ones Breath, with, or without a Fever, sometimes with great wheezing, and other times without it, proceeding from an ill affection of the substance of the Lungs, and the Intercoastal Muscles, serving to Respiration. For whenever the Nerves, that belong to the Intercoastal Muscles, and other Organs serving to Respiration, are obstructed, it produceth difficult Breathing. For the removing of which Obstructions, Physicians commend the use of mild Aromatics, and Volatile, Oleous Salts, which by their Volatility are very proper to pierce the windings of the Lungs, and to open their Obstructions, caused by tough and slimy matter. The fore-mention'd Decoctions of Wood are likewise very useful, as consisting of hard, ponderous and stiff Particles, which by their irregular figure and heaviness drive through the Pores, resolve the viscid or tough matter, and restore the Blood to its due fluidity.

The **PLEURISIE**, as also the **PERIPNEUMONIA**, is an Inflammation, the one of the Pleura, (that is, the Skin that covers the Ribs;) the other of the Lungs, accompanied with the greatest difficulty of Breathing, a high Fever, a continual Cough, sometimes with Frothy Spittle, and frequently also with that which is Bloody, with great Pain, Heaviness and Anxiety about the Breast and Heart, caused by a sharp, distending, pricking and corroding Matter. For this Matter is nothing else in the Pleurisie, but the sharp-pointed and volatile Parts of the Blood, transmitted to the Membrans that cover the Ribs and the intercoastal Muscles; whereas in the Peripneumonia, or Inflammation of the Lungs, they are conveyed into the very Substance of the Lungs, and extravasated thence. Wherefore in either of these Distempers, it is proper to breath a Vein, as well to allay the furious effervescence of the Blood, caused by the foresaid Particles, as to evacuate some part of them. And to alter and correct the sharpness of the Particles of the Blood, testaceous Powders are commended, which do not only imbibe the acidity of the Blood, but also by their ponderosity, serve to dissolve the grumous and coagulated parts thereof.

PTHISIS, or the Consumption of the Lungs, is a wasting of the whole Body, with a slow or Hectick Fever, and Cough, with the spitting of Purulent matter, caused by the sharp Particles of the Blood, fretting and corroding the Lungs. For these malignant Particles, whether proceeding from the Arteries, or the Lymphatick Vessels, or from the open'd Imposthume of a Quinsie or Pleurisie, by effusion of the Purulent matter into the Cavity of the Breast, do there infect and taint the Lungs. And therefore to rid the Lungs of these

XXIV. The Tisick.

XXV. The Pleurisie and Peripneumonia.

XXVI. The Consumption of the Lungs.

these sharp and corroding Particles of the Purulent matter, Physicians prescribe hard and ponderous Remedies, viz. Testaceous Powders, and the Decoctions of several sorts of Wood, which have a virtue to imbibe and alter the sharpness of the Humour: Mercurius Dulcis, Bole-Armenick, and Terra Sigillata, are also commended in this Distemper.

XXVII.
Syncope or
Swoounding.

SYNCOPE, or Swoounding, is a sudden failing of the strength of the Body, caused by the Extinction for a time, or overwhelming of the vital Flame in the Heart. For the want of a sufficient store of Spirits, with the ceasing of the Circulation of Humours, and of the determination of the Spirits into the Muscles for that time, makes the Body fall down like the Trunk of a Tree. In this Disease are commended Spirituous Medicaments, and Volatile Salts, which are proper to kindle and feed the flame in the Heart; as all spirituous, cordial, odoriferous Waters, such as Cinamon-water, Aqua-mirabilis, Vita-Martiholi, and the like, which rowze, corroborate and multiply the Spirits.

XXVIII.
Cardialgia or Pain
at the
Heart.

The Diseases of the Abdomen, or lower Belly, are **CARDIALGIA**, the Pain at the Heart, which is a painful Sensation at the Mouth of the Stomach, which by means of the Nerves is presented to the Soul. This Pain proceeds from the sharp and pointed Particles, that do prick, twitch and slash the Nerves and their Fibres, and consequently shake them; which Agitation being convey'd to the Organ of the Common Sense, it is vehemently moved thereby, and so represents to the Soul that afflicting Sensation, which we call Pain. Accordingly for the Cure of this Distemper, are prescribed several Remedies proper in Convulsions, but joyned with Specifick Stomachicks and Opiates, to which are frequently added the Powder of Native Cinnabar, Amber, Man's Skull, &c.

XXIX.
Singultus
or the
Hiccock.

The **HICKOCK** is a Convulsive motion of the Midriff, caused by tough and irregular Particles, twitching and forcing it to this disordinate motion. For the Fibres of the Nerves of the sixth Conjugation, distributed to the Stomach and the Midriff, are so vellicated in this Distemper, that by their motion communicated to the Brain, they frequently open those Pores there, by which the Animal Spirits, rushing violently towards the Mouth of the Stomach, contract the Fibres appointed for the expulsion of any offending matter, upwards, and make the Patients to explode the Air, contained in the Mouth of the Stomach with that vehemence, as constitutes the Hiccock; which ceaseth as soon as the sharp twitching matter is discharged by these repeated Convulsion Motions. For the correcting of these peccant particles all hard and ponderous matters, are commended, as Crabs Eyes, Coral, Filings of Steel, Mercurius Dulcis and Opiates.

XXX.
Diarrhoea
a Scour-
ing or
Lask.

A **LASK** is the defection of various and liquid Humours by stool, caused by the effervescence of the Blood, increased by the cholerick particles thereof, and irritating the Fibres of the Guts by their sharp points. For various Humours being precipitated through the Vessels which open themselves into the Guts, do vellicate their Fibres, and by this means make the Animal Spirits to rush down that way in greater abundance, whereupon a kind of Convulsion follows. In the dry Gripes

and the Lienteria, or that Scouring, when the Meat passeth away in the same manner as it was taken in, the ferment of the Stomach is faulty, as not duly digesting the Food put into it. In all Lasks or Scourings, at the beginning Rhubarb, Jalap, and Crabs Eyes are commended, mixed with other proper Medicaments; and in the Lienteria and dry Gripes, Balsamick Remedies and Stomachicks, are given both inwardly and outwardly.

The **CHOLERICK** Passion is a depraved Convulsive motion of the Stomach and Guts, occasioned by sharp and pointed particles twitching the Fibres of the Stomach and the Gut called Duodenum, and contracting them upwards. For this twitching of the Fibres cannot continue long, without irritating of the Animal Spirits, and disturbing of them in their several Orders and Stations, and thereby causing them to produce these Convulsive motions. In order to the quelling of this fury of the disturbed Animal Spirits, Bezoardicks are commonly prescribed, and all ponderous Medicines, as Crystal, Terra Sigillata, &c.

XXXI.
Cholera or
the Chole-
rick Pas-
sion.

The **BLOODY FLUX** is an Exulceration of the Guts, accompanied with frequent and Bloody Dejections, and violent Pain and Gripings, caused by sharp particles that corrode and cut the small Fibres of the Guts. For the Hooked and Pointed Particles that are mixed with the Humours, do pierce and divide the Membrans of the Guts, and by this means cause an Ulcer therein. In order to the cure of this Disease, altering and Evacuating Medicines are made use of: and above all Rhubarb, because it leaves an adstringent Virtue behind it after Evacuation. Emollient and Lenitive Medicaments are likewise employed for the removing of this Distemper, and such things as promote Fermentation, as Coral, &c.

XXXII.
Dysenteria
or the
Bloody
Flux.

The **TWISTING** of the GUTS, is a most exquisite Pain of the small Guts, accompanied with a most obstinate stoppage of the passage downwards, and vomiting of the Excrements, proceeding either from an Inflammation of the Guts, or from their obstruction by some hard Excrements. This Disease is often caused by sharp Humours, sticking within the Membrans of the Guts, which cause the Expulsory motion of the Guts to be turned the contrary way, because of the irritated Animal Spirits, flowing from the Brain into the ascending Fibres of the Guts, which influx being perverted, the Excrements contained in them are voided upwards by the Mouth. In the cure of this dreadful and desperate Disease, Blood letting is made use of, to remove the Inflammation; and afterwards Emollient and Lenitive Glisters to evacuate and temper the sharp Humours, and to make the passages glib and slippery. For the same purpose Lenitive Catharticks are commended. Crude Mercury is also prescribed mixed with the Yolk of an Egg, that it may not stick to the Guts; and lastly Narcoticks, which both correct the sharpness of the Humours, and allay the Convulsions of the Guts.

XXXIII.
Iliaca Pas-
sion or the
twisting of
the Guts.

The **COLICK** is an afflicting and painful sensation in the Colon, or its neighbouring Parts, caused by a Cholerick Humour joyned with a corroding Salt. For there is a sharp Salt contained, not only within the Hollow of the Guts, but also betwixt the Membrans of them; which saline

XXXIV.
The Colick

particles, when they enter into such Pores, through which they cannot pass, they become, as it were, lock'd up there, that is, in the pores of the Coats or Membrans of the Guts, where they occasion a most acute Pain, by twitching and corroding the Fibres thereof. Wherefore to break the force of this sharp Humour, and to heal the hurt Fibres of the Nerves, several Asswaging and Anodyne Medicaments are prescribed, and sometimes Opiates, to give some respite to the Patient, and that the Physician may gain time to eliminate that foreign and præternatural Salt. Glysters also are commended, and other outward Applications to comfort the hurt Fibres, and to allay the violent motion of the Animal Spirits.

XXXV.
The Yellow
Jaundise.

The **YELLOW JAUNDISE** is an Ill habit of Body, staining the solid and fluid parts thereof with a yellow or black Colour, caused by the effusion of a sharp and depraved Gall. For the Gall, whenever its Particles are vitiated, either in their figure or motion; then that part of it which commonly promotes the Voiding of Excrements, is no longer sent that way, but continuing with the Blood, and circulating with it through the Body, stains the Skin with a yellow, and sometimes with a black Colour, that is, when sour and gross Particles are mixed with those of the Gall. Wherefore in this Disease Purging Medicines are to be used at first, and particularly Infusions of *Rhubarb* and *Senna*; for otherwise, if they be boiled, or too strongly wrung out, they communicate those Particles to the Potion, that after Purging strongly bind the Body, which may be very hurtful.

XXXVI.
The Dropsie.

The **DROPSIE** is a Swelling of the whole Body, and more especially of the Belly, caused by a Collection of watry Humours. For when a watry Humour stagnates and grows thick in the Belly, then it obstructs the Surface of the Inwards, together with the Peritonæum and Muscles of the Body, with a kind of slimy, pituitous Matter, which hinders that the Vapours and Steams arising from the Body, cannot be evacuated by insensible Transpiration; which is the Reason, why those that are troubled with this Disease, are so difficult to be brought to Sweat. Whilst therefore these small Vessels are burst and broken by the thick and tough Particles, the serous Particles drop down into the Belly; which being by degrees and continually increased, they produce the Dropsie, and other Ills in the Body. Wherefore for the Curing of this Disease, Medicaments that purge watry and serous Humours, are commended, as *Pilule de Ammoniac* with *Mercurius Dulcis*; for the Mercury resolves tough and slimy Humours; and the Gum *Ammoniacum* is proper to consolidate the burst Vessels.

XXXVII.
Hypochondriacal
Melancholy,
or the
Spleen.

The **HYPOCHONDRIACAL MELANCHOLY**, or the Spleen, is a painful Sensation, caused by the Grossness, small Quantity, and Unevenness of the Spirits. For a sharp, sour, and tough slimy Humour, lying hid in the Belly, breedeth Obstructions, whence all the Symptoms observable in this Disease do proceed. Wherefore also the Cure of this Distemper, is endeavoured by Decoctions made of the Barks of *Tamarisks* and *Cappar-trees*, of the Herbs of *Germander* and *Chamaepytis*, &c. If the Blood abound with vitiated Salts, volatile Acids, are commended, Antiscorbutical Herbs, and

more especially sulphurated Tartar. And because præternatural Acids generally have a hand in this Disease; therefore all those Medicaments are used, that are proper to alter and destroy the same; as the Alkalisate Salts of Herbs, Crabs-Eyes, Pearl, Diaphoretick Antimony, Salt of Tartar, and other such like.

The **SCURVY** is a Distemper of the Blood, and other Juices of the Body, caused by a præternatural Sourness, afflicting more or less all the Parts of the Body, and accordingly producing a vast variety of Symptoms. For the Cause of this Disease chiefly consists in that the Blood is impregnate with much fixed Salt, or acid Juice, and is frequently to be impured to the Air, that is fill'd with such like Particles; which being drawn in by breathing, communicates the same to the Blood, and so forms this Disease. The Cure of this Disease is performed by Volatilizing of the Blood, and the fixed Salt, and by opening of Obstructions; to which end Blood-letting is prescribed, that the thicker part of the Blood being evacuated, better Blood might be furnish'd instead of it, by introducing of a volatile Acid.

The **STONE** is a Disease caused in the Reins or Bladder, by the Gravel or Stone, accompanied with a most exquisite Pain, by their grating against the Fibres of the Kidneys and Ureters. It is the product either of the too great abundance or thickness of the Blood, or the sharpness of the Humours. And therefore when the Patient, subject to this Disease, doth abound with much Blood, the Breathing of a Vein is necessary, and afterwards the Gravel and Stone must be evacuated by Diureticks and Lithontripticks. Emollient Glysters are also very much commended, for to make the Passages more slippery and open.

STRANGURY, is the continual desire to make Water, accompanied with an extraordinary Pain and Burning, caused by the sharp and pointed Particles that are in the Blood, or the Serous part of it. But the Cause of Bloody Urin, and of all other Bloody Fluxes, is the solution of any continuous Parts, caused by sharp and pointed Particles, pricking and cutting the Parts. And therefore the Remedies most proper for this Disease, are such as precipitate these acid Particles, or imbibe them, as likewise Anodyne Medicaments and Opiates.

DIABETES is a most swift and copious evacuating of the Liquor we drink by Urin, sometimes with little or no change made in it, accompanied with extream Thirst and a Wasting of the whole Body. For in this Disease the Contexture of the Blood is too loose, and the Pores of the Kidneys are too open, and the præcipitating Salt does too much abound. Some think the Drink goes directly by some short Passages from the Stomach to the Kidneys. Others, that it runs through the Pores of the Stomach and Guts into the hollow of the Belly, where meeting with the Bladder, it enters its pores, and thus is evacuated soon after, without any, or with but little change. In this Distemper adstringent and absorbent Medicines are commended, especially joyned with Opiates, to imbibe that vicious Salt, which precipitates the Blood too much.

The Stone.

XL.
Strangury.

XLI.
Diabetes.

The

G. Fremant. In.

J. Kip Sculp.

XLII.
The Gout.

The GOUT is a pain of the Joints, or parts about the Joints, caused by the various Corner'd Figures of Salts, or Saline particles, which twitch and prick the Fibres belonging to them. For when uneven and Saline particles do abound in the Blood, they by their Ruggedness and Points hurt the Fibres of the Nerves; or the Saline particles, by their sharpness twitching and vellicating them, are the Cause of those exquisite Pains, which those that are troubled with the Gout do endure; and other like Humours, impregnated with much the same Particles, flowing to the Parts already afflicted, do increase the Pain, which is often accompanied with a swelling and light Inflammation. For the Cure of this Disease, ponderous things are made use of, as Crabs-Eyes, Coral, Chalybeats, Mercurius Dulcis, as likewise Sudorifics, Topicks, &c.

XLIII.
The French-Pox.

The Disease commonly called the FRENCH-POX, is a Distemper of all the Humours of the Body, consisting in a Volatile Corrosive Acidity, disturbing all the Actions of it, and at last quite corroding it. For the sharp saline Particles that lye lurking in the Blood and Humours, do produce all the Symptoms that are obvious in this Disease. And therefore in order to the altering and blunting of these Particles, the Decoctions of Woods and Roots, and Mercurial Medicins are prescribed; and for the evacuating of them out of the Body, Preparations that cause Salivation are made use of, and particularly Mercurius Dulcis.

XLIV.
Ague or Fever.

An AGUE, or Fever, is an Effervescence of the Blood in the Heart, sometimes exceeding that which is Natural, and at other times less; but ever with greater Malignity. For when the Febrifick matter or humour, endued with a Fermentative quality, doth from its Focus or Seat, be it Mesentery, or any other part of the Body, in which it hath been a long time a gathering, come into the Veins, and is mingled with the Blood, and with it carried to the Heart, it stirs up an Ague. For when it is thus communicated to the Blood, passing through the Heart, the Matter of the First Element, which is a great Enemy to our Blood, doth greatly shake it, and confound the parts and mixture of it, in which Confusion the Nature of an Ague and Fever doth consist. Yet it is not every thing that mingles with the Blood, doth presently produce an Ague; but such Matter only as is of a Fermentative Nature, that is, which disturbs the Mixture of the Blood. For this Fermentative Matter may be compared with Green-wood that is laid upon the Fire; for as such Wood, when once it begins to burn, doth burn more vehemently than Dry-wood; so the said Humour becomes more heated and dilated, than the Blood it self in its Natural condition. Hence therefore we conclude, that a Quartan Ague is produced, when the Matter, which is the Cause of it, stands in need of the space of 3 Days for its Concoction, before it can be fit to be united to the rest of the Blood; a Tertian Ague, when 2 Days is enough for this purpose; a Quotidian, when it is concocted every day, and mingles with the Blood; and Continual, with Exacerbations or Fits, when the Corrupt Matter doth so much infect the Blood, that it cannot rid it self of those defilements from that time, that the last drop of that Humour is run out, and that wherein the first drop of that which is gather'd anew begins to enter the Heart. For this being the time wherein

this depraved Humour, and ready to raise an Effervescence, is in greater quantity conveyed to the Heart, it must of necessity cause a greater Heat and Ebullition. Wherefore to the end that this Feverish Ferment may be expell'd in Agues, and more particularly in Quotidians, Vomits and Purges are used, which being exhibited at the Beginning, before the Fits, are found to be very successful in the Cure of them. But if the Ague be of long continuance, and the Stomach swoln, it is best to abstain from Vomits, and instead thereof to give gentle Purges; because Vomits weaken the Stomach. As for Fevers, they are commonly Cured by Remedies that precipitate and imbibe sower Humours, as Crabs-Eyes, Antimony Diaphoretick; by such as thin the Blood, and make it more fluid, as Barly-water, Whey, &c. by such as open Obstructions, as Cardus Benedictus, Camphire, Venice-Treacle, Volatile Salts and Spirits. All Bitter things are also employed with good success, both in Fevers and Agues, because they strengthen the Stomach, and keep out the the Enemy; so that according to the Report of Physicians, Agues have frequently been Cured, only by exhibiting the Compound Essence of Wormwood.

CHAP. XXIV.

Of Medicaments in General, and of their Operations.

HAVING treated of the Diseases that afflict the Body of Man, it remains now that we add something concerning Medicins. Now a Medicament in general is that which being applied to the Body of a Sick person, is able by its virtue, to reduce it from a Præternatural state, to a Natural.

Some Medicins are Simple, as Roots, Barks, Leaves, Flowers, Fruits, Seeds, Gums, Juices, Animals and their Excrements, Products of the Sea, Salts, Stones, Minerals and Metals. Other are Compound; and these again are either Internal, which by the Mouth are taken into the Body: And these again are either Preparatory, otherwise called Digestive, which prepare and digest peccant Humours, in order to their Expulsion; as Syrups and Conservees; or Purgative, which evacuate the Matter that hath been prepared and ripened by the foregoing Digestives, as Purging Elebuaries, Pills, and those the Latins call Linctus, and the Arabians Lohoch; or Cordial and Corroborative, which are used to strengthen the Body after Purgation, or rather when the Violence and Continuance of the Disease hath greatly weakned it; as likewise to remove any Obstructions or Distemperature in the Bowels or Humours of the Body; and take away the Symptoms of the Disease (as Pain, Watching, Loosness, Swounding,) such as are Cordial Confections, Powders, Troches. External Medicaments, are those that are outwardly applied to that part of the Body which is chiefly affected, and therefore are called Topicks, because they are applied to the place grieved; such are Oils, Ointments, Cerecloaths, and Plaisters.

But to leave the more particular Disquisition into these Matters to Physicians, I shall only in a few words speak something of the Common Medi-

cements, viz. *Vomits*, *Purges*, *Diureticks*, *Sudorificks* or *Diaphoreticks*, *Cordials* or *Alexipharmacks* and *Opiates*; and then pass to *Specificks*, and briefly declare the Nature of them in general, and the manner of their Operation.

IV.
Vomits or
Vomitory
Medicins.

VOMITS are *Medicins* that evacuate the *Stomach*, and drive out peccant humours upwards, and that by drinking luke-warm *Water*, but more readily if some *Oil* or melted *Butter* be mingled with it, which will make the *Stomach* the more to loath it, and therefore the more easily to discharge it. Besides these common things, several *Chymical Preparations* are made use of to this purpose, as *Salt of Virriol*, *Glass of Antimony*, *Flowers of Antimony*, *Crocus Metallorum*, *Sulphur of Antimony*, *Mercurius Vitæ*, the particles of all which *Preparations*, when dissolved, do so violently twitch and affect the *Fibres* of the *Stomach*, as to cause a *Convulsive Motion* both of that and the Neighbour Parts, viz. the *Gut* called *Duodenum*, the *Porus Choledochus*, or Passage that conveys the *Gall*, and the *Ductus* or *Vessel* of the *Pancreas*, by which *Convulsive motion* whatsoever is contained in them is carried up to the *Stomach*, and from thence to the *Mouth*; and not only so, but by these *Vomits* the serous part of the *Blood* is often drawn out of the *Extremities* of the *Arteries*, carried up to the *Stomach*, and thence evacuated by the *Mouth*.

V.
Purging
Medicins.

PURGING MEDICINS are such as move and loosen the *Belly*, and drive out the peccant *Humours* in the *Body of Man* by *Stool*, such as are *Roses*, *Violets*, *Cassia*, *Manna*, *Aloes*, *Rhubarb*, besides manifold compound *Purgatives*. The reason of the operation of these *Catharticks* is, because they painfully affect the *Spirits* that are in the *Fibres* of the inward parts of the *Body*, and provoke them to excretory contractions; and moreover raise a *Fermentation* in the *Humours*, and thereby produce several fusions and separations of their parts. For tho' *Manna* and *Cassia* and other such like *Gentle Purgers*, which consist of very subtil parts, do not at all, or very little disturb the *Stomach*; yet as soon as they are past the *Pylorus*, or outlet of the *Stomach* into the *Guts*, they begin to irritate and twitch the most sensible *Membran* of the *Gut Duodenum*, and before they get any further, almost spend their whole force there. And because by the twitching and vellication of this *Membran*, the *Porus Biliaris* or passage of the *Gall* is considerably shaken, therefore they produce *Bilious dejections*.

VI.
Purging
Medicins
do not act
Electively.

The opinion of old was, that *Catharticks* purged *Humours Electively*, that is, by choice, as evacuating one *Humour* rather than another: They were induced to be of this Opinion, because they often found that the *Excrements* evacuated by *purging Medicins*, were of a *Yellowish*, and sometimes of a *Blackish Colour*, whence they concluded, that some *Catharticks*, purged *Choler*, and others *Melancholy*, as it were choosing and separating them from the rest of the *Humours*. But this is no better than an error; for tho' there be *purgative Medicins* that evacuate *Choler*, *Phlegm*, *Melancholy* and *Watry Humours*, which gave occasion to *Physicians* to distinguish *Catharticks* into *Cholagogues*, *Phlegmagogues*, *Melanogogues* and *Hydragogues*; as for Example, *Rhubarb* and *Scammony*, purge *Choler* rather than *Phlegm*; whereas *Mercurius*

Dulcis, and the *Troches Albandal*, evacuate *Phlegm* rather than other *Humours*. Yet is not this so to be understood, as if *Scammony*, for instance, purged *Choler* only, without touching any other *Humours*; or *Mercurius Dulcis* only expelled *Phlegm*; for it is certain that it purgeth other *Humours* also, tho' not so copiously as that of *Phlegm*; and therefore some *Purgative Medicins* may well be called purgers of *Choler*, and other *Phlegm*, &c. for tho' they do not purge that *Humour* only, whence they take their denomination, yet they do purge that *Humour* more copiously and signally than any other.

DIURETICKS are *Medicins* that purge by *Urin*, such as are the *Roots of Smallage*, *Parley*, *Radish*, *Bitter Almonds*, *Spirit of Salt* and of *Nitre*, *Juice of Limons* and of *Sorrel*, *White-wine*, *Renish-wine* and *Cyder*; which when taken into the *Body*, do precipitate the mass of *Blood*, and separate the *Wheyish* part from it, which soon after is evacuated. For the particles of these *Diuretick Medicins* by their pointedness and thinness penetrate the *Vessels*, and by diluting, inciding and dissolving the *Blood*, cause a great quantity of *Wheyish Matter* to be separated from it in the *Reins*, and to be thence evacuated by the *Ureters*.

VII.
Diureticks.

SUDORIFICKS are *Medicaments* that provoke *Sweat*, such as are the *Leaves*, *Roots* or *Seeds of Carduus Benedictus*, *Contrayerva*, *Angelica*, or the like, being taken either in *Powder*, *Decoction*, *Conserve* or *Magistery*. The reason of their Operation is, because they consist of such particles as are very friendly to the *Stomach* and *Guts*, and therefore do not produce any *Convulsions* or *Excretory Motions* in them; only the mass of *Blood* being by them *Rarefied* and *Heated*, and consequently more swiftly circulated, do put the *Body* into a *Sweat*. Moreover, the particles of these *Diaphoreticks* entering the *Vessels* which are implanted in the *Stomach*, mix themselves with the *Blood*, and raising a *Fermentation* in it, make it run more swiftly through the *Veins* to the *Heart*, and there entering with some impetuousness, encreaseth the *Beating* or *Pulse* of it, by which means the whole mass of *Blood*, being rarefied and enkindled, rusheth more swiftly through the *Arteries* to all the outward parts, which not being able to admit it, nor the *Veins* to send it all back to the *Heart*, a considerable part of the serum of the *Blood* is evacuated through the *Pores* by *Sweat*.

VIII.
Sudorificks
or Diapho-
reticks.

CORDIAL MEDICINS are such as are proper to restore and kindle the interrupted or weakened *Fermentations* of the *Blood* in the *Heart*. Wherefore these *Remedies* are not called *Cardiaca* or *Cordials*, because they are appropriated to strengthen and comfort the *Heart*, as are all things that are *Spirituos* and *Volatil*, such as *Saffron*, *Wine*, especially to those who are not accustomed to the drinking of it, and *Strong Waters*. The reason of which operation is because their *Volatil Particles* entering the *Blood*, separate all *Heterogeneous* and *Malignant Particles* from it. Neither is the Passage from the *Stomach* to the *Blood* so long, that there should be need to fear that the virtue of these *Medicaments* would be lost by the way. For it is evident that the inward *Nervous Coat* of the *Stomach* is all interwoven with multitudes

IX.
Cordials.

tudes of *Veins* and *Arteries*, so that *Medicaments*, not only *Purgative*, but any others may exert their operations upon the *Blood*, before ever they pass out of the *Stomach*.

X.
Opiats.

OPIATS are those *Medicines* which have *Opium* for their *Basis* or chief ingredient, and are proper for the laying of *Noxious Vapours*, and asswaging of *Grievous Symptoms*, for the strengthening of the inward parts, the removing of *Pain*, and recruiting of the *Animal Spirits*. The manner of their performing these effects is this, the particles of these *Medicines* do put a stop to the outgoing or efflux of the *Animal Spirits* and suppress them; so that during the operation of the *Opium*, they do flow much more sparingly to the inwards and other parts of the *Body*. And accordingly the *Pulse* of the *Heart*, and *Respiration* are diminished in their swiftness and force, and sometimes cause a difficulty of *Breathing*, and a weakness of the *Pulse*, with a listlessness to move, and drowsiness over the whole *Body*.

XI.
Why the Author treats of Specifics.

Next after the common *Medicines* follow **SPECIFICKS**, whose *Virtues* discovered by Experience, are consistent with the *Principles* of our *Philosophy*, and may be perspicuously unfolded by them. Some *Galenists* indeed have altogether rejected *Specifics*, probably because they found themselves unable to explicate the manner of their operation.

XII.
What a Specifick is.

The word *Specifick* is by *Physicians* used in a threefold Sense; for some call that a *Specifick Medicine*, which is peculiarly friendly to some particular part of the *Body*, as to the *Heart*, *Liver*, *Brain*, &c. Others call that a *Specifick Medicine*, which by a peculiar *Quality* doth evacuate some determinate *Humour*, as *Rhubarb* and *Cassia* are said to Evacuate *Choler*; *Senna*, *Melancholy*; *Fal-lap* and *Diagridium*, *Serofities* and *Phlegm*. But more frequently that is called a *Specifick Medicine*, which peculiarly cures some particular *Disease*, as the *Pleurisie*, *Tissick*, *Colick*, *Dropsie*, and in this Sense I take it here.

XIII.
Whether there be any Specific Medicins.

It may therefore be enquired, whether there be any such *Specifick Medicins*. Some *Dogmatical Physicians*, leaning too much upon the *Principles* of the *Scholastick Philosophy*, will admit of no *Medicinal Virtues* that cannot be reduced to their manifest *Qualities*: But *GALEN* somewhere complains of these Men, that they either plainly deny matter of *Fact*, or else assign such causes to these effects as are not sufficient to explain them. So that not only *Galen*, but many other *Learned Physicians*, both *Modern* and *Ancient*, do maintain that there are *Specifick Medicins*.

XIV.
The effects of Specifics may be explained Mechanically.

It may also be queried, whether the effect of *Specifics* are mechanically explicable, that is, whether they be consistent with the *Principles* of mechanical *Philosophy*; to which I answer, that the *Principles* of the said *Philosophy* are of such a vast comprehension, that he who considers it, will not at all question, but that the effects of these *Medicins* may be explained in such a manner, as shall not in the least contradict the said *Principles*.

XV.
In order to the explaining of the Effects of Specifics, the

To make out this we are to observe, that the *Animated Body of Man* is not to be considered as a meer *Statue*, as if it were nothing else but a dead heap of several parts and matters whereof it consists; for to speak the truth, it is a most wonder-

ful and curious *Machin* or *Engin*, composed of fixt, liquid and spirituous *Substances*, with such exquisite *Artifice* joined together, that frequently we cannot judge so well concerning the action of an *Agent* that acts upon it, from the *Power* and forces of the *Agent*, considered in it self, as by the effects proceeding from it, because of the mutual action of the parts of this *Living Machin* upon each other.

It is likewise to be observed from the learned *Mr. BOYLE*, that it is not necessary that the *Operations* of all *Specifics*, or of the same in differing *Diseases*, must be of one kind; but differing *Specifics* may operate in several manners. And of these general ways he has proposed such as follow, premising only, that the *Specifick Remedy* do's not commonly, tho' sometimes it may, relieve the *Patient* by this or that single way of *Operation*, but by a *Concurrence* of two or more, that as it were join their forces to produce the desired effect.

Specifick Medicins may sometimes cure by dissolving or resolving the *Morbifick matter*, and thereby making it fit for expulsion by the greater *Common-Shores* of the *Body*, and the *Pores* of the *Skin*. For it is most notorious, that a great many *Diseases*, and those very obstinate and *Chronical*, are caused by some tough and slimy *Humours*, which obstruct the *Passages*, and so hinder the *Circulation* of the *Blood*, and the free motion of other useful *liquors*; which peccant *Humours* are sometimes so exceeding *Glewy* and *Ropy*, that they will not give way to common *Remedies*. Whereas the *Specifick*, by the minuteness of its *Parts*, and the congruity of their *Figure* with the *Pores* of *Morbifick Matter* may be able to penetrate and resolve it, with the concurrent heat of the *Patients Body*, and thereby dispose for an evacuation by *Urine*, *Sweat* or otherwise, as *Nature* finds most convenient. So that the *Blood*, or some other *Liquor* of the *Body* being impregnated with the amicable and *Active Particles* of the *Matter*, may be a *Menstruum* to dissolve the peccant matter; even as common *Water* impregnated with *Salt Armoniack* becomes a *Menstruum*, which by degrees will dissolve *Copper* and *Iron*.

Sometime a *Specifick Medicine* may mortifie the too over *Acid*, or other immoderate *Particles* that infest the mass of *Blood*, and destroy their *Coagulatory* or other *Effects*. For seeing that most *Distemper*s do arise from *Acids*, and their *Malignant Effects*, it is very probable that all such *Diseases* may be cured, or much alleviated by such a *Remedy* as abounds with particles proper to mortifie the said *Acid Juices*. Which *Mortification* may be effected these two manner of ways: for there are some *Bodies* which destroy *Acids* by a *Positive Hostility*, that is to say, by such a contrariety as is discernible by the *Taste*, and by a conspicuous fight or conflict they maintain with the *Acid Juice*: Of this kind are all fixed *Askalies*, viz. the *Lixivous Salts* of *Plants*, and all volatil *Alkalies*, as *Spirits* of *Harts-horn*, *Salt Armoniack*, &c. Another way whereby *Acids* may be mortified or dulled is, when their *Particles* are, as it were, sheathed or blunted; for as a *Knife* may be disabled to cut, either by filing or otherwise blunting its *Edge*, or else by covering the *Blade* with a *Sheath* fit for it; so an *Acid Compound* may lose

M m m m

make or structure of Mans Body is to be noted.

XVI. Another thing to be noted about the operation of Specifics.

XVII. The first way or manner whereby Specifics perform their Effects.

XVIII. The second way or manner.

its power of cutting or pricking, when an *Alkali* alters its *Figure*, or when its sharp *particles* are, as it were, sheathed in the *Pores* of some other *Body*, tho' it may be the said *Body* may be wholly without *Taste*, or any considerable manifest quality by which it might appear contrary to the *sour Juice* it enervates, as a *File* is contrary to the *Edge* of a *Knife*.

XIX. *A Specifick Medicin may sometimes help the Patient by precipitating peccant Matter out of the Blood, or other Humours of the Body.* Thus SENNERTUS seems to intimate that in some cases the *Disease* is vanquish'd by a precipitation of the *Aguish Matter*. And KERGERUS in his *Treatise of Fermentation*, Sect. 3. Cap. 3. tells us in plain terms, that he had cured above 1000 persons of *Agues* without *Blood-letting*, *Purging*, *Diaphoreticks*, *Diureticks*, altering *Medicins* or *Topicks*, only by means of one precipitating *Medicin*. Neither need we to fear any danger in these precipitations by the *particles* of the *Medicin* entering into, and spoiling the *Temperament* of the *Blood*; because it is certain that *Heterogeneous Matters* in the *Blood* may be precipitated by means of *Remedies* which never enter the *Blood*: For *Physicians* often exhibit *filings* of *Steel*, and other preparations of that *Metal*, to mortify the *Acidities* of the *Blood*, and yet we have no reason to believe that the said metalline *particles* ever enter the *Blood*.

XX. *Sometimes Specifick Remedies exert their effect by a peculiar corroborating of the Heart, and by that means, or without it, the Parts affected.* For seeing that the *Heart*, *Brain*, *Liver*, *Kidneys* are all of them of a peculiar make and structure, and so likewise the liquid parts, as the *Gall*, the *Blood* and the *Lympha*; it may happen that the *particles* of a *Remedy* dissolved in the *Stomach*, and carried up and down the *Body* in the *Vehicle* of some of its *Liquors*, may according to their determinate *Figure*, *Size*, *Stiffness*, *Flexibility* or *Motion*, &c. be more fit to be admitted in some one part of the *Body*, as the *Brain*, *Heart*, &c. than another, and so by continuing in the *Pores* thereof, and associating themselves to the *Fibres*, or furnishing it with some *particles* it wants, may strengthen the *Tone* of that *Part*, and enable it to resist the action of the *Morbifick* matter, and expel it.

XXI. *Sometimes a Specifick Medicin may exert its operation, by producing such a Disposition in the Mass of Blood, as may enable Nature by correcting, expelling, or other fit ways, to overcome the Morbifick matter, or other cause of the Distemper.* For seeing that as most of the *Diseases* incident to *Mans Body*, are produced by a vitiated constitution of the *Blood*, so the recovery of it to *Health* and *Soundness* depends on the restoring of it to its former state; a *Specifick Medicament* may divers ways effect this advantageous change of the *Blood*. As *First*, by furnishing the *Blood* with some very active *particles*, by which means it will not be necessary for the *Medicament* to raise any *Fermentation* in it. *Secondly*, A *Specifick* may be of great use in restoring the *Mass* of *Blood* to a laudable state, by dilating and attenuating or thinning of it. For when the *Blood* is too thick, as frequently it is, it cannot so freely pass through the *Capillary Vessels*, whence an obstruction will follow in them, whereby the *Circulation* of the *Blood*

will be retarded, and great inconveniencies accrue to the *Body*. And on the other hand, if the *Blood* be too thin, especially if it be overmuch agitated, it will easily run out of the *Vessels*, and produce various *Fluxes* of *Blood*, and other dangerous effects, that commonly accompany the extravasation of the *Blood*. Now a *Specifick Medicin* may correct this vitious consistence of the *Blood*, by furnishing it with such *Particles*, which by their *Figure*, *Bulk*, *Motion*, &c. may subdue those vitious *particles* that thicken the *Blood*, and attenuate them; or by dividing the *parts* of it dispose it to a greater degree of *Fluidity*. And when the *Blood* is too thin, which is the effect sometimes of *Diseases*, and sometimes of certain *Medicaments*, and more particularly of *Aloes*, a *Specifick* in this case may afford such *particles*, as by their easie complication and infolding one another, may curb the too active *particles* of the *Blood*, which do too much attenuate it, or it may assist the expulsion of the said *particles* by *transpiration*, or any other way. *Thirdly*, a *Specifick* may be helpful to restore the *Mass* of *Blood* to its former good state, by some particular operation it may exert upon the *Heart*, by strengthening the *Tone* and *Vigor* of it, so as that it may be able to transmit the *Blood* to the greater advantage and welfare of the *Microcosm*.

Sometimes also a *Specifick* may unite its *particles* with those of the *Peccant Matter*, and with them constitute a *Neutral Matter*, that may be easily, or is not needful to be expelled. As when the *Blood* being impregnated with an *Acid Juice*, hath lodged the same in some stable part of the *Body*, as in the *Liver*, *Spleen* or *Kidneys*, &c. In this case the *particles* of the *Specifick* may without any sensible contest or effervescence, when manifest *Acids* are mortified by such like *Alkalies*, so combine themselves with the *particles* of the vicious *Acidum*, as to make one compound with them, which differing from the *particles* of the *sour Juice* in *Motion*, *Figure*, *Solidity* and *Stiffness*, or in one or more of the same, must needs constitute a *substance* of a Different *Nature* from the said *Acid particles* before that they were corrected.

It was noted before, that when it was said that a *Specifick* doth cure a *Disease*, it is not to be understood as if a *Specifick Remedy*, or *Nature* by means of it, did for the most part cure *Distempers* by one only of the propounded *Modes*, seeing that two, or more of them may concur to produce this effect. Besides, I have only here undertaken to explain the operation of *Specificks* in General; but never asserted that the *ways* and *modes* by me propos'd, to be true and genuine, but only propounded them as so many probable ways whereby *Specificks* may produce their effects. Wherefore these things are not *Dogmatically* asserted by me, but only delivered by me as *Possible* or *Probable Explications*, my chief design being only to evince thereby, that the *Operations* of *Specificks* are congruous to the *Principles* of *Mechanical Philosophy*.

There is an *Objection* the *Rejecters* of *Specifick Remedies* usually urge against them, which is, that by being taken into the *Stomach* and *entrails*, they are greatly changed by *Digestion*, and mixture with the *Aliments*, a good part of them sent away

XXII. *The sixth manner.*

XXIII. *An Adversus concerning Specificks.*

XXIV. *An Objection against Specifick Medicins answered.*

away by *Excrement*; and that as soon as they are got out of the *Stomach*, they pass through manifold *Strainers* of different *Textures*, which in all probability stop the greater part of the *Medicinal Particles*. But this Difficulty will disappear, if we consider that *Rhubarb* tingeth the *Urine* of those that have taken it, many hours after, with a *Yellow Colour*. That *Elaterium* eaten by a *Goat*, communicates a *purging* quality to its *Milk*, so as to *purge* a *Child* that takes of it. For the *particles* of some *Bodies* do very obstinately retain their *Figures*, and do not easily quit their *virtue*. For if a *Medicament* exerts its activity by impregnating the *Blood*, or any other *Liquor* in the *Body*, thereby turning it into a kind of *Menstruum*, it may so happen that the several *Strainers* through which the *Particles* are to pass, may stop the less fit parts of the *Vehicle*, so as to make the *Menstruum* more appropriate to the overcoming of the *Peccant Humour*, or that at least thereby it may be so changed as to restore this *Substance* in the *Body* of a *Man* rather than another. And tho' there may but a small quantity of the *Medicinal Matter* reach to the part, on which it is to act, yet ought not we to question the effect upon that account, seeing that the efficacy of *Natural Agents* upon the *Body* of *Man* is not to be measured by their *Bulk* or *Quantity*, but by their *Activity* and *Subtily*.

XXV. An *Objection* may be also made against what hath been here asserted concerning the *Operation* of *Medicaments*, that all *Topical Medicins*, especially such as are applied to the *Wrists*, *Amulets*, and things hung about the *Neck*, or only outwardly touching any other part of the *Body*, cannot afford sufficient *Medicinal Particles* for correcting of the *Peccant Matter*, or subduing of the *Disease*. For an Answer to this *Objection*, it will be sufficient to consider that the *Skin* of *Man's Body*

is very full of *Pores*, by which the more *subtil particles* of the *Remedy* may enter; as is evident from manifold instances. *Water* penetrates the *Pores* of the *Bladder*, and dissolves the *Salt* of *Tartar* or *Sugar* contained in it. *Quick-silver* mixed with *Ointments*, and outwardly applied, insinuates it self through the *Pores* of the *Skin*, into the most inward parts of the *Body*, where it often produceth most violent operations. Neither can it be difficult to conceive how the *particles* of any *Specifick* being once got into the *Pores*, may further diffuse themselves throughout the *Body*, forasmuch as near the *Cuticle* or thin outward *Skin* of the *Body* there be many *Capillary Vessels*, which tho' very small, yet have their *Cavities* continuous with other greater *Vessels*, and it will be easily understood that the *particles* of the *Medicament*, being once entred into these *Capillary Vessels*, will by the *Vehicle* of the *Liquors* contained in them, be transmitted to the *Branches* of the *Principal Veins*, and so by means of *Circulation* be mingled with the whole *mass* of *Blood*, and with it conveyed to all parts of the *Body*.

The only difficulty that remains now to be removed, is whether there be any *Medicaments* that are appropriate to this or the other particular part of the *Body*? To which I Answer, that there is no impossibility nor improbability in it, that the *Particles* of a *Specifick Medicament* should be destined more to one part of the *Body* than to another, so as not only to strengthen it, and preserve its sound Constitution, but to restore it to its former strength and vigor, when weakened by any *Disease* or *Distemper*: Forasmuch as by their particular *Texture*, *Motion*, &c. they may in a peculiar manner prepare the *Molesting Matter* for *Expulsion*, and withall so work upon the *Fibres* of the *Part* affected, as both to *Enable* it, and *Excise* it to free its self from its *Enemy*.

XXVI. Whether there be any Medicaments appropriated to any particular part of the Body.

MAN,

Considered in the other PART,

The MIND.

CHAP. I.

Of the Nature of Human Mind, and that it is more Evidently perceived than Body.

I.
That too
much Credit
is not
to be given
to our fal-
lacious
Senses.

SINCE we have often been deceived by our Senses, and the Images of things have been impos'd upon us, which differed from the Objects whence they proceeded, or whence we imagined they proceeded; and since in our Dreams we have seem'd to behold some things, which nevertheless were far enough off from us; and to hear things which in no wise smote the Organs of our Hearing: We have hereupon sufficient Cause to suspect that Corporeal things are not always such as we apprehend them to be, and consequently that we have sufficient reason to doubt of their Existence, forasmuch as Natural Reason dictates to us, that we are not to trust those things which have at some time or other deceiv'd us. Wherefore we may doubt whether there be a Heaven, Sun, or Stars; whether those Bodies which are about us are real; whether we have Body, Feet, or Arms, in regard we have oftentimes in our Dreams seem'd to make use of them, whenas at the same time, deep Sleep hath bound us fast, and rendred us immoveable.

II.
The Existence
of Human

But though we may doubt of the verity of Corporeal Things, yet we cannot doubt but that we have an Existence, so long as it is certain we doubt;

for it is impossible that any one should doubt or think, and at the same time not be. Whence this Proposition, *I think therefore I am*, is the first certain Conclusion we can possibly make, when we muster up our thoughts in Order; whence it is inferred, that our Mind is more known to us than our Body, in regard whatever doubt we make of other things, we cannot but Be so long as we Doubt.

For if I attentively weigh and examin who I am, who write these things, who see, who hold the Pen, who draw the Lines; I know for certain, that were the use of my Hands taken away, my Eyes digg'd out, and my Fingers cut off, I could neither write, see nor touch; but nevertheless should find it apparent that I yet Exist; and suppose I were depriv'd of all Exterior Senses, yet still I am, so long as I think: For my Body may be dismembered into divers parts, and none of those parts be remaining with which I am encompass'd, since I am not all Heart, nor Brain, nor Liver, nor any other of those parts which constitute the Body; yet nevertheless something of me may be remaining, which makes use of those parts, and with which it is surrounded as with a Garment.

The Existence of Human Mind being thus explain'd, we are now to inspect what it is, or rather, who that I is, who have a clear conception, that I am, and do doubt of the Existence of others. For am I any thing? surely I am. What then, I am a Thinking, Knowing, Imagining, Perceiving, Willing, Affirming, Denying Thing; for I know that I Perceive, I imagine that I Behold many things, I am sensible that

that many things are conveyed from their Objects to my Senses, I affirm that I am a Thinking thing, I deny that Corporeal things do certainly Exist, and am conscious to my self of them all; but I am more certain that I am, since it may come to pass, that all those things of which I Think, may be no where Existent; but it cannot be otherwise, but that I must needs be, who appear to Behold, to Affirm, to Deny, to Will, &c.

Human Mind therefore may rightly be defined a Thing thinking by a certain peculiar way, finite, and as it were, by mutual Covenant joyned to a Body well disposed. And herein it differs from an Angel, or Spiritual intelligence, which is indeed apt to assume a Body; but not so firmly inclining to it, as to desire, as the Human Mind doth, to have it intimately united.

VI. But it is called Finite, because tho' a Human Mind always Thinks, yet it Thinks not of all things, nor penetrates immediately into those things of which it Thinks. Moreover it Wills many things which it attains not to, all which are Arguments of imperfection, from which the infinite Mind, that is to say, God Almighty is absolutely free.

VII. By the name of Thought is understood that interior Sense and Conscience by which we are certain of all those things, which we Act or Suffer; so that to say that Human Mind is a Thinking substance, is no other thing than to say, that there is in it a Conscience, or Co-discerning of all Cogitations, Wills, Appetites and Sensations which are found therein; whether it be their Principle, or suffers from others: For certain it is, that whatsoever is in us which depends not upon the Cogitations of the said Mind, belongs not to it. Whence the simple Cogitation of Human Mind may aptly be defined to be, an implanted Action of Human Mind: Whereof the said Mind by its own testimony is conscious. In the first place, Cogitation is said to be something implanted in the Mind, because it is indeed the very Essence of the Mind. Secondly, It is said to be by its own testimony conscious, in regard every Mind hath its own Cogitation so known, that tho' there should be a doubt concerning other things, yet the Cogitation, it self can never be called into doubt; since the doubting, nay the very Erring person must of necessity Think.

VIII. Some difficulty may haply arise from the foregoing definition of the Mind, as if Human Mind be a Thinking substance, that is, Willing, Nilling, Doubting, Perceiving, &c. it should always Think, which seems a thing impossible to any one that is asleep, since then we cannot be conscious that we do Think. To this I answer, that nothing occurs to us in Sleep, which directly or indirectly proceeds from the Soul, whereof we are not conscious; and tho' our Soul in the midst of Sleep may Think, but negligently, yet it is not to be thought totally destitute of all Cogitation: By the same reason almost as when it is said, that there is no part of the World which is at any time totally void of all Motion, tho' some parts may be said to Rest, by reason of the more slow and insensible Motion, and may seem as it were deprived of all Motion.

IX. It may haply be urged, if this were true, we could not but remember at least some of those Cogitations, but we daily experience the contrary. I

answer: It is one thing to be conscious of our Thoughts, and another thing to remember them; for there is more required to the remembrance of any thing, than to the being conscious thereof; for to remember a thing so long as the Mind is joyned to the Body, it is requisite that the Species or Image thereof should have its Vestigia or Foot-steps in our Brain, upon which we afterwards reflecting should remember; but to Think, it is sufficient that we are conscious of our Perception or Cogitation, which happens not only to persons Sleeping, but even to Infants in the Mothers Womb. Since doubtless those very Infants have many Cogitations, and their Minds taken up with Ideas of Heat, Cold, Titillation, Pain, &c. which proceed from the Union of the said Mind with the Body; however they remember not afterwards what they Thought, or suffered at that time.

If it be alledged that it is sufficient for Human Mind to be called Cogitant, for that it hath the power to Think, and not for that it always actually Thinks: As a Potter hath a faculty always of forming Pots, Pitchers, &c. yet nevertheless for want of Clay, or the Potters Wheel, cannot always reduce his Power into Act; so it suffices, that there be implanted in the Mind a Power to Think, tho' it do not always actually exercise that Power for want of Matter which should occur, or through the defect of Organs which are hinder'd in Sleep.

The Answer is ealie; for there is no necessity that the Potter should always actually Operate, by reason he Acts ad extra, or Externally, and requires External Matter for those things he is to form; but Human Soul in its Operations wants no Object to tend unto: For if all things which are to smite the Senses of the Body were removed, it would yet have the Idea of it self, and of all those Verities which we term Nota per se, or known of themselves, and consequently Human Mind cannot but always Think; and certainly it seems to imply a contradiction, that that Spiritual Part of ours, so long as it hath an Existence, should not Think, since it is no other than a Thinking thing, and we can conceive nothing in it besides Cogitation or Thought.

For the difference between Matter and Soul is, that that is the Potentia or Power, this the Act; so that Cogitation must needs be always present in every Intellectual thing, but actual motion is not always requisite in Body or Matter, in regard its Nature is Sluggish and Idle, that it comprehends Potentiality or Power, and not Act; but for a Soul to be without Act or Cogitation implies a Contradiction, since if you take away Cogitation from it, there will remain nothing in it of positive and absolute, by which it may be said to Exist.

I know that some will object, that Human Mind may be without all Cogitation; but this we absolutely deny: For if it should so happen, it would either so happen, because it hath not a Power or Faculty of thinking, or because it will not have such a Faculty or Power. If it hath not such a power, its Essence is destroy'd, in regard it consists in Cogitation; but if it will not, that very thing is an inference that it doth think, since to Will and Nill are Modes of perceiving, for we undergo no greater difficulty in conceiving that the Soul must needs always think, than in conceiving the Light must needs always Shine; and that Heat

N n n n

cannot

not but be always *Hot*, for as much as it belongs to the *Essence* of the *Soul* to *Think*, as it belongs to *Light* to *Shine*, and *Heat* to *Warm* or make *Hot*; for a Faculty supposes something real, and *Existing* in *Nature*; or if we well attend to our *Conception*, it is no other than a thing really mutable and capable of divers *Modes*; So that as the faculty of receiving *Figures* in the *Body*, is meer *Extension*, so the faculty of *Thinking* in the *Mind* is meer *Cogitation*, so far as it may be applied to divers *things*, and by divers *ways*.

XIV. Moreover the *Actual Cogitation* of the *Soul* may be proved by comparing it to the *Body*, for as it cannot be granted to be a *Body* which is not extended; that is, which hath not an *actual* and *determinate Figure*; In like manner *Human Mind* must of necessity have some *Cogitation*, which in a manner is its *Life*; but that *Children* and *Infants* in the *Mother's Womb*, should not afterwards remember their *Cogitations* in that *State*, need not be any matter of wonder, since in *Persons* of more adult *Age*, there may possibly sometimes remain no memory, not only of *things* which were represented in *Sleep*, but also even of those *things* which have been acted or thought on *Waking*.

XV. It will yet more clearly appear, that *Cogitation* belongs to the nature of *Human Mind*, if *Cogitation* be in a twofold acceptance considered, first as it is that which constitutes the *Nature* of an *immaterial thing*, and then it is no other than that *thing* which *Thinks*; in another sense *Cogitation* may be taken for divers *Modes* of *Thinking*, in as much as *Substance* is capable of *Exciting* divers *Cogitations*, for the *Thinking Nature* hath power from it self to draw forth such or such *Acts*; nevertheless it is not thence to be infer'd, that a *Thinking Substance* is something universal, containing all the *Modes* of *Perceiving*: No more than it can be said, that a *Body* is something common containing all *Figure*, because *Cogitation* is not a *Universal*, but a particular *Nature* which admits all those *Modes*, as *Extension* is a *Nature* receiving all *Figures*; for we may very well conceive a *Cogitant Nature*, tho' all its *Modes* are not known, yet they cannot be understood without the said *Cogitant Nature*. For if I *Imagin*, if I *Will*, if I *Remember*, *Cogitation* appears in all these *things*; yet on the contrary, if I *think*, there is no necessity that there should be any one of these in particular, and consequently *Imagination*, *Remembrance*, *Volition* are only divers *Modes* of *Thinking*, even as *Figure*, *Motion*, *Size*, &c. are divers *Modes* of *Extension*, or of a *thing Extended*.

XVI. Wherefore we must conclude, that the *Essence* of *Mind* is placed in *Cogitation* in the same manner, as the *Essence* of *Matter* consists in *Extension*, and according to the various *Modifications* of *Cogitation*, *Mind* is always *Willing*, *Imaginant* or *Sentient*, in like manner, as according to divers *Modifications* of *Extension*, *Matter* assumes the *Form* sometimes of *Water*, sometimes of *Fire*, sometimes of *Fevel*, or infinite other particular *Forms*, and consequently as a piece of *Wax* may be changed into divers *Figures*, and be *Round* or *Square*, not without varying its *Nature*; so *Human Mind* remains one and unvaried, although it may be altered divers ways, and may be mutable by a different Application of it self to *Heaven*,

for example sake, *Earth*, *God*, *Angels*, &c. because tho' it be limited and finite, yet it is not determined to any thing certain, and consequently *Thinks* or perceives all *things* which are deeply inherent in it.

I have heretofore in several places said enough to shew, that the *Soul* or *Mind* is a certain substantial *Form*, when as all other *Forms* are nothing else but certain rangings and dispositions of *Parts*. Nor must I now omit to declare openly, and in most express *Terms*, that it is that which individuates a *Human Body*, or rather *Man* himself, and does principally and essentially make one to differ from another. For as the whole *Essence* of a *Human Body* in general, consists in a certain disposition to receive a *Human Soul*; and the particular *Essence* of each *Body*, as for instance the *Body* of *Peter*, is founded in a particular disposition it hath to receive its own proper *Soul*; supposing that in some part or portion of *Matter*, should be found the same essential disposition, which that *Body* had wherewith *Peter* was Born, it cannot be otherwise, but that it must be a *Human Body*, even the *Body* of *Peter* himself, and the very same in number wherewith he was Born; forasmuch as it hath the same essential *Form*, or principle of *Individuation*: And also if the same *Soul*, to wit *Peters*, were actually united thereto, it is necessary for the same reason that there must be a *Man*, yea, *Peter*, and the same numerical *Peter* that was before.

CHAP. II.

That *Human Mind* is distinguished from the *Body*, and is *Spiritual* and *Immaterial*.

I. THAT the *Immateriality* of *Human Mind* may the more clearly be discerned, it will not be from the purpose to explain more at large the *Essence* of *Mind* and *Body*, and shew wherein they may be exactly distinguished.

They who have most deeply searcht into the *Nature* of *things*, have observ'd among the *Attributes*, which constitute the *Essence* of any *thing*, that there is one primary *Attribute*, which in a manner gives a being to it, and from whence all the rest flow as from a *Fountain*: As *Cogitation* in respect of *Human Mind*, for as much as all *things* which are found in it presuppose *Cogitation*; for *Imagination*, *Volition* or *Will*, *Sensation*, &c. are only different *Modes* of *Cogitation*, which spring from it, as from its *Root*: For to *Imagin* is another *Mode* of *Thinking*, than to *Will*, and to *Will*, another *Mode* of *Thinking* than *sensation*. In like manner *Extension* is the first *Attribute*, which constitutes a *Corporeal thing*, and from which all the rest are derived, for as much as all *things* which attend it, presuppose *Extension*; for whatsoever hath *Figure* is *Extense*, whatsoever can be divided is *Extense*, and whatsoever is contained in place is *Extense*; so that *Cogitation* and *Extension* constitute the *Natures* of *Intelligent* and *Corporeal Substance*.

If any one urge, that there are *Idea's* granted which involve *Cogitation* and *Extension* together; for Example, the *Idea* of *Pain*, *Colour*, &c. for whosoever is sensible of *Colour*, *Pain* and other *Idea's* of the *Senses*, or does but imagin them,

XVII.

The *Soul* or *Mind* is the cause of individuation to the whole *Man*.

IV.

the *Power* of *Thinking* is not in the *Body* but in the *Soul*.

XV.

Cogitation is either taken for the *thing* *Thinking*, or for the *Modes* of *Thinking*.

I. The *Mind* is to be distinguished from *Body*.

II. In every *thing* a principal *Attribute* is given from whence other *things* proceed.

III. An *Object* is distinguished from the confused *Idea* of a *thing* *Extense* and *athing* *Cogitant*.

Extension must needs occur to him with such a *Perception*. Who is able to perceive *Whiteness*, or any other *Colour*, without *Extension*? Wherefore if *Idea's* be granted, which are compounded of *Cogitation* and *Extension*; what hinders, but that we may judge that there is in the thing itself something like to that *Idea*; that is to say, that *Cogitant* and *Extense* may be in the said Thing at the same time.

IV. I Answer, that by this Argument *Cogitation* is not concluded to be one in *Reality* and *Essence*, with *Extension*, but only in *Composition*. So that *Cogitation* and *Extension*, or a *thinking* and *extended Substance*, constitute one *Compound*, so far as there are found therein divers Modifications of *Cogitation* and *Extension*; which together, and in one act are attain'd by the *Senses*, and also by *Imagination*. And in Truth, if the Matter be narrowly weighed, it will appear that those *Idea's* of *Senses* and *Imagination*, in which *Extension* is join'd with *Perception*, afford us no other Notion, than that *Cogitation* and *Extension* have an *Existence* together, or that we are compos'd of *Mind* and *Body*. So that these two things are no ways oppos'd to each other; to wit, that the Judgment concerning these things, follow the *Idea's* which we perceive by *sense*, and is conformable to them; and yet the Nature of a thing *Thinking*, is altogether distinct from the Nature of a thing *Extended*.

V. For the *Idea* of the *Mind*, hath nothing common with the *Idea* of the *Body*, and one of them may be clearly and distinctly conceiv'd without the other. Nay, so great is the difference between *Cogitation* and *Extension*, that *Cogitation* may more properly be said to be *Nothing*, than *Extended*; because tho' in respect of *Substance* generally so taken, *Mind* differs not more from *Body*, than from *Nothing*, since both of them is something subsistent, and wants not the help of another *Substance* to *Exist*; yet if they be consider'd in themselves, so far as one of them is *Extense*, and the other *Cogitant*, they are more distinguish'd from each other, than from *Nothing*; in regard every *Creature*, being not a most perfect *Entity*, but including many *Imperfections*, participates of *Nothing*. But it can be no way apprehended, that the *Idea* of *Cogitation* should include any thing of the *Idea* of *Extension*, and consequently *Cogitation* disagrees or differs more from *Extension*, than from *Nothing*. In the same manner as *Virtue* is more properly distinguish'd from *Vice*, than from *Stupidity*: And *Science* is more remote from *Error*, than from *Ignorance*.

VI. This distinction being well understood, it will be no difficult thing to make out, that the *Mind* is a *Spirit*, or some *Immaterial Entity*; because since *Mind* and *Body* are Subjects of different Proprieties, the *Conceptions* which we have of them, are also absolutely different. For the diversity of *Essences* is known to us by their Proprieties. Nor have we any other Indication whereby to judge, that the *Natures* of things are different, than by inspecting into the distinction of Proprieties in them. For we have no other way to make observation, that *Ice* and *Fire* differ from each other; but because *Fire* heats, and *Ice* cools; or that the *Eye* is a thing different from the *Foot*; but because we see with our *Eyes*, and distinguish divers Objects,

and with our *Feet* we walk and sustain our *Body*. Since therefore *Human Mind* and *Body* have altogether different Proprieties, no *Man* can doubt, but that there is an absolute distinction between them; and I dare say, there are no *Attributes* which are more opposite one to another, than to *Think* and to be *Extended*. For to be *Corporeal*, and to *Know*, what relation have they one to the other? What Similitude can be apprehended between *Perception* and *Motion*? or between *Will* and *Figure*? Whence it is plainly to be asserted, that *Mind* and *Body* are altogether different; and consequently since *Body* hath *Extension*, the Thing *thinking* must needs be void of all *Extension*; which is the same thing as to be *Immaterial*: For by the Name of an *Immaterial Entity* nothing else is to be understood, but that which hath no parts, and is void of *Extension*.

If it be Objected, that diversity of *Conceptions* does not always infer a difference in things; so as that they must be incompatible in the same Subject. For the *Conception* we have of *Justice* is undoubtedly distinct from that we have of *Mercy* in *GOD*; and yet no *Divine* can deny, but that they are both equally fit to be ascrib'd to *GOD* himself; therefore it follows not, because the *Conception* of the Thing *thinking*, is distinguish'd from the *Conception* of the Thing *Extended*; but that they may be attributed to one and the same Subject.

I Answer, When two things may be conceiv'd incompletely, or by abstraction of the *Intellect* inadequately conceiving the Matter, there is no necessity that they be repos'd in divers Subjects; but those may well be which are consider'd adequately, or as *Compleat Entities*: For *Justice* and *Mercy* in *GOD* are consider'd not as two *Compleat Things*, since *Justice* may be understood without a *Just Person*; but not *Mercy* without a *Merciful Person*: And consequently since they cannot be but modally distinguish'd, they may be both in *One GOD*. But we completely understand, that a *Body* or *material Substance* is *Extense*, *Partible*, *Figurate*, with an Exclusion of all those things which are peculiar to the *Mind*: And on the contrary we understand, that the *Mind* is a *compleat Substance*, which *Perceives*, *Wills*, *Doubts*, &c. tho' those things be remote from it which belong to the Nature of *Body*; and so *Cogitation* and *Extension* are incompatible in the same Subject.

Other Objections which may be made against the Incompatibility of *Cogitation* and *Extension*, are resolv'd in the same manner, as if any should say, that *motion* and *figure*, and the like *modes* of a thing *Extended*, have divers *Conceptions*, and yet are found in the same Subject. For *figure* and *motion* cannot be conceived, but in *Extended matter*; For as *motion* is a *Body* having *figure*, so we cannot understand *figure*, but in Matter apt for *motion*. There is a great difference between *Motion* and *Figure*, and between a thing *extended* and *cogitant*; for should all Moveable be taken away, we should have no longer any *Idea* of *Figure* or *Motion* remaining, since such is the Reason of *Modes*, that altho' *Substances* may be conceived without *Modes*, yet *Modes* cannot without *Substances*; therefore in regard we might conceive a thing *Cogitant*, tho' there were no such thing as *Body* in

VII.
An Objection drawn from the distinction of *Justice* and *Mercy* in *GOD*

VIII.
An Answer to the Objection

IX.
A thing *Cogitant*, and a thing *Extended*, are conceived in another manner, than *Figure* and *Motion* in the same Subject.

X.
The Spirituality of the Soul is demonstrated by its Operations.

rerum Natura; it follows, that a thing *Cogitant* is really distinguish'd from a *Subject Extense*, and consequently is *Material* and *Spiritual*.
The same Conclusion may also be demonstrated *a posteriori*, to wit, by its *Operations*, which are *Spiritual*, and absolutely Independent of all *Matter*. For *Volition* and *Intellect* include no *Extension*, since we conceive both very well, without any mention made of *Matter*. Besides, we find by daily Experience, that the *Cogitations* of *Man* are render'd the more obscure, by how much the more he hath of commerce with the *Body*; and on the contrary, more subtil and distinct, by how much the more he subtracts himself from the *Body*, as is manifest in *Extasie* and *Rapture*, where the *Mind* in a manner abstracted Meditates altogether on what is *sublime*, and distinctly sees all things; all which would never happen, if the *Soul* were *Material*. For if the *Power*, for Examples sake, of *Understanding*, depended upon the *Body*, it would of necessity follow its *Dispositions*, that is, be depress'd when that is weakned, and become more vivacious, when that is vigorous and strong. Whereas we find by Experience the contrary thereof in *Old men*, who apprehend things more clearly and distinctly than *Young men*, who at the same time excell *Old men* in *Strength* of *Body*, and have their *Animal Spirits* more vivacious, upon which *Corporeal motions* depend.

XI.
The Apprehension of Spiritual things, shews the Mind to be Incorporeal.

Then how can it be, if *Human Mind* be *Material* and *Corporeal*, that it should contain in it self such vast *Images* of things? How should it comprehend the *Latitude* of the *Earth*, the *Immensity* of the *Heavens*, and the *Bodies* that are diffus'd through all parts of the *Universe*, if it be not *Spiritual*? How can it discern a *Line* to be altogether void of *Latitude*? A *Point* not discernable to the *Eye*, and wholly *Individual*? Wherefore we must in this Matter conclude with the Words of St. AUGUSTINE, If *Corporeal things* are beheld with *Corporeal Eyes*, by a certain wonderful *Affinity*, it certainly follows that the *Mind*, by which we see *Incorporeal things*, is not *Corporeal* or *Body*.

XII.
The Cognition of Verity, &c. argues the Immateriality of the Soul.

Moreover, who knows not how many and how great things totally separate from all *Matter* our *Soul* can conceive? For without any help of the *Senses*, it apprehends *Verity*, *Sapience*, *Unity*, *Beauty*; it understands the *Principles* of *Sciences*, and unfolds the *Demonstrations* drawn from them, and attends to the *Series* of *Reasons*; but with what *Sense*, or with what *Corporeal Species* doth it represent these things to it self? Wherefore since by *Reason* alone it performs all these things, it must of necessity be *Immaterial* and *Incorporeal*. Lastly, Many things which are divided in themselves, meet together in our *Mind*, as *opposite* and *contradictory Propositions*, &c. yet nevertheless the *Soul* is not increas'd by the reception, nor by the withdrawing of them. A thing which cannot happen to *Body*, which always become greater by the addition of *Parts*, and lesser by the abstraction of them.

CHAP. III.

How Human Mind is United to the Body.

I.
Three Notions

Here are Three principal *Notions* which commonly offer themselves to us: The No-

tion of *Body*, which we have maintain'd, consists in *Extension*, from whence the *Idea's* of *Figure* and *Motion* proceed: The *Notion* of *Mind*, whose *Essence* we place in *Cogitation*, and to which the perceptions of *Intellect*, and propensions of *Will* do tend: The third *Notion* is of *Soul* and *Body*, as they are united; from which *Union* we understand, that *Mind* hath the force of moving *Body*, and on the contrary, the *Body* hath the power of Acting upon the *Mind*, as shall hereafter be more clearly made out: For it is not to be imagin'd, that the *Soul* is only present with the *Body*, as a *Mariner* is present in his *Ship*, or as a *Rider* is seated upon his *Horse*; but that it is intimately united to it, so as to make one Compound with it: I say, the *Notion* of *Soul* and *Body*; because the *Soul* is properly so called, inasmuch as it is destin'd to *Inform* the *Body*, or inasmuch as it can be United to a well-disposed *Body*, as hath been formerly mention'd.

For the *Soul* of *Man* is not to be consider'd as a *Spirit* in it self, and as it is *Absolute* and a *Substance* which *Thinks*; but according to the Relation which a *Spirit* hath to a *Body* well dispos'd, and to which it is United. For Experience plainly teacheth us, That all the *Functions* of the *Soul*, consider'd in *Quality* of a *Soul*, depend absolutely on the *Body*, to which it is United, and which renders this *Union* altogether necessary.

The only difficulty is to apprehend this sort of *Union*: For our *Intellect* can hardly conceive, how *Body*, which is a thing *Extense*, moves the *Mind*; and *Mind*, which is a thing *Immaterial* and *Inextense*, can impel the *Body*; and tho' by Experience we find it is so, yet no Comparison or Discourse drawn from other things is sufficient to demonstrate and evidence it to us. Those *Philosophers* who admit *Real Accidents*, and judge that they are *Entities* distinct from *Substance*, produce a Similitude of a *Stone* tending downward, by the force of *Gravity*. Now since, according to these *Philosophers*, this *Quality* of *Grave things* tending downwards, is not *Substance*, but *Accident*, this may serve for a sufficient *Explication*, how a thing not *Extended*, may act upon a *Body* Extended.

Yet because we maintain, that there is no such *Quality* in *Nature* granted, another way is to be found out; but before we fix upon a *Mode*, by which the *Body* is annex'd to the *Soul*, it will be worth our while to note, that all the difficulty in conceiving that *Union*, arises chiefly from our selves; who following the *Prejudices* of our *Imagination* first, and afterwards the trite *Opinions* of *Philosophy* in *Schools*, have thought it impossible for *Human Intellect* to conceive, how a thing *Material* and *Incorporeal* can be United, and how a thing *Unextended* can be associated to a thing *Extense*, unless that be taken also for *Extense*. This *Prejudice* hath exercis'd the *Wits* of many; and because they could find no *Mode* of *Union*, by which things so distant in *Nature* could be United, were compelled to have recourse to certain *Virtual parts*; and to assert, that the *Soul* is not indeed really, but only *virtually Extended*, and that it hath *Virtual parts*, by means whereof it may the better be adjoyn'd to the *Body*, and so compose one *Total* with it.

But

II.
Human Mind is to be consider'd, as United to the Body.

III.
It is difficult to conceive, how the Soul is United to the Body.

IV.
To this difficulty the Prejudices of Infancy, and the Opinions of a School conduce.

V. But what they mean by these *Virtual parts*, I confess I do not in the least understand; nor doth any *Notion* of them present it self to me. Nor can it be conceived, that there are things *Virtually Extense*, unless thereby are understood *parts* without *parts*, that is, whereof one is placed beyond the other. But *parts* situate one beyond the other, are distinguish'd not *virtually*, but *really*, and may separately *Exist*, and consequently may be said to be *really* distinguish'd; since in the Conception of them *Division* is included, and a Separation of them one from another, which presuppose *Extension*.

VI. But that the Conjunction of *Mind* and *Body*, which is commonly call'd *Union* may be the better understood, we are to premise what *Union* is, and how many kinds of it there are. *Union* is a *Con-sociation of things agreeable into One*. And since we can have a *Conception* but of two things, namely *Mind* and *Body*, we can thence infer only a *Threefold Union*: The first, which intercedes between two *Bodies*; the second, by which two *Minds* are associated; the third and last, by which *Mind* and *Body* are United. But all *Union* includes some *Similitude* and *Dependency*, in which respect 2 different things pass after a certain manner into one. For in this very respect they are judged to be United, when they can *act* and suffer dependently upon each other: For 2 *Bodies* are said to be United, when they are so near, that one may *act* upon the other; and that again suffer from the former. Not that it is necessary, that both together *act* and suffer at once; but it is sufficient, if one *act* and the other suffer. In the same manner 2 *Minds* are united one with another, when the same *Affections* are common to them both, and are so dispos'd, that neither of them *wills* or *loves* any thing, but for the others sake. In the same manner we say, that a *Rational Soul* is joyn'd to the *Body*, when any *Operations* of the *Body* depend upon the *Cogitations* of the *Mind*; and on the contrary, that the *Body* is joyn'd to the *Soul*, when any *Cogitations* arise dependently from these *Operations*, or rather *motions* of the said *Body*.

VII. Nor do I think, that any one will deny this manner of *Conjunction* or *Union*, by which the *Mind* and *Body* are conjoyned, since a clearer cannot be made out; in regard the *Mind* and *Body* operating dependently upon each other, we may very easily understand the *Similitude* and *Relation*, which ought to be among things which are united; and this *Similitude* and *Relation* we have formerly affirm'd to consist in *Action* and *Passion*: So that as the *Union* of 2 *Minds* will continue so long as *Love* remains between them; so the *Union* of 2 *Bodies* will never cease, so long as they are locally present one with another. In like manner the *Union* of *Mind* and *Body* will not be dissolv'd, so long as he who hath joyn'd them together shall suffer the *Body* to produce its *motions*, with a dependency upon the *Cogitations* of the *Mind*, and the *Mind* to Exercise its *Cogitations* dependently upon the *motions* of the *Body*.

VIII. By Two ways most especially may *Spirit* be joyned with *Body*; first into one *Person*; as the *Word* was made *Flesh*, S. John I. Secondly, into One *Nature*; as *Human Mind* is joyned with *Body*. Of the first, *Divines* treat in their *Theses*, con-

cerning the *Incarnation* of the *Word*; the second is handled by *Philosophers*.

IX. The *Union* of *Soul* and *Body* consists in an *Actual dependency* of all the *Cogitations* of the *Soul*, upon certain *motions* of the *Body*; and of some certain *motions* of the *Body*, upon some *Cogitations* of the *Soul*; I said in the first place, That this *Union* consists in an *Actual dependency*; because for the *Uniting* of *Body* and *Soul*, it suffices not that their *Motions* and *Cogitations*, can mutually depend upon each other; but it is also necessary, that they *Actually* depend. In the second place, I said; and of some certain *motions* of the *Body*, upon some *Cogitations* of the *Mind*; because not all the *motions* of the *Body* depend upon the *Cogitations* of the *Mind*, since many depend upon the *Machin* of the *Body* only, and the *Universal Laws* of *Nature*.

X. Others explicate this *Commerce* another way; for they will have it, that a certain *Mode* intercedes between *Body* and *Mind*, to which they give the Name of *Union*, and account it instead of a *Ligament* or *Bond*, by which those things that make up the *Compound* are joyn'd one with another. For they cannot conceive how 2 Things can be joyn'd together, and nothing of *New* happen upon this *Conjunction*. But they have enough to be satisfied: For if by the Name of *Union*, they understand nothing, but that mutual *Commerce* of *Actions* and *Passions*, which is found in *Mind* and *Body*, they agree with us; for we acknowledge that *Union* is the *Mode* of the Being of *Body* and *Soul*: For all things are after another *mode* or *state* when United, than when Separated. But if they mean, that this *Union* is some real thing distinct from both, and as it were that very thing, by the *mediation* whereof the *parts* of a *Compound* are United, we apprehend not, nor acknowledge any such thing in *Philosophy*; and should we receive it, we can no way make it out, how such a thing can joyn together two such, as *Mind* and *Body*. For this *Union* should be either *Extense*, or void of all *Extension*: If they affirm it *Extense*, how can it be Co-extended with *Mind*, which is a *Spirit* and *Immaterial*? If it be void of *Extension*, how can it be joyn'd to a *Body*? So that this *Mode* of *Uniting* is altogether superfluous, since the difficulty of *Conceiving* how 2 *Substances* can be immediately United one with another, by a mutual dependence of their *Motions* and *Cogitations* is less, than to comprehend, how they should be united by another thing, which if it be *In-extense*, cannot be conjoyn'd to the *Body*; nor to *Mind*, if it have *Extension*, and be divided according to *parts*.

And the Truth is, since neither *Body* can *Think*, nor *Mind* be capable of *Dimension*; there can be no *Mode* common to *Mind* and *Body*, except a mutual *Acting* of each upon each, from which alone the *Proprieties* of both can follow.

Perhaps it may be said, That the *Conjunction* of *Mind* and *Body* cannot consist in the relation which the *Actions* and *Passions* of both have to each other; because such a *Concourse* presupposes, that the *Mind* is already United to the *Body*. For the *Mind* must first be in the *Body*, before it can draw forth any *Operations* which depend upon the *Body*, and consequently *Union* precedes that mutual dependency.

IX. Wherein consists the Union of Soul and Body.

X. There is not required any Union, as a thing distinct from Mind and Body.

XI. But a Reciprocal of Action and Passion.

XII. Whether the Soul and Body be United to each other, before they mutually Act and Suffer.

XIII. *The Answer.* *But* Answer, That there is no Necessity that the Mind should be first United to the Body, before it operate there, in regard its Existence precedes not Action in Time: So that it does not absolutely require to be joyned to the Body, before such time as it draws forth its Operations. Nay, if the Matter were well Examind, when as Spirit is confin'd to no Space, and may only be in a place by its Operations: It cannot therefore be said, to be in the Body, but because it exercises there its Operations or Cogitations dependently on the Body. Which mutual Correspondence constitutes the Reason of the Union, which is between the Mind and Body.

XIV. *When the Union between Mind and Body begins.* *But* if it be ask'd, How comes about this Conjunction of Soul and Body, and when doth it begin?

I Answer again, It is most Consistent to Reason, to believe that this Union begins at that very moment in which the Body gives occasion to the Mind, to draw forth some Cogitation, and Contrarily the Soul, to the Body, to stir up some motion. For as this Conjunction is plac'd in a mutual Dependency, which is between both, in respect of certain Actions and Passions, it cannot begin sooner. So that it is most probable, that such a Union begins, as soon as the Heart, Brain, Nerves, Muscles, &c. are sufficiently fram'd to bring it about, that the Action of the Objects may be transmitted as far as the Glandula and the Animal Spirits be convey'd into the Muscles. On the contrary, this Union ceaseth, whenever it happens that the said Commerce cannot be continued, or when any part of the Body is so defective, that the Heart is no longer able to transfuse the Spirits to the Brain; nor the Brain into its Muscles, to agitate some, and conserve others in their proper state: So that the said Confederacy is never broken on the part of the Mind, but of the Body.

XV. *This Union is Essential to Man.* From these things we deduce, that the Conjunction of Soul and Body, though it be call'd an Accident of either part, so far as it may be present or absent, without the destruction of either part, is nevertheless so proper to both Parts of Man together, that it may and ought to be allow'd to be Essential to him: For Essence, as it is deriv'd from Esse, to be, is so called, because so long as it is something, it must of necessity be. So that so long as Man is, it follows, that the foresaid Efficacy of Mind upon Body, and of Body upon Mind, must needs be.

XVI. *Why GOD may not be said to be joyn'd to his Creatures, or an Angel to an assumed Body.* *But* it is also easie to Understand, why GOD, tho' he is present to all Created things, as who Conserves the same by a Continued Creation; yet nevertheless is not said to be conjoyned to them, in regard they cannot act upon GOD, by exciting in him those Cogitations which he had not before. So also an Angel, who according to the Vulgar Opinion, is present personally in an assumed Body, cannot be said to be joyned to the said Body. For tho' an Angel may act upon such a Body, yet that Body cannot Re-act upon the Angel; So as that when the said Body, for Examples sake, is hurt, the Angel should feel pain, as we find by Experience in our selves.

XVII. *Conditions of the Union of Body and Soul.* But as there is no Society, which is not founded upon some Conditions, which are Reciprocal between one and the other party, united or associated

together: GOD, in the formation of Man, united Body and Spirit upon these Conditions.

The First is, That as long as the Soul shall remain United to the Body, there will be an Idea of Extension, that is to say, of Body, consider'd in it self; and that it shall have this Idea from the motion of the Brain, excited by the general Course of the Animal Spirits; according to which condition, the Soul hath always present the Idea of Extension, as Experience teacheth us.

The Second is, That the whole motion of the Brain, which is excited by the Nerves, will produce within the Soul a certain Sensation, which will always accompany this motion, and the Soul not be able to separate it. By means of this Condition, we see, for Example, the Light, when the Sun moves the Optick Nerves: We hear Noise, when resounding Bodies shake the Auditive Nerves.

The Third, That the Spirit, so long as it remains United to the Body, will have the Idea of some particular Body, from the motion which this Body shall excite in the Brain, by the means of the Organs of Sense. By this Condition, the Soul hath the Idea of all Bodies, which smite the Senses.

The Fourth, That the whole motion of the Brain, which shall be excited by the determinate Course of the Animal Spirits, resembling another motion, caused by the Nerves, will produce in the Soul the Idea of some particular Body, which the Soul hath already perceiv'd. By this Condition it is, that there are represented to us things absent, which we have formerly seen.

The Fifth is, That by the Sense of Touching we feel pleasure or pain, according as the movents, which cause these Sensations, shall be conformable or in opposition to the Natural Constitution of the Body. By this Condition, the motion of a Feather drawn over the Hand, as it were for Titillation, will cause a Sentiment of pain in Sick People, in regard the said motion is not agreeable to the present state of the Body. On the contrary, it excites a Sentiment of pleasure to those that are in health, because in that Estate it is conformable to the present Constitution of the Body.

The Sixth is, That when we have received the Idea of an Object, it will be attended by an Inclination of the Soul, which will carry it either to fly or to pursue the said Object, according as it shall appear good or bad. By this Condition it is that we are sensible of Love, Hatred, and generally all Passions that attend the Soul.

The Seventh is, That all the Thoughts of the Soul, which regard the preservation of the Body, as they create Sentiments and Passions, must be accompanied with that motion of the Animal Spirits, which shall be most proper for the Execution of the Desires of the Soul. And it is upon this Condition that Fear, for Example, is accompanied with a Course of Animal Spirits, which induceth us to shun what we fear; and that on the contrary, Desire is accompanied with a Course of Spirits, which carries us to the pursuit of that which we desire.

The Eighth is, That the Spirit, inasmuch as it is united with the Body, never Thinks, but by the motions of the Body, to which it is united. And it is by this Condition, that all the Ideas which we have

have of particular Bodies, depend mediately or immediately, upon some motion of the Brain. I say, All the Ideas we have of particular Bodies. And hereby we are to Note, that the Ideas, which the Spirit hath of GOD, and of it self, depend not at all upon its being United with the Body; but simply upon its being a Spirit, whose whole Nature is to Think, and by consequence to think of GOD and of it self.

XXVI. The Ninth is, that when the Animal Spirits are more abounding than usual, they excite in the Soul, Goodness and Liberality; when their Parts are more strong and gross, they excite Confidence and Hardiness; when they are equal in force, in grossness and in figure, they procure Constancy; when they are more agitated, they produce promptitude, diligence, and desire. In fine, when they have a temperate agitation, they cause tranquility of Spirit. On the contrary, when these Qualities fail in the Animal Spirits, or when there is an opposite Temper in them, the effects that are produc'd in the Soul, are Malignity, Timidity, or Fearfulness; Inconstancy, Tardiness, Inquietude, &c.

XXVII. The Tenth and last Condition is, That the Union of Spirit and Body will continue so long as the Heart shall be in a condition to send Blood towards the Brain, and from thence to send the Animal Spirits through the Nerves into the Muscles, which are subservient to those motions that are necessary for Life. By this Condition it is, that the Soul never gives occasion to the Body to break the Union, it being sufficiently evident, that the default always proceeds from the Body, as Experience teaches us.

CHAP. IV.

Whether there are Innate or Inbred Ideas in Human Mind.

I. There are three sorts of Ideas.

IT is a frequent and common Disquisition in the Schools, whether Human Mind be pure Potentia, or Power, and so abstracted from the Species or Idea of things, as to have no inbred Cogitations in it. The Aristotelians maintain the Affirmative, and are of Opinion, that that Faculty of Perception which we experiment in our selves, is, when first the Mind begins to exist, as it were a Rasa Tabula, or plain Table: So that whatsoever Idea, in process of time, is deprehended in it, is drawn from the Senses, or acquir'd by Tradition. So that for the better Solution of this famous Question, we are first to know what an Idea is, and how many Acceptations it admits of. By the Name of Idea, nothing else is understood, but the thing it self thought, so far as it hath any thing Objective in the Intellect. Or more in short, Whatsoever can be conversant in our Cogitation: And there are Three kinds of it, namely, Adventitious; or those which are receiv'd from things transmitted by the Senses; as is that Idea which we have of the Sun, Stars, and the like External Objects. Secondly, Fictitious, or which are formed from our Intellect; as the Ideas we have of a Chimera, Syrens, &c. Lastly, Innate, which are Created with the Faculty of Thinking and forming them: And they are called Innate, in the same manner as we speak of the Stone, or the Gout, to

be Natural to some Families, of which Families they who are born, bring with them into the World a disposition prone to those Diseases.

These things thus briefly noted, we are next to enquire, Whether Human Mind be so Created, as to have these sort of inbred Ideas born with it, and not drawn from any of the Senses; and in Truth, it seems not to be deny'd, but that many such Ideas are found therein. For to begin from things most obvious, it is most certain, that the Ideas which we perceive by any sense, are inbred, and can no way proceed from the Things themselves by any Similitude. For he that well understands, by what way the perception of Pain, for Example, is excited in the Soul, will easily be convinc'd, that the Idea of Pain hath no more affinity with that perverse disposition of Parts, by whose means the Soul frames an Idea of Pain, than that deprav'd Affection hath an affinity with a Sword, by which a Wound hath been inflicted into a Body; or than the unwonted agitation of Blood or Spirits, by whose impulse Human Mind conceives Ideas of Passions, carries a Similitude with those Images or Cogitations; and consequently when the Sense of Pain, and other Perceptions which are produc'd by the motions of the Spirits, are excited in the Minds by no other Species, which have affinity with them, it must needs be affirm'd, that these sort of Ideas which have no affinity, are innate or inbred to it. For it is evident, that all the Perceptions of the Senses are obscure and confus'd, insomuch that Light, Colours, Sounds, Odours, Sapours, Heat and Cold, and other tactile Qualities, are not apprehended by us, but by a confus'd way, and not under the Conception of Motion: And hereupon we must conclude, that their Ideas are innate in us, and that it is from our Nature that we understand them.

This takes place not only in Qualities, whereof we acknowledge our Cogitation to be confus'd; but also in things most clear and manifest. For what can be more clear, than that when a Line, a Triangle, a Rhombus, or other Mathematical Figures are given, it is not to be attributed to our Senses, that we have the Ideas of them? Since most certain it is, that there is no absolute true Right Line in Nature, nor any Triangle whose 3 Angles are perfectly Equal to two Right Angles. Since therefore the Ideas of Figures proceed not from the Senses, and contain nothing Corporeal or of Corporeal Affection, we must necessarily conclude, that they are implanted in Human Mind; that is, that a Faculty is given by GOD to the said Mind, to produce such like Forms of Conceptions, and that they are not form'd according to any Exemplar of things without.

If any one Object, That trite Saying of the ARISTOTELIAN S in the Schools, viz. that there is nothing in the Intellect, which was not first in the Senses. I answer, that that Vulgar Axiom is altogether false, and only to be admitted by those who do not sufficiently consider by what Motives the Soul is excited to perceive External things. For whoever will seriously examin, how far our Senses extend themselves, and what it is precisely that can arrive from them to our Faculty of Thinking, must needs grant, that no Ideas of things are presented from them to us, such as we form them

II. The Ideas of Qualities are Congenite or Equally born with the Soul it self.

III. The Idea of Mathematical Figures, are implanted into the Mind, from their first Original

IV. It is a false Maxim, that there is nothing in the Intellect, which was not first in the Senses.

them in our thought; so that there is nothing in our *Idea's* which was not first inbred in our *Mind* or *Cogitant Faculty*, excepting those *circumstances* which regard experience, so as to judge, that such or such *Idea's* as are now present to our *Cognition*, are to be referred to things without us: not that the said *Idea's* have immitted those very things to our *Mind* through the *Organs* of our *Senses*, but because they have immitted something which gave it occasion to form those very things by a faculty innate to it, at one time rather than another; forasmuch as nothing hath access to our *Mind* from external *Objects*, through the *Organs* of our *Senses*, except certain *Corporeal Motions*; but neither those *Motions*, nor the *Figures* arising from them, are conceived by us, such as they are form'd in the *Organs* of the *Senses*; whence it follows that those very *Idea's* of *Motions* and *Figures* are inbred in us. And so much the more ought the *Idea's* of *Pain*, *Colours*, *Sounds*, and the like, to be innate, as our *Mind*, by means of certain *Corporeal Motions*, can exhibit them to us; since they have no similitude with *Corporeal Motions*.

V. Besides, who can have the confidence to assert, that the *Idea's* we have of *Thing*, *Substance*, *Truth*, *Goodness*, *Equity*, and the like general *Natures*, have any commerce with *Material Things*, and that the *Idea's*, which we form of them, flow'd out of *Bodies*, through the *Senses*, into the *Mind*? Who will be so positive as to affirm that these *Common Notions*, for Examples sake, *The same thing cannot be and not be*; *that which is done cannot be undone*; *those things which agree in a third, agree among themselves*; *take equals from equals, and there remain equals*; and the like, proceed from the *Senses* and from things without us? What can be more absurd, than that all *common Notions*, which are in our *Mind*, arise from the said *Motions*, and cannot be without them? I would fain have any one tell me, what that *Corporeal Motion* should be, which can form any *common Notion* in our *Mind*; since all those *motions* are particular; but these *Notions* are universal, and have no affinity or relation to the said *motions*. Since therefore nothing can come into our *Mind* from *Bodies* but by *motion*; it is not to be doubted, but that those *Idea's*, at least, which have no affinity with *motion*; are *Congenite* and *Inbred* with the said *Mind*, from their *Original*. Hence St. *Augustin* in his 9th Book de *Trinitate*, *The Mind*, saith he, *knows it self by it self*; and in another place, *It is known for a certain, that the Mind can never be so affected, as not to remember, not to understand and love it self, though it should not be always thinking*.

VI. The same thing also evidently appears in that *Idea* which *Human Mind* hath of the *Existence* of *G O D*; forasmuch as it forms the said *Idea*, not by the *Benefit* of the *Senses*; nor by *Human Institution*; nor by its own *Arbitrement*: And consequently it must needs be innate or inbred in it, since there is nothing else in *Nature* to be found, which can set forth an *Ens Infinite*, *Omnipotent*, *Immenſe*, *Supreamly Good* and *Perfect*; for though there is in us, in regard we are *Substances*, an *Idea* of *Substance*; yet there occurs not to us from thence an *Idea* of a *Substance*, *Infinite*, *Independent* and *Supreamly Intelligent*, &c. since we

are finite; and so, whatever *Idea* we have of *G O D*, must needs have it from a *Substance* which is *Infinite*, that is, *G O D*; and consequently which immediately proceeds from him.

It is urg'd, that this *Idea* of *G O D* which we experiment in us, proceeds not from our faculty of *thinking*, to which it is innate, but from *Divine Revelations*, *Tradition* or *Observation* of things; for in an *Entirely* *Supreamly* *Perfect*, which is call'd *G O D*, *Human Mind* considers nothing but those *perfections* which are found in *Man*; for Examples sake, *Existence*, *Power*, *Justice*, *Mercy*, and the like; from which, if one perfection be removed, they may be so ascribed to *G O D*, the most *Excellent* of *Beings*.

This *Objection* is resolved by our most illustrious *Philosopher*, in his Answer to the *ſam'd* *REGIUS*, *Physician* of *Utrecht*; by giving to understand, that one thing may be from another two ways; either because this other thing is the *proximate* and *primary Cause* thereof, or because it is *remote*, and only *accidental*, and so gives occasion to the *Primary Cause* to produce its effect at one time rather than another: As all *Artificers* and *Workmen* are the *primary* and *proximate Causes* of their own *Operations*; but they who set them on *work*, and pay them for their *labour*, are the *accidental* and *remote Causes* of the said *performances*, which perhaps, the *Workmen* unbidden, and without hopes of reward, would scarce have gone about. Now there is no doubt but *Tradition*, or the *Observation* of things is often times the *remote Cause* which inviteth us to give attention to that *Idea* which we are able to conceive of *G O D*; and to represent it to our *Cognition*. But that it is the *proximate* and *efficient Cause* of the said *Idea*, cannot be asserted by any one, except by him who judges that nothing is ever understood by us concerning *G O D*, but what the name *DEUS* or *G O D* means, or what sort of *Corporeal Figure* it is, which is made use of by *Painters* to represent *G O D*. Forasmuch as *Observation*, if it be made by the *Sight*, represents nothing to the *Mind* by its own proper virtue, but *Pictures*, and those only consisting of certain *Corporeal Motions*; if by *hearing*, nothing but *Words* and *Voices*; if by other *Senses*, nothing is contain'd in the said *Observation* which can possibly relate to *G O D*: So that all those things we think of, except *Voices* and *Pictures*, as their *significates*, are represented to us by *Idea's*, not coming from elsewhere than from our faculty of *thinking*, and consequently inbred in us.

CHAP. V.

Of the *Faculties* of *Human Mind*, *Intellect*, *Imagination*, *Will*, *Memory*, *Reminiscence* and *Wit*.

SINCE there are found various *Operations* in the *Mind*, we must of necessity assign various *Principles* from whence they proceed; for diversity of *Actions* argues diversity of *Powers*. Wherefore since there are divers *Species* of *Cognitions* in the *Mind*, there are consequently to be establish'd divers *faculties* which are the proprieties of a *thinking Being*. Forasmuch as by the word *Faculty*, nothing else is understood, in *Human Mind*,

Mind, but an Aptitude or Capacity to a certain Variation; for since *Mind* is Indefinitely Variable, Actual Variety must needs proceed from some Faculty, as from a present Cause. All Operations which carry Cogitation with them, are of two sorts. Of the first kind are those Operations which have *Intellect* for their Principle. Of the second are those which depend upon *Will*. And tho' many other modes of thinking may be reckoned, yet they all proceed from two faculties of *Perceiving* and *Willing*: For *Sense*, *Imagination*, *Intellect*, *Memory*, &c. are various modes of perceiving, whereas *Judgment*, *Affirmation*, *Negation*, and all our *Appetites* and *Propensions* are different modes of *Willing*. Of the *Senses* we have already discours'd; it remains that we say something of *Intellect*, *Imagination*, *Will* and *Memory*.

II. By the word *Intellect*, nothing else is to be understood, but that faculty by which the *Mind*, without any *Material Species*, apprehends all Objects whatsoever, whether *Immaterial* or *Corporeal*; and this faculty is more inseparable from the *Mind* than any of the rest; whereof there is not any one that hath not some dependence upon the *Body*; whereas the *Mind* hath no need of the help of any other thing to understand by, but it self and its own proper *Idea's*. So that the *Mind* hath no need of any *Organs*, nor makes any use of the *Brain*, whereby to *Conceive* or *Understand* External things.

III. Only in this one thing, *Intellect* is distinguished from *Imagination*, that is, that the *Mind* can *Imagine* nothing but *Corporeal*, when in *Imagining* it applies it self to the *Body*, and contemplates the *Image* of the Object as present to the *Eye*, which happens not in *Intellection* or *understanding*; when as the *Mind*, in *Understanding*, is in a sort recluded or shut up within its self; and if it apply it self to any *External Body*, it is only to contemplate the *Idea* of the Object which it hath in its self. Wherefore that common Saying, *Nothing is in the Intellect, which was not first in the Sense*, is not to be conceived of the pure faculty of *Understanding*. Since the pure *Intellection*, as we have said, as well of a *Material* as *Immaterial* Object, is independent of any *Corporeal Species*, and cannot any way be received in the *Intellect*; but may very well be understood of the *Imagination*, because we cannot possibly *imagin* any thing but what is *Corporeal*, particular and determinate. Whence the *Power* of *Imagining* in the *Soul* may be defin'd, *The Power which the Soul hath to know particular Bodies, and the representations of Equality or Inequality which are in them*. So that *Intellect* and *Imagination* differ in respect of the Object; since the Object of the *Intellect* is of larger extent than the Object of *Imagination*, as having a perception, not only of things which belong to *Intelligences*, and *Substances* meerly *Spiritual*; but also many other *proprieties*, or particular *Bodies*, which are not deprehended from the *Senses*, and which decline even *Imagination* it self, as hath been said in the foregoing Chapter.

IV. Whence we may conclude, that *Intellect* in general is nothing but a *Faculty* or *Power* which the *Soul* hath to know whatsoever it knows, by what way or manner soever it knows it.

The second sort of our Cogitations proceeds from the *Will*, that is, from a *Power* within us, to determin our Resolves, by giving or denying our Assent in things which are propounded by the *Intellect*. For such is the form in the ordering of our Cogitations, that the *Light* of our *Understanding*, always precedes the *Actions* of our *Will*; in regard the *Intellect* is, as it were, the *Torch*, without which our *Will* cannot determin any thing. When, I say, that *Will* cannot determin any thing, but what the *Intellect* shews it; it is not to be so taken, as if those two *Powers* were things distinct from each other, but that it is one and the same *Mind* which is diversly considered according as it *Perceives* or *Wills*, and according as it *Suffers* or *Acts*; so as that *Knowledge*, *Pleasure* and all other *Faculties* of the *Soul*, are but one and the same *Soul*, considered as having power to *Know*, to *Will*, to *Imagine*, to *Perceive*: For the *Intellect* is a *passive Power*, which consists in this, that it wholly receives *Idea's*; whereas the *Will* is a faculty by which the *Mind* chooses, or is determin'd to embrace or decline all that which the *Intellect* clearly perceives; so that the *Will* is nothing but the free determination of the *Mind* to do any thing, or not to do the said thing, to affirm or deny a thing to be such or such.

And consequently *Will* in general may be defin'd, a power which the *Soul* hath to determin and resolve about those things which it apprehends, which way soever it apprehends them.

For this is the *Nature* of *Will*, that at the same time wherein *True* or *False*, *Good* or *Bad* is, by the *Intellect*, propos'd to it clearly and without confusion, it resolves, without any hesitation, to choose the one and reject the other; so that the *Essence* of it consists not, as some will have it, in *Indifference* to choose any thing, or not to choose it, since *Will* can never be said to be indifferent, except when the Object is not clearly and distinctly propos'd to it, or when it knows not what it ought to resolve upon. For a *Man* is said to be indifferent, when few *Reasons* are propos'd to him, or such as are not sufficient to move him, to embrace one thing rather than another: whence it is said of a *Sinner*, that always some things are found indifferent in him; namely, a *Sinner* knows not clearly the *Bad* he is about to commit; or if he formerly knew it, he attends not, at the time he commits it, to the reasons which prove it to be bad; for if he perceiv'd it, it could not be that he should sin, according to that vulgar Axiom, *The Will pursues no Evil as it is Evil*.

On the contrary, when a man sees a thing clearly, and without all obscurity to be convenient for him, it is almost impossible but that he should be carried with an inclination to it, so long as the judgment of the self same thing remains in the same person. So that *Will*, infallibly tends toward that which appears most convenient for it; so it be made clear and manifest to him. Nor is there less reason why it should be called *Free*, since as *DESCARTES* saith, in his fourth Meditation, *Neither is it necessary that I should be carried into both parts, to be free; but by how much the more I incline to one part, either because I perceive True and Good more evidently in that, or because GOD so inwardly disposes my thought, so much the more freely I choose*

VIII. But in Determination.

choose that. Neither indeed doth Divine Grace, or Natural Cognition ever diminish Liberty, but rather increase and confirm it. But that indifference which I experiment, since no reason impells me to one part more than another, is the Lowest degree of Liberty, and witnesses no perfection therein, but only a defect, or a certain negation in Cognition. For if I could always see what is True and Good, I should never make any doubt, what is to be judged of it, or chosen out of it; so though I might be absolutely free, yet never indifferent.

IX.
Memory,
and in
what it
consists.

By the name of Memory, so far as can be collected from the descriptions of other faculties, is understood the Power which the Soul hath to conceive, feel or imagin, that which is hath already conceived, felt or imagin'd. And on the part of the Body, a certain facility which the Pores of the Ventricles of the Brain, which had before been relaxt by the Animal Spirits, have to open themselves again. For if we consider the Nature of those Species which are preserv'd in the Memory, we shall find that they are nothing but certain Vestigia or Footsteps which the Agitation and Course of the Spirits leave among the Fibres of the Brain, almost in the same manner, as folds in a complicated leaf of Paper retain a faculty of entertaining again those forms which had been before impress'd upon them; in regard that when the Spirits have a power of dilating the Pores of the Brain, of pleating, and variously disposing of the Filaments, through which they pass, according to the various motions in which they are carried, it comes to pass that the Pores have a certain power of drawing and directing the Spirits, so that at length they pass out through the same intervals, and in the same manner as formerly they went out; and so the said Spirits finding out those Pores, enter more easily into them than others; whence it happens, that a man remembers any thing, when the said thing, having been formerly observ'd by him, hath left certain Vestigia in the Brain, by occasion whereof the said thing comes in mind.

X.
How we
come to be
able some-
times to re-
peat a
whole Ora-
tion.

Whence no wonder, if, upon hearing a Narration, or reading an Oration, which we have committed to memory, we are able afterwards to repeat the same, and that in the same manner as we heard or read it; because, as upon making of folds in Paper, the first fold being made, the rest constituted in the same series easily follow, as having regard to the said series. So that whatever Vestigium is first made in the Brain, the rest which have respect to that series, easily follow.

XI.
How we
come to re-
member
those things
which we
had forgot.

In like manner we remember things which we have forgotten, when we recollect a certain distinct Vestigium in the Brain, according as it occurs in the same series; from whence beginning to deduce and unwind the series, we proceed so far, till at length we discover that which, while hid, we enquir'd into. As in Paper, not meeting easily with some certain fold, we choose out some other distinct fold, occurring in the same series, from whence a deduction being begun, the fold which they hid is at length discovered.

XII.
What
things help
Memory in
the Brain.

All Species which help the Memory, are especially in the Glandule (which we have formerly declar'd to reside in the midst of the Brain) in regard that it is the principal Seat of the Soul; though other parts of the Brain are also sometimes

intervient to Memory; nay, even the Nerves-like-wise and Muscles, as is observable in a Minstrel or Musitian, who hath something of Memory at his Fingers ends, since his dexterity in the moving of them, and shifting them up and down, which he hath acquir'd by long use, helps his Memory to the finding out of those places, to the smiting whereof he is disposed; and for the same reason the Ideas of two things occur in the Mind, if they were both impress'd together: For upon the beholding of any ones Countenance, immediately there occur, at one and the same time, Eyes, Nose, Forehead, Lips, &c. in regard when we beheld his Face, all those things appeared. Hence they who have once tasted of any Meat, wherein they have observed any thing that might hurt the Eyes, can never remember the said Meat, but that also will occur, that it offended the Sight. Neither can they endure to bear any other person speaking of such sort of Meat, but they will be affected with the same aversion; the cause whereof is, that the Animal Spirits excite the same motion in the Glandule, which they excited, when they first beheld the Meat.

Reminiscence is an addition of something above Memory; for it is not enough to remember that the Species of a thing is simply objected, but it is also necessary, that when it occurs to us the second time, we take notice, that it therefore so happens, because it had been presented to our view before; for indeed Reminiscence is nothing but the Resumption, by present Memory, of Cognition first had, and then afterwards Obliterated; and much of the like Nature is the inquiry and recovery of the Knowledge of a Man whom we had forgot by reason of the present memory of Places, Plays, and the like; and consequently there is required to reminiscence, that the Images of things be partly obliterated, partly not; For we are then said to reminiscence, when, from the Footsteps of the Images which remain, we recollect something of those which were slipt from our Mind. Wherefore the whole difference which is between Memory and Reminiscence, consists only in this, that to Memory it suffices, if any Species return upon the Glandule, and that Species be received without any reflection: But to Reminiscence, besides that reception of the thing, it is required, that the return thereof be known to us, and that we may have knowledge, that we had it, or perceived it before.

From what hath been said, may be easily collected, that Conscience, or Self-knowledge is involved in all Human Knowledge, and is inseparable from it; for Conscience is so manifest and intrinsic to the Mind, that it cannot be abstracted from it; but upon that very account, it may be affirmed to be destitute of Sense and Knowledge, properly so called; for that which acts and suffers, and yet knows not that it acts or suffers, may be justly said to want sense in the said action or passion; as is clearly demonstrated in those who being wholly intent upon any thing, or being moved with anger, perceive not; for examples sake, the sound of a Bell, or any thing presented to the sight, and consequently neither are sensible of, nor acknowledge any of those things. From whence it appears, that Conscience is a certain Species of Cognition, namely that immanent or inhering action of a thinking Substance, by which it knows that

XIII.
What Re-
miniscence
is, and
what it
adds above
the Memo-
ry.

XIV.
Conscience
is included
in all
Knowledge.

that it hath a real *Cognition* or perception of any thing. Forasmuch as *Conscience* seems to be no other thing but the mind indued with knowledge, as well of it self, as of its own *Cogitation*: whence *CICERO* in the 3d. Book of his *Offices*; When, saith he, a Matter is to be propos'd to a person sworn, he is to remember that he hath *GOD* for a witness of what is said to him; that is to say, according to my Judgment, his own Mind. Whence it follows that we are convinced by *Conscience*, as by a clear and distinct Knowledge.

XV. Nor is it against our assertion, to say that the Mind is able to form various judgments, even tho' false, concerning its own perception, and intellection; because the Mind is never deceived in this, namely, that it should know or understand, at that time when it thinks that it knows and comprehends. In regard this Perception or Cogitation is always perfected by the Mind in the Mind, and therefore it cannot be, that when I think that I receive any thing with my Ears, I should not have such a perception; nay though it were possible, and should often happen that I should not hear at all, and the Organ of hearing should not be affected with any thing, so long that I think that it is affected; as we find it falls out in our Dreams: So that in all Cognition, two things chiefly are to be observed; the first is *Conscience*, which is that *Animadversion* whereby we mark, or take notice of any thing; the other is that which is said to be *Animadverted* or observed, and is all that which is immediately apprehended by the Mind, and which in the first and second part of this Institution we have often call'd *Idea*.

XVI. Now since the Indowments of Wit have also regard to the Soul, it may be here inquired, what Wit is, and whence so great a diversity of Wits arises, and why some men are more propense to certain Studies, and certain peculiar managements of Life than others. As to the first, some so describe Wit, as to call it a power implanted in man to understand, act and govern himself and others, to be approved in Virtues, or commit Vices; in all which generally one man very much excels another. In fine, Wit seems scarce to differ from Ingenuity or Aptness, and thereupon it may probably be said that it chiefly depends upon the Organs of the Body, and the disposition and contexture of the Fibres.

XVII. As to the second, concerning the Variety of Wits, It can by no means or possibility be imputed to the diversity of Souls; for in regard all Souls are Intellectual and Incorporeal, and own no Author but *GOD* alone, they seem, according to Nature, to be altogether equal, (unless *GOD* for some certain ends should design to produce some more perfect than others) and then all the inequality which is deprehended in them, must proceed from the variety of the Organs, and especially of the Brain: We understand not human reason pure and abstracted from the Body, but the same so far as it is perfected or hindred, in any manner, by the disposition of the Body.

XVIII. So *DES CARTES* in the beginning of his Dissertation, concerning the method of rightly using Reason, reckons up three qualities of Wit; Celerity of Thinking, Facility of distinctly Imagining, and Capacity and use of Memory: Nor does

he acknowledge, that he knows any other qualities different from these, by which Wit can be rendred more excellent. But right Reason or a good Mind, that is, a Power of judging incorruptly and discerning true from false, he concludes to be equal in all, and distinguishes it from Wit.

Now whence should the Celerity of Thinking proceed, but from the agility and promptitude of the Spirits? for we see Men frequently after a chirping cup of Wine, to become more chearful; and indued as it were, with a new faculty of Thinking; whence that trite Adage, with little variation from *Horace*, Rich Wines make even Fools Philosophers. On the contrary, we see others of an acute Understanding and Sagacity of Wit, upon taking a Cup too much, or upon the Brain being ill affected, by never so small an indisposition, to become Heavy, Dull and Stupid, and very much unlike themselves, as to what they appear at other times, which certainly argues that the Celerity of Thinking, depends much upon the disposition of the Body, and that the inequality of the Operations proceeds from the inequality of the Organs.

In like manner the Facility of distinctly Imagining, and the capacity of Memory having regard to the internal Senses, are acquired chiefly by use, and rendred familiar by long habit and custom; whence we find by experience, that not all Men are carried with the like proclivity to certain kinds of Studies, but that as in some Men there is one sort of ingenuity, in others another: So there is a various promptitude to attain to Sciences; for they that are prevalent in Imagination, are very comprehensive of Mathematical Demonstrations, but have not happy success in Metaphysical Speculations; which happens not for want of Ratiocination; but because in Mathematicks Imagination only, not Ratiocination is made use of. So *DES CARTES* Part 2. Epist. 33. That part of Wit, namely Imagination, which is chiefly conducive in Mathematicks, hurts more than profits in Metaphysical Speculations. The diversity therefore of Wits ariseth from the constitution of the Organs, and from the temperament of the Brain and Spirits; which disposition, nevertheless, in regard it varies infinite ways; no wonder some Geniuses are most inclined to Philosophy, others follow Mathematicks, others Musick, &c.

CHAP. VI.

Of the Affections or Passions of the Mind.

HAVING treated apart of the Nature of the Body and Soul, and distinguished the Functions of both, it remains that we say something of the Passions which are peculiar to Man, to whom nevertheless they are no otherwise Attributed, but as he consists of Body and Soul; for those Affections and Operations being neither belonging to the Mind alone, nor to the Body alone, proceed meerly from the Union and confederacy of Mind and Body; such as are the Passions, which are called Affections and Commotions of the Mind; because it is the Mind, which they principally shake and divers ways impel and disturb: For tho' the Senses depend also upon the said Union of Body and Soul, yet they gently insinuate themselves

XIX. Celerity of Thinking depends upon the Spirits.

XX. The facility of distinctly Imagining, and capacity of Memory ariseth from the disposition of the Body.

I. That the Passions of the Soul are distinguished from the Senses.

themselves into the *Mind*, and relate not so much to the *Soul* as to *External Objects*, by which also they may be deceived and drawn into an Error; but the *Affections* of the *Soul* are inward, and so adhere to it, that it cannot have experience of them any other way but as they are; whence it comes that they who are in a deep *Sleep*, seem to behold certain things with open *Eyes*, and to suffer those things in the *Body* which no way touch us: Yet nevertheless, it can be no way brought to pass, that we should feel our selves *sad* or *deeply in Love*, but that there must be really such a commotion in us, and that we are affected not with a *Feigned*, but *Genuine Love* or *Sadness*.

II.
The defini-
tion of Pas-
sion.

Wherefore the *Passions* of the *Soul* are thus best defined: The *Perceptions*, or *Senses*, or *commotions* of the *Soul*, which are *referr'd* especially to it, and which are *produc'd*, *conserved* and *corroborated* by a certain *motion* of the *Spirits*. They are first called *Perceptions*, because that name is common to all *Cogitations*; and we use it to signify all *Cogitations*, which are *produc'd* without the *Concourse* of the *Will*, and which are excited by impressions left in the *Brain*; for whatsoever is not *Action*, ought to be called *Passion*.

III.
Each part
of the de-
finition ex-
plained.

Next, they are called *Senses*, because they come to the *Soul* after the manner of *Senses*, and are of the number of those *Cognitions*, which by that straight bond that is between *Soul* and *Body* are rendered confused: But by a special term they are called *Commotions* of the *Soul*, in regard we are taught by our own experience; that no *Cogitations* enter into our *Soul*, which so much disturb and move it as those do. It is moreover added, that they are especially *referr'd* to the *Soul*, to distinguish them which come from exterior *Objects*, or arise from interior dispositions of the *Body*, as the preceptions of *Colours*, *Odours*, *Sounds*, &c. which are referred to *External Objects*; *Hunger*, *Thirst*, *Pain* which are referred to our *Body*.

IV.
Passions de-
pend upon
the con-
course of
the *Spirits*.

Lastly, it is concluded that those *Passions* are *produc'd*, *Nourish'd* and *Corroborated*, by a certain *peculiar motion* of the *Spirits*; to distinguish them from the proper *Acts* of our *Will*, which indeed may be called the *commotions* of the *Soul*, and also such as may be *referr'd* to the *Soul*, but which are not *produc'd* from the *Spirits*, but from the *Soul* it self. Whereas, in the *Passions* the *Animal Spirits* proceeding from the *Heart*, are carried into the *Brain*; and from their *commotions* ariseth the perturbation of the *Soul*, and being risen is *conserv'd*, so long as the *Animal Spirits* passing the same way, agitate the *Mind* by the same reason; and upon their increase, the commotion of the *Mind* may so increase as to be excited by them, not only to *judge*, but vehemently to *desire*, and sometime to grow *Mad*.

V.
How Hu-
man Pas-
sions are
distinguish'd
from the
Affections
of a Sepa-
rate Soul
or Angel.

Whence the *Passions* which are incident to *Man*, as he is composed of *Soul* and *Body*, are distinguish'd from those which are belonging to a *Separate Soul*, or *Angel*; for there is no doubt, but that a *Soul* dislodg'd from the *Body* is toucht with various *Affections*, and is lyable to divers kinds of *Motions*: For seeing it hath a clear and distinct knowledge of things, it may also have *motions* attending the said *Cognition*; and so long as in those things it deprehends good or evil, it may refer them to it self, and consequently prosecute them with *Love*

or *Hatred*: For if it obtain that good which it hath judg'd convenient for it self, there cannot but arise much *Joy* thereupon; but if it find it self deprived thereof, *Sadness* will follow: Yet those *Passions* differ from ours, because they are not joind with the *motions* of the *Animal Spirits*, which excite and conserve them in us. Nay, they arise in them by a clear and distinct *Cognition* which they have, of the thing which they look upon and behold as their good.

But lest for the future any difficulty should arise about the word *Passions*, we assert that *Actions* and *Passions* in *Intellectual* and *Cogitative things*, are no other than what they are in *Corporeal things*; for as in a *Material thing*, *Action* and *Passion* consist in *Local motion*, being called *Action* when the *motion* is conceived to be in the *Movent*, and *Passion*, when it is considered to be in the thing *moved*; so in *Incorporeals*, *Action* is said to be, that which holds on the *Movers* side, as *Volition* in the *Soul*: *Passion* is that which keeps on the part of the thing *moved*, as *Intellection* and *Vision* in the same *Soul*. So the *Affections* which we take upon us here to describe, are called *Passions* in respect of the *Soul* to which they belong; but *Actions* in respect of the *Body*, which *Acts* immediately upon the *Soul*, and in its *Actings* effects mutation and variety.

But because in *Man* there are found various *Passions*, and those *Passions* obtain several *Names*, according to the diversity of *Agents*: We say, those *Passions* are only considered by us, which proceed from some particular *Agitation* of the *Spirits*, and whose effects are as it were felt in the *Soul*; for tho' other impressions, which are formed in the *Brain* by *External Objects*; or which depend upon the Footsteps of former impressions left in the *Brain*; or which by the ordinary course of the *Animal Spirits*, are presented to us *Sleeping* or *Waking*, may be called *Passions*; that is, so far as they are excited in the *Soul* without the concurrence of the *Will*: Yet to speak properly, they are not so much to be called *Passions*, as *Habits*, or *Propensions* which dispose to some *Passion*, since they move not the *Soul*, nor depend, or are cherish'd by any special course of the *Animal Spirits*.

Although the *Agitation* of the *Spirits*, may be called the proximate cause of our *Affections*, yet there are other remoter causes, which may be assigned, as the *Temperament* of our *Body*, which conduces not a little to the exciting of *Passions* in the *Brain*; since it is in the stead of *Disposition*, and after a sort impells the *Soul* to follow its propensions: Hence, those who have their *Body* any way disposed to *Love*, easily suffer their *Minds* to be drawn away to those *Cogitations*, by which they are excited to the said effect.

The second *Principle* is those *Objects*, which incur into our *Senses*; as any terrible *Figure* excites the *Passion* of *terror* in the *Soul*; whereas a grateful *Figure* which courteth the *Eyes*, causeth *Joy* and *Benevolence*; in regard the *motions* convey'd from *External things* to the *Brain*, variously dispose the *Spirits* thereof, and thereupon there arise different *Affections* in us: So that who ever desires any thing of us with a smooth *Tongue*, down-cast *Eyes*, and a *Body* disposed to *Humility*, will more easily obtain his desire of us, than another

VI.
Affections
are call'd
Passions in
respect of
the Soul,
Actions in
respect of
the Body.

VII.
Passions
ought to
move the
Soul.

VIII.
The various
causes of
Affections.
First Tem-
perament.

IX.
The second
cause of
Passions is
the Objects.

ther, who on the contrary, with a severe Countenance, an imperious Tone of Voice, and more like a Commander than a Suppliant demands the same.

X. The third Cause, is the Action of the Soul it self, as often as according to its innate Liberty, it proposes such or such Objects to be considered, in the long meditation where the Passions arise.

XI. The fourth Cause is, the first Disposition of the Body in regard not only Affections; may be excited in us by Rational motions of the Mind, whilst it knows what to prosecute with Love or Hatred; but also by those first Dispositions of the Body, that procreate those obscure Sensations of Good and Evil, which happens to the Body, as DESCARTES intimates in his Epistles. Behold, saith he, four Passions, Joy, Love, Sadness and Hatred, which I suppose being first in us, we had before our Birth, and judge them to be no other than very confused Sensations or Cogitations; in regard the Soul was so tied to Matter, that it could not yet attend but to those divers impressions, that were to be received from it: And tho' after some years, it began to be affected with other Joys, and other Loves than those which depend only upon a right Disposition, and convenient Aliment of the Body; nevertheless that which was Intellectual in its Joys and Loves, had always concomitant those Senses which the said Passions first excited in it; yea, and those Natural motions and functions which were then in the Body.

XII. So by reason, that before the Nativity Love did not arise but from a convenient Aliment, which flowing in great plenty into the common Ocean, the Heart and Lungs, excited in them a greater heat than usual; hence it is, that the said heat always accompanies Love, tho' proceeding from far different Causes.

XIII. Now we may observe, that there is a threefold degree in the Affections of the Mind, answerable to a threefold degree of the Senses. The first is the commotion or alteration of the Heart, the Blood and the Animal Spirits: The second being a consequent from the first, is the perception of the Mind. And lastly, an access of perturbation of Mind, so far as it precipitates inclination or aversion of Judgment or Will, is the third degree in the Affections.

CHAP. VII.

In what part of the Body the Soul receives its Passions.

I. From what hath been said, is sufficiently manifest, that Human Soul is joind to the whole Body, and that the motions thereof so depend upon its Cogitations, that they may be said to make one compound. Hence that common saying among Philosophers, That the Soul is whole in the whole Body, and whole in each part thereof: Not that the Soul can positively, and by true extension be found in each part of the Body, for that is repugnant to immaterial Substance, such as we have already demonstrated Human Mind to be; but because the Body is one certain thing, and in a certain peculiar Sense Individual, namely in respect of the disposition of the Organs; all which

are so mutually related one to another, that any one being taken away, the Body is thereby rendered maimed and imperfect; and since such is the Nature of the Soul, that it is void of all Extension and Dimensions, it can be referr'd to no Member of the Body so as to equal its quantity; but only to the whole Compages of the Organs which is considered as one; whence it comes to pass, that any part of the Body being cut off, the Soul could not be conceived a jot less, nor if any could be added, a jot greater.

But tho' the Soul were joind to the whole Body, yet it could be said more intimately and immediately to be united to one part than another. Thus GOD, tho' he be diffused through the whole World, and by his Power in a manner fills all places, yet in a peculiar way he may be said to be in Heaven, where he Governs and Rules all things as he pleaseth. So we say, that Human Mind resides in the Brain, as in the upper part or Citadel of the Body; and that not promiscuously neither in all its Parts, but more especially it hath its Seat in the Conarion, whose office it is to receive the Animal Spirits, and to unite in it self the Images proceeding from Corporeal Organs: For this is that part, wherein the Soul most proximately and especially exerciseth its Functions, by perceiving and willing all things which proceed from the Body, or have their tendency into it.

The reason why such a Glandule is asserted to be in the Brain, and to be the Seat of the Common Sense, I have already declared, to which others may be added, whereof this is not the most inconsiderable, that our Soul is one and undivided, and consequently it seems most consentaneous to reason, that that part of the Body to which it is immediately joind be also one; and since there is no part in the Brain besides this Glandule which is not double, it seems most probable to be the Seat of the Soul; and that which conduces not a little to the confirming of this Opinion is, that this pineal Glandule is as it were seated in its Throne, from whence it may, as I may so say, have a fair prospect into all the 4 Ventricles of the Brain, and so may easily receive impressions from the Nerves that come from all parts: Moreover this Glandule is sufficiently agile and moveable, as being hung upon two Nervous strings, so that it may be moved this way or that way, according to the arbitrement of the Mind; which is the thing chiefly required in the common Sensorium, for otherwise the Spirits could not tend one way more than another.

These things thus briefly stated, it must be concluded, that the Passions have their chief residence in the Brain, not in the Heart, as some would have it; since when ever there are Cogitations or Senses, as above noted, they are produc'd by the Mind in the Brain; nor is what we affirm rendered invalid by saying, that the Passions, which are always accompanied by some commotion of the Blood and Spirits, may be as it were felt in the Heart, for that so happens because all the Nerves of our Body, are extended as certain Filaments into all parts of the Body: So that when it suffers Pain in any of the Members, for Examples sake, in the Foot or Leg, it is not to be imagined that the Soul makes use of its faculties in those parts; but rather that it feels Pain, by the

the ministry of those *Nerves* which are extended from the said *Members* to the *Brain*. No other-wise than when one end of an extended *Rope* is drawn, the other is immediately moved, as hath been above declar'd.

V. In what Order the Passions are form'd. So the *Blood* being well tempered, and expanding it self more than usually in the *Heart*, the little *Nerves* being diffused about its *Orifices* are so loosened and agitated, that there follows thence another *motion*, which affects the *Mind* with a certain *Natural Sense* of *bilarity* or *cheerfulness*. So upon the imagination of the *fruition* of any good, the *Spirits* are sent from the *Brain* to the *Muscles*, and by their help the *Orifices* of the *Heart* are dilated, and its *Nervules* mov'd in that motion, from whence the *sense* of *Joy* cannot but follow. In like manner, upon the receipt of a grateful *message*, as soon as the *Mind* perceives it, the *Spirits*, from the *Brain*, flow to the *Muscles* of the *Bowels*, and there moving the *Nervules*, by their means excite another motion in the *Brain*, which affects the *Mind* with a *lively sense* of *Joy*. And by the same reason, the *senses* of *Sadness*, *Love*, *Hatred*, *Anger*, *Fear*, &c. are communicated to the *Brain* through the *Nervules* of the *Bowels*, and there immediately, and most especially affect the *Mind*, and consequently reside therein, as in their primary *Seat*; but in the *Heart* and other parts affected by them, as in their secondary *Seat*.

VI. It is not necessary that the Soul be in the Heart, thereby to perceive Passions. Therefore whilst in the *perturbations* of the *Mind*, we observe a certain alteration, as it were, inhering in the *heart*; we must certainly conclude, that our *Mind* perceives not but by the help of some *Nervule* which reaches from the *Brain* to the *Heart*; and there is no more necessity that the *Soul* should immediately exercise its *functions* in the *Heart*, because it feels its *Passions* therein, than that it should be in *Heaven* as often as it perceives the *Rays*; and the *Globular Pression* made by the *Sun*.

VII. The more vehement Motions of the Spirits may disturb the Soul. Hence it often happens, that divers *affections* arise in the *Soul*, namely, when the *Spirits* are otherwise disposed by the *Mind*, than by the *Objects*, or their own temperament. In regard that *Human Mind*, tho' it be wholly rational, yet does it not always make good use of its own *reason*, but is greatly disturbed by *external things*; so that the *Body* by its *Spirits*, and the *Soul* it self by its *Will* may excite different *Motions*; and herein conflicts those conflicts which are vulgarly said to interceed between the lower and upper part of the *Soul*. For since all our *perceptions*, as well those which proceed from the *Will*, as those which depend upon the *Impulses* of the *Spirits*, contain something evident in them, that may invite to prosecute this or that *Object*; this by *Love*, that by *Hatred*: the *Glandule* may be drawn one way by the *Soul*, another way by the *Animal Spirits*; from which different *motions*, the *Soul* feels it self alternately inclin'd, one while to take one part, another while the other; and in this one thing consists their repugnance: yet not so, as that the *Soul* can at one and the same time be carried two contrary ways, or the *Glandule* be at the same moment inclin'd to opposite parts, but only upon this account, that the *force* wherewith the *Spirits* incline the *Glandule* on one side, and wherewith the *Mind* struggles with its *Will* on the other

side, hath this effect, that the *Soul*, almost at one moment, feels it self stirr'd up to have an *affecti-on*, and *aversion* for one and the same *Object*.

CHAP. VIII.

Of the Order and Number of the Passions.

ALTHOUGH the *Soul* depends not upon *Corpo-real Objects*, so as to *think*, and without any *material Species*, to be able to comprehend all sorts of *things*: And tho' in the forming of the *Passions*, it sometimes makes use of its own *intelligent faculty* alone, and can at pleasure apply it self to conceive sometimes one *Object*, sometimes another; yet it is manifest from what hath been said before, that the *passions* may also be excited by *Objects* which move the *Sense*: Nay, and that these *Objects* are the most especial and common *principles*: so that to find *passions*, there needs nothing but to weigh the nature of the *Objects*, and to take notice of the *Effects* which proceed from them. But because in *man* they are many and various, and many times so confus'd among themselves, that they can scarce be distinguish'd from each other; we must mind the diversities of *Objects* which present themselves to our *Senses*, that by the perception of them, we may the more easily arrive at the knowledge of those *affections* which are begotten in us. Yet there is no necessity that all the diversities of *Objects* should be examined; but those alone which can either profit or hurt us, or any other way be relating to us.

Wherefore the better to enumerate the *Passions*, we are only to take notice how many several ways *Objects* may concern us, or may act upon our *Senses*, so as to profit or hurt us. Nothing is more frequent in *Schools*, than to take the *Soul* in pieces and to divide it, I know not by what *Art*, into *Sensitive* and *Rational*, by which they constitute two *Appetites* in the *sensitive part* of the *Soul*; whereof one they call *concupiscible*, which resides in the *Body*, and tends wholly to its *Conservation*; the other *IraScible*, which comes nearer to *Reason*, and supplies it with *strength* and *vigor*. But hence arose this Error of assigning 2 persons as it were in a *Scene*, that they did not carefully distinguish the *Functions* of the *Soul* and *Body*, but attributed to the *Soul* those *Offices* which belong to the *Body* only. For whatsoever opposes *Reason*, cannot proceed but meerly from the *Body*, which comes to pass when the *Animal Spirits*, which are also *Bodies*, hit by an opposite way upon the *Glandule*, and by their *power* endeavour to hinder the effect of the *Soul*. For in one *Body* there is to be considered but one *Soul*, void of all parts, and being but one and the same, called both *Sensitive* and *Rational*.

But if those *Authors*, who admit 2 *Appetites* in the *Soul*, only mean this, that the *Soul* is indued with 2 *Functions*, the one of *Lustling*, the other of being *Angry*, we shall not gain say them; but whereas it hath the *faculties* not only of being *Angry*, and being *Concupiscible*, but also the faculty of *Admiring*, *Hoping*, *Fearing*, there seems to be no reason that all *affections* should be referred to *Concupiscence* or *Anger*; when as *Ad-miration*,

I. Passions are made different from their Objects.

II. The Soul is void of partition, and consequently ill divided into Sensitive and Concupiscible.

III. There are divers faculties in the Soul.

miration, which is the primary Affection, hath no relation either to *Concupiscence* or *Anger*.

IV. Therefore another way must be found out to enumerate the *Passions*; and in my mind there can be none more convenient, and more certain, than for all the motions of the *Mind*, which occur to us, to be considered in their *Order*. For as soon as any thing presents it self to us, or appears under any *species* which hath no similitude with any thing we knew before, it causes the *Soul* to be surpris'd at the sight thereof, and to remain some time in *contemplation* upon it; and in regard this may possibly happen before we have well considered whether the said thing represented to us be good or bad for us, it hence follows that *Admiration* is to be accounted the first of all those Affections which are inbred in us; but since it happens that we either *admire* the excellency of any admirable *Object*, or *contemn* the despicableness of any other, either *Esteem* or *Contempt* must needs accompany this *Admiration*, and by this means *Magnanimity* or *Abjection* of *Spirit* are created in us; namely, while we either extol our selves for some just cause, or contemn our selves for that pusillanimity which we find to be in us: But when we esteem greatness of *Action* in other persons, whom we esteem capable of doing *Good* or *Ill* to *Mankind*; from such an esteem as this proceeds *Veneration*.

V. In the next place, when the *Soul* considers under some qualification an *Object* of *Good* or *Evil*, that is, of what is either agreeable or ungrateful to us, having no regard to difference of time therein, it excites either to *Love* or *Hatred*; forasmuch as *Love* is an Affection of *Union*, as *Hatred* is of *Separation*. But when respect is had to time, that is, when a man is more carried on to the *Contemplation* of the future, than of the present or past time; a future *Object* is expected, either as only possible, or moreover as *easy* or *hard* to be obtained. From the former consideration is kindled *Cupidity*, by which not only the presence of an *absent Good*, and the conservation of what is posselt is desired, but also the *Absence* of an *Evil*, as well present as in apprehension. But if a thing be represented, not only upon the account of possibility, but also as *easy* of acquisition, it begets *Hope*, the utmost degree whereof is *Trust* or *Security*. But if it be lookt upon as difficult to be obtain'd, it creates *Timidity* or *Fear*, the utmost degree whereof is *Despair*: Hitherto may be referred *Doubtfulness* or *Fluctuation* of *Mind*, when we dispose our selves to deliberate or enter upon *Counsel*.

VI. Lastly, when *Good* and *Evil*, as being considered to have relation to us, are present, they produce 2. other Effects; the first *Joy*, the other *Sorrow* or *Sadness*. But when we look upon them as relating to others, we judge those persons either worthy or unworthy of so great a *Good*. If worthy, it produces gladness in the *Soul*, either *Serious* or mixt with *Derision*: If unworthy, the good which attends upon them stirs up *Envy* or *Heart-burning* in us; and if bad attend them, it stirs up *Commiseration*, which is a kind of *sadness*.

VII. In an *Object* past, or even also present, attention may be had to the Cause of *Good* or *Evil*. A *Good* which has been done by us, if it relate to opinion we have of it as *Good*, it begets an inward acquiescence or contentment, which is the

sweetest of all *passions*, and wonderfully delights the *Soul*; whereas an *Evil* done, if it relate to the *Opinion* we have of it as *Evil*, brings forth *repentance*, which is the most troublesom of all the *passions*, and incessantly disturbs and afflicts the *Soul*. A *Good* done by us, as it relates to the *Opinion* which others conceive of it, produces *Glory*; on the contrary, *Evil* so relating, *Shame* and sense of *Disgrace*. If a *Good* be conferred upon us by another, we testify our *Gratitude* towards him: If the same *Good* be bestowed upon another, he is the *Object* of our *Favour*: On the other side, if an *Evil* be inflicted on others, it causes our *Indignation*; if on our selves, our *Anger*; which two last Affections may be said to be species of *Hatred* or *Aversion*. A long *Duration* or *Continuance* of *Good* induces *Satiety* or *Loathing*; as on the contrary, *Duration* of *Evil* diminisheth *Pain* or *Misery*, and renders it more light and tolerable.

Lastly, from a past *Good*, upon remembrance of the *Joy* thence received, there springs up *Desire*, as from an *Evil* happily surmounted, *Hilarity* arises, which may be referred to *Joyfulness*. Now altho' we have here enumerated several sorts of *Passions*, yet if they be each of them well considered and examined, it will soon appear, that many of them are referrible to others as primitive ones, which are reckoned only 6 in number, namely *Admiration*, *Love*, *Hatred*, *Cupidity* or sensual desire, *Joy* and *Sadness*: The rest are secondary, being either compounded of many of them, or referrible to them as to their *Genus*'s.

CHAP. IX.

Of Admiration.

Ad miration leads up a Troop of *Passions*, being the first and chief of all that affect *Human Mind*, and upon which all the rest, in some sort or other, depend. For as in other Functions of the *Soul*, *Apprehension* precedes *Judgment* and *Discourse*, and it is necessary that some *Object* be represented before such time as the *Soul* gives or denies assent thereunto: So any thing whatsoever is perceived by *Admiration*, before any one can prosecute it with *Love* or *Hatred*, or can *Corvet* it, or conceive *Joy* by the obtaining of it, or *Sorrow* by the want of it.

Now *Admiration* is a suddain impulse of the *Mind*, by which it is led to an attentive consideration of those *Objects* which seem unwonted to it, and with the novelty whereof it is surpris'd. This *Passion* belongs to the *Brain* alone, and hath no commerce with any other parts of the *Body*, as other *Passions* have, which are referred to the *heart*, and which the motions of the *Blood* and *Spirits* ever accompany. That this is peculiar to *Admiration*, may be collected from hence, namely, that when ever this *Passion* is imploy'd in the attention of the thing perceived, and only regards the novelty thereof, it hath no consideration therein either of *Good* or *Evil*, and consequently hath no correspondence with the *Heart* and *Blood*, upon which the whole concern of the *Body* depends, but only with the *Brain*, in which are laid up all those *Instruments* which conduce to the forming of this *Cognition*.

VIII. Desire, Hilarity, &c.

I. Admiration precedes all other Passions.

II. The definition of Admiration.

The

III.
What pro-
duces Ad-
miration.

The Cause of this *Affection* is the very Impres-
sion made in the *Brain*, according as it represents
some Extraordinary Object, worthy the *Souls* Em-
ployment and Attention. For the *Novelty* of the
thing hath somewhat of Gratefulness, which takes
the *Beholders*, and draws their *Contemplation* to it.
Hence it comes to pass, that we admire all things
that are Novel, and those always please most that
came latest into our *Sense*. To confirm what hath
been said, the *motions* of the *Spirits* are not a little
conducting, which are dispos'd by that *Impression*,
and with great Violence direct their *Course* to-
wards that part of the *Brain* in which it was
form'd; and so far as they receive from it a dispo-
sition to pass into the *Muscles*, which serve to
retain the *Organs* of the *Senses* in the same Po-
sition.

IV.
The force
and efficacy
of Admi-
ration.

Altho' *Admiration* takes beginning in the *Brain*,
and is wholly employ'd in the *Contemplation* of a
New and unwonted Object; yet nothing hinders,
but that by the said *Impression* which it makes in
the *Brain*, it may act upon our *Body*, and imitate
the Efficacy of other *Passions*. Nay, sometimes it
grows so prevalent, that it seizeth on our *Body*
more strongly than they, and exercises its Power
upon it much more forcibly; which chiefly pro-
ceeds from hence, namely that the *Novelty* from
whence it springs, brings forth *Motions* the most
prompt of all, and such as have their whole
strength at the beginning. Nor can it be doubted,
but that these sort of *Motions* are stronger, than
those which are increas'd by degrees, and have no
strength, but what they acquire by little and little.
Since it is most certain, that such like *Motions*
may either be averted, or stopt by little labour;
whereas the sudden Surprizal of a New thing,
admits of no such aversion, since it can scarce be
discern'd, and insinuates it self in a moment.
For as we can stir *Hand* or *Foot* almost in the same
Moment in which we think of *Moving* them;
in regard the *Idea* of this sort of *Motion*, which
is form'd in our *Brain*, sends *Spirits* into the *Mus-
cles*, fit to effect that said *Motion*: So the *Idea* of
a grateful Object, which comes unawares into the
Mind, immediately by the help of the *Nerves*,
sends *Spirits*, which opens the *Orifices* of the
Heart. Nor does *Admiration* any thing else in
this business, but by its *Novelty* add *Strength* to
the *Motion*, and causes the *Blood*, which upon the
sudden dilating of the *Orifices* of the *Heart*, flows
through the *Vena Cava* into it, and goes out
through the *Vena Arteriosa*, suddenly to inflate
and expand the *Lungs*.

V.
A Novelty
affects the
Brain in
an un-
wonted
manner.

To which *Reasons* another also may be added,
namely, That those Things which outwardly
excite *Admiration*, when they are New, and have
not yet arriv'd through our *Senses* to the *Brain*,
strike it in some certain Parts, where it hath not
been struck before; and since those Parts of the
Brain are more soft and tender than the rest, it
falls out that they receive the Stroke deeper, and
the *Affections* of the *Motions* which are there
begotten, are, by reason of their unwontedness,
render'd more Vehement.

VI.
Esteem and
Contempt,
Species of
Admira-
tion.

There are 2. Species of *Admiration*, *Esteem*
and *Contempt*, which are not to be taken for
simple *Opinions*, that without *Passion* may be
entertain'd concerning the Value of any thing
whatsoever, but for the *Affections* which arise

from those *Opinions*: *Esteem* therefore is a pro-
pension of the *Soul*, produc'd by the Motion of the
Spirits, to represent to its self the Value of any
thing whatsoever. And *Contempt* is the opposite
propension which the *Soul* hath to consider the
Littleness or *Vileness* of the thing Contemn'd:
which *Passions* may be refer'd not only to *Exter-
nal Objects*, but even to our selves; as namely,
when we strictly enquiring into our selves, find
Reason to suspect or despise our own *Merit*. But
in regard we often flatter our selves, and judge
that more laudable, which is done by our selves,
than by others; it will be worth our while to
understand what it is, for which we may entertain
a Self-esteem. And truly, I can see nothing that
I judge can be Entitled to this *Merit*, but the
right use of our *Free will*, and that *Greatness* of
Soul by which we govern our *Wills*, and subdue
them to the Yoke of *Reason*. Forasmuch as other
Goods, which are out of our power, can conduce
nothing to our Good, and consequently deserve
not our *Esteem* or *Praise*. Only those *Actions*,
which depend upon our *Will*, can confer upon us
the *Merit* either of *Praise* or *Dispraise*; since by
the use thereof we are render'd in a sort like to
GOD, and come so much the nearer to his *Image*.
In this alone true *Generosity* consists, when a *Man*
well knowing that nothing properly is his own,
except the free disposition of his *Will*, duly Va-
lues himself as he sees Cause, upon the right use
of his *Reason*, and retains a firm purpose always
to act those things which he shall judge to be
most Excellent.

Veneration, which considers Objects without us,
is an Inclination of the *Soul*, by which it is carried,
not only to *Esteem* the Person which it honours,
but also to Subject it self to him with a certain
Fear, for the sake of gaining his Favour. Whence
it comes to pass, that *Veneration* proceeds only
from the Consideration of *Power*, which we con-
ceive to be in a *Free Agent*, wherewith he is
able either to benefit or hurt us; although all this
while we know nothing of his *Will*, that is, we
are not certain which of the two will befall us,
Good or *Harm*. So in Old times, some venerated
Mountains, *Temples* and *Groves*, not that they
believ'd, that these *Works* of *Art* and *Nature*
were *GODS*; but because they imagin'd, that
certain *Divinities* lay hid in them; which
might at their pleasure either do them *Good* or
Hurt.

To this *Passion*, *Dedignation* or *Disesteem* is op-
pos'd, by which we despise *Free Causes*, though
at the same time we judge them to have power
of doing *Good* or *Harm*; because we think them
so much beneath us, as not to be capable of Ex-
ecuting their said *Power* upon us.

Stupour, or *Amazement*, is an Excess of *Admi-
ration*, which happens to us when a sudden Sur-
prizal causes the *Spirits*, which are included in the
Cavities of the *Brain*, so to advance to that place
in which the *Image* of the Object, which we
admire, is form'd, as sometimes to carry all to the
said place, and to make them so employ'd in Con-
serving that *Image*, that from thence to the
Muscles, from those *Vestigia* which they first fol-
low'd in the *Brain*, no way lies open to any others.
Whence it happens, that the *Body* remains wholly
immoveable in that State wherein it first was;
and

CHAP. X.

Of Love and Hatred.

I.
Why Love
and Ha-
tred are to
be treated
of together.

Altho' Hatred be oppos'd to Love, and they both of them never agree in the same Per-
son, about the same Object, nevertheless it is Expe-
dient to joyn both together in this one Chapter,
that by comparing the Nature of them both, one
with another, it may the more appear wherein
they most chiefly differ.

II.
The Defini-
tion of
Love.

LOVE is defined, a Perception or Commotion
of the Soul, generated by a special Motion of the
Spirits, whereby it is excited to joyn it self by its
Will to those things which seem grateful to it.
On the contrary, HATRED is a Commotion of
the Soul, produc'd by the Spirits, by which it is
incited to separate it self, by its Will, from
Objects which are represented as ungrateful and
noxious to it. But in regard the Soul applies it self
to those things which it judges Good, and is averted
from the very same things, so far as they are re-
presented to it under the Notion of Evil; not
only by Love and Hatred, but also by Judg-
ment; we add, that Love and Hatred are caus'd
by the Motion of the Spirits, which is peculiar to
all Passions, and which separates them from other
Perceptions of the Soul. To joyn our selves by
Will to any Object, is not to tend to that which
is future, and to covet it as a thing absent; but to
consent by Affection, which happens when we
consider our selves, as it were already joyn'd to
the thing belov'd, that is, when we conceive our
selves to make up, as it were, one Total with it,
and whereof we think our selves to be but one
part, and the Belov'd thing another. But in
Hatred, we consider our selves as a Total, wholly
separated from the Object.

III.
What
things pro-
duce Love
or Hatred.

The Causes of these Affections, are Objects
which may be represented to the Soul by the Inter-
nal Senses, to wit, its own proper Reason. For
that is generally accounted Good or Evil, which is
judg'd by our Internal Senses, either agreeable or
contrary to our Nature. Or else by the External
Senses, by which the Beauty or Deformity of
things is apprehended. For we commonly judge
those things Beautiful or Deformed, that court or
offend our Sight; which, in that particular, ex-
cells all the rest of our Senses. Hence we are
inclin'd to things beautiful and fair by that part
of Love, which may rightly be call'd Complacence.
Evil and Deformed things, we prosecute with
Hatred and Horreur. The said Love may also be
called Benevolence, in regard we affect not all
things with the same Affection: For according to
the Esteem we have of them, we love some things
more, and some things less; whence Philosophers
have been forc'd to invent several Names, for the
making a distinction between some sorts of Love
and others.

IV.
There are
three sorts
of Love.

For when we set a less Value on any Object,
than upon our selves, and think it inferior to
us, we may be said to have a Propension, or sort
of Benevolence towards it. When we have the

same Value for it as for our selves, and Opinion
of Merit makes no difference between us and
that, we are tied to it by that which we call
Friendship. But if we place more Worth and
Merit upon the Object, and admire it above our
selves, it becomes the Object of our Devotion,
Reverence, or Worship. So that Love may be di-
stinguish'd into Benevolence, Friendship, and De-
votion, as into three species or diversities; wherein
it wholly consists: For things Inanimate, or Ani-
mals void of Reason, may be belov'd; but no
such thing as Friendship can be; but between Man
and Man; that is, not as to the Sex, but as be-
tween one Human Creature and another; in whom
it is so innate to be United each to other, that
neither of them can be so vile or contemptible in
the others Eyes, as not to be thought worthy to
be joyn'd to the other by some Tye or Relation;
provided he know that he is belov'd and be in-
duced with a generous Spirit.

But by Devotion we are affected most chiefly to
the Supream Deity, whom if we knew to that degree
as were fit, we could not but love, tho' it may be said
that Subjects to their Prince, Natives to their Country,
Citizens or Towns-men to the City or Town where
they were born or bred, are carried with a sort of
Devotion, as Valuing the said Objects thereof
above themselves, and thinking it their Duty to
expose, if need be, their own Lives upon their
account.

The Cause of Love and Hatred, as also of the
three other Passions, is not, as that of Admiration,
in the Brain alone; but also in the Heart, Liver,
Spleen, and other Parts of the Body, which con-
duce to the generation of the Blood, and the con-
veyance of the Spirits thence. For altho' the
Blood is carried to the Heart through the Veins,
by a Circular motion; yet sometimes it happens to
be impell'd into it with a more violent Force
through some Veins, than through others. It
happens also, that the Passages by which the Blood
enters into the Heart, or by which it issues out of
it, are by some Accident or other, made more wide or
more narrow. Hence in Love there arises a Notable
agitation of the Blood and Spirits, when the Im-
pression of the Lovely Object, form'd in the Brain,
conveys the Animal Spirits through the Nerves
of the 9th Conjugation, to the Muscles of the
Stomach and Intestines, that so the Chyle or
Alimental Juice, which by an iterated Circuit
passing through the Heart, is turn'd into Blood,
may pass on very swiftly to the Heart, and makes
no stay either in the Vicine parts, or elsewhere;
but with a rapid Course entring into it, stir up a
more than ordinary fierce heat or fire therein:
Because then the Blood becomes rarefied, and
sends the more enlivened Spirits into the Brain;
which Spirits corroborating the Impression which
the first Perception of the amiable Object forms,
Cause the Soul to rest in that Perception, and to
take notice of the said Object, as acceptable and
good.

On the contrary in Hatred, the first perception
of the thing we have an aversion to, so draws
down the Spirits which are about the Intestines and
Stomach, that they hinder the Chyle from mixing
with the Blood, that is, by Compressing all the
Orifices, by which it uses to flow down thither,
and at the same time transmits some of this Chyle
through

from diffe-
rent Causes.

through the *Nerves* of the *Milt*, and lower part of the *Liver*, which is the receptacle of *Choler*, with other *Blood* to the *Heart*, which causes no small inequality in its *Heat*, because the *Blood* that proceeds from the *Milt*, hardly suffers alteration, and can scarce be *Heated* or *Dilated*: Whereas the *Blood* that proceeds from the lower part of the *Liver*, which is the receptacle of the *Gall*, is rarefied and expanded in a Moment: Wherefore the *Spirits* transmitted from the *Heart* toward the *Brain*, consist of parts of different *Vertue*, and are agitated with unequal motions. Whence it comes to pass, that they there corroborate and fortify the *Thoughts* of *Hatred*, which they find newly formed, and weary the *Soul* with thoughts of *Melancholy* and *Sourness*.

VIII. Various effects of Love. There are reckoned up many effects of *Love*, as the *Pulse* of the *Arteries* being equal and more intent and vehement than usual; a calm *Heat* glowing in the *Heart*; a sudden *Concoction* of the *Meat* in the *Stomach*, and the like; but the most principal of all, and which most chiefly requires our consideration, is a kind of *Languishment*, which is no other than a certain proclivity to a cessation of motion, which proceeds from hence, namely, that the *Pineal Glandule* disposes not the *Spirits*, which are in the Cavities of the *Brain*, to flow into one *Muscle* rather than another. This *Languor* is produc'd by *Love*, when the thing desired cannot for the present be obtained, for then *Love* so detains the *Soul* in the Cogitation of the beloved *Object*, that it makes use of all the *Spirits* in the *Brain*, to represent to it the *Idea* thereof, and stops all other motions of the *Glandule* which conduce not to this effect.

CHAP. XI.

Of Affections.

I. Cupidity no less disturbs us than those Passions that respect the future. Since all the *Affections* of the *Soul*, except *Admiration*, tend towards *Good* and *Evil*, and are given us by nature, for the aiming at what is profitable, and rejecting of what is hurtful to us; it is to be considered how many ways it may be done. For since in *Love* and *Hatred*, there is no respect had of time, and only the convenience or inconvenience of the *Object* is lookt upon, these *Passions* seem to agitate, no less than those which tend towards the future, and seek after the *Object* with a kind of *Anxiety*: Hence the Cogitations of young *Men* which regard things to come, are more precipitous, and more sharply molest and disquiet their *Minds*, such as are *Hope*, *Fear*, *Jealousy*, &c. which are species of *Cupidity*.

II. What Cupidity is, and how it comprehends as well an aversion of Evil as desire of Good. *Cupidity* therefore or desire is a commotion of the *Soul* produc'd by the *Spirits*, whereby it is carried towards *Good* as a thing to come, by which *Passion* we not only wish for an absent thing, whose presence we judge convenient for us, but likewise the conservation of the thing possessed; nay, if we strictly inquire into the Nature of *Cupidity*, we by it no less desire the absence of an *Evil* not present, than the presence of that which is *Good*, and which we apprehend may possibly happen, so that *Cupidity* comprehends not only the desire of *Good*, but also the declining or aversion of *Evil*: For as much as to speak properly, there is one and the same agitation of *Mind*, by which

at the same time we are moved to aim at some *Good*, for Example sake, *Honours*, and to decline a contrary *Evil*, that is to say, *Ignominy* or *Disgrace*: For since there is no assignable *Good*, whose privation is not an *Evil*, nor any *Evil*, if it be considered under a positive respect, whose privation is not a real *Good*, there seems no reason to distinguish between that *Appetite* by which we affect the *Good*, and that by which we decline and reject its contrary.

All the difference that can be conceived in them, proceeds only from the *Passions* which accompany this various desire, namely, because to the *Cupidity* by which we tend to any *Good*, there are annexed *Love*, *Hope*, *Joy*, &c. and to the same *Cupidity*, by which we are carried to the *Aversion* of any *Evil*, there are joyn'd *Hatred*, *Fear* and *Sadness*; wherefore if *Cupidity* be considered according as it tends to the Prosecution of *Good*, or *Aversion* of its contrary *Evil*, it cannot be a double *Passion*, but only one, which executes both parts.

The causes of this *Passion* are the *Animal Spirits*, which pass from the *Heart* to the *Brain*, and seem to cherish and preserve the *Image* there first impress'd. For as soon as the *Soul* hath a *Will* to acquire some *Good*, which is grateful to it, or to remove some *Evil*; immediately it Transmits the *Spirits*, by the help of the *Glandule* to all parts of the *Body*, especially to the *Heart*, that, so much the greater plenty of *Blood* as is received within its Cavities, so much the greater quantity of *Spirits* may be conveyed to the *Brain*, as well to conserve, and corroborate therein the *Image* of the *Will*, as to move those *Muscles* that are necessary for the gaining of that which is desired; whence it comes to pass, that when the *Mind* desires any thing, the whole *Body* is rendred more *Agile*, and becomes more chearful to execute all the offices of the *Body*, than at other times it uses to be; namely, because the *Heart* being more vehemently agitated, supplies the *Brain* with the more *Spirits*, which taking their course thence to the *Muscles*, cause the *Senses* to become more vivacious, or the *Members* of the *Body* more disposed to motion.

To *Cupidity* or *Desire*, as hath been said, are reduced *Hope*, *Fear*, *Jealousy*, *Security*, *Desperation*, *Fluctuation* of *Mind*, *Animosity*, *Boldness*, *Emulation*, *Pusillanimity* and *Consternation*.

Hope is a disposition of the *Soul*, produc'd by a special motion of the *Spirits*, to believe that that will come to pass, which it desires. So that no *Object* can stir up *Hope*, unless it be represented to the *Mind*, as easie to be obtained.

Fear, is another disposition of the *Mind*, by which it persuades itself that that which it desires, will not come to pass: These two *Passions* however they are oppos'd, may nevertheless be found in the same, and at the same time, namely, when any one is perswaded by different *Reasons*, by some, that the *Object* he desires may be easily, by others, difficultly acquir'd.

Jealousie, which is referr'd to *Fear*, is the *Fear* of losing a good which we greatly esteem, proceeding from the least causes of suspecting; or when led by suspicion only, we fear to lose a certain good.

IX.
Of Fluctu-
ation of
Mind.

Fluctuation of Mind, is the Fear of Erring in the choice of things, which tend to constitute the end, which while it retains the Soul in doubt, and suffers it not to perform one action more than another, causes it to perform none, and consequently hath a sufficient time left it to determine before it makes choice of any thing: Which Passion is so prevalent in some Persons, that oftentimes when there is no need of deliberation, in the thing designed, nay when it is the only thing to be omitted or performed; yet nevertheless, they remain in such suspense, that they are altogether incapable of inquiry into other things.

X.
Of Animo-
sity, Bold-
ness and
Emula-
tion.

Animosity is some certain Heat or Agitation, which disposes the Mind to act stoutly in the performance of those things which it designs. If any great danger attend the said things, it is called Boldness, which disposes the Soul to act those things, on which some great and imminent danger is attendant. Emulation, which is a certain Species of Animosity, ariseth from the consideration of other Men's success: Because when we see other Mens undertakings happily succeed, we are commonly moved by their Example to set upon the same thing, and in our Acting to Trace the same Footsteps as they have done. And this happens while the Body is so disposed, that Cupidity and Hope, have more strength to impel the Blood copiously into the Heart, than Fear and Desperation have to hinder it.

XI.
Of Pusilla-
nimity and
Consterna-
tion.

To Animosity, Pusillanimity is directly contrary, and it is a Languor or Coolness which hinders the Soul from going on to execute those things, which it would certainly execute, if it were destitute of the said Coolness. And Consternation, which is opposite to Boldness, is joyn'd not only to the Cold, but also to the Stupidity and Perturbation of Mind, which disarms it of its Power and Ability, to oppose its self against those Evils which it expects, and thinks to be at hand.

CHAP. XII.

Of Joy.

I.
Gladness
is the Term
or Bound
of all Af-
fections.

Gladness or Joy may be called the Term or Bound of all the motions of our Soul; which as they begin in Admiration, so they cease or terminate in Joy as in their own proper Scope or Aim: For desire of Good ceaseth in the obtaining of Good, and all inquietude is removed from us, as soon as we possess those things which we so greatly desired. In present Joy Fear ceaseth, Sadness is banisht, Desperation is destroyed, Love is at rest, and the rest of the Affections vanish; whilst we are wholly taken with Joy or Pleasure.

II.
The Defini-
tion of Joy.

Gladness or Joy is a pleasant commotion of the Soul, in which the possession of that Good consists, which the impressions of the Brain represent to it as its own. We say, that the possession of Good consists in a pleasant commotion of the Soul, in regard it is as it were the only Fruit of all the Goods it has, which being taken away, it can no more be said to enjoy them, than if it were totally deprived of them. To which it is properly added, that that Good, by the impressions of the Brain, is represented to the Soul as its own: That Joy, which is a Passion, may the more easily be distinguished from that which the Soul experiments by

Action, which that they may not be confounded, it will not be from the purpose to observe the Nature of each.

For Joy is twofold, one Sensual or which so depends upon the Body as to make it its principal Object, the other Intellectual, which is a pleasant commotion of the Soul, springing from a clear and distinct knowledge of the Good which is apprehended: Which distinction is hence understood, namely, because the Intellectual Joy may sometimes be without the Sensual, as when from any good Action, we feel a satisfaction from that pure consideration that we have performed our Duty; altho' it be difficult to experiment it, so long as the Soul is in the Body, since the Intellectual Joy makes always some impression upon the Body, such as is required to the framing of a Passion, for there is so streight a Union between our Soul and Body, that tho' the Good which the Soul is sensible of belongs not to the Body; yet Imagination always fains some Idea in the Brain, from whence there follows a motion of the Spirits, which produces the Passion of Joy.

The cause of this Passion, as may be gathered from its Definition, is the possession of some Good; for then the Soul seems to be satisfied, when it enjoys that thing which it esteems to be its own Good, and to conduce to its Felicity; tho' it often happens, that we find our selves overjoy'd, and wrapt up in I know not what kind of Pleasure, when the cause of this change is utterly unknown: As when our Body is cheerfully dispos'd, and with great alacrity performs its offices, but this proceeds from hence, namely, that the Good impresses some Idea's in the Brain, without the help of our Soul: That is, when the constitution of the Brain is such, that the Animal Spirits may the more easily be brought down into the Nerves, as well those which serve for dilating the Orifices of the Heart, as others. So when the Heaven is somewhat more than ordinary Serene, we feel a kind of Hilarity or Cheerfulness in our selves, which proceeds from no Function of the Intellect; but only from the impressions, which the motion of the Spirits excites in the Brain.

The Internal Causes of this Passion are the Blood, and motion of the Spirits, not so much in the Nerves of the Stomach and Intestines, as in Love, or of the Milt and Liver, as in Hatred, as in those which are spread through the rest of Body, those especially which are about the little Mouths of the Heart. In regard they by opening and enlarging afford a way to the Blood, which other Nerves propel from the Veins to the Heart, that it may go in and out in greater plenty than usually; but because the Blood having many times before entred the Heart, and so flowing out of the Arteries into the Veins, is thereby more subtilized, it thereupon becomes the more easily rarefied and creates Spirits, which by reason of their equality are adapted for the forming and corroborating impressions of the Brain, which supply the Heart with joyful and serene Cogitations; whence it happens that so long as the Soul is affected with Joy, the Pulse of the Arteries is equal, and more quick than usual; moreover a certain grateful Heat is felt, not only in the Breast, but also in the External part of the Body, into which together with the Blood it is copiously transmitted.

The

VI.
The various effects of Joy.

The most noted instance of Joy, and which is commonly observed in those that are therewith affected, is a *Lively Colour*, and generally ruddy, which it paints in the *Countenance*; and which hence proceeds, namely, that Joy dilating the *Fibres* of the *Heart*, causeth the *Blood* more copiously to enter into the *Heart*; and being there more intensely warmed to be distributed the sooner into the *Veins*; and by this means excites a grateful and lively *Colour* in the whole *Body*, especially in the *Face*. Moreover, in the same affection of Joy, the *Spirits* happen to be so disposed; as that those which flow into the *Muscles* of the *Face* and *Breast*, make such a concussion of them, as to cause *Cachinnation* or bursting into a strain of *Laughter*, which sometimes is so great, that by the force thereof, the passages of the *Eyes* being opened, *Tears* thereupon gush out: For *Tears* are nothing else but *Vapours*, which in their passage out of the *Eyes*, are turn'd to *Water* in the superficies of them, after the same manner, as was before declared, concerning the Original of *Fountains*.

VII.
Of Joy there are divers Species.

There are divers species of Joy, according as we consider the *Good* hapning to our selves, or the *Evil* to others. The first which offers it self is *Derision*, which hence hath its Original, viz. that we find some *Light Evil* in one, who is thought to deserve it. In which *Passion* there is mingled something of *Hatred*. As when we have an aversion to the said *Evil*; and yet nevertheless rejoyce to see it inflicted on him whom we think it but just it should fall upon. Those that are remarkable for any kind of deformity or defect of *Body*, are chiefly obnoxious to this *Passion*, as the *Gibbous* or *Bunch-backed*, *Goggle-Ey'd*, *Lame*, who, in regard they are not ignorant of their being an *Object* of contempt and derision from others, rejoyce to find others in as bad circumstances as themselves; it being to them a solace of that *Grief*, which they suffer from the *Contumely* objected against them; so that they take the least occasion given to insult over them, and sport themselves with their defects.

VIII.
What Satisfaction is.

Satisfaction or *Acquiescence* in ones self, is a Joy of all the most grateful, which proceeds from the *Opinion* of something done by us which we judge to be *Good*. Whence they who give themselves to *Virtue* and *Honest Actions*, feel, I know not what *Tranquillity*, of *Soul*, and *Quiet* of *Conscience*, which is the most pure and sincere of all satisfactions, because they depend upon those things which are in our power.

IX.
What Favour is.

Favour is a Joy wherewith we are affected toward those that do well, and use their *Free-will* according to *Reason*. Since by a *Natural Impulse*, we are apt to *Love* those whom we judge to be *Well-doers*, tho' nothing of profit accrue to us thereby.

X.
What Gratitude is.

Gratitude is a certain joyful desire of doing well to those who have deserved well of us. This Affection is peculiar to *Generous Souls*, who are never insensible of *Kindnesses*, but strive always to be requiters of *Benefits* receiv'd.

XI.
What Glory is.

Glory is a Joy arising from *Opinion* or *Hope*, conceiv'd of obtaining praise among others. This *Passion* is founded upon *Self-love*, as when we value our selves according to the esteem we see set upon us by others.

CHAP. XIII.

Of Sadness.

GRIEF brings up the Rear of the Passions, the most common affection among Mortals, the Companion and Enemy of Joy. It seems to have been allotted by Nature for the Persecutor of Mankind, and lies in wait as well for Soul as Body. There is scarce any Sadness which does not transfer its force from the Soul upon the Body, and with one stroke hit two different things at once.

For Sadness is no other than a certain ungrateful Languor, or the Inconvenience which happens to the Soul, from the Evil or Defect which the Impressions of the Brain represent to it as its own. Which Definition extends only to Sensual Pains, as they differ from Intellectual. For no doubt, but sometimes, there may be Sadness in the Soul, tho' all Cause be removed which excites Corporal Pain, as appears in those who have a Limb cut off, who are not only affected with Sadness upon the loss of the said Member, but also long after when they look upon themselves as maim'd persons, and depriv'd of a part which conduceth to the gaining of a *Livelihood*. But in regard these sorts of Pain are seldom found, which are produc'd by an Action of pure Intellect; and whatsoever happens to the Soul, so long as it is united to the Body, is depainted forth by Imagination in the Brain, We only here treat of Sadness, as it is a Passion.

And it arises from from an Opinion of an adherence of some Evil or Defect; for the Body cannot be hurt, but the Soul must immediately be disturbed, and be sensible of a certain bitterness thereby. Tho' it sometimes happens, that we find our selves sad or dejected, when ignorant of any causes of the said dejection. As when the Body languishes, and is not able to perform its functions, when the Heaven is all over covered with Clouds, as it often happens in the Winter-time; because then the Nerves of the Body are not, as they us'd to be, agitated, and so remain, in a sort, immoveable.

Sadness arises when the Animal Spirits are so dispos'd by the Glandule to the presence of an Object of Sadness, that they streighten and contract the Orifices of the Heart by the Nerve wherewith they are encompassed, and hinder the Blood from its copious entrance into it, and egress out of it. Whence it happens that the Heart hath very little of Ardour and Inflammation, the passages in the mean time remaining open, through which the Chyle is conveyed from the Stomach and Entrails into the common Ocean, which is the cause of Appetites being diminish'd, unless Hatred supervening Sadness, which is oftentimes joyned to this Passion, closes and shuts them up.

Thereupon in persons affected with Sadness, the Pulse becomes weak and flow, and they seem to feel, as it were, Fetters about the Heart, which bind and restrain it like Icicles. Which frigidity being dispers'd through the rest of the Body, causes it to remain sluggish and unactive, and does also make those that labour under Sadness to grow pale, because by compressing the vessels of the Heart, it causes the Blood to flow the more slowly into the Veins; and so having less agitation than usual, it requires a less place to possess; so that betaking it

I. Kip Sculp.

it self into larger *Veins* which are nearer to the *Heart*, it leaves the more remote; whereof those that are diffus'd through the *Face* are more conspicuous; and upon that occasion they are rendered more pallid. Nor is the cause very different of those *Tremours* which are incident to persons affected with *sadness*, in regard when the *Blood*, as hath been said, is languidly deduc'd through the whole *Body*, it must needs be but slowly convey'd to the *Muscles* of the *Arms* and *Legs*, so that the *Valvulae* are not straightly enough closed, which is the reason that the *Spirits*, swiftly taking their course through the *Connivent Ostioles* of the *Muscles*, produce *tremours* in the said members of the *Body*.

Tears, as they accompany *Joy*, so also sometimes *Sadness*, and are produc'd, when upon the *Blood* being refrigerated by *Sadness*, the *Pores* of the *Eyes* are contracted, by reason of which compression the *Vapours* proceeding from them are converted into *Water*; that is to say, because their motion being retarded, their parts meet, and are so united one with another, that they end in *Tears*.

As *Evil* is an Object of *Sadness*, so it produces various effects in us, according as we refer it to our selves or others. For an *Evil* offered by us under the notion of an *Evil*, when we consider that we have committed it, excites *repentance*, which is so much the more bitter, in regard it depends upon our Free Will, and was in our power of committing or not committing that which so much aggrieves us. The *Remorse* of *Conscience* is a *Sadness* arising from a scruple or doubt, whether what we have done be good or not. In this *Passion*, *Dubitation* ought to be necessarily included; forasmuch as if what we commit should be manifestly known to be *Evil*, we should refrain from committing it, since our *Will* is never carried on, but to those things which are represented to us under some appearance of *Good*. And if that *Evil* which we commit, should plainly appear to be an *Evil*, we should then be toucht, not with a simple remorse, but with downright *Repentance*, which is the severest of all *Passions*. We are therefore toucht with remorse, because we attempted a work before we made any doubt of it, or shook off the scruple of *Mind* which attended it.

Envy is a species of *Sadness*, not simple, but mixt with *Hatred*; which proceeds from hence, namely, that we see a *Good* to befall others which we judge them unworthy of. This *Passion* extends not it self to all sorts of *Good*, but only those which we call the *Goods* of *Fortune*. For those things which are granted to us by *Nature*, seem to be above *Envy*. The *Envious* are for the most part of a *Livid Colour*, in regard *Sadness* operates upon the *Body* the same way as *Hatred*, causing *Choler*, which proceeds from the lowermost part of the *Liver*; as likewise *Melancholy* from the *Spleen*, to flow to the *Heart*, from whence diffus'd through the *Arteries* and *Veins*, they cause the parts of the *Blood* which is in the *Veins* to be less agitated; and this is sufficient to induce a *Livid Colour* upon the *Countenance*, provided it be copious and intense enough.

Fastidie or *Loathing*, is another sort of *Sadness* arising from the same cause from which *Joy* for-

merly arose; for we are of that *Humour*, that almost all things we possess, are valued by us as good, only for the time being, and are afterwards lookt upon as incommodious, which especially appears in *Eating* and *Drinking*, which never please but so long as the *Appetite* prevails, and are distasteful when the *Appetite* ceaseth, and because they then cease to be grateful to the *Taste*.

Commiseration is a *Sadness* mixt with *Benevolence* or *Love*, proceeding from the consideration of some *Evil* which befalls those persons whom we think unworthy of it. And is in some so vehement, that it draws *Tears* from their *Eyes*, by reason that at that time, through the *Affection* of *Love*, a great quantity of *Blood* is propelled to the *Heart*, from whence many *Vapours* being emitted to the *Eyes*, and having their motion retarded with cold, are, as hath been several times already intimated, changed into *Tears*.

Indignation hath a great affinity with *Hatred* or *Aversion*, wherewith we are naturally stirr'd up against those that do ill. It is very often join'd with *Envy* and *Commiseration*, and the difference lies chiefly in the Object. Forasmuch as we envy those to whom any thing of good happens, and are fellow-sufferers with those that suffer ill undeservingly. But our *Indignation* is against those only who do good turns to those that are unworthy of them.

Anger, which may be referred to *Indignation*, is the *Aversion* against those who have offered any ill, or at least have design'd any *Injury* to us. This *Anger* is always attended by a desire of *Revenge*, which is the most impetuous of all *Affections*; in regard the *Hatred* which is found in it, causes the *Bilious Blood*, which flows from the *Milt*, and from the little *Veins* of the *Liver* to undergo a very great *Agitation*; which *Blood* entering the *Heart*, stirs up an extraordinary *Heat*, which is far more rigid and vehement than that which proceeds from *Love* or *Sadness*.

There are two sorts of *Anger*, one very quick, and soon breaking forth, and disclosing it self in the *Countenance*; but this is of little effect, and with small labour allay'd: The other is not so soon discharged, but inwardly afflicts and stings; and the effects of this are much more dangerous than those of the former. To the first, those are *Obnoxious*, who either *Love*, or are indued with a good *Nature*; by reason that this sort of *Anger* proceeds not from *Hatred*, but from a sudden *Aversion* which hastily seizes them; because those things which they think of, fall not out in the same manner as they imagin; whence it happens, that as soon as they come to consider that those things which so moved them, ought not to have stirr'd them up to *Anger*, they are toucht with shame and *Repentance*, and condemn themselves for their rash and unseasonable passion; whereas those that are affected with the other sort of *Anger* are more to be fear'd, discovering no other colour in their *Face*, but a pallid Hue, in regard the heat being drawn back to the *Heart*, they reserve themselves for *revenge*, and think of nothing but the time of *Vengeance*, and those circumstances which lead thereunto: This is a *Vice* peculiar to Persons of a *Base* and *Abject Spirit*.

Shame is founded upon *Self-love*, which proceeds from Opinion or Fear of *Dispraise*. Desire,

The Effect of Commiseration.

XI. The Effects of Indignation.

XII. Of Anger.

XIII. A Twofold Anger.

XIV. What Shame is, and Desire.

if it be more strictly inquired into, than commonly it is in *Schools*, is a certain sadness for a *Good* lost, and whereof there is no hope of recovery: For we are never afflicted with *Desire*, except for the loss of *Goods* sometime possess'd, and which we imagin so snatcht from us, as to be left without any hope of ever obtaining them again.

C H A P. XIV.

Whence the Natural Inclinations and Aversions of some Men arise.

I. Various Inclinations are found in Men.

HAVING treated of those *Passions* of the *Soul* which are common to all *Men*, and which presuppose a Connexion of the *Body* and *Soul*; it remains that we say something of the *Inclinations* of some *Men*, which are peculiar to themselves, and which have the *Body* only for their Principle. For there are found in some *Men* certain *Affecti- ons*, which are by Nature implanted in them, by which they incline to some things with a wonderful Ardour of *Desire*; and are so abhorrent of others, as not to be able to indure the sight of them. So some *Men* have certain *Meats* in very great esteem and delight. Others on the contrary, have as much aversion to one thing or other: Many cannot endure the sight of a *Cat*, or the very presence of it in the same *Room*, tho' they see it not; some cannot abide the smell of *Roses*; and so for other things some have a *Love*, others an *Aversion*, of which neither can give any account.

II. Antipathy and Sympathy are only words in the Schools.

It is a common thing in *Schools* to have recourse to the words *Sympathy* and *Antipathy*, and thereby to pretend to give an account of *Passions*, which indeed they are wholly ignorant of, by saying that these things so happen, because there is a certain *Agreement* or *Enmity* in *Natural things*, by which they either *Love* or *Hate*. But this way of *Philosophizing* may be compared with a certain design or project for a piece of *Painting*; as if any one should go about to give directions with a *Pen* and *Ink*, how the *Sign* of a *City* were to be painted, in what part of the *Country* the *City* was situated, what *Posts* were chiefly possess'd by the *Besiegers*, where the *Enemies* planted their *Scaling-ladders* to get over the *Walls*, how the *Engines* broke the *Gates* asunder, where the *Pioneers* sprung their *Mines*, with what *Arms* the *Besieged* defended themselves, and where they made their *Sallies*; but after all should leave the whole Draught and Colouring to the Art of the *Painter*, yet nevertheless should take upon him to be the Author of this *Picture* of the *Siege*, to which he had contributed nothing but *Names*. So to assert that any thing is effected by a certain *Virtue*, and not to declare after what manner it is done, is to my apprehension the same thing as to confess ingenuously, that he is totally ignorant of the matter discours'd of.

III. If a Corporeal Action be joyned to any Cogitation, we cannot remember the one without the other.

Therefore some other way must be tried for the finding out of these *Occult Inclinations* or *Qualities* which are observed in some *Men*; which may easily be effected, if we consider but two things; First that there is such a connection of *Soul* and *Body*, that when once we have join'd any one *Corporeal Action* to any *thought*, never after any one of them manifests it self, but the other attends

it; as we may observe in those persons, who being sick, have drunk up any *Potion* with much distast and reluctance, that they cannot afterwards feed upon any *Meat* or *Drink* that hath any thing of the relish of the said *Potion*; but that the *Stomach* must needs have an aversion to it; nay, cannot so much as remember that *Aversion*, but that the same *Savour*, which sometime offended the *Tongue*, must return into the *Mind*.

Secondly, observe that it is not always of necessity that the same *Actions* of the *Body* be joyn'd to the same *thoughts*. For those that speak *English* utter their conceptions by some certain words different from those by which the *French* express their cogitations, yet they both mean the same thing; for no otherwise is *DEUS* conceived by an *English Man*, under the word *GOD*, than by a *French Man* under the word *DIEU*, both of them understanding the same thing, tho' by two different appellations: For as often as an *English Man* hears the Name of *GOD*, he presently apprehends thereby an *Infinite, Eternal, Almighty Being*, &c. the same doth a *French Man* when the sound of the word *DIEU* comes to his Ear.

These things thus briefly noted, any one may easily give an account of all those matters which he finds particular either to himself or others. The *Aversions* which are observed in some men, against some things, hence proceed, namely that, in the beginning of their *Life*, they have been hurt or offended by them: So the smell of *Roses*, might possibly have given to an *Infant*, while yet in the *Cradle*, some great Offence, or a *Cat* might have affrighted him, without any ones taking notice thereof, or the Party's retaining it afterwards in memory. Some *Aversions* also are produced in us before we are born, since certain it is, that the *Motions* of the *Mother* have a very great influence upon the *Motions* of the *Child* in the *Womb*, so as that whatever is hurtful to the one, is also hurtful to the other. Thus *James I.* King of Great Britain, had so great an Aversion to drawn *Swords*, that he could not behold them without a world of horror, which is thought to have thus affected him, by reason that his Mother *Mary*, Queen of Scots, when she was great with *Child* of him, was frighted at the sight of a *Sword*, wherewith in her *Bed-Chamber*, and before her *Face*, in a barbarous manner, one of her *Courtiers* was stabb'd to death.

'Tis true, that it is no easie matter to determine the cause of this King's Horror upon the said occasion, since it is hard to conceive how the Image of the thing which was only transmitted through the *Eyes* to the *Mother's Glandule*, could light upon the *Glandule* of the *Infant*, whereas, as for other things, as the Odour of *Roses*, or the *Savour* of *Meat*, it may be aptly enough made out, since the Odour of the *Roses*, and the *Savour'd Aliment* might easily through the *Pores* of the *Mother*, reach to the *Infant*, since it is nourish'd by the *Mother*, and both have a communion together by the *Navel String*. Yet it may be said that that Aversion in the King, might happen to him by the *Mother's Eyes*, because at the presence of so horrid an Object, a Notable Mutation might be made in the *Mother's Animal Spirits*, by which the *Infant* she carried in her *Womb* was offended,

IV. Sometime it may be, that the same thing may be effected, yet the Action of the Body not be the same.

V. Whence Natural Aversions arise.

VI. How it came to pass that K. James I. so much abhorred the sight of a drawn Sword.

offended, by reason of the mutual Relation between the motions of them both.

VII. Besides, there is not an absolute Necessity that the Object should be always present to our Senses, for the exciting of any Passion in us, since that can be effected by Imagination alone. For an Impression through the Arteries of a Woman with Child, may arrive to a certain part of the Birth, and there produce some Marks thereof. Whereupon it happens, that those Women who transgress their Nuptial Faith, and prostitute themselves to other Men, many times bring forth Children like to their Husbands; namely, because the fear of being surpris'd by the sudden arrival of their Husbands, causes them to have the Presence of their said Husbands perpetually represented to their Imagination, as hath been observ'd in the 9th Book of our Natural History, in the Chapter of Imagination.

VIII. There seems yet to be a greater Difficulty, how to give an account, why of two Persons, whose Merits are equally unknown, we incline to Love one more than another. But this will not be any great Miracle, when we seriously consider that the Objects which affect our Senses, move certain Parts of the Brain, by the help of the Nerves, and make Pleits, which, without any farther concern of the Object, vanish; yet so, as that the part in which they had been receiv'd, remains dispos'd for the receiving of Pleits from any other Object, which have any Similitude with the former. So when yet a Child, languishing with a long Distemper, and given over by the Physicians, I fell into the hands of a certain Woman, by whose Care and Industry recovering my Health, I contracted so intimate a Friendship with a Son of hers, that I could scarcely be divided from his Company, without much Regret and Impatience: Yea, after some Months, being carried home to my Parents, I perpetually languish'd with a desire of this my Little Companion; nor put I any end to my Tears, till such time as he was restored to my Society. And when a few Months after, it pleas'd GOD to take him out of this Life, I continued to bear a singular Affection towards all Boys whatsoever, that resembled him in Countenance; and to this very day preserve the same Affection to Children of the like Resemblance.

IX. In like manner, when we Love any Body for any hidden Cause, it is more credible that it hence proceeds, namely that there is something in him, like to those things which were formerly in some beloved Object, tho' we know not what it is. And though doubtless that which thus allures our Affection, is oftner a Virtue than a Vice; yet nevertheless, in regard it may sometimes so happen, that it may be a Vice, no wise Man ought to indulge to this sort of Affection, till such time as he hath well weigh'd the Merit of that Person, with whose Presence or Concernment, he finds himself so affected. DES CARTES, when a Child, as he himself writes to CHANUTE, loved a little Girl of the same Age with himself, that was Squint-Ey'd; and by this means the Impression, which through the Sight was received in his Brain, was so joyn'd to the Impression which was also made in him, to move the Passion of Love, that even a long time after, as often as he lighted upon any who had the like sort of Eyes, he found himself propense to Love them above others, and

for this very thing, because they had that Imperfection; yet did he not know that this was the Cause of his Love. On the contrary, from the time that revolving with himself, he apprehended this Blemish to be an occasion thereof, he was no longer affected by it.

CHAP. XV. Of the Immortality of Human Mind, and of its State after Death.

THAT Human Mind is incapable of Death and Destruction, its Nature and Functions clearly demonstrate: For whereas it is evident from what hath been often said, that the Soul is a Spiritual Essence and separate from all Matter, it must consequently of necessity be free from all Destruction and Corruption; since nothing but what is Concrete and Compound can be separated, divided, or taken asunder. For Destruction is, as it were, a Separation, Dividing, or Parting asunder of those Parts, which before the said Destruction were held together, as it were, by a certain Link or Tye.

Nor do the Functions of the Soul less argue its Incorruption, as being Effected by no Organ of the Body, as is sufficiently made out almost throughout this whole Work; forasmuch as it forms and proportions the Universal Natures of things abstracted from Matter, which cannot be the Work of a Corporeal Faculty. For a Power or Faculty subjected to a Material Organ, receives the Qualities and Forms of things after a certain Corporeal manner. What therefore comprehends Forms in a Spiritual manner, uses no Instrument of the Body. Neither indeed are the Principles impress'd upon the Mind, or the Rudiments of Cogitation assign'd to our Intellect, Mathematical Demonstrations, or Certain and Fix'd Judgments, any Corporeal Acts or Productions of Imagination. But nothing Incommutable or perfectly Single; nothing Eternal, nothing Universal and Abstract is perceived by the Power of Imagination; whereas all Bodies are subject to mutations, place, and time.

Now the better to support this Verity with Reasons, we must suppose, that of those things which perish or cease to be, some are Simple, and some Compound. The Compound are said to lose their Existence, when the Parts which concur to their Composition are separated from each other. As a Man is said to Cease, when Soul and Body, of which he is compos'd, are separated. Whereas the Simple can no other way cease to be, but by Annihilation, as they could no other way be produc'd but by Creation. And since Creation, as also Annihilation, are both beyond the power and ability of Nature, they can no way be destroy'd by any Creature. But it is evident, that the Soul is a thing purely Simple, since it is the only Subject that entertains Cogitation or Thought, together with the various Modes of Cogitation, and consequently the Capacity of being destroy'd, is Naturally repugnant to it.

And this will appear more evidently, by comparing the Soul with the Body. Certain it is, that the Body which gives place in dignity and perfection to the Soul, is not reduc'd to Nothing, when the Soul is separated from it: How therefore can the Soul, which is more noble and more perfect

I.

must the
Soul have
an Existence.

be thought to be annihilated when the *Body* is separated from it? Since indeed, no Reason can be brought for the duration of a *Material Substance*, which may not, by a more forcible Right, be apply'd to *Human Mind*. If we have recourse to the Evidence of *Sense* for the Consistence of *Body*, it cannot be maintain'd of all its Parts, since very many of them, into which it is resolv'd, are undiscernible to our *Senses*. Neither is the perception of our *Senses* so efficacious a means to demonstrate the Existence of *Bodies*, as the Reasons henceforth to be produc'd, are for asserting the *Immortality* of the *Soul*.

V. Human Mind can be destroy'd by no Created Being.

If it be Objected, That *GOD* by his Power can annihilate all *Souls* whatsoever, and that it is through his Preservation alone that *Souls* are said to be *Immortal*. This we are ready to confess, as acknowledging that *GOD* alone is a Being wholly Independent, Eternal, Necessary, &c. and that there is nothing Existent in *Nature*, but only so long as he pleases. So that we have nothing now to do, but to make it out plainly, that *Human Mind* is of such a Nature and Quality, that it cannot be corrupted or destroy'd by any *Created Being*, which is a sufficient Ground for it to be call'd *Immortal*. For it being Undeniable, that *GOD* is all *Wise*, all *Good*, and all *Constant*; and *Human Soul*, the Noblest *Workmanship* of so great a *Maker*, and the Image of him: Who can imagine or believe, but that it must needs be far from the *Mind* of so *Wise* and *Constant* a *Maker* to Create so Glorious a *Work*, and afterwards to destroy it? True it is indeed, and not to be gain-said, that *GOD* by his extraordinary Power, can destroy the *Human Soul* consider'd, according to its absolute *Esse* or *Being*: But it is repugnant to Reason, that he should destroy it by his ordinary Power, which is sufficient to make the *Soul* *Immortal*. For when we treat of the *Immortality* of the *Soul*, the Question is not, Whether *GOD*, by his Extraordinary Power can destroy it; but whether it can be destroy'd by *Natural Causes*, and by the ordinary Power of *GOD*.

VI. The Corruption of the Soul follows not from the Corruption of the Body.

Moreover, when a *Man* dies, *Death* happens to the *Body* upon this occasion only, namely, because some of its Parts are divided, and its figure changed. But the division of *Members*, or change of *Figure*, no way concern the *Mind*, in regard it is indivisible, and affected with no *Figure*. Who therefore can believe that the *Soul*, which is *Inextense*, can, for so slight a Cause, as is the Change of the *Body*, perish or be annihilated? In the next place, this sort of *Annihilation* hath not yet been found in *Nature*: Nor can it be made out by any *Argument* or *Example*, that *Substance* can perish. Wherefore, seeing that *Human Mind* is a *Substance* Independent of the *Body*, and not any way subject to the Mutations which are made in it, we conclude, that it may Exist separated from it, and by consequence, that it is *Immortal*.

VII. There is no Cause capable to destroy a separate Soul.

As to what some say, That hence may indeed be infer'd, that the *Soul* may possibly subsist separate from the *Body*; but that it will not last so Eternally. To this I Answer, that admitting one, the other must of necessity follow, in regard no Cause can be assign'd, which can destroy it in its state of Separation, since at time it is free from Matter, which alone is obnoxious to Change.

I know that there are many *Arguments* heap'd up by *LUCRETIVS* against the *Immortality* of the *Soul*. But they are of no weight against those who distinguish *Soul* from *Body*, and assign them contrary *Functions*. For if the *Soul* seem to be affected with the Diseases of the *Body*, to be disturb'd in immoderate Drink, Epilepsy and Phrensy, to be as it were lost in swooning Fits. This happens, because it is joyn'd to the *Body*, and makes use of it as its *Instrument* in performing most of its *Actions*. For as a *Scribe* furnish'd with a well-made *Pen* makes neat *Letters* or *Characters*; but that *Pen* being worn out with long use, he can no longer Cut his *Letters*, as before: So the *Soul* lighting upon a weak and infirm *Body*, ceaseth to perform its wonted *Office*, and remains as it were benum'd, sluggish and altogether unactive.

This change therefore is not to be imputed to the default of the *Soul*, but of the *Body*, by whose help, so long as it is tyed thereunto, it operates. So that in a *Phrensy* or *Lethargy*, it is not the *Soul* which is distemper'd, but the *Brain*: The *Instrument* fails, so the *Functions* are at a loss. In like manner *Drunkennes* is not to be attributed to the *Soul*, but to the *Body*; forasmuch as the *Brain* being unloaded of its *Vapours*, the *Soul* is recover'd and comes to it self again, and performs its *Offices*, as before.

But the state of the *Soul*, after its Departure from the *Body*, is altogether unknown to us, since it wholly depends upon *GOD'S* good Pleasure; nor can we know, but by Conjecture, how it will then use its *Faculties*. It is but a rash Conceit in those, who ascribe such Perfections to it, as they are uncertain of, and measure its Felicity by their groundless *Apprehension*, since without *Revelation* we can have no assurance thereof, except that it follows necessarily from its *Nature*: Only thus much we may know, viz. that it will be *Immortal*, by reason that since it is a *Substance* distinct from the *Body*, its destruction follows not from the dissolution of its *Mate*, so that it will always persevere in its *Nature*, that is, will always *Think*.

We may likewise know, that it will have no commerce with *External Objects*, and that nothing of *Body* whatsoever can act upon it, because only its Union with the *Body* renders it capable of receiving the *Species* and *Actions* of *Objects*; so that it must needs be depriv'd of all *Sensibility*, and be destitute as well of *Memory*, as *Imagination*, in regard those things depend of the *Body*, and are chiefly conducive for the safeguard and knowing of the *State* thereof. Altho' it is not to be denied, but that it will perceive many *Objects*, by the force of *Intellect*, which will render their *Notions* more distinct and clear, than those which it had, when it was conversant in the *Body*. And there will be no *Obstacle*, but that the *Soul* may reproduce those *Notions* of things, which it had in this *Life*; by which it will come to pass, that it may the more easily remember them, forasmuch as it will occur to it, that once it had them.

So that in regard no *Bodies* can any longer act upon it, there will be an evident consequence, that in that *State* and *Condition*, it will be absolute Mistress of its own *Thoughts*, and will not think, but

VIII. Arguments of Lucretius against the Souls Immortality.

IX. Diseases are not to be attributed to the Soul, but to the Body.

X. The State of the Soul, after its Departure from the Body is unknown.

XI. The Soul after Death, will not be sensible, nor remember.

XII. The Soul will more clearly know Objects.

but of such things as its own Will and Pleasure shall be to think of; except by chance the Almighty Maker of All things, or other Minds or Intelligences with which it converseth, create a new Thought in it. But so long as the Soul is separated from the Motions of the Body, and nothing hinders, but it may remain employed in its own Cogitations, it will the more diligently, and with greater attention perceive things Objected to it, and will the more acutely advance in Sciences.

XIII.
Will every
where
accompa-
nies the
Mind.

The like may be said of the Soul's Will and Faculty of disposing it self. By reason that when it shall be free from all Commotions, to which before, because of its Commerce with the Body, it was obnoxious, it will with the greater liberty execute its own own Affairs, and will the more easily expel the Doubts, which are an Obstacle to its Determination. Yet of it self it will not be altogether free from Error; because in regard its Intellect is Finite, and penetrates not into all things, it may be deceiv'd in its Perceptions, tho' it be not so prone to Error as before. Forasmuch as being no longer possess'd by any Prejudices, and being free from Affections, it will the more easily gain this Point, not to be obliged to give assent to those Things which it knows not clearly and distinctly, and by this means it will be less liable to Deception.

XIV.
It is Doubt-
ful whe-
ther the
Mind can,
after Sepa-
ration,
move ano-
ther Body.

But it is not so apparently determin'd, Whether the Mind will, after the said State of Separation, retain the Power which before it had of moving a Body; since indeed such a Faculty doth not necessarily follow the Nature of a Finite Being, neither indeed is the said Faculty granted to its Will, except so far as it hath pleas'd its Maker, that is, so far as he hath Decreed, that its Moving Power must depend upon his Will. But since it highly conduceth to the extolling the

Clemency of Almighty GOD, that his Works should be manifested to his Creatures; it is most probable, that he will conserve this Moving Power in Souls, and give them Capacity to joyn their Cogitations at pleasure to certain Bodies, and in such a manner, as it shall desire to move and know them.

As the Mind or Soul is all Spirit, it will no more after Separation be capable of Joy or Pain, according as they sprung from the Affections of the Body; but only of Joy and Pain, which proceed from the Intellect. But if ever the Mind chances to suffer any thing from a Corporeal thing, it must be acknowledged, that it must consequently of Necessity be United thereunto by the Divine Power, as it was upon Earth; so as that its Cogitations must be connex'd to the Motions of the said Body, and according to the Measure of that Impulse, it must suffer from it more or less. And upon this account it is not improbable, but that the Fire of Hell may act upon the Body of the Damned.

Other things which are attributed to the Soul, after its Departure from the Body, are uncertain and altogether depend upon the Goodness and Mercy of Almighty GOD; whose Arcana or Secret Counsels, to go about to search into, is both Rash and Profane. Hence it is that our Illustrious Philosopher, in his Epistle to the Princess Elizabeth, thus utters his Mind about the State of the Soul separated from the Body. But as to the State, saith he, of the Soul, after this Life, I know far less, than Sir KENELM DIGBY: For omitting those things which Faith instructs us in, I confess indeed, that we may Conjecture many things by the meer Dint of Reason, upon which we may sufficiently flatter our selves, and build mighty Hopes; but can gather nothing of Certainty.

XV.
The Soul,
after Sepa-
ration, will
be capable
of no Pain,
as from
the Body.

The

The Tenth Part OF THE INSTITUTION OF PHILOSOPHY.

ETHICKS,

Or, The Right way of Ordering the

LIFE of MAN.

A PREFATORY Discourse.

Of the Dignity and Use of Ethicks.

I.
The Dignity
of
Ethicks
above other
Sciences.

TH O' all Philosophy was invented for the Good of Man, and there is no part of it, which is not conducive to his Natural Felicity; yet doth ETHICKS deservedly take the first place amongst them all, as excelling them, both in Usefulness and the Worthiness of its End. For whatsoever other Sciences prescribe, is only an Exercise and Accomplishment of Human Wit; whereas the Rules of Ethicks are the Remedies of the Soul. Logick may pride her self, for that her Rules direct and guide the Operations of the Mind, and by putting a difference between Truth and Falshood, illuminate the Understanding, and prevent it from falling into Error: But Ethicks, taking a higher flight, enquires into the Nature of what is Good, persuades the pursuit of it, and having discover'd its Charms and Amiableness, allures Mortals, and enflames them with the Love of it. Natural Philosophy may boast her searching into the Essence of things, and that by penetrating all the Secrets of the World, she discerns those hidden Properties that escape the most piercing Eye: But Moral Philosophy, pursuing a more Noble Game, teaches us to subdue Monsters, to tame our Passions, and to be Victors over them. Let Metaphysicks please her self, that mounting up to Heaven, she takes a view of Intelligences separate from Matter, and by a daring Undertaking endeavours to discover the Divine Majesty, Power, and Unity: Whilst Ethicks

with much more certainty displays the Honour that is due to Angels, and the Worship we owe to GOD; and by manifesting to us that Supreme Essence, as the first and chiefest of all Beings, doth not only put us in mind of the Obedience and Observance we owe to Him, but also forceth us to believe it most due to Him.

Who is there amongst Men, that doth not prefer the Love of Good before the Love of Truth, *It is a more excellent thing to pursue Good, than Truth.* and that would not rather embrace Vertue, than to please himself with the barren Knowledge of it? I confess it is a Noble thing to understand the Affections of Material things, and to search out the Nature and Properties of all the sorts of Bodies contained in the Universe: And yet who must not own, that it is far more glorious, to put a Curb in the Mouth of Concupiscence; and to undervalue all the gay Bubbles, which almost the World doth admire and doat upon? What can be imagin'd more great and wonderful, than to wrestle against Fawning Lust, and to retort the Darts of this Domestick Enemy upon himself? Is it not the express Character of a great and sublime Soul, to despise Honour, and to prefer a mean and low Estate before the Pleasures of the Court, and the top of Grandure? All those are the Effects of the good Counsel Ethicks gives us, and all the great Qualities we so much admire in Men, are but the product of her Precepts. And therefore the Ancients look'd upon that Philosophy to be in a manner fruitless and to no purpose, which did not restrain our Passions; which did not put us upon the practice of Vertue, nor insinuate into our Minds the wholesome Laws of Nature.

III.
Ethicks
cures the
Diseases
of the Soul.

For as that Art of *Physick* is of no use, which cannot remove the *Disease* of *Mans Body*, or teach us how *Health* may be preserved or restored; so there is little or no advantage in that *Philosophy*, which doth not remove the *Maladies* of the *Mind*, and which like some *Trees* produceth nothing but *Leaves*, and pleaseth us only with the shade of *Words*. This commendation doth only belong to *Ethicks*, who like a *Mistress* of *Manners* informs *Men* what they ought to do; and is indeed the discipline and exercise of *Actions*, rather than of *Words* or *Notions*. If we take a view of the extent of her *Power*, it is she that first built *Cities*, and reduced *People* of different inclinations into *Societies*. She it is that instructs *States-men*, and teaches them the *Art* of *Governing*, shewing them how they may avoid the *Envy* of those that are governed. She it is that informs *Husbands*, how they are to behave themselves towards their *Wives*, with what care they are to mind the *Education* of their *Children*, and to govern both the one and the other, without injuring them. She it is that prescribes *Rules* to *Masters*, how to govern their *Servants*: In a word, there is no manner of *Life*, which is not directed by her advice, and which doth not borrow the *Rules* of *Governing* and *Obedying* from her.

IV.
What
things are
to be hand-
led in this
Tenth part.

In order therefore to the more distinct discovery of the end of *Moral Philosophy*, it will be worth my pains in a few *Words*, to declare what I intend to treat of in this Part, and to lay open the whole Order and disposition of this Work. First, I intend to begin with the Nature of the *Summum Bonum* or *Highest Good*, and to shew wherein it precisely consists; next I shall proceed to the *Definition* of *Vertue*, which I distribute into two Parts.

V.
The divi-
sion and
Nature of
Vertue.

One of these, named *Prudence*, is the *Directive*, she that giveth *Instruction*. The other are the chief *Doers*, employed in the making men *vertuous*.

The First whereof re-
gards our selves, viz. { *Temperance*
and
Fortitude.

The latter regards o-
thers, viz. { *Justice*
towards
Men, which is *Benevo-
lence* and *Beneficence*.

Neither have I unadvisedly resolved upon this *Method*, forasmuch as the *Vertues* are a help to us, in the constant prosecution of this *Highest Good*, and as so many steps, whereby we raise our *Souls* to that which is *Worthy* and *Honest*. And having done this, I proceed to the *use* of the *Passions*, as being the Matter for the exercise of *Vertues*, and whereon they chiefly exert their *Activity*. To these I add a few Chapters of *Human Actions*, wherein is chiefly treated concerning the *Liberty* of the *Will*, whether it belong to *Man*, and whether it be consistent with the *Knowledge* and *Power* of *GOD*. Upon this occasion also, I enter upon the examination of the *Goodness* and *Evil* of *Human Actions*, and when they may be said to be conformable to right *Reason*, and when to thwart and cross the same. And Last of all, I shut up this discourse with the *Duties* of *Man* in general, and of a good *Citizen* in particular; in which two

considerations, all that belongs to *Man* may be comprehended. I would also have the Reader to take notice, that in this Treatise I follow the Sentiments of *DES. CARTES*: And tho' he hath writ but little concerning *Moral Philosophy*, yet I have a mind to raise this structure upon the Foundation he hath laid, and from what he hath Writ concerning the *Soul* of *Man*, and the *Passions* to discover his Sense of *Moral Matters*.

CHAP. I.

Of the Nature of Ethicks, and the principal Parts thereof.

Forasmuch as *ETHICKS* is a part of *Philosophy*, and the *Directrix* of *Human Life*, accordingly she derives her certainty from her own *Principles*; which do so much conduce to the obtaining of her end, that without their assistance, *Goodness* and *Vertue* can never be had. For as *PLATO* well observes, it is not by an impulse of *Nature* only, or by *Divine choice* and *favour*, that *Vertues* are acquired, and *Vices* banished; but it is necessary to call in *Science*, or rather the Art of *doing well*, to our assistance, that by her *Rules* and *Directions*, we may be exercised to good manners, and the inborn *Seeds* of *Vertue*, that lye buried in us, may be cherished and spring forth. And if at any time some have been known to arrive at the perfection of a *Vertuous Life*, without the precepts of *Ethicks*, yet must not we therefore deny her to be an *Art*; no more than we refuse the title of *Art* to *Physick*, tho' sometimes we may recover our Health without it.

Some think it is but a small thing to undertake the *Explications* of the *Precepts* of *Ethicks*, because the *Rules* conducing to the right deportment of our *Lives*, seem so very notorious and familiar, and common to all *Nations*. Who knows not, say they, that *Vertue* is to be had in esteem and practised; that *Parents* are to be obeyed and honoured; and that *GOD*, whom all adore, is to be beloved above all things? It is proper indeed, to form *Rules* concerning things we are ignorant of; but as for Matters that are known to all men, these are best left to every ones own *Sense* and *consideration*. For my part, I should be apt enough to be of their mind also, if all men did agree universally in the *Principles* and *dictates* of this *Art*, and if all without exception embraced, what seems evident to some. But alas, most men now adays are so infected with the itch of *contradiction*, that they many times start, and maintain new *Opinions* only to gratifie their wrangling and disputing *Humour*. As appears more particularly in this Matter before us, for tho' the name of *Moral Philosophy* be tost in the *mouths* of all men, yet there are but few that concur in their *Sense* about the nature of it; and notwithstanding it be very dangerous to mistake in the forming of our *Manners*, and the due regulating of our *Lives*, yet many chuse rather, to question the truth of *Moral Dictates*, than to want an opportunity of thwarting and contradicting the *Sentiments* of others, tho' never so clear and incontestable. But may I never be tainted with this Evil, whose aim only is, to pursue Truth, not concerning my self about what others teach, or what *Opinions* they espouse:

I.
The Cer-
tainty of
Moral Phi-
losophy.

II.
Tho' Ethicks
in it self
be very
familiar,
yet there
are but few
that agree
in explain-
ing of its
Nature.

My

My design only being to explain what *DE SCARTES* hath left in writing about these *Matters*, and to pursue his sense and meaning.

III. Wherefore from his *Method of discoursing a-right*, I gather this definition of *Moral Philosophy*: viz. that it is a right way or course of thinking, in order to the obtaining of *Human Felicity*. Or a Discipline directing man, in his voluntary Actions, so as to live well and happily. In the name of *Discipline*, it agrees with the other parts of *Philosophy*, but is distinguished from those *Arts*, which leave behind them some perceptible Matter, when the Action is over. For *Moral Philosophy* is not conversant about any *External Matters*, nor considers *Bodily Actions*; but is intirely employed and concern'd about the inward Operations of the *Will*, inasmuch as they are submitted to *Right Reason*, and by it directed to that which is *Good*. Wherefore to constitute its difference from other *Arts*, it is added to live well and happily; that from thence we might gather, that the *Mind* of man is perfected by *Moral Philosophy*, and directed by its precepts to act rightly, and comporting with reason.

IV. The Object of *Ethicks* is right reason, which is to be exercised towards all persons and things, and in all our Actions, and the several circumstances of them. Or if you will, it is man himself, inasmuch as he can and ought to be directed to an *Honest*, that is *Moral Good*, according to certain reason. And the end of *Ethicks* is to perfect man, and make him happy. For if a man be steadily conformable to right reason, in all circumstances of Persons, Things and Human Actions, he is arrived to the highest top of his *Moral Perfection* and *Blessedness*.

V. The word *Ethicks*, signifies nothing but *Moral*, or that which concerns *Manners*; and accordingly *Ethicks* takes upon her to frame and direct our *Manners*; which are nothing else, but a way or course of Living confirmed by custom; or a certain accustomedness of Acting, or repeated *Human Actions*, which when they are conformable to right reason, are called *Good manners*; but if contrary to the same, *Vicious* and *Wicked*.

VI. And altho' many *Human Actions* are *External*, and such as cannot be performed without the help of the *Body*, as *Liberality*, which communicates her Benefits to others; *Justice* which gives to every one his due, and other such like which are free, and at the command of the *Will*: Yet are not these Actions primarily considered by *Moral Philosophy*, but secondarily only, so far as they are the effects of *Internal Actions*, and the product of the *Will*. For the Duty of *Liberality* doth not principally consist in the relieving of our Friend, but in the care and desire we have to assist him, which is the peculiar property of a generous and vertuous *Mind*. Neither can we suppose that the restoring of a *Pledge* or *Trust*, or the paying of a *Debt*, doth fulfil the whole requiring of *Justice*; but rather that firm purpose of the *Will*, whereby a man unalterably resolves to restore the *Trust* that is committed to him, and not wrong any by withholding their due from them. Wherefore outward Actions may be said to be the Instruments only, whereby the *Will* executes her decrees, and performs what she hath resolved upon. And tho' all particular Actions be free, as being performed

or omitted according to the pleasure of the *Will*; yet it is not the concern of *Ethicks* to consider particular Actions; but only the Actions of the *Will* in general, to which it universally prescribes, that *GOD* is to be loved, *Vertue* to be embraced, and *Vice* to be avoided, &c.

From all which it is evident, that *Moral Philosophy* is not merely *Speculative*, or consisting in the sole contemplation of *Manners*; but that it is to be reckoned amongst the active Sciences, its work and business being to form our *Manners*, to instruct us to *Vertue*, and prescribe the Rules of well-doing.

Moral Philosophy is commonly divided into three Parts, viz. into *Private*, *Domestick* and *Politick*. For man may be considered under various respects; First, as he is a particular man, that is, as he takes care of himself, and provides for his own Good: Secondly, as he is the Master of a Family, and performs the Duties incumbent on a Master or Parent; and Lastly, as he is concern'd in the Government of a City, or *Commonwealth*, and the giving Laws to others. All which diversities of Offices or Duties, are directed by so many several parts of *Moral Philosophy*. The *Private*, which some call *Monastick* or *Solitary*, is that part of *Ethicks*, which gives Rules how men in their singular State ought to behave themselves: The *Domestick* or *Oeconomical*, is that which lays down Precepts, how Families may be rightly ordered: And the *Political* teaches and instructs us in whatsoever conduceth to the good of Societies, and how both *Magistrates* and *Subjects*, are to behave themselves in their several Stations: For seeing that man stands in need of the Help and assistance of others, as well with reference to those things which are the necessities of Life, as those which are the comforts and conveniences of it; he is assisted in those things which are necessary to Life by his Family, and by the Society or *Commonwealth*, with that which conduceth to his safety and well being.

But whatsoever *Modern Philosophers* may talk of this distribution of *Ethicks*, it seems clear to me, that the two latter parts of *Moral Philosophy* are contained in the former, and that if a man be only instructed in good Manners, this is sufficient to qualify him, for the well and happy governing of his House or *Commonwealth*. For it is still a *Private man*, that manageth matters, whether in a Family or *Commonwealth*, and who certainly will be by so much the more fitted to discharge his Duty and Trust in either, by how much greater command he hath got over his Passions, and the more eminent he is in *Vertue*. For the *Vertue* of a *Private person*, doth not differ from that of a *publick* and *Political*; no more than the *Felicity* of the one, differs from that of the other. For whatsoever the *Private* part of *Ethicks* professeth, the same is with equal Right contained in the two others, viz. the Science of Life, besides which nothing is taught, or contained in the *Oeconomical* and *Political*. Neither can we assign any other difference betwixt them than there is, in the several Pipes of *Wind-Engines* or *Instruments*, in which one and the same *Wind* produceth several Sounds. In like manner all men receive from the *Private* part of *Moral Philosophy*, the Rules of living well and conformably to reason,

son, notwithstanding that as the greater Pipes of an Organ yield a deeper Sound, so those who are in high and honourable places in the Commonwealth, may have a more large field wherein to exercise their Vertues, and more ample matter, of giving illustrious and signal instances of their Firm Probity.

C H A P. II.

What Good is, and how and why the same is desired.

I. Nothing is Good but with reference to another.

Before we proceed to explain the nature of Good, and to discover that which is the desire and delight of all men; we are to take notice, that a thing considered in it self, cannot be said to be either Good or Evil, but only with reference to some other thing, to which it is conducive to attain that which it pursues, or on the contrary. Thus Venom is good and wholesome to a Serpent; but hurtful and destructive to man. And therefore, if we except GOD Almighty only, who doth good to all, and preserves the Being of every thing; there is nothing in the World, which in a different respect may not be accounted Good and Evil. But this being so, a difficulty seems to arise, how then we may come to know and perceive that which is Good, and how to distinguish it from that which is Evil.

II. Good cannot be defined with the reference it hath to our Appetite or desire.

Some define the Essence of Good by our inborn Propensity, or Inclination; as supposing that to be Good which excites our desire, and allures us to embrace and pursue it. But these according to my Judgment, do not exactly enough lay open the nature of Good. For that Inclination whereby we are carried out to desire that which is Good, supposeth it to be something that is suitable to our Nature, so that the thing must be endued with the formal reason of Goodness, before ever it can move our Appetite. For Appetibility or desirableness, is nothing else but an Affection or Property of that which is Good, and which flows from its Essence. Now it is inconsistent with the Rules of true Definition, to make the proprieties of things to constitute the natures of them.

III. The true Definition of Good.

Good therefore may better be defined thus, viz. that which is acceptable and suitable to every one. And that this is a true Definition, will appear by an enumeration of the several general heads of Good things; for all Good is comprehended under one of the three heads of Honest, Pleasant or Profitable. An Honest Good is that which is agreeable to right reason, and is desired for its own sake: As Vertue, Piety, to love Good, to honour ones Parents, to relieve the Poor, to curb the lusts of the Flesh. Pleasant Good is that which is desired for delights sake (yet without thwarting the Honest Good and Right Reason) as Musick delights the Ear, a curious Picture the Eye, and the conscience of Good deeds, does afford innocent pleasure to Mind or Body. Profitable Good is that which is Good, in order to some other thing, for the acquiring whereof it is desired, as Money, Riches, &c. But not one of all these is called Good, save only in reference to its being suitable, or agreeable to some other thing. The reason whereof is this, because the operation of the Understanding, must go before the Act of the Will; and therefore it is necessary that the Object be first

known to be agreeable to a reasonable Nature, before that the Will can be carried out towards it.

Now it will be easie to shew how, and in what manner things are carried out towards that which is Good, that is to the desire of that which is agreeable to, and convenient for them, if we consider the two Appetites in Man, whereof the one is call'd Innate, the other Elicit: The Innate Appetite is an inborn inclination, whereby a thing is carried towards that which is convenient for, and acceptable to it. Thus the Peripateticks generally hold, that the Fire by a natural propensity tends upwards; and that Plants attract a suitable Aliment out of the Earth. Tho' indeed this seems very difficult to conceive, that things utterly devoid of Sense and Knowledge should desire any thing, or be endued with any propensity. We cannot deny, but that in things of this nature, there are some certain Laws of Motion, appointed by the Author of Nature, which may be said to be a kind of inward propensions; as that every motion affects to pursue a right Line; but we yet must have a care, not to attribute any Appetites or Inclinations to things, when we search into their more hidden Qualities, for this would be to confound the Attributes of the most different things. Wherefore Appetite is only to be attributed to Man, it being an Act of the Will, whereby upon previous Understanding, it is carried out to that which is convenient for it.

Wherefore when I say, that Inanimate things have an Appetite, I would not be so understood, as if I did attribute any Knowledge to them, by which they desire things grateful, and avoid the contrary (for Knowledge is no where but in the Mind) but only that by an infallible necessity they follow the guidance of the Divine Reason, and indispensably obey his Will; in like manner, as an Arrow by a skilful Archer is guided to the mark, with out having any Knowledge or Perception thereof: Inanimate things therefore pursue that which is Good by a natural impulse, and reach it by means of Local motion, which the great Creator of the Universe hath furnisht them with. Man alone desires Good from a preceding Knowledge, because he only is possessor of a Soul, whose peculiar nature it is to Perceive, Will and Imagine.

But it may be enquired, seeing that Man doth not pursue that which is Good, without a foregoing knowledge of it, how it comes to pass, that he sometimes goes in quest of the contrary, that is, Evil? To which I answer, that Evil is never desired by Man; but whatsoever his desire is carried out after, the same is always proposed to him, under the likeness and appearance of Good. For tho' it may be, that which he hankers after, be contrary to Reason, and the Law of GOD; yet is the same always represented to him as some Pleasurable or Profitable Good; and is consequently allured to it, under the notion of its being suitable to him.

It will be sufficient for the explication of the Nature of Good, only to discover the cause, why all Men promiscuously desire that which is Good, and are byast towards it, by an inborn propensity. To do this will be very obvious, if we remember, that GOD is the supreme Good, comprehending all

IV. There are two sorts of Appetites.

V. In what sense Inanimate things may be said to desire things.

VI. How it comes to pass that Man sometimes desires Evil.

VII. Why all Men, none excepted, desire Good.

the *Perfections* that can be conceived by the *Mind* of *Man*. Wherefore when any other *Good* is represented to us, we desire it upon no other account, but as we apprehend it to partake of the *Divine Goodness*, because by its *Essence* and *Existence* it bears some kind of Resemblance with him. And hence it is that no *Rest* can be found, either in the Possession of *Good things*, or in the *Contemplation of Truth*; because nothing created can equal the *Idea* we have of *Good* and *Truth*: tho' in the mean time we snatch at some imperfect *Images* and *Glances* of it, whereby our *Love* is inflamed to attain the *Supream Good*. This *Affection* also is sometimes kindled in us from the Diversity of *Objects*, as being apt to imagin that we make some approaches to the infinity of that *Highest Good*, by enquiring into the Nature of new *Objects*, and by extending the Bounds of our *Knowledge* and *Enjoyments*. Accordingly it happens sometimes that *Covetous Misers*, quitting their niggardly *Companions*, frequent the company of *Liberal Persons*; and that such as are *Sad*, keep company with those that are *Merry* and *Jovial*; and those that are *Angry* and *Froward*, with persons of *Meek* and *Quiet Spirits*; as being sensible of an insufficiency in themselves, and that they stand in need of the help of others towards the obtaining of their proper *Good*.

VIII.
In every
Desire
there is
some ap-
pearance of
the Su-
pream
Good.

Now in all these there is somewhat of a tendency towards that *Highest Good*: for *Ambition* doth not proceed from an Inborn desire of *Honour*; nor doth the concupiscence of *Love* proceed from *Nature*, but from a *Pravity* of *Manners*, whilst they are panting after that Immense *Good*, and affect the Possession of that which is infinite. For the desire of that which is *Good*, is, as it were, the *Great Artificer* that endeavours to make *Created Beings* conformable to their first *Principle* and like unto him.

CHAP. III.

What the Highest Good is.

I.
All Men
aspire af-
ter Happi-
ness.

THERE is nothing sticks so close to the mind of *Man* as the desire of *Blessedness*, and tho' sometimes we can hardly obtain or reach it, yet we are still in pursuit of it. For all the other motions of our *Mind* vanish away by degrees, and in process of time are lessened and weakened. For we are not always taken with the splendor of *Honours*, or inflamed with the love of *Riches*; and *Pleasure* or *Voluptuousness* at last loseth all its charms, whereby it formerly captivated us, so that we loath the *Objects* we before panted after. But the desire of *Happiness* admits of no vicissitude, but as long as we breathe, or our *Hearts* do beat, excites us to the pursuit of it.

II.
What the
Highest
Good is.

This is that in which all *People* do agree, that they desire to be *Happy*; and how greatly soever they may differ in their *Temper* and *Inclinations*, yet they all unite in this *Passion*, that they all affect to be happy. And accordingly the *Ancients* called the *Highest Good* the *last of all, desirable things*; forasmuch as the said *Good* is every way perfect and absolute, which being once attained, there remains nothing further to be desired. The *SUPREAM GOOD* therefore is that Mark which all our *Words* and *Deeds* tend to; and

as *Seafaring-men*, direct their *Eyes* to the *Pole Star*, so likewise is our *Soul* to be directed to some end, to which all our consults and deliberations of living well, and acting aright must tend.

Tho' almost all *Philosophers* have written concerning the *Highest Good*, and have left great *Volumes* on that *Subject* to *Posterity*, yet were they never more mistaken in any thing, than they have been in that point, insomuch that I dare affirm, that excepting only a few, they were never more unhappy in any of their undertakings than in this research after the true *Nature* of *Human Felicity*. I conceive that their mistake herein was caused by reason of their not duly considering what properly belongs to *Man*, or for want of accurately distinguishing between the *functions* of the *Mind*, and the *motions* of the *Body*; by which means, flighting the *Inhabitant*, they only had regard to his *Home* or *Lodging*.

The *Highest Good* therefore of this *Life*, is that which makes *Man*, here on *Earth*, most perfect and happy. And therefore for its sake only all other things are desired, whereas the *Supream Good* is desired for its own sake. We seem to express, at least, a kind of confused knowledge of this *Good*, when we prefer one thing before another: for when-ever we choose one thing rather than another, we always suppose the one to be *Better*: now that only is so which comes nearest to the *Best*. So that it appears we have an indelible notion of the *Best*, that is, *Supream Good* impressed on our *Minds*.

Some have defined the end of all our *Actions* to be *Pleasure*, the desire whereof is born with us, as well as the aversion of *Pain*; of which number was *ARISTIPPUS* the *Philosopher*, and the *CYRENAICKS*. Others determined *Blessedness* to consist in the enjoyment of a *concourse* of all *Good Things*; and that no *Man* was happy, that did not possess the affluence of them all. And accordingly, for to constitute their *Happy Man*, they require that he have *Friends* to advise and assist him; that he have *Riches* for necessities and convenience; *Power*, whereby he may command others, and make them serviceable to him; *Nobility*, to make him conspicuous and eminent; yea, and *Beauty* too, with a *fruitful Wife*, and well-mannered and witty *Children*. But, as I said before, I suppose that these *Philosophers*, who placed *Happiness* in these things, never well considered the *Nature* of *Man*, nor what belongs to his *Mind*, and what to his *Body*. For had they lookt upon the *Mind*, as they ought, to have been the chief and principal part in *Man*, they would never have placed his *Felicity* and satisfaction in things that gratifie his *outward Part*, seeing that true satisfaction appertains only to his *Rational* and *inward Part*. But forasmuch as the dispute amongst *Philosophers* is not so much about the *Nature* of *Felicity*, as the *Causes* of it, that is, the means which lead to it; it shall be our care chiefly to discover, whence *Happiness* doth arise, and what that *Supream Good* is, by the enjoyment whereof we are made *Happy*.

piness.

CHAP. IV.

That the Good Things of the Body conduce nothing to Mans Happiness.

I.
Aristotle
ranks
Health a-
mongst the
most confi-
derable
Good things
that concur
to Mans
Happiness.

THE Good things of the Body are commonly reduced to these three, viz. *Health, Beauty, Pleasure*; in the enjoyment whereof we are commonly esteemed happy. For if we consult ARISTOTLE, he will tell us, that *Health* is as great a Good to us, as a calm Sea is to the Birds called *Halcyons*; who, when the Face of the Sea is smooth, and not wrinkled with Winds, with great ease and delight dispatch their affairs, sit brooding upon their Eggs, hatch their Young, cherish and feed them: and that much the same pleasure and ease attends those that have a firm and healthful Constitution of Body, whereby they with cheerfulness exert all the functions of Life, and with a ready activity discharge all the Offices incumbent upon them. For when the Body is sick and weak, who knows not that the Briskness and activity of Man languisheth, and that the very perceptions of his Senses prove burdensome and irksome unto him? His Ears loath the sweetest Musick, his Sight is tired with the most Beautiful and charming Objects, the Conferences of his Friends prove tedious, and by an utter dislike of all things, he sometimes becomes intolerable, even to himself.

II.
If Health
were the
peculiar
Good of
Man, Beasts
would ex-
cel him.

But, notwithstanding all this, far be it from us to constitute the Good of Man in so mean a gift of Nature, and to make his Felicity to depend on his Body. For if we place the chiefest Good in a due state of the Body, shall we not make Beasts more happy than Man, who generally enjoy a more firm and vigorous health, and more perfect Senses? Whatsoever conduceth to the Happiness of Man, must be peculiar to him, and not common to him with the Brutes. Besides, the things that constitute the Highest Good, must be stable and unmoveable; but what is more weak and tottering than Health, which is overturn'd with the least fit of Sickness, and which as years encrease upon us, decreaseth continually? That which is not in our Power, but depends on another for its subsistence, doth not deserve the name of Good. Do't we see frequently that the most Learned and most accomplished Men are the most weak and sickly? And that the things which promote and assist the mind, are hurtful to the Body? Are not Studies, which inform and enlighten the Mind, and inflame the Will, prejudicial to the good Temperament and State of our Bodies which they alter and weaken?

III.
Beauty is
no part of
Mans Happiness.

And the same judgment must be made of Beauty, because of its Frailty, and short continuance. For what season of the Year can be named, that doth not conspire to the defacing of it? The Winters Cold by driving the Heat inwards, much abates the florid colour of the Face, whilst the Summers Heat tans the Skin, wherein Beauty hath its peculiar residence, and sits exalted as on her Throne. But suppose we this fading Flower to be perpetual, and exempt from the Power of the distemperature of Seasons or Weather, yet after all, we shall never be able to make it a part of the Highest Good, seeing it brings nothing but trouble along with it, and disturbs the peace of those that are most possess'd of it with continual sollicitude.

How vexatiously sollicitous are Young Men and Maids to appear Beautiful to the Eyes of Spectators? What pains and inconveniencies do they not undergo, to preserve this fading Flower? How many hours do they spend in Curling and Combing their Hair, and other Trimmings, and neglect the improvement and good state of their Minds, to adorn and deck their Bodies? Nothing can be esteemed Good, but what is conducive to Virtue; but who is so blinded with the Charms of Beauty, to assert that it is any way helpful or conducive to Virtue and Honesty? When on the contrary it is apparent that it is the greatest allurements to Sin, and furnisheth the strongest incentives to Lust and Concupiscence? A Woman that sets many Hearts on fire, is in no small danger of being fired her self: And it is but seldom that we find exact Chastity and great Beauty to go hand in hand together; and there is but too just reason to suspect, that she who is too industrious to please others, is not free from impure desires her self. Wherefore conclude we, that Beauty cannot be ranked amongst the Good things that constitute Human Felicity, as well because it is so brittle and fading, as because it gives occasion to promote Vice and advance Folly.

But there are none that more abuse the name of the Highest Good, than those who place it in Pleasure, and take its height from sensual delectation. not that I suppose this to have been the opinion of EPICURUS, as most do, since I am perswaded that his Precepts were Vertuous and Good, and that he made use of the word Pleasure, not to advance Voluptuousness, but to promote Virtue, as I have elsewhere shewed at large. Wherefore I do here contend with them only, who owning nothing in Man besides his Body, suppose that his happiness consists in abounding with Pleasure, and that he is then Blessed when every part of him hath its share of joy and delectation.

But these may be easily convinc'd of their error, by putting them in Mind, that by setting this Estimate upon Mans Happiness, they level him with the Beasts, and assign to him no greater Good than Swine themselves do enjoy. Nothing can enter the Constitution of the Supreme Good, but what is Eternal, and which affects the Soul in such a manner, as to be hurtful or prejudicial to no Body, and never causing wearisomeness or loathing. Whereas Pleasure is inconstant, and soon languisheth, and is extinguish'd when it delights most. Whatsoever is the true Good of Man, doth not thwart any other Good, but is advantageous to Virtue, and to his Body and Soul; whereas there is no greater Enemy to Prudence than Pleasure; nothing that more overcasts the Mind, and fills it with disquiet and ignorance; being always Rash and Precipitant, impatient of Advice or Counsel, and not so much the effect of Choice, as of a suddain attack and onset. What agreement can there be betwixt Human Felicity and such a Good as this? The thing must be Immortal and Eternal, that can make an Immortal Soul Happy.

Besides, how can the Highest Good of Man consist in that which is common to Good and Bad, to the Criminal as well as the Innocent; that which enticeth Men from Virtue, and clouds their Judgment; the affluence whereof clogs and breeds a loathing, and commonly ends in Sadness and Repentance?

IV.
Bodily
Pleasure
cannot
make Man
happy.

V.
They that
constitute
the Felicity
of Man in
Bodily
Pleasure,
do level
him with
the Beasts.

VI.
Pleasure is
common to
Good and
Bad Men.

penitance? Now that all these things may be truly affirmed of *Pleasure*, is evident to every one that considers the Nature of it.

CHAP. V.

External Good Things are not the Good of Man.

I. The Good things of Fortune are not in our Power, and therefore do not belong to us.

II. Riches are frequently a Man's greatest Enemy, and most prejudicial to his Peace and Quiet.

III. Riches cannot make Men happy.

Forasmuch as *Suitableness* constitutes the Nature of Good, and that we always desire that which is most agreeable to our Nature, we do abuse our innate Faculties, when-ever we desire things that are not suitable to us, or which are not in our own Power: which they evidently seem to be guilty of, who rank outward Goods amongst those Good things that are conducive to the Happiness of Man. For such as these pursue Happiness in matters that are foreign to them, and the Acquisition whereof is not in their own Power. Whereas what can be imagined more foolish than to prosecute a *Precarious Felicity*, and to borrow the means and helps of a *Happy State* from foreign things? Who ever acquired *Riches*, *Renown* or *Nobility* when he pleased? they being Largeesses of *Fortune*, which she gives, and takes away by chance, and at random.

You'll say that *Riches* are necessary to a *Happy Life*, forasmuch as they furnish us with many comforts and conveniencies. But for all this, I shall never admit any thing to enter the constitution of the *Highest Good*, except it be first demonstrated to me to be Good in it self, or that it be in the possession of such a one, who can *vertuously* make use of it. But where is he that understands the true value and worth of things, and estimates them accordingly? Where is the *Rich Man* that is not puffed up with his *Riches*, that doth not despise his Inferiors, and doth not scorn their company? *Riches* indeed may conduce to Pomp and Splendor, but not to that state which we require in a *Wise Man*, viz. a constant calm and sedateness of Mind. For with what racking solicitude are they tormented in the acquiring of them? What care, what pains do they take to preserve them when got? So that they may truly be said not to possess their *Riches*, but to be possessed by them. Besides, the possession and enjoyment of Good must needs fill and satisfy the Soul: But where is the *Rich Man* that is content with his Condition, seeing that they are never satiated with Gold; and that all their acquisitions serve but to enlarge their Desires, and render them insatiable? Lastly, we find nothing more frequent and obvious than that *Riches* do debauch men, and corrupt their manners, and tempt the best Natures, sometimes, to the worst of Vices. It was *Riches*, far more powerful than *Swords* or *Darts*, that broke and vanquished the *Roman Vertues*, and made Slaves of them, who had mastered the whole World. The *Romans* were every where Conquerors, whilst they were poor, neither could any thing stand before them; but were conquered, and trod upon as soon as they began to wallow in *Riches*.

Moreover, that which is the *Highest Good* must needs accomplish and Bless Man in the highest degree, it must needs be constant and permanent, be desirable for it self, belong to Good Men alone, and exclude all Evil; but nothing of all these can

be found in *Riches*. For *Riches* are not desired for themselves, but for the ornament and convenience of Life; they are more frequently possessed by Bad, than Good Men, as daily experience sheweth; they are the Cherishers and Fomenters of Vice; they do not bar or keep off Evil, they do not fill the desire, and they often make a man infamous and corrupt him, instead of making him better.

Neither can Honour, with any greater Right, lay claim to the title of Good, as wanting stability and permanence, and any other subsistence but what they have in the opinion of men. For they do not long follow the same person, but shift continually, and imitate the inconstancy of the People, whose breath they depend upon. Do not Histories furnish us with Examples of those who from wielding a Scepter, have been reduc'd to hold the Plough; and who from a state wherein they were raised, not only above the Heads of others, but above the Laws themselves, were forced within Bounds, and had their extravagant Power retrencht? Did we never hear of SEJANUS, that most famous Roman Consul, who was the Emperors Deputy and Lieutenant General, and whom TIBERIUS called his Friend, how upon a Letter from that Emperor to the Senate he was cast into Prison, and ignominiously treated, being abhorred and flouted at by those, who worshipt him but a while before? And shall we not conclude from these, and a thousand other instances that Fame and Honour are brittle like Glass, and inconstant as the Wind, which whilst it flatters, doth ensnare us, and when it shines strongest, is nearest its setting. Lastly, why should Honour be desired, since it doth not depend on him who is praised, but is wholly in the Power of those who give it? Neither are Men Honour'd because they are worthy, but because others think them so.

Others again cry up Nobility, and think it very much injur'd by those who reckon it amongst indifferent things, which do not concur either to Happiness or Misery. For they suppose it to be an innate Worthiness, founded upon the Vertue and Achievements of their Forefathers. But how can this make them better, since the Nobility they value so much is none of their own, but wholly derived and borrowed from others? Every one must have his own Vertues, since it is impossible for any Man to borrow them from another. What, am I to be accounted Noble, because my Parents or Ancestors were Famous and Renowned for their Vertue, and because they deserved well of their Prince and Country? We Pride our selves with that which is anothers, whilst we boast of our Pedigree, and arrogate the Praises of our Ancestors, as if due to us? For what else is this but to Rob the Dead, and to expect Glory, for what we never labour'd for? But besides this, how often doth Nobility take its rise from Crimes and Wickedness, and how frequently hath an honourable Title been the reward of Murder or Treachery? What more common than to purchase Nobility with Money or Pimping, and for a man to become illustrious for his Vices? The Posterity of such as these cannot be said to be Noble but Notorious, and the Rise of the Fathers Gentility, becomes the reproach of his Children. But we'll suppose your Ancestors to have been all of them great and Gal-

IV. Honour is a Fickle Good, and depending of another.

V. Nobility being an external advantage only, cannot make Men happy.

lant Men, and to have been beholden to their *Virtue* only, for their *Nobility*; yet can they not transmit this *worthiness* of theirs to you, nor indeed any thing besides their *Riches*, which without any regard to the *Virtue* of our *Forefathers*, we do often abuse to the Ruin both of *Soul* and *Body*. How often do we meet with *Gentlemen* by name, who, as to their *Manners* and *Accomplishments*, are very mean and inconsiderable? He is *Noble*, who hath a great *Soul*, disposed to *Virtue* and *Goodness*, who knows things that are *Right* and *Honest*, and doth heartily love and pursue them.

CHAP. VI.

What is the Highest Good of Man in this Life, and his Ultimate End.

I.
How the
Highest
Good, Happi-
ness and
Beatitude
may be dis-
tinguished.

TH O' from what hath been already said, it doth in great measure appear, what that is which we call the *Supream Good*, yet will it be of use in the beginning of this Chapter, to enquire what *Felicity*, and what *Bliss* is, and how they differ from the *Chiefest Good*. We commonly call them *happy*, who abound with the *Goods* of *Fortune*, and who without their own *Wit* and *Industry* jump into *Riches* and *Honours*. And therefore such are commonly said to be more *Fortunate* than *Wise*; forasmuch as the things they possess are only *external*, and do not properly belong to them. But *Beatitude* consists in that *Joy* of *Mind*, and *Tranquillity* of *Soul* which ariseth from the Possession of the *Chiefest Good*; and the *Highest Good* is that *Object*, the enjoyment whereof makes us *Blissful*, and than which nothing higher or better can be desired by us. So that the *Highest Good* of this *Life* is that which makes a *Man* *Blessed* and *Perfect* here on *Earth*, according to the Possibility of this *State*. And therefore all other things are only to be desired for the sake of it, and it only desirable for its own sake.

II.
The Chief-
est Good of
Man in Ge-
neral.

It will be useful also for our better understanding of the *Nature* of the *Chiefest Good*, to consider *Man* in a double state, and that is either as a *Private Man*, and as he is a *person* that takes care of himself, and refers all things to his own *Good* and *Interest*: or as *Man-kind*, or the *Nature* of *Man* in general, which comprehends all *Men*, and does, as it were, constitute a *Body Politick*. The *Chiefest Good* of a *Man* considered in this latter sense, seems to be no other than a *Concurrence* of all *Perfections* whereof he is capable. For so *Man* cannot be lookt upon as most perfect, without he be furnished, not only with the *Goods* of *Soul* and *Body*, but also with those of *Fortune*.

III.
The Chief-
est Good of
a Private
Man.

But forasmuch as we do not enquire here what it is that makes *Mankind*, or all *Men* collectively taken, *Happy*, but what makes every singular *Man* so; we say that the *Chiefest Good* of a *Private Man*, is the *right use* of his *Reason*, and which chiefly consists herein, that he have a *firm* and *constant purpose* of always doing that, which he judgeth to be best. And this is therefore the *Chiefest Good*, because no *Good* must be esteemed by us more than it, and all other things undervalued in comparison of it. And then because we enquire here after a *Good* which is in our *Power*, and can be obtained by us; and that the *Good* things of

the *Body* and *Fortune* are without us, and come to us, and go from us without any contrivance or endeavour of ours; nor can we be said to possess those things which are only borrowed by us, and which we may lose the next moment; therefore it is of absolute necessity that we place our *highest Good* in our *Mind*, and that it depend on our *Free Will* only.

All that belongs to our *Soul* is compriz'd in 2 *Faculties*, viz. the *Power of Understanding*, that is, of knowing *Truth* and *Good*, and discerning them from *Evil* and *Falshood*: and the *Power of Willing*, or assenting to those things which we know to be *True* and *Good*. And in the right or due use of these 2 *Chief Faculties*, we say that the *Supream Good* of *Man* doth consist. Which is then chiefly done, when we diligently inspect whatsoever is propounded to us, and when we exert the utmost of the vigor of our *Mind* to the discerning of that which is best; which is the *first Function* or *Office* of our *Intellective Faculty*. And in the next place, that our *Choice* exactly follow our *Perception*, so as to undertake nothing which is not clear and manifest to us. For our *Knowledge* is the *Rule* of our *Actions*, and, as it were, the *Guide* of them, which we are to follow; and as long as we do so, we may be said to be out of the reach of *Error*: For tho' we may happen to be deceived, and tho' that which we have accounted *Good* may be only so in appearance, or may be indeed *Evil*, yet notwithstanding we are assured that we have performed what was our *Duty*, and have omitted nothing, whereby we might discover the true *Nature* of it.

Which *satisfaction* of *Mind* we shall attain to, by giving heed to, and observing these 3 things which are the *Foundations* of all *Ethicks*, or *Moral Philosophy*. First, That we, according to our utmost endeavours, strive to attain the *Knowledge* of what we ought to embrace, and what to avoid in all the *Circumstances* and occurrences of our *Lives*. For seeing that many and various things happen to us, during the whole course of our *Life*, which according to the different *Circumstances* of *Time*, are called by different names, we are constantly to fix our *Eye* upon the *Dictate* of *Reason*, forasmuch as it often happens, that those things which were once *Good*, are accounted *Evil*; and that which was *Honourable*, is now lookt upon as *Ignominious* and *Despicable*. Above all, we must take heed of espousing the *opinions* of the *Vulgar*, not minding what *Men* commonly do, but what ought to be done.

The *Second thing* is, That we stand firm and constant to what we have once resolved upon and purposed; that is, that we retain an unmoveable *Mind* and *Will*, of doing those things which *Reason* commands, not suffering our *Passions* and corrupt *Inclinations* to lead us aside.

The *Third*, That we lay this down as an unmoveable *Ground* and *Principle*, that nothing besides our own *Thoughts*, is in our *Power*; and that therefore seeing the *Goods* we want, are without us, they are not to be wished for or desired by us.

The *Greatest Good* therefore that we can attain to in this *Life*, consists in the possession of all those *Perfections*, the obtaining whereof depends on our own *Free Will* or *Choice*; and seeing that

IV.
It consists
in the due
use of his
two Chief
Faculties.

V.
In order to
the attain-
ing of Bea-
titude, three
things are
to be done.
The First.

VI.
The Second.

VII.
The Third.

VIII.
Whatso-
ever doth
not proceed
from our
Free Will
or Choice,
deserves no
praise.

there is nothing, besides the *Exercise of Vertue*, that is of this Nature, we are to conclude, that our proper *Good* and *Happiness* doth therein alone consist. For indeed, whatsoever doth not proceed from this *Principle*, neither merits *Praise* nor *Blame*; for *Praise* is the *Reward* of *Good Actions*, and can never be deserved, if they be the effect of *Necessity*, and are not the *Fruits* of our *Free Choice*. 'Tis without *Reason* therefore that we delight our selves in *Riches*, *Honours* and such like, seeing that they are things without us, and therefore do not belong to our *Happiness*. We may be allow'd indeed to have some *Value* for them, but no *Praise* is due to us for them, any further than they have been acquir'd *justly* and *honestly*, that is, in the due use of our *Reason*.

IX.
Wherein
the Bliss or
Beatitude
of a Na-
tural man
doth con-
sist.

Whence we may easily gather, That the *Natural Happiness* of *Man*, is nothing else, but that *Tranquillity* or *Joy of Mind*, which springs from his Possession or Enjoyment of the *Highest Good*. Which being nothing else but the *Right use* of our *Free-will*, we must conclude, that from the Possession thereof our *Chiefest Pleasure* must proceed. This will be evident as the *Sun at Noon-day*, if we consider, that all *Pleasure* and *Delight* is the Inmate of our *Soul*; and tho' there be some *Delights* which cannot be communicated to it, but by means of the *Body*, yet we may assert, that they are intimately present to the *Mind*. For it is the *Soul* which perceives all *Outward Objects*, tho' they be convey'd to her by the Ministry of the *Senses*; and it is the *Soul* alone that is affected with, and capable of *Pleasure*, whilst she perceives her self possessed of the *Highest Good*, whereof she is capable in this *Mortal Life*.

X.
It is im-
possible, but
he must be
sensible of
the Highest
Joy, who
lives in the
due use of
of his Free-
will.

Moreover, we are to take notice, that *Good things* are not so much to be rated by us, from the *Conveniences* or *Advantages* which accrue to us from them; as from the *Relation* and respect they have to us. Now seeing that *Free-Will* is properly and peculiarly ours, and that it is the *Best thing* we are *Owners* of, it follows, that nothing less than the *Highest Joy*, can be the result of the *Right use* thereof. For what can be more excellent in *Man*, than that whereby he is raised above all other *Animals*; than that whereby he resembles the *Great and Glorious God*, seems to stand, as it were, on even ground with him, and to be exempt from his *Command*? Forasmuch therefore as it is manifest that our *Free-will* is the greatest of all *good things*, and that the possession thereof is ascertain'd to us, there can be no question, but that the greatest *Peace of Mind*, and the most solid of all *Pleasures*, must naturally spring from the due use of it.

XI.
The Anci-
ent Philo-
sophers were
of the
same Opi-
nion.

And by giving this Notion of the *Highest Good* of *Man*, we concur with the *Opinions* of the *Ancients*, and embrace the *Sentiments* of *EPICURUS*, as well as of *ZENO*, and the rest of the *Stoicks*. For tho' *EPICURUS* placed the *Chiefest Good* in *Pleasure*, and *ZENO* in *Vertue*; yet they may easily be reconciled by saying, that *Vertue* is to be accounted the one only *Good* of *Man*, forasmuch as it alone depends on his *Free-will*: And seeing that full *Satisfaction* of *Mind* proceeds from the possession of the greatest *Good*, that therefore *Pleasure* also must be a concurrent Means to make us *Happy*.

The *Highest Good* of *Man* therefore consists chiefly in 2 things, viz. in the *Knowledge* of the *Best Good*, and in the constant prosecution of it. If any one enquire what that *Best Good* is in the knowledge and pursuance whereof we must spend all our *Endeavours*. I Answer in a word, that the *Good of the Universe* is, that a *Man* in particular be happy, and all others with him. For seeing that the *Greatest* of any *Good*, is to be measured by the *Relation* it hath to us, we are to take heed that whatsoever we undertake, may promote our *Happiness*, and conduce to our chief and ultimate End.

XII.
What that
best thing
is, we all
aspire
after.

And forasmuch as we are not born only for our Selves, but for our *Country*, and the *Society* and *Family* whereof we are *Members*, we are also to endeavour the well-being of others, and be no less solicitous for the *Good* of the *Publick*, than for our own. For *GOD* hath so order'd the *World*, and hath joyned *Men* in so close and strait a *Band* of *Society* and *Communion*, that tho' a *Man* should be so *Selfish*, as only to mind himself; yet *Prudence* would move him to do *Good*, and be kind to others. Besides, it is the *Mark* of a great and sublime *Soul*, to do good to others; and the *Noblest Minds* are always found most carried out to *Benevolence*, and to have a low Esteem of the *Goods* they possess: Whereas it is the *Character* of *Low* and *Little Souls*, to have a great *Value* for themselves, and little or no *Regard* or *Esteem* for others.

XIII.
We must
also do good
to others.

Wherefore *Private men*, and such as mind their own Interest, are oblig'd, as well as those who are in a more *Publick Station*, to be helpful and assistant to others; and if they act prudently, will endeavour, to the utmost of their Abilities, to be beneficent to others, doing them all the *Good* they can. For this is the end and design of *Human Policy*, or *State Government*, to settle such *Laws* whereby we may be helpful and useful to one another, or at least, not be hurtful or prejudicial to our *Neighbours*. For whosoever shall thus sincerely and heartily obey the *Common Laws* of the *Society*, shall without doubt live more happily and safely, than those who pursue their own profit, without any regard to the *Publick Good*; who tho' sometimes they may seem to prosper, yet for the most part have an unhappy End, and frequently come to their Fall and Ruin, by those selfish and unjust Means, whereby they design'd to raise themselves.

XIV.
The Interest
and con-
cerns of
the Publick,
are to be
prefer'd
before any
Private
Concerns
whatsoever.

CHAP. VII.

Of the Nature of Vertue in General.

Forasmuch as *Vertue* alone can make us happy, we can do no less than treat of it in particular, to the end we may be fully informed of the Nature of that thing, the possession whereof procures our *Felicity*. For tho' all *Men* own *Vertue*, yet do they not agree in their Thoughts about the Nature of it. But not to trouble my self about enumerating the *Opinions* of others, I say, that *Vertue* consists in a *Steady Resolution* and *Vigour* of *Mind*, whereby we are carried to do things we believe to be *Good*. For *Man* only is *Praise-worthy* for those things that are in his *Power*, and which depend on his firm *Resolution* of *Well-doing*.

I.
The Defi-
nition of
Vertue in
General.

doing. And it is of absolute necessity, that he who would Live well and happily, be constant and unmoveable in his *Resolutions*; for he that is wavering, and tost this way and that way by manifold *Passions* and *Inclinations*, doth not act, but is a Slave to his *Passions*; neither follows that which is best, but what is most pleasing to his *Lusts* and *Affections*.

II.
A firm Purpose as necessary to Virtue.

The most necessary therefore of the Requisites to *Virtue*, is a *steady purpose and vigour of Mind*, by which we are readily and fully carried to the prosecution of that, which after due Examination, we find to be *Best*, without suffering our selves to be stopt or turn'd aside by any *Passions* or *Appetites* whatsoever. For as *Vice* proceeds from *Doubt* and *Wavering*, which are the Consequents of *Ignorance*; so on the contrary *Virtue* is founded upon a firm and steady Purpose of performing whatsoever *Right Reason* doth suggest. Which *Right Reason* is nothing else, but a true Sense and Judgment concerning *Human and Divine things*, as far as they belong to, or concern us. Wherefore also this is that which is the proper and peculiar Good of *Man*, whereby, to speak with the *Stoicks*, he excels *Beasts*, and follows *GOD*.

III.
The Laws of Virtue are truly Good, and unrepreeable.

Nor will this sound strange to us, seeing *Reason* is no other, but that *Power of Understanding* and Judging, derived from and communicated by *GOD*, the *Highest and First Reason*, which therefore we are to follow as a *Rule* in all our *Actions*, and to which we are to have a constant Eye, as to our *Sovereign Lady*, whose *Power* over us is most *Lawful* and *Equitable*, whose *Laws* are *Irreprehensible*, and all her *Statutes*, *Beneficial* and *Perfective* of our *Natures*. So that he that *Obeys* and follows her, cannot go astray, since by keeping her Dictates he obeys the *Divine Law*, written in his *Mind*, which is the *Source* and *Rule* of all *Equity*.

IV.
A firm Purpose of always doing what is Best, is a necessary Ingredient of Virtue.

We have already said in the *Explication* of *Virtue*, that it is a firm purpose of doing those things, which *Reason* tells us are *Best*; because it is requisite that this *Will* be firm, and that the things we undertake, be thoroughly Examined by us. For those who perform the greatest *Actions*, do not merit any *Praise*, if they be not done after mature Deliberation, and with a steady Purpose. For *Virtue*, as *SENECA* tells us, is not an *Action*, but the *Exercise and Purpose* of it. For he who is prepar'd, dispos'd and resolved for the Patient enduring of the hardest *Trials*, and who is fully purpos'd to relieve and succour the *Miseries* of others, but is hindred of an *Opportunity* of exerting his *Virtuous Resolutions*, is without doubt possessor of *Virtue*, tho' he hath not been able to exert or exercise it. So that seeing it is in our *Power* to Judge what we ought to do, and what to omit; yet can we not of right be said to be *Virtuous*, except we have a steady Purpose of doing whatsoever *Reason* shall propound to us to be *Best*.

V.
Aristotle makes Virtue to consist in the midst of Affections.

ARISTOTLE, *Lib. 2. Ethic. cap. 8.* thus defines *Virtue*; *Virtue is an Elective Habit, consisting in Mediocrity with respect to us, determin'd by Reason, and agreeable to the Judgment of a Prudent man.* For according to him, *Virtue* consists in the midst of two *Affections*, and derives its Excellence from the *Mediocrity* it observes between them: For perceiving that *Liberality* for Example,

was attended by *Covetousness* and *Prodigality*; and that *Fortitude* was equally removed from *Cowardliness* and *Fool-hardiness*, he concluded *Mediocrity* to be the *Formal Cause* of *Virtue*, and to be conversant about the *Passions*, in which Excess and Defect is found. So that *Virtue*, according to him, is a kind of *Mean* betwixt 2 vicious Excesses.

But tho' this may be allow'd, as to some *Virtues*, yet it cannot be asserted of all, forasmuch as many of them admit of no *Mean* at all. For what *Extreams* can we allot to the *Affections* of *Mercy* and *Benevolence*; seeing that they, in what state soever they be consider'd, are always *Good*, and always *Virtues*, whether they be in an *Intense* or *Remiss* degree. Again, what *Mediocrity* can there be conceiv'd in *Hatred*, *Envy*, *Pride*, when these *Affections*, how temperate soever they may be, are ever vicious, and therefore can never produce any *Virtue*. For this *Mediocrity* of *Virtue* is only to be met with in those *Affections* which we call *Indifferent*, which are neither *Good* nor *Evil* of themselves, as *Anger*, *Love*, *Desire*, *Fear*, and the like. For if *Anger* be moderate, it takes the Name of *Virtue*, but becomes a *Vice*, whenever it turns to *Rage* and *Fury*, which is the Excess of it; or sinks down into *Unconcernedness*, which is the defect thereof.

Moreover, the *Love* we bear to *GOD*, and the *Grief* we have for *Sin*, are both of them *Virtues*; and yet neither of them consist in a *Mediocrity*, since they have no bounds or limits, the one of them having *GOD* for its Object, who is *Infinite*; and the other respecting his opposite, *Nothing*. Now, who can love *GOD* to Excess? or be overmuch grieved for his *Sins*, or too much incensed against himself, for having offended his *Creator*? No Body questions, but that *Adam*, in *Paradise*, was endued with many *Virtues*, as *Justice*, *Piety*, and the like: But what was the Form of these *Virtues*? It could not be *Mediocrity*, because he was not subject to any Excess of his *Passions*. And how could there be a *Mean*, without *Extreams*? Conclude we therefore, that the *Mediocrity* of *Affections*, is not the Form of *Virtue*; and that the same may be, tho' there were no vicious Excesses at all. Besides, all own, even those that are the Followers of *ARISTOTLE*, that *Justice* is not the *Mean* betwixt two *Extremities*, nothing being oppos'd to it, save *Injustice* only; and that, because it doth not give to every one his due.

But yet I do not deny, but that many *Virtues* are thus placed betwixt two *Vices*; for it is evident that *Magnificence* is a disposition of *Mind* between *Niggardliness* and *Sumptuousness*: *Modesty*, betwixt *Ambition* and a stupid *Carelessness*, and disregard of *Honour*: *Temperance*, between an *Insensibility* of all *Pleasure* and *Intemperance*. All that I contend for is, that this *Mediocrity* is not *Essential* to the Constitution of *Virtue*, and therefore cannot be said to be the Form of it: For so *Mediocrity*, for Example, in *Meat* or *Drink*, doth not deserve the Name of *Virtue*, as it is a *Mean* between the Excess and Defect of *Meat* and *Drink*; but for that it is according to *Reason*, and in compliance with the Dictates thereof. For the *Soul* that is under the *Governance* of *Reason*, chuseth the *Mean* between 2 *Extreams*, because it finds, that

VI.
This Definition doth not hold good, as to many Virtues.

Ch. or D. Love a Repentance, admitt of no Excess.

VIII.
Mediocrity cannot be the Form of Virtue.

C H A P. VIII.

Of the Law of Nature and Right Reason, with the Practical Dictates thereof.

that most suitable to it self. Neither need we to have recourse to this *Mediocrity*, since that which is most suitable and convenient for us, as we are *Rational Creatures*, must of necessity be a *Virtue*, tho' there be no Extreame between which it mediates. For he that exceeds all other *Mortals* in his Love to GOD, is so far from being blameworthy upon that account, that on the contrary he is highly therefore to be praised, because this excess is conformable to the Precepts of the *Natural Law* or *Reason*, which requires of *Man* the Highest Piety, and commands them to Love their Maker, with their whole *Mind*, and all their *Strength*.

IX.
All the
Virtues are
in conjun-
tion

It is a common Saying in the *Schools*, That all the *Virtues* are undivided, and link'd together, so that he that hath one, hath all the rest also; which in some Sense may be admitted, that is, when we speak of *Heroical* or perfect *Virtue*; because such *Virtue* is supposed to have all the Excellence it is capable of. Sure it is, that all the *Virtues* are helpful and assistant one to another; for it is impossible for any one to be *Prudent*, without being partaker of *Fortitude*, *Temperance* and *Justice*; neither can any *Man*, as *SENECA* saith, suffer bravely and boldly, without making use of all the *Virtues*, tho' *Patience* be the *Virtue*, that is most apparent in this case. For it is most certain, that *Fortitude* must be there also, *Patience* and *Endurance* being only *Branches* thereof: Neither is *Prudence* wanting, without which there can be no *Council* or *Advice*, who adviseth us to bear that courageously, which we cannot avoid. *Constancy* also makes one of this happy *Company*. And in a word, the whole *Chorus* of *Virtues* do meet in that one *Action* of suffering courageously; for indeed whatsoever is *Honestly* done, tho' it may be chiefly performed by one *Virtue*, yet is it not without the assistance of the rest.

X.
All the
Virtues
meet to-
gether in
Prudence.

And to evince this beyond Contradiction, let us consider, that there can be no *Virtue* without *Prudence*, and that all *Virtues* meet and are joyned in her. For every *Moral Virtue* only executes or performs what *Prudence* prescribes, and what agrees with the *Rule* and *Line* of *Right Reason*; and therefore it cannot be otherwise but that those *Virtues*, which partake of this *General Nature*, must be linked together, according to that *Axiom*, That those things which agree in a third, must needs agree with one another. Wherefore no *Virtue* can be without *Prudence*, neither can there be any constant or ready *Prudence*, without the *Company* of all the other *Virtues*. For as *ARISTOTLE* informs us, *Lib. 6. Ethic. cap. 8.* The Judgment of our Reason about practical Principles, is subject to be perverted and deceived by the pravity of our Natures; so that it is evident that no *Man* can be *Prudent*, except he be a good *Man* also. And consequently the *Virtues* that make *Man* good, cannot be separated from *Prudence*.

And therefore *ARISTOTLE* *Lib. 3 Politic.* saith, he who will have the Law to bear sway, would have GOD to bear sway. As if he would intimate

Such a deep sense of the *Law* of *Nature* is impress'd upon the *Mind* of *Man*, that even the most *Wicked* and *Perverse* do profess to own and follow it: For *Men* in all their *Affairs* appeal to the *Law* of *Nature*, and contend that they act according to it. A *Covetous Wretch* that with an insatiable desire scrapes and rakes together *Riches*, pretends that he acts herein according to the impulse of *Nature*, and follows her Teaching. An *Ambitious Person*, that by any means, tho' never so wicked and flagitious, makes his way to *Honour* and *Dignities*, meanly fawning upon some, that he may crush others, supposeth himself all this while acting conformable to *Nature*: He that is a *Slave* to his *Lust*, and abandons himself to *Luxury* and *Idleness*, brings in *Nature* to justify his *Lewdness*, and contends that his *Debauchery* is consonant to her *Laws*: In a word, there is nothing so unworthy and contrary to *Reason* but hath its *Abettors*, that will prove it to be conformable to the *Light* of *Nature*.

But these *Wretches* are much mistaken, who take their *Lusts* for the *Law* of *Nature*, and suppose the greatest violation of her, to comport with her own Dictates. For what *Nation* was ever so far corrupted, as not to condemn *Murders*, *Incest*, *Theft*, *Rapin* and the like? For *Nature*, tho' it be greatly deprav'd and weakned in some *Countries*, yet for all that cannot patronize *Sin*; and as long as the least spark of *Reason* still glimmers in them, they condemn what other *Nations* forbid and punish. The *Laws* of *Nature* preserve and defend *Nature*, but are not destructive of it. Wherefore it will be worth our pains to enquire here, whether there be any certain and unalterable *Laws* of *well-living*, and doing, to which all *Men* are obliged, the violation whereof is accounted criminal amongst all *Men*: In order to the clearing whereof, we shall first consider what the *Laws* of *Nature* are, and how they may be defined.

The *Laws* of *Nature* are nothing else but a certain *Light* or *Notices* which serve to guide and direct us in all particular occurrences, and which are derived from that general Reason, which GOD hath imprinted in the Souls of all men in their formation. We say in the first place, that the *Laws* of *Nature* are certain *Notices* which serve to guide us, &c. to distinguish the *Laws* of *Nature*, from the *Rules* of *Motion*, which we sometimes also call *Laws* of *Nature*. We say in the second place, that they are derived from that general Reason, &c. to shew that the *Laws* of *Nature*, are nothing else but the consequences and effects of the *Light* of *Nature*; adding, which GOD hath imprinted on the Souls of all men; to signify that the *Laws* of *Nature* are general and common, and that there is no *Man* in the *World*, how wicked and profligate soever he be, but hath some Sense and Knowledge of them, and that from GOD himself.

And therefore *ARISTOTLE* *Lib. 3 Politic.* saith, he who will have the Law to bear sway, would have GOD to bear sway. As if he would inti-

mate to us, that whatsoever Reason prescribes, ought not to be lookt upon, as the invention of *Mans Wit*, or the constitution of *Nations*; but as something *Divine* and *Eternal*, that governs the *World* by its *Commands* and *Prohibitions*. So that whatsoever deviates from this *Eternal Law*, is to be lookt upon as a *Monster*, and as a *Sacrilege*, against *GOD*, who is the *Author* of *Nature*, and of this *Knowledge* of *Good* and *Evil* in us. For what else, saith *SENECA*, is *Nature* but *GOD* and the *Divine Reason* diffused through the *Universe* and all the parts of it; which meets thee whithersoever thou turnst thy self: All the Reason that is in material things, is the Gift of *GOD* who ruleth all things.

V. And that there are such *Eternals Laws* may be demonstrated from the common *Nature* of things. For the *World* which imitates the *Unity* of its *Author* and *principle*, is governed by one *Law* common to all *Creatures*, which as it provides for the good of the whole *Universe*, so of every particular *Being*. For whatsoever is contained in the *World*, is subject to the *Reason* of the *Divine Mind*, who is the *Regent* of the *Universe*. For the *Beings* that are destitute of *Reason* follow their natural instinct, and like *Arrows* shot by an expert *Archer*, fly directly to the *Mark*; and the *Rational*, who are guided by the dictates of their *Judgment*, tend to their appointed *End*. So that the former are necessarily, and the latter freely and of choice, subject to this common *Law*. Hence it is that *CICERO* *L. 10 de legibus*, saith, In the constituting of what is *Right*, we must take our Beginning from that *supream Law*, which took its rise before all *Ages*, when yet there was not any *Written Law*, or *Civil society* constituted. And notwithstanding that almost in every different *Climate* we meet with different *Customs* and *Manners*; yet amongst them all, we shall find the Footsteps of this *Universal Law*, which binds not only the *Inhabitants* of one particular *Country*, but also those of the whole *World*.

VI. The same may be also made out from the end and *Constitution* of *Man*, whose peculiar privilege it is to have the use of *Reason*, and square his *Life* by it. For the *Dictates* of *Reason* are so evidently impressed upon his *Mind*, that he readily follows what is *Just* and *Right* without any *Matter*, without any *Written Law*, without any compulsion of the *Magistrate*, and discerns betwixt that which is equal and unequal, by the *Light* of his *Conscience* only. It is vain and useless to instruct *Men*, that *Murder* and *Adultery* are *Crimes*, and that *Theft* must be avoided, seeing that the *Light* of *Nature* anticipated this their information, and that all these *Laws* were long before *Written*, on the *Tables* of their *Hearts*. And therefore the *Sovereign Legislator* in delivering those *Laws* cuts them short, *Thou shalt not kill. Thou shalt not commit Adultery*, without adding any reason of them, as taking for granted that he address them to those who knew that already. For a *Ray* of the *Primordial Reason*, appears in *Man* by a twofold preeminence; for being endued with *Reason*, the light which illuminates other *Creatures* outwardly and superficially only, is his property and part of his *Essence*. And in the second place, the *Sense* of *Right* and *Truth* and *Affection* for it, is most intimately present in his *Heart*, whereby

he is directed both in his *Speculation* and *Practice*. The *Minds* of *Men* are stored with the *Seeds* of *Vertue* and *Honesty*, which are excited by the least admonition, like a *spark* of *Fire*, which being only assisted with a small *Blast*, displays it self into a great *Flame*.

For *GOD* being concerned for the *Preservation* of *Man* whom he hath made, hath of his infinite *Goodness* and *Wisdom* engraven in their *Minds*, when he united it to the *Body*, a general knowledge of what is *Good*, that is, an *Idea* of whatsoever is conducive to the preservation of that *Union*. And it is this *Idea* or *Knowledge*, which we call a *Good understanding*, *Right Reason*, the *Light* of *Nature*; and the particular *Notices* derived from this general *Idea*, are those we call the *Laws* of *Nature*.

And tho' some may think themselves very obsequious to the *Law* of *Nature* whilst they indulge their *Flesh*, and wholly abandon themselves to their *Lusts*, whilst they cram themselves like *Pigs*, and are as *Luxurious* as *Goats*. Yet most certain it is that such *Men* as these do not follow their *Human*, but *Animal Inclinations*, and in a word, live like *Beasts*. For would they but attentively search into their own *Bosoms*, and consult the *Law* of *Universal Nature* written in their *Hearts*, it would appear a most monstrous and unjust thing to them, thus to disguise themselves with the *Manners* and *Passions* of *Brutes*, seeing that they are reasonable *Creatures*, and as such are obliged to direct their *Lives*, not by the compass of *Sense*, but *Reason*. They only *Live* according to *Nature*, who square their *Actions* by *Reason*, and who confine themselves to these three *Precepts*, to *Live Honestly*, not to *Hurt* another, to give every one his due. Which *Precepts* by the unanimous Suffrage, both of the wise and common *People*, are called the *Fountains* of all other, and a compendious, but *Essential Institution* of the *Law* of *Nature*.

These unalterable *Laws* of a good *Life*, may be further demonstrated from the *Relation* *Man* hath to other *Rational Agents*; for seeing that *Man* is a *Sociable Creature*, and affects the company of such as are like him, it is necessary there should be some *Laws*, whereby they might be engaged to lend their mutual assistance one to another, and directed to *Love* their *Neighbours*. Accordingly *Men* following the impulse of *Nature*, and entering into *Civil Societies*, establish this first *Standard* of *Justice*, To live *Honestly*, to hurt no *Body*, and to give to every one his *Right*. It is the *Right* of *Nature*, saith the *Law* *L. 205. F. de Reg. jur.* that no *Body* enrich himself with the damage of another. And therefore we find that there is no *Nation* so depraved in their *Manners*, which doth not abhor and abominate *ungrateful Persons*, *Murderers* of *Parents*, *Breakers* of *Covenants*, *Deceivers*, &c. and think them worthy of the worst of *Punishments*, looking upon them as profest *Enemies* of *Society*, and violaters of the *Law* of *Nature*. How dismal would the condition of *Mankind* be, if it were lawful for every one to do what he listed, and to make his own *Lust* and *Humour* the *Rule* of *Good* and *Evil*? What *House*, what *Palace* would be secured from devouring *Flames*, if any one at pleasure might put *Fire* to them, and warm himself at the cost of another?

Y y y y

VII. How GOD hath impressed these Laws on the Mind of Man.

VIII. Men that deviate from these Laws are to be herded amongst Beasts.

IX. The certainty of the Laws of Nature confirmed from the Relation Man hath to other Rational Agents.

What

What *Wife* would be safe within her *Husbands Arms*, if there were no *Laws* to secure publick *Honesty*, and to guard the *Enclosure* of the *Conjugal Bed*? *Nature* hath deeply engraven this precept in the *Hearts* of all, *Do not that to another, which thou would'st not have another do to thee*; this is that *Dictate*, which is present to all *Mens Minds*, and directs them, if so be they do not stop their *Ears* to its *Voice*, and listen to their *Passions* rather than their *Reason*.

X. From what hath been said, may be gathered, that there are some certain and immutable *Idea's* of *Good* and *Evil*, whereby, under the sole guidance of *Nature*, we distinguish things that are just, from those that are unjust; and things honest, from filthy and unbecoming: Like as by the different notations of *Figures*, we distinguish *Mathematical Schemes*, and separate them from one another. For as we define *Figures*, not by *Sense*, but by *Reason*; so we perceive what is right or unjust by *Reason*; which teacheth us that *Good* is to be desired, and *Evil* to be avoided. The ground whereof is this, because *Good* and *Evil* from whence our *Idea's* are taken, do not depend on the *Judgment* of any private person, or of any multitude of *Men* how great soever, but are such of their own *Nature*, and therefore necessarily to be embraced, or avoided by *Intellectual Creatures*. For as the *Understanding* of *Man* doth not enquire what appears to some to be *Truth*, but what is *Truth* simply and in it self: So likewise the *Will* of *Man*, doth not embrace that for *Good*, which seems to be so to some private persons, or to most *Men*, but what is really and immutably so, and which is to be chosen and embraced in spite of, and notwithstanding all the *Reluctance* of our *Animal propensity*. And therefore as there is something in *Nature* which is absolutely and simply *True*; so likewise must there be something that is good in its own *Nature*, and for its own worth and loveliness to be desired by the *Will* of *Man*. And therefore as he abuseth his faculty of *Understanding*, who being imposed upon by the deceptions of *Sense* or *Imagination*, doth not perceive what is naturally *True*; so in like manner he also abuseth his faculty of *Willing*, who suffers himself to be so blinded by his *Animal Appetite*, as not to chuse that which is good of its own *Nature*, and for want of due attention fails of his end and aim.

XI. Some Sentences into which Moral Reason may be resolved.

Now what *Method* or *Order* a *Man* is to follow in his choice, and what *Good* he is to embrace in such *Circumstances*, will appear from the subjoyned *Axioms*, into which the whole *Nature* of *Virtue* may be resolved.

1. That is accounted *Good*, which is agreeable to *Intellectual nature*, and is commensurate to its *State* and *Condition*, and is some way or other conducive to the *Conservation* of the perceiver.

2. On the contrary, that is accounted *Evil*, which is inimicentious or opposit to an *Intellectual Nature* with respect to its *Condition*, and causeth grief and aversion to it; and if it threaten its destruction, then is it esteemed to be the worst of *Evils*.

For one *Evil* supervening to another, is thereby made the more *Heavy*. For it is seldom seen saith *ALEXANDER* ab *ALEXANDRO*, that a *Commonwealth* shaken at once with intestine and forein War, can hold out long; for the

superadded danger by dividing their *Councils* and *Subsidies*, which otherwise were scarce sufficient to stem its double *Tide*, makes them still weaker, and so at last over-throw the tottering *Commonwealth*.

3. All *Good* is not equal, as the *Stoicks* held, but some preferable to other, since it is certain that that *Good* is more excellent, which exceeds another in *Nature*, *Duration*, or both.

For it cannot be questioned but that *GO D*, who is *Eternal*, and who by his *Nature* includes all other perfections, must needs be a more excellent *Good* than the *Creature*, how perfect soever. And that an *Angel* in *Goodness* excels *Man* and *Beasts*. So that the value of *Good* may be considered after a twofold manner; either *Intensively*, as it affords the greatest satisfaction to the *Mind*; or *Extensively*, according to its more ample diffusion of the same, and its greater tendency to the *Good* of the *Universe*. From whence afterwards follows its *Duration*; for the more durable any *Good* is, the more excellent it must be also, and is so to be esteemed.

4. It is the peculiar property of *Good* to move the *Will* to the choice and embracing of it; whereas *Evil* produces the contrary effect; and even as a greater *Good* kindles a greater *Love* of it self; so a less *Evil* is to be born, to avoid a greater.

Because a less *Evil*, with regard to a greater has the appearance of *Good*. Whence came that common *Axiom* amongst *Moralists*, that of 2 *Evils* the least is to be chosen. For seeing that *Nature* doth always what is best, therefore it also avoids the greater *Evil*; for a less *Evil* comes nearer to *Good*, and is accounted comparatively *Good*. Hence it is that *Men* to avoid being burnt, cast themselves from a *Precipice*, or leap into a *River* to avoid the *Jaws* of a *Wild Beast*, or the *Sword* of a *Robber*, and to keep themselves from perishing there, lay hold of *Thorns* or *Briars* or any thing how painful soever, to save their *Lives*.

5. If any thing happen to us, whose nature we are ignorant of, we may safely trust those, who profess themselves skilful in that matter; in case we are fully persuaded of their skill and faithfulness, and that it be evident to us, that there is no deceit in the matter, or desire of particular gain or advantage.

6. Tho' the event of things be doubtful, yet when ever we apprehend that any *Good* thing will happen, we ought to take as much pains to obtain it, as if it were present; since if we do so, it shall certainly come to be our lot at last.

7. In the judging and discerning of things, we are to take care that the *Mind* may be free from all the *Prejudices* of *Infancy*, and *Enticements* of our *Passions*; for the *Understanding* being clouded with the dark smook of the *Passions*, cannot discern the *Good*, and the *Will* following its guidance, mistakes in her choice.

These few *Sentences* or *Axioms*, are sufficient for the forming of *Ethical Demonstrations*, and for the begetting in us the 4 *Virtues* hereafter to be explained. And as to the *Duty* we owe to others, the same is comprehended in this general *Axiom*, Whatsoever thou wouldst not have another do to thee, neither do thou to him. Which is of as great extent and force in *Morals*, as *Charity* or *Divine Love*, (which comprehends all *Virtues* and *Graces*).

is in Divinity. Thus a Man, from the Command of GOD, considers his Neighbour, and learns to love him as himself. For in a like case, and in a like respect to GOD and his Law, a like Judgment must be made. If you think it unjust, that you should be robb'd or oppress'd by one more powerful than your self, by parity of Reason neither must thou thy self possess thy self of the Goods of one, who is too weak to resist thy Violence. And therefore this Law prevailed amongst the Romans, That the Right a man vindicates to himself against his Neighbour, the same may his Neighbour use against him. Because it is but just, that the same Measure a man measures out to another, should be measur'd to him again.

CHAP. IX.

Of Prudence; and the Parts of it.

VERTUE is commonly divided into 4 Species, Prudence, Temperance, Fortitude and Justice, which Ethical Writers call Cardinal, because they consider them as the Hinges upon which all other Vertues turn, and from whence they proceed as so many Branches. The first Rank amongst these is given to Prudence, which makes use of all the rest, and as the Eye of the Soul doth point out to them their Order and Manner; and accordingly may be defined a firm and constant Will, heedfully to look out, and diligently to examine what is best. For it is the Office of a Prudent man, not to undertake any thing, which he hath not first weigh'd in the Balance of Reason, and found, that according to the present Circumstances of Place and Time, wherein he undertakes a thing, there is no truer, or at least more probable Reason, than that which he is resolv'd to follow. For Prudence is not a certain Science, which contemplates things necessary, and which can be no otherwise than they are; but a kind of knowledge that is conversant about Contingent matters, which are not only mutable, as to their Manner, but as to their Existence. For tho' the Object of Prudence generally consider'd be something common, viz. whatsoever ought to be done according to Right Reason; yet Prudence, as consider'd in every particular Man, is conversant about Singulars, which may, or may not be; or may be thus, or otherwise.

There be 3 Offices or Chief Acts of Prudence; Good and wary Consultation, Right Understanding or rather Judgment, and Sentence or Command. Consultation, or Deliberation, doth above all the rest belong to Prudence, whilst it considers what Means are most proper and best to obtain her End; to which is oppos'd Precipitancy, when we do things rashly and inconsiderately. And to the end this Consultation be such as it ought, it must be done with due Consideration, and aim at a good End; for otherwise it will be only Cunning and Craftiness. Right Understanding, or Judgment, is that whereby we pass a dextrous Judgment of the Means, by a reflex Act, approving of them. And is therefore called by ARISTOTLE, a quick and ready Understanding; to which is oppos'd dulness of Mind, or Folly: So that a Prudent man seems in some sort to keep the middle Station, betwixt a Block-head or Dull-fellow, and

a Crafty Knave. The Sentence, or the Habit of passing a Decretory Sentence, concerning the Goodness of the Means, follows next after Judgment, and is that whereby a Prudent man rightly determines, how to make use of the Means which he hath judg'd to be best; and with Constancy puts the same in practice.

Three kinds of Parts are assigned to every Vertue, the first whereof are Helps or Advantages, which are necessarily required to the Perfect Law of Vertue; the other are called Subjective Parts, which as so many Species do resort under it; and the last are called Potential, which Potentially are contained in the chiefest Vertues, and which do not comprehend their whole Natures, but belong to some secondary Laws.

The Constituting parts of Prudence are,

1. To know the Laws of Nature, according to which we ought to live.
2. To compare them together, that we may know what place they must take, or which of them hath the Precedency.
3. To consider, and have regard to the Circumstances of place, time and persons, in all our Actions.
4. To have an Eye to our Chief End, and to pursue the same by all honest and lawful Means.

The Helps required to Prudence are reckoned 8 in number, viz. Memory, Understanding, Fore-cast, Teachableness, Quickness of Wit, Reason, Circumspection, and Cautelousness. Of which some are helpful to Consultation, others to Judgment or Discerning, and lastly, others to Sentencing or Determining.

Sharpness or Quickness of Wit belongs to Consultation, or Deliberation; by means whereof a Prudent Man finds out the Means, which conduce to the obtaining of his proposed End. This Help is of kin to Sagacity, which speaks a disposition in the Soul, whereby it readily and dextrously discovers what lies hid, and finds out the Ways which are the shortest and surest to the desired End.

Understanding, or Intelligence, is a Help to our Judgment or Discerning; and it is not here taken for a Habit of the first Principles; but for a knowledge of the things that ought to be done, whereby we perceive and judge rightly of things that offer themselves.

Teachableness is a Promptitude of the Mind, for the Learning of the things we are ignorant of: For seeing it is the part of a Prudent man to know many things, and to be able to distinguish the Honest Good, from the Pleasant and Profitable, it is necessary that he be Teachable, so as to improve himself by the Discourses of others, or in the Reading of Books.

Memory is that, whereby a Prudent man calls to Mind things that are past, and represents to himself several Actions and Events, from whence, as from the Premises, he concludes what Judgment he ought to pass of the future.

Reason is the right use of the Knowing Faculty, whereby a Prudent man, from fore-known and pre-consider'd things, argues aright, gathering and judging what he ought to do in present Circumstances.

X. Memory.

XI. Reason.

IX. The Division of Vertue.

II. The Nature of Prudence, and what it is conversant about.

III. The Three Duties or Offices of Prudence.

XII.
Forecast,
Circumsp-
ction and
Cautelous-
ness.

In order to *Command*, or the passing of a *De-cretory Sentence*, a *Prudent man* is assisted by *Fore-cast*, *Circumspction*, and *Cautelousness*: *Fore-cast* is that *Habit* whereby he diligently considers *Future things*, and from things that are past, ga-thers what will be, and accordingly resolves what to do. *Circumspction* is that *Habit*, whereby the *Circumstances of Affairs* are heedfully and dili-gently minded. And lastly, *Caution*, or *Heedful-ness*, is that whereby *Obstacles* that might happen are removed, and all *Impediments* that might hinder the obtaining of our intended End.

XIII.
The Subje-
ctive Parts
of Prudence

The *Subjective parts* of *Prudence*, according to the *School men* are 4, viz. *Private* or *Soli-tary Prudence*, *Oeconomical*, *Political*, and *Mili-tary*.

XIV.
Wherein
Private
Prudence
doth consist.

Private Prudence, tho' it be frequently con-founded with the *Monastick*, yet is it not pecu-liarly to be restrain'd to those that lead a *Monastick Life*; and separating themselves from the *Multi-tude*, betake themselves wholly to *Contemplation* and *Devotion*; but is that which belongs to every *Singular Man*, who, whether he hath none to take care of but himself, or whether he takes care also for others, stands in need of *Prudence*, to di-rect and assist him in his several Actions.

XV.
The First
Office of
Private
Prudence.

The Office of *Private Prudence* is twofold; the First, That every one do chuse some kind of *Profession* or *Way of Living*, wherein he may spend the rest of his days: For no *Man* can be happy that keeps no certain *Course of Life*, but being unresolv'd and wavering, is ever deliberating what *Condition of Life* he had best embrace, and to what *Order of Men* he had best joyn himself. *Prudence* therefore adviseth every man to consult his own *Genius* and *Ability*, and to chuse for him-self such a *State of Life* as comports with his *Natural Gifts*, and the *Temper of his Mind*, and wherein he may with *Pleasure* and *Satisfaction*, continue throughout the *Course of his whole Life*.

XVI.
The other
Duty of
Private
Prudence.

The other Duty of *Private Prudence* is, that having once pitch'd upon a set *State* or *Condition of Life*, he use all possible *Industry* that he square all his *Actions* by the *Rules of Vertue*, according to the *Dictates of Reason*; and take heed to commit nothing that may necessitate him to *Re-pentance*. All which he may, without any great difficulty obtain, in case he undertake nothing without mature *Deliberation*, and be constant and firm in his *Purpose*, when once he is assur'd of the *Goodness* and *Honesty* of them. For the chiefest part of *Human Beatitude* consists in *Acting con-stantly*, and never turning aside from the *Right path of Vertue*.

XVII.
What Oeco-
nomical
Prudence is

Oeconomical Prudence is, that whereby a man orders the *Concerns of his Family*. Its *Dictates* are, that no man rashly or inconsiderately cast himself into the indissoluble Band of *Matrimony*; but that he consider well of it before he enters a *State*, which he cannot quit again at his pleasure. That the *Woman* he takes to be his *Wife*, be adorned rather with the *Embellishments of Mind*, than of *Body*; and that she be more recommend-able by her *Chastity* and good *Manners*, than by her *Riches* or *Portion*. Also, that there be an *Equality* between him and her, since it is a com-mon thing for a *Wife*, who is above her *Husband* in *Nobility* or *Riches*, to despise him, and look

upon him rather as her *Servant*, than her *Husband*. *Prudence* also adviseth, that he seriously weigh and consider the *Temper of Women*, the *defects* and *weaknesses* they are subject to, and that their *Will* is commonly much stronger than their *Reason*, and their *Phansy* and *Humour* the *Law of their Actions*: That many *Husbands* have only 2 good and plea-sant Days, as *HIPPONACTES* saith by *STOBÆUS*, the one, that of their *Marriage*, and the other, that of their *Wives Burial*: That being once married, he must treat her as his *Wife*, by communicating his *Secrets* unto her; especi-ally if he knows she can hold her *Tongue*, and conceal what ought not to be divulged; lest she should conceive her self to be slighted or neg-lected, and by this means becomes careless of her Duty.

Prudence also prescribes *Rules*, how *Children* ought to be *Educated*, and *Servants* kept to their Duty; which it would be too prolix to insert here, and may be seen set down at large in a *Treatise* which I have written in *French*, concerning *Ver-tue*, conformable to the *Sentiments of Epicurus*, entituled *L'Epicure Spiritual*.

Political, or *State Prudence*, imitates the *Oeco-nomical*, and differs from it only in this, that its Subjects are more numerous: For as the former is concern'd with governing ones *Wife*, *Children* and *Servants*; so *Political Prudence* consists in *Ruling a City*, *Province*, or *Nation*. In order to the discharging of which *Function* aright, it is first necessary that he who bears *Rule* over others, does himself excel in *Vertue*, that his *Actions* may serve for *Examples* to his *Subjects*. For *Subjects* think it their *Glory* to imitate the *Manners* of their *Prince*, and to express him in all their *Actions*, *Words* and *Gestures*. Hence it is, that the *Crimes* and *Vices of Princes* spread like a *Contagion*, and infect the whole *Body of their Subjects*: For they think, that what their *Princes* do, is not only lawful for them, but even *Praise-worthy* also; so dangerous are great *Examples*, and so effectual for the promoting of *Vice* and *Wickedness*. He there-fore that *Governs* others, must carry a *Majesty*, and command *Respect*, not by his *Big and Severe Looks*; but by the *Rectitude of his Manners* and *Heroical Vertue*.

As it is highly commendable for *Princes* to be *Religious*, and *Eminent* in their *Piety* towards *GOD*; so must they also excel in punctual *Faith-fulness* and *Truth* towards their *Equals*. For a *Prince* that doth not keep his *Word* and *Promise*, makes himself *Vile* and *Despicable*, because it is a mark of *Fearfulness* and *Impotence* to break his *Word*, and to elude the *Execution of his Treaties*. *Prudence* therefore adviseth, that a *Prince* be exact in performing of his *Word*, and just and equal in his *Actions*. For *Rulers* are not exempt from, or above all *Laws*, for *Justice* is above them; and if it be in their power to do what they please, yet are they not to will any thing, but what they ought. It must be also a great part of their *Care*, to have an *Eye* to the *Great Officers* and *Magi-strates* under them, to see that they perform their *Duties*, to the end that the *Judges* may be Ho-noured, the *Laws* Reverenced, and they themselves Loved and Dreaded.

XXI.
What Mi-
litary Pru-
dence is.

Military Prudence, which chiefly belongs, and is necessary to the *Commanders in Chief of Armies*; teacheth how to undertake a *War*, carry it on, or bring it to an happy Issue: First, by instructing them not to enter upon it rashly, and without good Advice, having first well weighed their own *strength*, and being moved to it by a just Cause. For if they find, that the *Power* they intend to oppose will prove an over-balance for them, *Prudence* will advise them to desist from the Thoughts of attacking a too Potent *Enemy*, and to conclude a *Peace* with them, rather than hazard the *Loss* or *Ruin* of their *Kingdom*. But if *Peace* cannot be had but upon unreasonable Conditions, then a *War* is to be hazarded; and after having implor'd the *Divine Favour* by *Prayers*, and encouraged the *Souldiers*, they are to give *Battle*, and to dye rather, than to lose their *Right* and *Liberty*.

XXII.
What things are necessary for the waging of War.

In the waging of *War*, great care is to be taken, first, to Lift strong and courageous *Souldiers*, Exercis'd in *Arms*, and hardied to *Labour* and *Service*. Secondly, That they be well *Arm'd*, not only with *Defensive*, but also *Offensive Arms*. Thirdly, That a sufficient Quantity of *Provisions* be provided, and ready at hand, for the supply of the *Army*, seeing that for want thereof, not only *Castles* and *Towns* are often lost, but whole *Armies* sometimes miscarry. Fourthly, That there be store of *Money*, which is the *Sinews* of a *War*, and without which the *Souldiers* cannot be kept to their *Duty*, nor restrain'd from *Robberies*. These 4 things being well fore-cast and provided, *Princes* or *Generals* may safely undertake a *War*, and Invade their *Enemies*, since this is all that *Military Prudence* requires, in order to the Successful carrying on of a *War*.

XXIII.
Prudence is acquired two several ways.

From what hath been now said, it is easie to conclude, that the ways of acquiring this *Vertue* of *Prudence*, are reducible to 2 only, viz. to *Precepts* and *Experience*. The latter of which is twofold, viz. ones own *Experience*, and that of another. Proper *Experience* is the knowledge of things, that we our selves have seen or done; and the other is the knowledge of things, that have been seen or done by others; and which we have only by *Relation*. The *Prudence* we get by *Experience* and *Use*, is much more sure and certain, than that which is attain'd by *Precepts*, or by the knowledge of *History*; but as it is more excellent, so likewise it is more difficult to be obtained.

CHAP. X.

Of Temperance.

I.
About what things Temperance is conversant.

TEMPERANCE is so nearly ally'd to *Prudence*, that it always accompanies it, and seconds it in all its *Laws*; and was therefore called by the *Ancients*, the *Conservatrix* of *Prudence*, because it preserves the Soundness of the *Mind*, and is very conducive to Consultation and *Judgment*. For an *Intemperate* person seems to have suffer'd *Shipwrack* of his *Reason*, and therefore ought to be serv'd as *Mad-men* are, in order to the Recovery of it. For *Temperance* imports nothing else, but the *Moderation* of *Reason*, and the absolute Command of the *Soul* over all its *Passions*: For it suppresseth *Concupiscence*, stifles vain

Hopes, moderates *Love*, and keeps the *Mind* from being ruffled by any other *Perturbations* whatsoever. But being taken in a stricter Sense, it signifies the restraint only of those *Pleasures* which belong to the *Taste* and *Feeling*, which are common to us with the *Beasts*; and to which, according as *Men* either addict themselves, or bid defiance, so they are termed *Temperate* or *Intemperate*.

We may therefore define *Temperance*, A firm and constant Will or Resolution, to resist and restrain Bodily Lusts and Pleasures, especially those that belong to the *Taste* and *Touch*. By which words it appears, that those *Pleasures* are excluded which belong to the *Senses* of *Seeing*, *Hearing*, and *Smelling*; and that *Temperance* in this Sense, is only conversant about the pleasures of the grosser *Senses* of *Tasting* and *Touching*.

The Parts which in some sort may be said to constitute *Temperance*, are *Honesty* or *Decency*, and *Bashfulness*. For there is a kind of *Comeliness* beaming forth from *Temperance*, which allures men by its *Loveliness*, and makes them to restrain and repress flattering *Pleasure*, and to deny whatsoever is most pleasing to the *Body*. For it is a commendable thing to avoid all *Immoderateness*, and to follow *Temperance* only for the *Comeliness* and *Loveliness* of it. *Bashfulness* also is a great help towards the exercise of this *Vertue*; whereby we fear *Instancy*, lest by indulging our *Lusts*, we should expose our selves to shame, and lose our *Fame* and good *Repute* by our *Intemperance*: for *Shamefastness* or *Bashfulness*, is not here taken for a *Passion*, but for a kind of *Fearfulness* of incurring *Reproach* and *Disgrace*, by committing any shameful Action; which *Fear* of *Shame* may well be called the *Guardian* of *Vertue*, as being always accompanied with a laudable *Moderation*.

There be 2 Species of *Temperance*, viz. *Sobriety* and *Chastity*, the former whereof moderates our *Eating* and *Drinking*; the latter sets Bounds to the Enjoyment of a *Conjugal Bed*.

Sobriety teacheth us, that our *Bodies* are contented with a little, and cannot without *Pain* and *Prejudice* bear what is superfluous. And accordingly hath given us a *Measure*, by which every one may be informed what quantity of *Meat* and *Drink* he ought to use. For *Nature* being a Careful *Mother* of her *Children*, condemns all those things that serve to tempt and provoke an *Appetite*, and which are taken rather for *Pleasure*, than for *Necessity*; and teacheth us by daily *Experience*, that *Diseases* and *Infirmities* of the *Body*, are the *Fruits* of *Intemperance*, and that *Pains* and *Dulness* of the *Head*, *Crudity* of the *Stomach*, *Griping* of the *Guts*, would be in a great measure unknown to *Men*, if they did not by *Drunkenness* and *Gluttony* pull them down upon themselves. Whereas on the contrary, *Sobriety* secures the *Body*, restores decayed *Strength*, and by reducing the *Humours* to a due *Temperament*, easily subjects the *Passions* to *Reason*. Do we think that he is wholly depriv'd of *Pleasures*, whose Diet are the *Fruits* of the *Earth*, and contents himself with *Viands* that are prepared without the need of a *Cook*? Such an one as he enjoys a vigorous and healthful Constitution of *Body*, in which his *Soul* exerciseth her *Functions* freely and expeditely:

VI

So *Abstinence* to him is instead of the most delicious *Liquor*, as preserving his *Health*, and fortifying it against all *Infirmities*. Wherefore we must accustom our selves to a Moderation in *Diet*, if so be we would enjoy a sound *Mind*, in a Healthful and sound *Body*. And this will be our portion, if contenting our selves with Common *Food*, we shall despise *Dainties*, except only so far as may be necessary for the Recovering of our *Health*, and to comply with the Advice of our *Physician*. Since nothing is more sure than, that *Meats* are spoiled and adulterated by too much care and exquisiteness in Dressing; and that the Art of *Cookery*, for the most part, leaves them more unwholsom than it found them.

VI. And as for *Chastity*, which permits no *Pleasures*, besides those that are enjoyed in Lawful *Wedlock*, it will be of use to set down some Preservatives, whereby a *Man* may secure himself against the violent Attacks of *Carnal Lust*, and render *Chastity* easie and familiar to himself. The First and Chiefest of these Preservatives is, that he use a slender *Diet*, and carefully avoid all *Meats* and *Drinks* that are enflaming. For it is very hard, or rather impossible, for a *man* to indulge himself in *Gluttony*, and not to be tormented with *Lustful motions*. For *Gluttony* and *Carnal Lust* are so closely ally'd, that, as TERTULLIAN hath it, *Lust* without *Gluttony*, may well pass for a *Prodigy* or *Monster*. Let the *Body* therefore be fed with that Caution, that the strength of it only may be preserved, without furnishing Copious Matter to increase a *Passion*. Food is afforded us for the maintenance and support of our *Bodily Lives*; and tho' it be necessary to our *Nature*, yet is it to be taken with care and anxiety, lest it should supplant our *Chastity*, and excite us to *Uncleanliness*.

VII. The Second Preservative is, that he be always busied and employ'd in some honest *Calling*, without indulging *Sloth* or *Idleness*. For continual Business or Study waists the *Animal Spirits*, which invigorate us; or at least by taking up the *Mind*, divert it from *Lustful Thoughts* and *Imaginations*. Idle persons are most haunted with this *Spirit* of *Luxury*, and such who by doing nothing, learn to do Wickedly. We must take Care therefore to eschew *Idleness*, and to entertain our *Minds* with such *Thoughts*, as are so far from being Incentives to *Lust*, that they are destructive of it.

VIII. Thirdly, It will be of good use to avoid and fly from the Temptations, which may come from the Sight of, and too free *Discourse* with *Women*, lest by handling *Pitch* we be dawbed with it. For *Lust* is better conquer'd by *Flight*, than by *Fight*.

IX. Fourthly, A full Resolution and long contracted *Habit* and *Custom*, to repel the Assaults and Onsets of *Lust*, is very advisable: For as he is easily overtaken with *Lust*, who hath been often conquer'd by it: So he who makes it his business strenuously to resist its *Temptations*, becomes thereby the more strong and vigorous to resist them. I confess, it is a Master-piece to overcome so smiling and fawning an *Enemy*, which whilst she ruins, seems to Caress us. But what is all this, if compared to our *Strength*? Nothing is impossible to a *Soul* that is resolved to conquer: They are

Cowards that upon the first Onset give way, without ever putting their Strength to the Trial. But you'll say, It seems impossible, all on a sudden to quit a *Habit* of long standing: Suppose it so, Disaccustom your self by little and little, contain your self for a few Days at first, and afterwards by degrees protract the said Time, and question not, but that by frequent *Fights* and *Resistings*, you will at last become *Conquerour*. Call to mind, how great and sincere a *Joy* thou hast been sensible of, whenever thou hast shewed thy self a courageous Combatant, in resisting and putting by these Assaults; and on the contrary, how thou hast been cast down; what Shame, what Repentance, what Anguish have pinch'd and rack'd thy *Soul*, whenever thou hast weakly and cowardly made thy self a Slave to thy *Beastly* and *Inferiour Nature*. In a word, thou wilt soon be *Chaste*, if thou canst once heartily Will to be so.

Temperance likewise hath its Potential Parts, viz. *Meekness*, *Clemency*, and *Modesty*. The business of *Meekness* is, to restrain *Anger*, and to refrain the *Mind* from *Revenge*. For by means of this *Virtue* a *Man* becomes truly *Human*, and lovely in the sight of others. For as he is Hateful and Troublesom to all, who is easily provoked to *Anger*; and who, upon the least occasion, becomes enflamed with *Wrath*; so on the other hand, we love and delight in the Company of those, who, tho' highly provok'd are easily reconcil'd, and forgive the Injury done to them.

Wherefore we must take care to moderate the impetuous Flame of *Anger*, and to quench it by *Meekness*, that we may come to our selves again, and recover the possession of our *Minds*, whence that violent *Passion* had turn'd us out. Wherefore, as soon as any one finds himself mov'd to *Anger*, let him consider how contrary this *Passion* is to *Humanity*, and how shamefully it disguiseth his *Body*, and casts down the *Soul* from its Throne of Power and Command. Consider the Looks of an *Angry man*; his *Eyes* flame, the *Blood* comes up into his *Face*, boyling up from his *Heart*, he Faulters in his *Speech*, his *Face* is distorted and dreadful; so that it is a great Question, whether this *Vice* be more detestable in its Nature, or more ugly in its outward Appearance. Let a *man* consider also, what a *Man* gains by all his *Rage* and *Wrath*; whereas by refraining his *Anger*, he delivers himself from this dreadful Commotion and Concussion, which has prov'd fatal to many, whilst they have endeavour'd to wreak their *Spleens* upon others. How much more glorious is it, to bear *Injuries* patiently, and to condemn *Affronts*, rather than to meditate a *Revenge*; and whenever we perceive this *Enemy* creeping upon us, to have that of MARK ANTONINE the Emperor always before the *Eyes* of our *Mind*. Behold one thing here that is highly to be valued, to converse courteously with *Truth* and *Justice*, amongst a Company of perverse and lying Men.

Clemency is near of Kin to *Meekness*, which is that *Virtue* whereby the *Mind* is inclin'd to Forbearance and Forgiveness, rather than to Punishment, and that according to right Judgment. This is a *Virtue* that well becomes a Prince, who like GOD ought to be ready to Forgive the Offences of Men; as it is express'd L. Imperialis de Nuptiis. For as the Top of the House does keep off the

the Assaults of *Wind* and *Weather*; so it is the Duty of him, who is the Head of the *Government*, to provide for the Safety of the whole *Body*. *Kings* indeed have the Superiority and Dominion, but it is for the sake of *Men*; not as meer *Arbitrary Governours*, but rather as *Guardians* and *Administrators*, to whom the *Commonwealth* is committed by *GOD*, to cherish and defend it, and take care for the Safety of it.

XIII.
Modesty.

Modesty is conversant about the moderation of the desire of *Dignity* and *Honour*. He deserves the name of a *Modest Man*, who doth not boast of his *Merits*, or vaunt of his *Endowments*; but owning himself to be a *man*, thinks lowly of himself, and esteems nothing properly to belong to him, besides that which he hath attained to. And accordingly a *Person* adorned with this *Vertue*, is more solicitous about rendering to others the *Honour* that is due to them, than desirous to receive the same from others; and is much more carried to the performing of good and great *Actions*, than concerned to obtain the name and esteem which gallant *Atchievements* bring along with them.

XIV.
The Duty of a Modest Man.

Whosoever thou art therefore, that art raised to great *Honour*, entertain no high thoughts of thy self, but being conscious of thy *Human Frailty*, and mindful of thy *Mortal Condition*, suspect and reject every thought that would flatter thee into a high conceit of thy self. A man famous for his *worth* and *merit*, and whose *Soul* is embellish'd with *Vertue*, must resemble an heavy *Ear of Corn*, which sinks its *Head* by so much the Lower, as it contains a greater number of *Grains*. For the least *Boasting* lessens *Merit*; and as *praise*, coming from a *mans own mouth*, is nauseous, so the proclaiming of ones own *vertue*, obscures the *Glory* that is due to it. When *CATO* was asked why the *Senate* had refused to erect his *Statue* in the publick place, he answered, that by their refusal they had taken more care for his *Glory*, than they would have done in allowing him a *Statue*, for that he would much rather, that *men* should enquire why the *Senate* had not erected his *Statue*, than demand why they had *honoured* him with one in the *Market Place*. For *Honour*, like a *Shadow*, follows those that flee from it, and is most found in their company who do not pursue it. Wherefore, a *Wise Man* that placeth his happiness in the exercise of *Vertue*, is always unmoveably resolv'd, never to prefer himself before any one, forasmuch as by this neglecting of *Honours*, he both secures his own *Peace*, and acquires the most solid and greatest satisfaction. But then this *Modesty*, or rather *Humility*, must be sincere and without dissimulation; and far from that *Ambitious Lowliness* of some *Philosophers*, who by their despising of *vanities*, sought for vain *Honour*, and as *STOBEUS* saith of them, trampled upon the *Pride* of others, with a greater *Pride* in themselves.

CHAP. XI.

Of Fortitude.

I.
Fortitude exceeds all other Vertues: The Definition of it.

TH O' all the *Vertues* be worthily esteem'd by *Moralists*, and engage *Spectators* to love them; yet there is none amongst them all, which more insinuates it self into their *hearts* than *FOR-*

TITUDE, or that shines with a more distinguishing Beauty and Lustre. *Justice* is had in great *Honour*, and the *Princes* and *Magistrates* that pursue it, do by this means attain to a high degree of *Veneration*. *Prudence* is the very *Soul* of *Statesmen*, and is industriously studied and sought for by all who have the care of *Families*, or the *Government* of a *Commonwealth* committed to them. *Temperance* hath many that praise and love her, because of the *Pleasures* she affords her followers, as well as by reason of her Comeliness, whereby she recommends her self to the *Eyes* and *Hearts* of her very *Enemies*. But yet all these *Vertues* do in a manner vanish and disappear when *Fortitude* presents her self, as the *Stars* at the rising of the *Sun*; for her powerful Beauty, at first sight, charms and ravisheth our *Hearts*, which, as *SENECA* saith, consists in her not dreading the *Fire*, in her receiving of *wounds*, and being so far from avoiding the *Darts* level'd at her, that she meets them, and exposeth her *Breast* to them. So that *Fortitude* may be defined, a *Constant purpose of Mind to undergo Dangers, and endure Pains and Labour, when-ever we think them to be best*. Its chief *Laws* are two, the one whereby she commands us to *Undertake*, the other whereby she teacheth us to *Endure*: For seeing that this *Vertue* is conversant about *Boldness* and *Fearfulness*, which are 2 extremes of it; it suppresseth *Fear* by enduring *Difficulties*; and moderates *Boldness*, by a cautious undertaking.

Wherefore to this *Vertue* in general, is required, first a kind of *Firmness* or constancy of *Mind* against all those *ills*, which we look upon as hard or difficult to undertake or endure. For a *man* cannot be look'd upon as possessor of this *Vertue* for excell'g in *Bodily Strength*; forasmuch as those who want that, may nevertheless be adorned with this *Vertue*, which consists chiefly in a firm purpose of performing those things we judge to be honest, and of wrestling against all *Adversities* without being discouraged by them, with an even temper and firm resolution.

It hath been said already, that the *ills* which a *Valiant Man* is to cope with, must be great and difficult; for if they be matters of no trouble, they are not so much the object of this *Vertue* as of *Expectation* only. The *Second* thing required to *Fortitude* is, that it be not the effect of *Rashness*, but that it be done for a good end. For he is undeservedly called a *Valiant Man*, who by a blind impulse, and without any regard had to his own strength, ventures upon any thing, and who rather dares and provokes *Dangers* than fears them; but he, who after a due weighing of the *Dangers* he is about to engage in, tho' he doth not love them, yet undergoes them with an undaunted *Heart*, and endures all things when, and how it best becomes him. Hence it is that *SENECA* defines *Fortitude* to be the *Science of distinguishing what is Evil, and what is not*. Forasmuch as this *Vertue* is not any inconsiderate *Rashness* or *Foolhardiness*, nor a love or desire of *Dangers*, but the knowledge of undergoing and overcoming *Dangers*. So that *Fortitude* is made up of these 2, viz. *Honesty*, which this *Vertue* must always have for her end and aim; and *Cautelousness*, or weighing of the *Danger*, before she undertake to grapple with it.

Moralists

II.
About what things Fortitude is conversant.

III.
Who it is that deserves the name of a Valiant Man.

IV. *Moralists* commonly divide *Fortitude* into 4 Species, viz. *Magnanimity*, *Magnificence*, *Constancy* and *Patience*. But all these have so great an agreement with *Fortitude*, that they differ from it by some conditions and circumstances only. For *Magnificence* imports only a circumstance of the *Danger*, that is to be ventur'd upon, as being supposed to be illustrious, and so the overcoming whereof *Glory* and *Splendor* is annexed. *Magnanimity* intimates that *generosity* and greatness of *Soul*, which is necessary to the undertaking of dangerous enterprizes, or the enduring of *Labour*. *Constancy* implies a kind of *Perseverance*, whereby the *mind* is confirmed to stick to its intended purpose, and never basely or cowardly to give it over. Lastly, *Patience* superadds nothing to *Fortitude*, save only that it is rather conversant about the enduring of *Evil*, than in the undertaking of difficult and dangerous performances, and rather suffers, than acts. Wherefore not to insist any longer on these, we proceed to the consideration of those ills, in the overcoming whereof the *Glory* of *Fortitude* doth chiefly consist; and these are either *Publick* or *Private*.

V. *Publick Evils* are, the *Destruction* of *ones own Country*, *Famine*, *Plague*, *War*, &c. which we shall be enabled to overcome, by considering that they are not *Evils* in their own nature, but are made such only by our opinion of them; that *Empires* and *Commonwealths* are subject to *Vicissitudes*, and that nothing is *Eternal* in this *World*. That we are to be affected towards *our Country*, that when we find we can no longer serve it, or be of any advantage to it, we do not hurt *ourselves*; and that when we see the whole cannot possibly be saved, that at least we endeavour to rescue a part of it. What reason have we to be so much surprized and astonished at any such change, since it is natural for that thing to have an *End*, which had a *Beginning*. It is the *Eternal* decree of *Heaven*, that all *Temporal things* must fall, all corruptible things haste away, and all changeable things perish. We shall no longer be amazed to see a *Kingdom* overthrown, when we consider that the whole frame of this *World* must be dissolved. Wherefore when we see that we can no ways procure our *Countries Liberty*, let us at least endeavour to secure our own, and that if we must dye with it, its ruin may oppress us undaunted and without pusillanimous fearfulness. And Lastly, forasmuch as we are assured that all things are ordered by an unerring decree of *Providence*, the *Love* of our *Country*, must give way to our *Love* of *God*; and our *Human Wisdom* become subject and captivated to the *Eternal* and *Infalible Decree* of the *Great Creator* of all things.

VI. As to *Private Evils*, such as *Imprisonment*, *Poverty*, *Shame* or *Ignominy*, &c. tho' they may seem to some to be hard to bear, yet doth a *Valiant Man* easily despise them, as knowing that these things are only *Evil*, according to the opinion of the *Vulgar*, and that they are afflicting, because we take them to be so. For what great *Evil* is there in a *Prison*, that it should afflict a truly great *Soul*? Is it because he is kept from the company of his *Friends*, and, as it were, excluded from the *Society* he is a member of? But a *Wise Man* knows that a wrongful *Imprisonment*,

is much better than undeserved *Liberty*; and that it is infinitely more eligible to suffer for *Equities* sake, than, by wicked means, to abound with *Riches* and *Honour*. Others consider a *Prison*, as a *Retirement*, where, tho' the *Body* be kept in, the *Mind* may have its unrestrained Flight, and take its unbounded walks in the infinite spaces of *Eternity*. Who would think himself to be a *Prisoner*, as long as he may betake himself to the *Market*, to the *Senate*, to *Heaven* it self, and divert himself amongst the *Stars*? Have not some writ Books in *Prison*, and others attain'd *Learning*? If to wicked and foolish men it be the *Devils House*, in which he keeps his *Family*; to a *wise man* it becomes the *School of Vertue*, where, without impediment, he dedicates himself to *Piety* and *Probity*. Why should a *man* abhor a *Prison*, who hath been conceived in a *Dungeon*, and thence borrowed the beginning of his *Life*; and who, after he is born, is confined to the *Prison* of his *Body*, till it return to the *Earth* from whence it was taken?

The loss of outward Goods seems to inflict a deeper wound, which yet a *wise man* is very little sensible of; who considers all the things of this *World*, as the furniture of a Lodging in an *Inn*, the use whereof, for a short time is afforded him, without any right of *Possession*. The loss of *Riches* is frequently the happy Mother of *Peace* and *Quiet*, and a *Tranquility* of *Mind*, which is seldom enjoyed but by a *Soul* free from *Earthly Cares*. ZENON, the Father of the *Stoicks*, called that day the happiest day of his *Life*, wherein he lost all his *Goods* by *Shipwrack*, and profest himself extremely engaged to those *Winds*, which, by casting the *Ship* wherein his *Estate* was contained, against the *Rocks*, had driven him into the safe *Haven* of *Philosophy*, where he spent the rest of his *Life* at the furthest distance from the *Storms* and tossings of this *World*. A truly *Valiant man* therefore knows that he hath no Right to any of these outward things; no more than the *Earth* can lay claim to the *Light*, which ariseth and disappears again in a moment. He calls to mind, that all the conveniencies he enjoys here are the *Divine Benefits*, which as they are freely granted, so are they taken away again, for just tho' hidden causes.

But your *Enemies* take away your *Good Name*, and endeavour by all means imaginable to obscure and blacken your *Reputation*. Neither can this reach any but weak and Pusillanimous Persons, who not considering the *Talkativeness* of wicked and perverse men, are too much concern'd with their *Babbling*. But the *man* that is posselt of true *Fortitude*, undervalues all these things, and as he despiseth *Pride*, so he is little concern'd at what men say of him, as long as he is conscious to his own *Probity*: He is a sufficient *Theatre* to himself, who esteems it to be a *Kingly* part to do well, and to be ill spoken of. Was there ever any *Good man* that escaped the *Slanders* and reproaches of men? The *Tongue* of *Backbiters* creeps in every where, not sparing *Sanctity* it self. Let every one therefore that is assaulted by the *Tongues* of malevolence consider with himself, whether he be guilty of the *Evil* that is reported of him, or not; if he be not, what reason hath he to be concern'd at the imputation of this *Slanderer*, or to vex himself, because

because a malevolous person useth the liberty of his *Tongue*, and complies with the perverseness of his own *Nature*? But if he be guilty of the *Reproach* laid at his *Door*, let him immediately take occasion thereby to amend his *Fault*, and by changing his *Life*, prevent, as much as in him lies, all occasions of *Reproach* for the future. Let him seriously consider, that all that is said is without him, and cannot enter his *Breast*, except that he himself admit it, since no man is, or can be offended but by himself.

IX.
How all
other Evils
are to be
obviated
by us.

And because the limits I have confin'd my self to, do not allow me to reckon up all particular *Evils*; I shall only prescribe this general *Remedy* for them all; that a man thoroughly persuade himself, that the *Peace* and *Tranquillity* of his *Mind* doth not depend on *Riches*, *Honours*, *Friends*, *Health*, and other good things so accounted; since many are miserable notwithstanding the enjoyment of all these, and many are happy without them. How inconsiderable is the loss of *Money* to him, who hath laid up his *Treasure* in *Heaven*? And how little is he concern'd with being banisht from his own *Country*, whose *Heart* is fixt on a *Heavenly*? What hurt is it to have ones *Body* bound, as long as the *Mind* is at full liberty? A truly valiant man is always the same; and as a *Hand* that is spread, or clutch'd into a *fist*, continues still the same *Hand*; so he bears the same *Mind*, and looks too, in the blustering dark *Storms* of *Adversity*, as in the serene *Sunshine* of *Prosperity*: For *Death*, *Diseases*, the loss of *Goods*, *Fame* and *Friends*, and other such-like that appear so terrible to some, are the *Tributes* due to *Nature* or *Fortune*, and are to be paid by us, whensoever they are demanded. How much more glorious therefore is it, to put a difference between our *Soul* and *Body*, and to keep our *Soul* free and unconcerned, tho' our *Body* be pain'd with *Aches*, shut up in a *Dungeon*, torn by an *Executioner*, and assaulted by *Death* it self.

X.
Some kinds
of false
or seeming
Fortitude.

As there are 4 kinds of true *Fortitude*, so there are 5 of that which is *False* and *Appearing*. The *First* whereof is the *Political* or *Civil*, which by fear of *Punishment* or *Shame*, or the hope of *Honour*, prompts *Citizens* to the undergoing of *Dangers*. 2ly. *Military*, whereby men relying upon their *Strength* or skill, or for hope of reward, cast themselves upon hazarding their *Lives* and *Limbs*. 3ly. *Angry* or *Wrathful*, whereby men, inflamed with *Anger*, venture upon the most desperate and dangerous attempts. The 4th. is *Experimental*, being proper to those, who having escaped many great and eminent *Dangers*, are confirm'd in a hope of a like good luck in the most dangerous undertakings they set upon. The 5th. is a *Blind* and *Ignorant* *Fortitude*, whereby men continue undaunted, because they are not sensible of the danger they are in. But none of all these is that true *Fortitude*, whereof we treat here; for a truly valiant man acts wittingly, knowingly, constantly, only out of *Love* to *Vertue*.

CHAP. XII.

Of Justice.

THO' JUSTICE be esteemed the Splendor of all other *Vertues*, and the Root of all *Duties* or *Offices* whatsoever, yet doth it derive its excellency only from the *Corruption* of men, and takes its rise from their *Vices*. For as we must first discover the *Disease*, before that we can be in a condition to *Cure* it; so *Laws* are made use of for a *Check* and *Curb* to *Vices*, and to bind depraved *mankind* to their good behaviour. For *Justice*, according to the account the *Lawyers* gives us thereof, is nothing else but a constant and perpetual *Will*, of giving to every man his due, L. 10. F. de Just. & Jur. By the word *Will*, in this definition, we do not understand that *Faculty* of the *Mind*, whereby it determinates it self to act, and assents to a thing clearly perceived by it, but rather the *Affection* or *Purpose* of constantly exercising *Justice*. Because he is not said to be *Just*, who simply doth that which is *Just*, when his chief motive is either *Fear*, or to obtain the favour of *Friends*, or the hope of *Reward*, or other such like; but he only who performs such actions from his own free will, and out of *Love* to *Justice*.

I.
Of the
Nature of
Justice, and
whence it
hath its
Rise.

It is also added, that this *Will* or *Purpose* must be perpetual; for it is not sufficient for obtaining the Title of a *Just Man*, now and then to render to another his due; but it is of absolute necessity that he be in full and constant Resolution of doing the same whenever occasion shall offer.

II.
The Will
or Purpose
of a Just
Man, must
be perpet-
ual.

There are 2 things wherein the whole requiring or duty of *Justice* is contained; the first whereof is to do *Good*, that is, to pay ones due; and the other to avoid *Evil*, that is, to hurt no body, and to decline all those things that may prove hurtful or incommodious to others. Not as if this latter part of *Justice* did consist in not doing any harm, but in a desire of the *Mind* to keep off evil from others, and to remove it as far as lies in our Power.

III.
Two things
are re-
quired to
the exer-
cise of
Justice.

Justice, universally considered, is divided into *General* or *Legal*, and *Special*. *General* is that which considers the *Good* that is common to many; and its business is to make good *Laws*, and observe them when they are made. So that its *Object* is not every *Good* that is common to many, but that which conduceth to the advantage of the whole *Commonwealth*. *Special Justice* is that which we have before defined to be a *Firm Will* of giving every one his due, or a *Vertue* inclining the mind always to render to every man his Right, and that according to *Equality*.

IV.
The Divi-
sion of
Justice into
Legal and
Special.

Special Justice is subdivided into *Commutative* and *Distributive*; whereof the former is conversant about *Compacts*, *Exchanges*, and *Contracts*; but the latter consists in distributing *Rewards* or *Punishments*, amongst those that are the *Members* of a *Civil Society*. The former of these considers things, and the latter *Persons*; the first belongs to all, the second only to *Princes* and *Magistrates*.

V.
Justice di-
vided into
Commuta-
tive and
Distribu-
tive.

They are also distinguisht by their *End*, because the end of *Distributive Justice* is to constitute an equality between *Proportion* and *Proportion*; so as that there may be the same *Proportion* between the things that are distributed, as there is from their

VI.
These two
sorts of
Justice are
distinguisht
between
End.

between the condition of the *Persons*, to whom the Distribution is made. As for Example, when after a *Victory* obtained, some *Rewards* are to be distributed according to the desert and condition of the *Persons*; here an exact regard must be had to the *merit* and *dignity* of each, so as that the *reward* which is given may be greater or less according to the *Dignity* or *Worthiness* of the *Person*. But in *Commulative Justice*, the equality only of the *thing* received and rendered is considered, so as that the return must be equal, according to *Arithmetical Proportion*, to that which hath been received, without any respect had either to *Merit* or *Person*.

The following *Vertues* are annexed to *Justice* as its *Species*, viz. *Religion*, *Piety*, *Observance*, *Friendship* and *Gratitude*.

VII.
What Religion is.

Religion is the Top and Principal of all *Vertues*, whereby we worship and honour GOD with the highest *Love* and *Veneration*. For this must be the chiefest affection of *Man* to adhere firmly to his *Author*, and to own him as the principle of all *Good*. For the first business of *Religion* is to discover GOD, as far as human Frailty will permit, and to persuade *Men* that he is, or doth exist. For the due worship and honour we pay to GOD, is derived from the knowledge we have of him; that is, that we are certain that the *World* was made by him, and *Rul'd* and *Govern'd* by his peculiar *Providence*. And in the next place, that nothing happens to us without his command or permission; so that all things are design'd for our *Good*, and whatsoever befalls us, must be believed to have a tendency to our *Salvation*. For seeing that his *knowledge* is most perfect, his *Power* infinite, and his *Will* most *Loving* and *Beneficent*, it is impossible that any thing should befall us, at his disposing, but must needs be for our *Good*. And tho' we cannot always perceive or understand this, yet we are to consider him as a *Physician*, who oft displeaseth his *Patient*, and puts him to *Pain*, that he may heal and make him sound.

VIII.
We must resign and submit our selves with all our concerns to GOD.

Relying upon this assurance we must submit all our concerns to him, and acknowledge that we are come into this *World*, not to prescribe *Laws* to others, but to follow those that are already established, and to yield a strict obedience to those which we are surely persuaded proceeded from him. Moreover we are in such a manner to order our *Prayers* we offer to him, as that we may obtain what is consonant and agreeable with this *Providence*, and to what he hath from *Eternity* decreed should come to pass. For he attempts, as it were, to corrupt the great *Judge* of all the *World*, who begs any thing of him, but what is the purpose of his *Will*. And above all things we are to remember, that we can never offer any more acceptable *Prayers* to him, or profitable to our selves, than those whereby we entreat him to moderate and subdue our *Affections*, and to captivate and overrule our *Will*, that we may always embrace what is best. We must also be assured and fully persuaded, that no *Sacrifices* are more pleasing to him, than such as proceed from a pure *Heart*, and which are accompanied with an *Innocent Life*. Let us therefore consecrate and dedicate our *Minds* to be his *Temple*, where we may offer *Sacrifices* to him, breath forth our pure *Affections*, and present to him the *Oblations* of our *Love*, *Worship*,

Veneration and *Subjection*. And after we have done all this, let us not be ashamed to make a frank and open profession, that we have done nothing worthy of his *Divine Majesty*, or that is worth his acceptance.

Having given to GOD the *Honour* due to him, we must proceed to the *Reverence* that is due to *Parents*, who are the *Channels*, whereby we have been conveyed into this *World*. And under this notion our *Native Country* first presents it self, which under a feigned name requires a true *Love* of us; forasmuch as of all *Societies* and *Fellowships*, as CICEERO saith, none is more grateful and pleasing, than that which we have with the *Commonwealth* whereof we are *Members*. Our *Parents* are *Dear*, our *Children*, *Relations* and *familiar Friends* are *Dear*, but it is our *Country* alone that comprehends all these *Endearments*, for which no good *Man* would make any question to hazard his *Life*, to procure its *Weal* and *Happiness*. Indeed our *Country* contains all that is near or dear unto us, so that as long as that is safe, they are so too, but if that miscarry, all these are lost together with it.

Next to the *Love* we owe to our *Country* follows the observance and *Love* which is due to *Parents*, who by special *Providence* have been destinated to bring us into the *World*, and who have been in stead of GOD, by imparting *Life* to us. Who, if they be *Godly* and *Vertuous*, deserve a double *Honour* at our *Hands*, as promoting and leading us by their *Example*, *Exhortations* and *Precepts*, to *Vertue* and good *Manners*, and make it their utmost endeavour that we may be *Happy* in this *Life*. If they be *barsh* and *perverse*, yet we must always remember that still they are our *Parents*, and that we are beholden to them for our *Lives*. And accordingly by natural instinct we are led to relieve our *Parents* whensoever they are reduc'd to any *necessity*, and for the saving of them, not only to hazard the loss of all we have, but also of our very *Lives*. *Heathens* have done no less, who with the danger of their own *Lives*, and neglecting their *Riches*, have only made it their business and care to save their *Parents Lives*. Hence it was that *ÆNEAS* obtained the name of *Pious*, for having carried his *Father* safe out of the *Flames* of *Troy*, and through the midst of his *Enemies*, *Æneid*. 6.

Him I through raging Flames did on my Shoulders bear,
Through Armed Troops, and Darts that clog'd the Air.

Let us not disdain herein to imitate a *Heathen*, and to learn from those who by the sole instinct of *Humanity* exposed their own *Lives*, to save their *Parents*.

Observance is a *Species* of *Justice*, whereby we *Honour* and *Reverence* those that are our *Superiors* in *Age*, *Condition* or *Gifts*; for to all these *Honour* is due, as a reward of their *Labor* and *Dignity*: For seeing that they take care for the *publick Good*, and endeavour to promote the *Happiness* of their fellow *Citizens*, nothing can be rendered to them in lieu hereof but *Honour* and *Respect*; for should they demand any thing else, they would be so far from being honourable, that they

IX.
Piety or Love to our Country.

X.
Observance to Parents.

XI.
Observance towards Superiors.

they would appear to all, to be mean and covetous.

XII.
Friendship
between
Equals.

Forasmuch as *Friendship* is a kind of Equality, it must also belong to *Justice*, as being nothing else but a mutual *Benevolence*, by which some persons mutually desire to do good to each other. This is the best of those things that can be obtained in this *Life*, as being the ground and foundation of our *Happiness*. This is that which takes away all the bitterness of this *Life*, and exalts all the sweets and pleasures of it. In *Prosperity* it furnisheth us with an object for our *Benevolence*; in *Adversity* and *Misery* it affords us an object which we may relieve and comfort. *Friendship* teacheth us when we are young, comforts and cherisheth us when we are old, and being never forgetful of her Duty, doth at all times help and assist us. Wherefore it is only to be lookt for amongst good Men, and they only are to be beloved with this Love of *Friendship*, whom of a long time we have known to be honest Men, and are far more considerable for their *Vertus* than for their *Riches*: And accordingly we are to endeavour to gain such as these by all occasions, and to preserve their *Friendship* when gained by all good Offices.

XIII.
Gratitude
or Thank-
fulness.

Gratitude is a *Vertue* that preserves a pleasing and acceptable *Memory* of *Benefits* received. This part of *Justice* seems to comprehend all other *Vertues*, forasmuch as no Man can be *Pious*, *Friendly* or *Observant*, that doth not live in the exercise of *Gratitude*. For what else is *Piety*, according to *TULLY*, but a grateful *Affection* and inclination towards our Parents? Who are good Citizens, and deserve well of their Country both at home, and in the Wars abroad, but such as are mindful of the *Benefits* they have received from their Country? Who are *Holy* and *Godly*, but those who with a thankful Heart and Mind full of acknowledgement, give *GOD* the *Glory* of all his *Benefits*? What *Pleasure* can there be in this *Life* without *Friendship*? And what *Friendship* can there be betwixt ungrateful Men? Who amongst us, that hath been liberally educated, doth not with Joy and *Gratitude* entertain the *Memory* of those who have educated us, and been our Masters to instruct us in good *Literature* and *Manners*? Who is, or ever was so Rich, that his *Wealth* was equivalent to the Love and good Offices of many *Friends*? Which cannot subsist without *Gratitude*, and a thankful remembrance of *Benefits* received. Wherefore it is the Duty of every one to endeavour to carry himself thankful towards all, and never to forget any *Kindness* done to him, if ever he desire to please and satisfy himself or others.

There be also some other *Vertues*, that are contained within the compass of *Justice*, viz. *Charity*, *Humanity*, *Civility*, *Affability*, *Hospitality* and *Liberality*.

XIV.
Charity.

Charity is that *Vertue* which incites us to Love all Men, and to succour and relieve them according to our ability. For seeing that the *Happiness* of this *Life* consists in *Action*; we are not only to bear a good Will to our Neighbours, but must endeavour to assist and help them by our Works and *Actions*. For as the Sun is beneficial to all, and doth not pick and choose some only, to whom he may communicate his *Light*; so likewise must our Love be extended to all, and being dilated by this *Vertue* of *Charity*, embrace all, and do good to all.

Humanity is that *Vertue* whereby with a kind of *Benevolence*, we express and testify to all Men our readiness to serve and oblige them, from a due sense of the *Dignity* of Man, and our common Bond of *Consanguinity*.

Civility is a *Vertue*, whereby a Man from the Sense of common *Humanity*, doth speak courteously to all those that have any business with him, or that he meets with; and makes use of such Words and Gestures, as do express a kind of *Benevolence* and *Benevolence*.

Affability is that *Vertue*, whereby a Man in his discourse with others, as well by his readiness and easiness to hear, as by the sweetness and agreeableness of his Speech, doth gain the Hearts of those he hath to do with.

Hospitality is a *Vertue*, which makes us kind and obliging to Strangers, by giving them kind and free Entertainment; not only because they are Men, but because being Strangers and out of their own Land, they may want many things, which at home and in their own Country they plentifully enjoy.

Liberality is a *Vertue*, which prompts us to be beneficial to others, freely and spontaneously according to our Abilities. This *Vertue* hath 2 extreams, for if our *Benevolence* be deficient, that is, less than it ought, we deserve the name of *Covetous*; but if we exceed in our Gifts and Kindnesses, so as to give more than we ought, to others, then we ought, or at another season, or for other reasons than we ought, we fall into a Vice, and are justly called *Prodigal*. And accordingly, saith *CICERO*, those Men are *Prodigal* who by Feastings, Doles and Shews, or by the vast charges of Plays and Publick Huntings, squander away their Money upon such things, the memory whereof is either none at all, or very short lived. But such are truly *Liberal*, who redeem Slaves, pay the Debts of their Friends or Poor Men, or assist them in the bestowing of their Sons or Daughters, or for the getting of an honest livelihood.

CHAP. XIII.

Of the usefulness of the Passions or Affections of the Soul.

Forasmuch as the *Vertues* do arise from the Affections of the Soul, and that they are wholly conversant and taken up about the Ruling and managing of them, I should be wanting to the design of this Discourse, if I did not examine the usefulness of them, and shew how many several ways they may be advantageous to Men. It is very notorious with what Virulence the Stoicks inveigh against the Passions, who being too solicitous for the Tranquility of their Wise Man, have supposed them to be altogether Evil, and therefore to be avoided by him, whom they will have to be exempt from all Vices, and not subject to any Perturbations. I confess my self formerly to have pleaded their Cause in my Discourse entitled, *L'Homme sans Passions*, and not only to have maintained *SENECA'S* Opinion, but also according to my slender Ability, endeavour'd to advance and exalt it. But forasmuch as I now follow the sentiments of *DES CARTES*, and my

Liberality.

1.
The Opin-
ion of the
Stoicks.

my business is not to explain the *Opinions* of others, but only to lay open *Truth*, no understanding man will reproach me of Lightness or Inconstancy, for going about to unfold the usefulness of the *Passions*, and leaving the *Stoicks*, consider *Man*, not as Translated amongst the *Glorified Saints* in *Heaven*, but as placed amongst his *Mortal Brethren* here on *Earth*.

II.
Virtues
without the
Passions are
weak and
languishing.

For the clearing of what I intend to deliver on this Point, it will be of use to call to mind that the *Passions of the Mind*, are certain Sensations or Perceptions of the *Soul*, which have a *special Relation* to the same, and are produc'd and maintained by the motion of the *Spirits*: As hath been declared more at large, in the foregoing part of this *Institution*. Now it is apparent, that these *Comotions of Mind* do greatly assist, corroborate and invigorate all *Human Functions*. For doth not daily experience teach us, that all *Human Actions* are dull and lifeless without them, and that the vigor of the *Mind*, where they are absent, ceaseth and fails? *Reason* it self in many cases appears dull and heavy, if it want the brisk company of *Affections*, and becomes stupid, when not excited with the *Spurs* and *Goads* of the *Passions*? Where shall we meet with *Fortitude*, that undertakes the most hardy and difficult attempts? Which pursues *Dangers*? Which dares and provokes the most terrible *Evils*, except it be assisted by *Anger*, which excites it to revenge the injuries and affronts done to ones *Country*, *Parents* or *Friends*? *Prudence* perisheth, where *Fear* is wanting to put it upon making provision for the Future: For it is this Monitor puts *Prudence* in mind of what *Evils* may happen, how she may obviate them, and by what means repel them? Who ever attempted any thing that was Great or Generous, without a strong and exalted desire? What Eminent Orator, or Famous *Philosopher* ever conceived or brought forth, any thing that was Rare and Excellent without it? Why are so many toilsome and expenceful *Travels* undertaken, to visit unknown *Nations* and *Countries*, but from an ardent desire of Seeing and Learning things unknown? Who loves *Vertue*, that is not accompanied with Joy and Gladness? For bare and naked *Vertue* is neglected and despised, except it promise, and actually bestow pleasure and satisfaction upon its Followers.

III.
Two things
are requi-
red to make
the Affec-
tions good.

The *Affections* therefore are good, and contribute to the Perfection of *Human Life*, as long as they observe these 2 following Rules. First, that the Object they are conversant about be lawful: For *Affections* seem to have been bestowed upon us by the *Author of Nature*, that they might excite us to the pursuit of *Vertue*, and the declining of *Vice*. The Second is, that our *Passions* be proportioned to their *Objects*, and comport with the *Light of Reason* in all their motions. For such is the force and power of *Reason*, that it thoroughly searcheth into, and contemplates the nature of *Objects*, perceives the *Qualities* of each of them, and distinguisheth them from others: He who follows her, is safe and secure from Error, and forearmed against all deceptions whatsoever. So that he has his *Ears* open to the instructions of *Reason*, who loves the best Good with the Highest love and *Affection*, and all other things according to their several degrees of worth and merit.

The *Passions* therefore are very useful to the *Actions of Human Life*, as long as they are subject to the command of *Reason*, and attempt nothing contrary to its *Dictates*. For they are the Master of *Vertue*; and as *Fire* becomes extinct, when it wants *fuel*, so without the *Affections* *Vertue* remains idle, and unactive. For what great thing can it ever attempt, as long as it continues fixt in its own mean or middle Point, and is not spurred on by the *Passions*? As long as the timorous *Thoughts of Human Wit*, are not excited to some choice or other? As long as *Fortitude* is not stirr'd up to gallant *Actions*? As long as *Justice* is not Arm'd with her *Sword*? And lastly, as long as *Temperance* is not kept within its due bounds by *Fear*, *Shame* and the *Emulation* of our *Perfidious Nature*? How are all *Human Functions* over-whelm'd with a deep Sleep, where for want of the awakening motion of the *Passions*, *Men* are not rowzed from *Rest* and *Idleness*, to *Briskness* and *Activity*?

But you'll object that most of the *Passions* are *Evil*, and lead us headlong to *Vice*: For as they break forth suddenly upon the *Soul*, so they hurry her away without expecting the advice and counsel of *Reason*, and reduce her to the blind and wild condition of *Beasts*; like unruly *Horses* that will not be restrained, running headlong into the *Precipices* of unlawful *Lusts*, accursed *Envy* and *Hatred*, and mad *Superstitions*.

To which I answer, that what I have said concerning the usefulness of the *Passions*, must only be understood of them, inasmuch as they are subject to the command and guidance of *Reason*, and proportion'd to their object and end; which then only takes place when those things are Loved that ought to be Loved, and when such *Objects* are loved in a higher degree, which because of their greater worth deserve more of our *Love*. For *Love* and the rest of the *Affections*, are never *Evil*, as long as they keep within their Bounds, and pursue only those *Objects*, that are agreeable to *Reason*. But as there are some *Passions* that are of no use at all to *Men* except they be moderated, and reduced to *Mediocrity*, to the end they may be subservient to the acquisition of *Vertue*: So some of them are so very good of their own Nature, that the more they exceed the better they are; for inasmuch as they always follow the Guidance of *Reason*, they cannot but be upon all occasions, fruitful and advantageous.

For there is a twofold excess in the *Passions*, the one whereof changeth the nature of a thing, and of Good makes it become *Evil*, and by this means hinders it from continuing in subjection to *Reason*. So we find that some *Affections* do to that degree oppose the motions of *Reason*, and depresso the force of the *Mind*, that being wholly abandon'd by it, they degenerate into down right *Vices*. The other excess is, whereby the degree or measure of the *Passion* only is encreased, and of a Good one is made Better. Thus *Boldness*, or as others rather express it, *Rashness*, is not said to be an excess of *Fortitude*, save only when it transgresseth the Bounds of *Reason*. But yet *Fortitude* is also capable of another kind of Excess, even whilst it continues within the said Bounds; which consists in this, that it is not subject to be shaken or moved by any Doubt or Fear: Which Excess is so

IV.

so far from being Blame-worthy or Reproachful, that the Tongues of all Orators are not sufficient to extol and commend it, this being the peculiar Vertue of Heroes, whom the Antients ranked amongst the Gods.

CHAP. XIV.

What is the use of Wonder or Admiration.

I.
Some condemn Admiration.

MOST of the Antients had but a mean Esteem for Admiration, as looking upon it to be the Vice of Ignorant Persons; and therefore took it to be an Enemy to Human Felicity, and the fruitful Mother of Sorrow, Fear, Desire, and other Passions that are the Tormentors of Mankind. And accordingly HORACE supposeth that Men would be exempt from all these, if once they could leave their wondring, Lib. I. Epist.

Nothing t^e admire is th^e only thing that can Make and preserve a Blest and Happy Man.

II.
Wonder or Admiration is necessary for the acquiring of Sciences.

But these men do not seem to have rightly understood the nature of Admiration, but rather to have confounded it with Fear, which beholds every thing with Trembling, and is affrighted at all the unusual Objects it meets with. But forasmuch as Admiration is nothing else but a suddain Occupation of the Mind, whereby it is strongly carried to the attentive consideration of those Objects, that appear rare and strange unto it, nobody can deny but that it must needs be very conducive to the Learning and Remembring of those things we were ignorant of before. For it is evident, that there are chiefly 2 Principles which concur to the invention of every Art, viz. Admiration; because as soon as any new thing is suddainly presented to our Understanding, our Mind is presently struck with Admiration, and is powerfully rowzed to the searching into the Nature of it; and Experience, because the Mind, being allured by the Admiration of a Rare and Uncommon Object, never rests till it have found by Experiment, what the Nature of it is, and the Cause of it. So they who first observed the Eclipse of the Sun, being seized thereat with extraordinary wonder, it ingaged them to search into the Cause of this unknown Effect, till after many repeated experiments, they found that the same was caused by the Moons moving between the Sun and the Earth; whence they gather'd this Proposition of certain and undoubted Truth, that a Solar Eclipse is produced by the interposition of the Moon betwixt the Earth and the Sun.

III.
Those who are not apt to Wonder, are generally unlearned.

The necessity of Admiration, in order to the attaining of Knowledge, is very apparent from this one instance, that commonly those who are destitute, or not apt to be touch'd with this Passion, are commonly unlearned, and very ignorant. For, notwithstanding that many things present themselves to our Understanding, or offer themselves to our Senses, yet will they never be fixt in our Memory, except by some Passion they be imprest in our Brain, or by the intent application of our Understanding, being determined by our Will to a serious Attention. For rare and unusual Objects encrease our Attention, because by their Novelty they leave a deeper impress of themselves; and

the Spirits flowing thither, do encrease the application of the Mind; by which means we frame more lively and lasting Ideas of things. Moreover, Admiration is of great use for our attaining of the knowledge of things which formerly we were ignorant of: For a Man that is seized with Admiration, compares the unknown Object, with things that he hath formerly known; by which means he sees it to be different, and enquires why it differs from them. Hence it is that Admiration is called the Beginning of Philosophy, the Seed of Knowledge, and Abrupt Science. To admire, saith PLATO, is much the Affection of a Philosopher; neither indeed can any other Original or Beginning of Philosophy be assigned but this.

The esteem of ones self, which is a Species of Admiration, is conducive to every man, in as much as it shews him, that he hath something that is his own, and possesseth some Perfections, in consideration whereof he may respect and love himself more intimately than all other things. For Self-Love is a Lawful Affection, it being allowed to every man to consider himself before others. Moreover, a man by loving himself, imitates GOD, who, like a Circle, turns into, and terminates in himself, and loves himself with the Highest and Essential Love. This is the Property of Wise Men, who, subduing all foreign things to their Mind, do so highly esteem the dignity thereof, that they account it the highest Sacrilege to defile it with filthy and vain thoughts. Hence it is that they have an awful regard for themselves as for Deities; and abhor to commit any thing that might make their Consciences to condemn them. And to this purpose ARISTOTLE in the Second Book of his Politicks, proves that a due Esteem of our selves is a Vertuous Quality; and if at any time Self-Love is blamed, that is only so far as it exceeds its Bounds, and makes us to love our selves over-much.

On the other hand, the Contempt or Low esteem of ones self, by which a man despiseth his own worth and merit, is very conducive to Humility, and makes him refuse the Honour others render to him. This Vertue teacheth him, that the praises of others are useful to him, as long as he continues vile in his own Eyes; and that he is not to mind what others say of him, as long as he is conscious to his own defects and meanness, and that he wants those very Vertues which others extol him for. This Passion, moreover, hath this good effect, that it makes us to despise no man; but owning our selves to be men, prompts us to measure their Vices with the same Equity wherewith we censure our own. For it is but Reasonable and Equitable, that knowing our own weakness, we should take pity on others, and according to the command of Charity, think better of them than of our selves: For indeed what do we know, but they may far exceed us in Vertue? and tho' they have fallen as Sinners, yet may have risen again as Saints. We may lawfully condemn our selves, but cannot despise any other without Sin, and being injurious to our Neighbour.

VENERATION, whereby the Soul is engaged to esteem the Object it respects and honours, and to subject it self to the same, teacheth us to Reverence those Powers that are above us, and to render unto them the Honour that is their due.

B b b b

IV.
The Esteem and due Value of ones self, how it may be profitable.

V.
The undervaluing of ones self is a great help to Humility.

VI.
Veneration teacheth us, to respect every one according to his Merit.

due. For seeing that *Authority* is various, and that the *Persons* that are above us, are not all of them of equal *Dignity*, *Veneration* prompts us to honour every one of them, according to the different *Power* and *Order* they have in the *World*, rendering them a various *Respect* and *Worship*, according to the difference of their *Merit* and *Dignity*.

VII.
Our Parents.

In the first place therefore, it puts us in mind of the *Reverence* we owe to our *Parents*, as to *G O D's* *Viceregents*, who have brought us forth into the *World*, who with anxious and solicitous care have educated us, who have instructed us in the *Duties* of *Religion*, framed us to *Vertue*, and furnished us with *Knowledge* and *Learning*. For since it is most agreeable to *Nature*, to Love those who Love us; how great is that *Love* which we owe to our *Parents*; seeing that our *Love*, like it never so intense, will not equal their most tender *Care* and good *Will* towards us.

VIII.
Magistrates.

In the next place, it adviseth us to honour *Magistrates*; and such as are in *publick* places of *Trust* and *Authority*. For seeing that they watch for the *Weal* and *Welfare* of the *Commonwealth*, and are set over the *People*, to the end they may assist and help them, procure their *safety*, and secure their *Estates*, they certainly deserve *Honour* and *Respect* from all whose *happiness* and *welfare* they contribute to.

IX.
Wise men.

This *Affection* also teacheth us to Honour and esteem those that excel in *Wisdom* and *Vertue*, and do recommend them, by the *Examples* to all others.

X.
Disdain.

Neither is the *Passion* of *Disdain* altogether useless, whereby the *mind* of *man* contemns some *persons*, and accounts them so much below it self, as to know that it is not in their *Power* to do him either *Good* or *Evil*. For this *Passion* is not a little conducive to the *Quiet* of the *Mind*, by raising it above the reach of any *Mortal Power*, making it to be unconcerned at their *Promises*, and fearless of their *Threats*. Especially in cases where the *Cause* of *Vertue* is to be appear'd for, or *Vertue* to be maintain'd.

CHAP. XV.

Of the End or Usefulness of Love and Hatred, and the Interpretation of them.

I.
Love teaches us to do good to others.

IT is an in-born instinct of the *Will* of *Man*, to desire that which is *Good*, and to testify its displeasure, when it cannot attain it. Thus we see that a *Covetous Man* desires *Riches*, and an *Ambitious Person* pursues *Honours*, because they look upon these things as *Good* for themselves, and are with earnest desire carried towards them, as to things perfective of their *Nature*. For *Love* is nothing else but a *Thought* or *Cogitation* of the *Mind*, by which it is stirred up to join it self in *Will* to those *Objects* which appear agreeable to it. So that this *Passion* puts us in mind to do good, not only to our selves, but to others also: Forasmuch as all *men* are united to us by a likeness of *Nature*, and constitute but one *Politick Body* or *Society*; wherefore also we are drawn by a natural impulse to bestow *Benefits* upon them, and to procure their profit and advantage, as far as lies in our way. For *Love* is a *Beneficent Passion*, and

rejoiceth to diffuse it self, to a vast variety of *Objects*. Hence it is that *PLATO* feigns it to be the *medium* between that which is *Deformed* or *Ugly*, and that which is *Beautiful* and *Lovely*; between that which is *Mortal* and that which is *Immortal*, because it cherisheth and maintains *Human Society*; and joyning contraries together, links the *Proud* with the *Humble*, and the *Poor* with the *Rich*. We shall therefore make a good use of this *Passion*, by assisting and relieving our *Neighbours*, and by desiring and promoting the good and welfare, not only of our selves, but of others also.

But forasmuch as some, under pretext of helping their *Neighbours*, do injure them: The Interpretation of this *Affection* is, that in doing good we take care that we be not hurtful or prejudicial to any: but that we assist them willingly and heartily, and endeavour to promote their good from a pure instinct of *Charity*, and be to them as *Light* which penetrates all *Diaphanous Bodies*, without any hurt or prejudice, either to them or it self.

By *Devotion*, which is a *Species* of *Love*, whereby the *Lover* esteems the *Beloved Object* more than himself, we are taught to love *G O D*, and embrace him with the utmost extent and strength of our *Affections*. To which *Divine Love* we may arrive, by considering that *G O D* is a *Spirit*, or a *Thinking Being*, upon which account, seeing that our *Soul* is of affinity with his *Nature*, we are persuaded to believe, that it is an *Emanation* from his *Supream Intelligence*, and, as it were, a *Particle* of the *Divine Breath*. Moreover considering the *Immense Power* whereby he created the *World*, and all the things that are, without any *preexistent matter*; the infinite reach and extent of his *Providence*, which, with one view, beholds whatsoever is, was, or is to come, yea, or can be: the unerring certainty of his *Decrees*, which tho' they be absolutely unchangeable, yet do not in the least prejudice the liberty of *Man's Will*. And lastly, by making a deep reflection upon our own great weakness, and on the other hand, on the *Amplitude* of the *Universe*, and all *Created Beings*, how at first they proceeded from *G O D*, and do still so depend on his *Power*, that they cannot subsist a moment without his *Care* and *Providence*. For the due consideration of all these things, will kindle a desire in us to be joyned to him in *Will*, make us to venerate his *Decrees*, as judging them most necessary and equal, and to wish for nothing more than to obey his *Will*, and for his *Glory* make no difficulty to hazard the loss of all things, even of our *Lives*, and in a word, to undertake or suffer any thing that may be offered to us.

Complacency is another *Species* of *Love*, whereby the *Soul* is carried out in desire towards *Beautiful Objects*, being greatly taken, and charmed with their aspect. For *Beauty* hath something whereby it powerfully recommends it self, so as to allure the *Eyes* of *Spectators*, and force an admittance into their *Hearts*. Hence the *Antients* were pleased to call it a *silent Imposture*, and a *Dominion* which needs neither *Arms* nor *Guards*, such as persuades without words, and makes all *men* readily to submit to its *Imperious Yoke*. This *Passion* prompts us to desire the *Beauty* of *Worldly things*,

I.
And to hurt no Body.

III.
Devotion excites us to love GOD.

IV.
Complacency is a help to the Love of Vertue.

things, and wholly to betake our selves to the Love of *Vertue*, and by trampling upon all *Earthly Enjoyments*, to aspire after *Celestial Objects*.

For if a comely shape of the *Body*, if a sweet and beautiful Aspect, if the sparkling lustre of a brisk and lively *Eye* be of force enough to astonish, ravish and surprize, what a degree of *Love*, think we, will not *Vertue* be able to enkindle in the *Hearts* of its Contemplators, who, if we will believe *S. E. N. E. C. A.*, sends her *Light*, as a *Harbinger* before her, into the *Hearts* of all *Men*, so as that even those who do not follow her, are convinced of her *Beauty*? What can be compared to the *Life* and *Vigor* which *Fortitude* communicates to the *Eyes*, to the *Intention* they derive from *Prudence*? to the *Reverence* wherewith *Modesty* adorns them? to the *Briskness* and *Serenity* which *Joy* affords them? and lastly to the *Awfulness* which *Severity* puts upon them? What can be imagined more *Beautiful* than *Justice*, which makes *Princes* most like to *GOD*? What more comely than *Temperance*, which sets bounds to *Pleasures*, and never embraceth them for their own sake? What more sweet and lovely than *Humanity*, which is affable and courteous to all, and doth so far only desire its own *Good*, as the same may be serviceable and profitable to others? What more grateful and pleasing than *Clemency*, which spares the *Blood* of another as its own, which by its kindness turns and overcomes the *minds* of the *wicked*, and sweetly comforts the *afflicted* and *miserable*? So that by beholding of *Beautiful Objects*, we are insensibly led to the love of *Vertue*, and taught to despise and neglect these frail and changeable *Beauties*, and to pursue the *Eternal Excellence* and *Comeliness* of *Vertue* and *Goodness*.

Neither is the *Passion* of *Hatred* altogether useless, where it meets with *Objects*, on which it may justly discharge its *fury*. For we hate all those things that hurt us, or injure our *Soul* or *Body*; and therefore we have good reason to abhor our *Vices*, and to avoid all those things that disturb our *Peace* and *Tranquillity*. For if it be natural to the *Soul* to separate it self by hatred from the things that are hurtful to it, what *Evil* ought she more to detest, than that which, in a manner, destroys and annihilates it? For the *Soul* dies whilst it commits *Sin*, and lays violent hands upon it self, as oft as it transgresseth the *Commands* of *GOD*, and thwarts the *Dictates* of its *Conscience*. Wherefore it is but justice to hate our selves upon the account of *Sin*, and to be inflam'd with an holy *Anger* against our *Defects* and *Transgressions*, forasmuch as by means thereof we are turned aside from our *Chiefest Good*, and depart from him, with whom to be united by *Love* is the *Sovereign Bliss* of *Man*.

The *Horror* we are seiz'd with at the beholding of ugly and deformed *Objects*, teacheth us to avoid all manner of *Wickedness* and *Pravity*, and to eschew the company and familiarity of those, who are likely to infect us with their corrupt manners. For seeing there is nothing in Nature more ugly and deformed than a *wicked and perverse Man*, we have all the reason in the *World* to avoid such a one, as we would do the *Plague*, lest we should be corrupted by his familiarity, and his *Vices* insensibly should get ground

of us. *Drunken Companions* easily draw in their Associates to the same Excess; and *Lustful* and *Unclean Persons* infect those they converse with, and effeminate the *Minds* of those that keep them company. *Covetous Persons* inspire their familiar Friends with a *Stingy Humour*. But what *Body* can be so deformed and monstrous, what *Skin* so scabby and ulcerous, as to compare with the ugliness and filthiness of *Vice*, which changes *Men* into *Beasts*? This *Passion* therefore will be of great good use to us, if it prompt us to detest the depraved manner of *wicked men*, or whatsoever can defile or weaken our *Innocence*.

CHAP. XVI.

Of what use the *Passion* of *Desire* is.

THE End and use of *Desire* is manifest from its *Definition*, which declares it to be a *Passion*, whereby the *Soul* is carried towards a *Good*, considered as *Future*. Which words sufficiently shew that this *Passion* aspires after those things which it wants, and wishes the conversation of those which it enjoys. The *Soul* by *Desire*, is carried to the Possession or enjoyment of some *Good*, like an *Arrow* driven from a *Bow*, and being raised upon the wings thereof, flies to the *Mark*.

Accordingly the *Soul* by *Hope*, which is the first Species of *Desire*, is stirred up to desire *Happiness*, and to enjoy that *Good*, which alone can satiate it. For as *Bodies*, by motion, approach nearer to their *Centers*; so the *Soul*, through *Hope*, tends to *Happiness*, and by its earnest wishes and desires, hastens that, which it so much longs for. Wherefore it looks upon these days, during which it is compelled to live here amongst *Mortals*, as already past and gone; and neglecting things present, esteems them as past, before ever they are come. And by this means it is neither corrupted by the *Prosperity* of this *World*, nor cast down by *Adversity*; applying the whole drift of her intent to this only, that none of these things may be a hinderance to her in her Progress to *Bliss* and *Felicity*. O Thrice *Happy* and *Blissful Hope*! whose *Promises* are so great and glorious, that they make a *Man* *Happy* and *Blessed*, even before he is in full possession of it.

On the contrary, *Fear* adviseth us to undertake nothing without *Heedfulness* and *Circumspection*, and to avoid *Rashness* in all our *Actions*. In the first place it teacheth us to examin all those things that may any way hinder or stop our intent, and to deliberate maturely and at leisure, about all those matters that are liable to change. For *Pre-emptancy* is without foresight, and cannot but frequently have *Repentance* for its Companion. And in the next place, that we foresee things to come, and with great exactness and diligence, consider the *Evils* that may possibly happen to us: For foreseen evils are less afflictive, and we bear those things much more easily, that have been our constant expectation. *Fear* therefore warns us, that standing in our *Watch-Tower*, we should keep a watchful *Eye* upon things to come; and as far as *Human Foresight* permits, anticipate the mutability of *Fortune*, the endeavours of our *Enemies*, and the *insultings* of *Men* in *Power*. For

I.

and *Cau-
telousness*.

V.
Hatred
makes us
to abhor
Vice.

VI.
Horror
or Abhor-
rence makes
us to avoid
Bad Com-
pany.

Afflictions and *Hardships* are only intollerable to him, whom they seize all on a suddain and at unawares, and whom they strike before they are discern'd.

IV.
The Usefulness of Jealousie.

Jealousie will stand us in good stead, when by it we are stirr'd up to endeavour to secure the Possession of those things which we count the best and most excellent of all others. This *Passion* moves and actuates the *Philosophers*, when they contend for the *Truth*, which they suppose themselves to have espoused, as for their nearest and dearest Interest, and endeavour to vindicate it from all Suspicion of *Erreur*, in opposition to all the Attacks and Assaults of their *Adversaries*. Hence it is that Controversies about *Religion* are maintained in the *Minds* of *People*, whilst every one is *jealous*, lest the *Religion* he professeth should suffer any thing by his slackness or indifference, or that he should be forced to desert it. Thus *Princes* and others, that have an *Honourable Name* in the *World*, are extremely *Jealous* of their *Good Name* and *Reputation*, and leave no *Stone* unturn'd to preserve the same in its full Luster and *Glory*; because they look upon the Opinion which others have of their *Virtue*, to be above all things most conducive to their *Honour* and *Esteem*, as well as the safest and strongest guard, against the Assaults of their *Enemies*. In a word, *Jealousie* may be of use to all, if the *Good*, the loss whereof they apprehend, be of great Concern to them, and such as they cannot be deprived of without great Shame or Loss. For as no Body faintly and carelessly Endeavours the obtaining of *Riches* or *Honour*; so it is no wonder to see *Men* strangely moved and concern'd, whenever they are threatened with the loss of either of them.

V.
Despair is sometimes of use to Lovers.

Altho' *Despair* be the most odious of all *Passions*, and be generally accounted the Common *Enemy* of *Mankind*, yet is it not altogether without its Usefulness. For inasmuch as it considers the desired *Object* as Impossible, and excludes all hope of ever obtaining it, it may be of advantage to *Lovers*, when they find themselves neglected and despised by the beloved *Object*; because then this *Passion* strongly persuades them to give over their vain pursuit, and to cease their fruitless Endeavours, and to quit themselves of their ill-advised *Desires*. It tells *Men*, that it is *Madness* to doat upon an ungrateful and insensible *Object*, and to cast away our *Love* upon that which cannot, or will not love us again.

VI.
Despair makes Soldiers Valiant.

As *Despair* proves advantagious to *Lovers*, so likewise it is useful to *Souldiers*, in cases where they are prest with *Difficulties*, and see no way open to escape their *Enemies*: For then it prompts them, since they are necessitated to engage those that are much stronger than themselves; and that in all probability they must *dye*, to sell their *Lives* as dear as they can, and in some kind make amends for their Loss, by causing a greater Loss to their *Enemies*. For *Necessity* often steels *Cowards* with *Valour*; and *Despair* hath often made weak and fearful *Troops* to triumph over *Conquerours*. This *Passion* inspir'd LEONIDAS, when with a small Handful of *Souldiers*, he set upon *Xerxes*, whose *Fleet* the *Sea*, and whose *Army* the *Land* was scarcely able to contain. For having posted himself with 300 *Men* in the Narrow-passage of the *Thermopylae*,

he stood the shock of that prodigious *Power*, and died valiantly with his whole little *Army*.

Fluctuation of *Mind* is necessary, when we are engaged in the Election of *Good things*; for seeing that one *Good* is preferable before another, and that all are not of the same Value, we have need of time before we can certainly know, whether the *Judgment* we frame concerning *Things*, be conformable to them, and consonant to all the *Circumstances* that concur to their *Perfection*. For we cannot, like *Angels*, understand things that are offer'd to us, in an Instant; our *Knowledge* is successive, and as the *Sun* from the Dawning increaseth to the perfect *Day*, so some time is to be allowed to our *Soul*, that after a mature Reflexion of *Judgment*, she may deliberate of things, and consider what she ought to determine concerning them. For seeing that things are various and manifold, and not equal in degrees of *Goodness*, their Nature must be diligently examin'd by us, that we may come to know what is *Good*, what *Better*, and what *Best of all*. For *Men* are very apt to favour their first *Thoughts*, and either from an Affection for *Novelty*, or too great Indulgence and Love for the Off-spring of their own *Brain*, to embrace that which first presents itself to their *Minds*. Wherefore *Delay*, which *Fluctuation* of *Mind* doth suppose, is very necessary to discern *Truth* from *Falshood*, and to make a due distinction betwixt *Good* and *Better*.

VII.
Fluctuation, or, Doubtfulness of Mind, useful in the Choice of things.

Courage and *Boldness* are good Helps to *Fortitude*, and superadd both Force and a Spur to that most *Generous Virtue*. For *Fortitude*, without the Company of *Boldness*, is but faint and languishing, and stands in need to be excited by its *Heat*, to the attempting and undertaking of *Great* and *Worthy Achievements*. This *Passion* may lawfully and worthily be employed, in repelling the *Enemies* of our *Country*, and in defending the *Life* and *Honour* of our *Prince*. *Nature* teacheth us to venture the loss of our *Hand*, for the saving of our *Head*; and to expose any part of our *Body*, to save the whole. This is that which *Boldness* performs, and when *Necessity* requires, does not only meet *Dangers*, but provokes and contemns them.

VIII.
Courage and Boldness are great Helps to Fortitude.

Emulation spurs us on to imitate the glorious *Actions* of *Famous Men*, by studying and eying the *Examples* of such as do exceed us in *Virtue* and *Learning*. It sets before our *Eyes* their *Achievements*, as so many *Originals* for us to express, and to take Copy by, suitable to the Requirings both of *Reason* and *Nature*. For there is an inborn Inclination in all *Men*, to become like their *Superiours* and *Betters*. This makes us to be always in the pursuit of those *Virtues* and *Perfections*, which we see shining so illustrious in others, and enflames us with *desire* to imitate the *Manners* and good *Qualities* of those who excel us, especially in *Intellectual Endowments*.

IX.
Emulation is conducive to Virtue.

CHAP. XVII.

Of the Usefulness of Joy and Sorrow.

I.
All pursue
Pleasure.

IT is not without Reason that some Physicians tell us, That the desire of *Pleasure* is Natural to man; for it is subservient to the *Mind*, and fills and satiates the wants of the *Body*. Young men are inclined to *Pleasure* and *Oblettation*, because it is serviceable to the ready and vigorous performance of all *Bodily Functions* and *Exercises*, and conduceth to the increase and good state of it. Melancholy Persons addict themselves to *Pleasure*, because otherwise the *Humour* that predominates in them would consume their *Body*, and by its malignity make all the *Humours* thereof eager and corrosive. Old men delight in *Merriment*; for seeing that the digestive Faculty of their *Stomach* is slow and weak, and that the *Blood* and other *Humours* move but slowly through their *Bodies*, they are with great eagerness push'd forwards to *Pleasure*, as to the only Remedy against all these *Distempers*.

II.
Joy is
grateful to
the Mind.

What *Pleasure* is to the *Body*, that *Joy* or *Gladness* is to the *Mind*; for it always is a Consequent of its *Tranquillity*, and doth in a manner perfect and compleat all its *Operations*. For even as by a Natural Instinct we are carried to that which is *Good*, and have an Aversion for that which is *Evil*; so we pursue *Joy* and *Pleasure* under the Notion of its being *Good*, and hate *Sorrow*, because it appears to us to be *Evil*. But because *Joy* may be infected by its *Objects*, and be conversant about those things which are unworthy of our *Esteem* or *Regard*, we must examin what is the right use of it, and to what *Matters* it may lawfully be applied.

III.
Joy always
doth ac-
company
good Affi-
ons.

And indeed *Joy* and *Gladness* are not to be found, but in the Exercise of *Vertue*, and in the pursuit of *Honesty*; seeing that all other *Good things*, which we do so solicitously look after, do not bring forth any true *Joy*, but only some false and feigned *Chearfulness* and *Mirth*, which is always accompanied with *Anxiety* or *Repentance*. For there can be no true *Joy*, but that which springs from the Consciousness of *Vertue* and *Goodness*.

IV.
Derision is
useful for
the Reproof
of Faults.

Derision, which consists of *Joy* and *Hatred*, and is occasion'd by the deprehending of some slight or *Venial fault* or defect, is frequently of good use for the amendment of *Faults* and lesser *Immoralities*, making him who is derided, to be more watchful over his *Actions*. For finding his *Immoralities*, or undecent *Manners*, to be exposed to *Jest* and *Laughter*, and that they furnish others with Matter of *Raillery* and *Merriment* at his Cost, he resolves to correct the same for the future, and so to prevent the like *Errours*, that he may no more become a *Laughing-stock* to others.

V.
Envy is
troubled
at the
Exaltation
of the
Wicked
and Un-
worthy.

Envy, forasmuch as it is a *Passion* and a Species of *Sorrow*, is not without its usefulness, it being that *Affection* whereby a man is displeased at the Prosperity or Elevation of another, because he is unworthy of it. For it seems but reasonable, to be moved with *Envy* and *Indignation* against those, who without their *Merit* are raised to ample *Fortunes* and high *Employs*. For whatsoever is conferr'd upon *Unworthy persons*, is look'd upon as a piece of *Injustice*, when that which should be the Reward of *Vertue*, is made an Encouragement

to *Vice* and *Wickedness*. From all which it is apparent, that this *Affection* is distinct from that *Envy* which is a *Vice*, because this latter hath not for its Object a Person unworthy of the *Good* he enjoys, but rather conceives a *Joy* and *Gladness* from the *Miseries* of the *Good* and *Vertuous*; whereas the former is only offended at the Prosperity of such as are *Unworthy*, but reaps no pleasure at all from the *Misfortunes* of those that are *Good* and *Vertuous*. The *Good things* for which we commonly *Envy* others, are *Riches*, *Honours*, and other such like, depending on the Gift of *Fortune*: For no Body is *Envi'd* for his *Vertue*, nor for his *Nobility*, *Beauty*, or other Endowments or Embellishments, whether of *Body* or *Mind*; forasmuch as they do not depend of his *Industry*, but were bestowed upon him by *Heaven*, before ever he was capable of committing any *Evil*.

Compassion, or *Pity*, on the contrary, provokes us to assist and relieve such as are in *Misery*, and to shew Kindness to those whom we suppose to be *Unhappy*, without any of their desert or merit. For it is not a *Vice* of the *Soul* (as some Philosophers have supposed) to pity the *Miseries* of others; but rather a kind of *Pious Sorrow* and *Blessed Misery*: Because this *Affection* doth not only move the *Mind* conformably to anothers *Calamity*, but also strongly excites it, to endeavour the easing and removing of it. For it is a *Duty* we owe to *Nature* and *Humanity*, to condole with those that are *Afflicted*, and to endeavour to lend a Helping-hand to those that are oppress'd with *Calamities*, and who without *Speaking*, strongly cry to us for help. It is no *Relief* to a miserable Wretch, that we are touch'd with *Grief* and *Compassion* at the sight of his *Affliction*, except also we do help and assist him to the utmost of our Power.

Satisfaction, or *Content* and *Acquiescence* in ones self, doth greatly conduce to *Security* and *Peace* of *Conscience*, when we call to mind any good *Action* that hath been performed by us. For as, according to *HOMERS Fiction*, the Herb *Nepenthe* added to their Cups, banisht all *Sorrow* and *Sadness* from the Banquet of the Gods; so a *Good Mind* secur'd and guarded by the Rectitude and Uprightness of its *Conscience*, extirpates all solicitous *Anxiety*, and begets the highest *Joy* and *Pleasure*. For the *Soul* that is always accompanied by *Innocence*, seems, as it were, to applaud it self, and to be rais'd above this *Earth*, being Conscious to its self of no *Crimes*, nor distracted by the *Guilt* of *Sin*. Hence it is, that those who are safe and secure by reason of the Purity of their *Conscience*, are always of an even Temper, and tho' in the presence of a *Tormentor*, that stands ready to Torture them; of *Fire*, that is ready to consume them; and of a *Funeral Pomp*, to appall and terrifie them, continue unmoveable, fixed on the Rock of a good *Conscience*, being unconcerned at the raging *Waves* and *Winds* that roar about them.

But *Repentance*, which supposeth *Guilt*, and which torments the *Guilty* with the Checks and Stings of *Conscience*, puts them upon bewailing of what is past, and to get rid of the Burthen that presseth them. For as nothing is more pleasant and joyful, than a good *Conscience*; so nothing is more tormenting than a Bad one: No Wild Beast

VIII.
Repentance
is necessary
for the
Effacing
of Sin.

tears and rends more Cruelly, no Flame burns more smartly, or Torments the Body more excessively, than a Guilty Conscience racks and tears the Soul, whose Inmate it is. Whosoever Sins, hath his Punishment immediately attending him, and his Crimes make him sufficiently miserable, without the Ceremony of a publick Condemnation. Punishment is the individual Companion of Wickedness, and never to this day was there any Man found that sin'd on free cost. Repentance therefore makes a Man after the Commission of Sin to hate himself, and from a serious abhorrence of his Crimes, to amend what is amiss, and enter upon a new course of Life.

IX.
Favour makes us to Love the followers of Vertue.

Favour, which makes us wish well to those that are Vertuous and do worthy Actions, is a great incentive to the Love of Vertue, because it inclines us to Love the same in others, and to bear good will to all the followers of it: Whereas on the contrary we do hate perverse Men; and tho' we do not abhor their persons, yet we do always abhor their Vices. It is inborn, and natural almost to all Men, to be angry with, and have indignation against Evil doers, and those who tho' they be never so criminal do go unpunished. But yet we are to take heed, that we do not imitate those Peevish and Morose persons, who are moved at things of little or no moment, and confounding slight fooleries, with the highest Crimes do abhor, the one as much as the other. It is the property of a Morose temper, to inveigh bitterly against small Faults, and to condemn all things that are not suited to his Temper and Apprehension.

X.
Gratitude prompts us to the rendering of Benefits.

Gratitude, which preserves the pleasing memory of Benefits received, incites us to the endeavour of repaying them with like good Offices: Which may be done by us 2 manner of ways; the first when by Gifts, or otherwise, we acknowledge the Favour or Benefit we have received. Thus we read, that AUGUSTUS CÆSAR rewarded the good Office done to him by a Veteran Souldier, in rescuing him from imminent danger, at the Battle of Actium. For when he being accused at Law, and in danger of being condemned had desired AUGUSTUS to appear for him, CÆSAR would not suffer his Attorney to plead for him, but himself appeared, and pleaded, that he might not seem ungrateful to him, who had saved his Life. The other way of shewing our selves Thankful is, when we receive a Benefit with a grateful Mind, and are ready at all times to acknowledge it. For indeed the returning of a good deed, does not so much consist in our recompensing it by good Offices, as in a grateful temper of Mind, whereby we are ready to acknowledge the favour bestowed upon us. For a Debt may soon be paid, and what hath been Stolen restored; but he properly repays a Benefit, who keeps it always in grateful Memory, and owns himself under Obligation for it.

XI.
Anger is of use to Princes and Magistrates.

Anger, which the Stoicks do so much inveigh against, calling it a short Fury or Madness, hath also its use, as long as it continues within the Bounds of Reason, and does only moderately move and affect the Soul; for being thus qualified, it is serviceable to Kings and Judges, to the removing of Lenity and Fear, which may oppose themselves to the Strictness and Severity of the Law, and incline them to over much Clemency. Thus it is lawful for Judges to be exasperated

against the Crimes of Malefactors, who violate the Laws, and infect others by their wicked Examples. It is also serviceable to Kings in Governing of the Commonwealth; for it is necessary for Kings, to avenge the Injuries and Indignities offered to themselves, and to be as ready to punish Traitors, as to resist and oppose their Enemies. For who will say, but that it is a just anger in Princes, which engageth them to inflict the worst of Punishments upon Traitors, who are guilty of the worst of Crimes?

Glory and Shame are of extraordinary use, and advantage to those who are taken with the desire of Vertue; for these 2 Passions naturally lead to her, and tho' they go different ways, yet tend to the same end. For Glory is as it were a Spur, egging us on to great and generous Actions, and to the undertaking of the most hazardous Exploits. It was under the conduct and command of this Affection, that the Romans procured their Greatness, and subdued all their Neighbouring Nations. It cannot be denied but that the Love of their Country, was a great and strong motive in the accomplishing of those brave Actions, but yet their desire of Glory, was a much stronger incentive to them. For indeed Vertues Vigor and Force seems to languish and expire, when it is not kindled with the desire of Praise and Honour; and the whole strength and Briskness of the Soul is very rarely exerted, but in the midst of Spectators, that are ready to applaud and extol it.

And Shame on the other hand deterrs a Man from Vice, and makes those things odious, which otherwise would appear delightful. This Passion may well be called the Guardian of Vertue, because it makes us to flee from the Face of every shameful and filthy Act. This keeps Judges to their Duty, and compells them to do Justice, for fear of making themselves infamous. This Passion furnisheth Women with Arms, wherewith to defend themselves against the attempts of Lewd and Lustful Men. And therefore SYNESIUS calls Shamefastness the second Good of Man, because it keeps them innocent, and doth not only hinder them from committing Wickedness in publick, but also in private.

Chearfulness teacheth us to bear Afflictions and Adversity with a pleasant Mind, and to undervalue and despise the Calamities we lye under. It informs us that it is Prudence, to despise the Evils and Calamities of this World, and to rejoyce in the midst of those troubles, wherewith we are continually tost in this Life. For as Gold shines bright in the Fire, and by all the violence thereof loseth nothing of its weight or Splendor, so a Cheerful Mind is of proof against the Injuries of Fortune, and turns its Calamities and Afflictions into Pleasure: It considers that nothing is more sweet, than the remembrance of past Labours and Miseries, and that that prosperity is sweetest, for which we have been prepared by the Bitterness of Suffering.

XII.
Glory and Shame of what use they are, and to whom.

XIII.
Shame keeps a man from the Commission of Sin.

XIV.
Chearfulness assists us in the bearing of Adversity.

CHAP.

C H A P. XVIII.

Of the Government of the Passions, and of their more general Remedies.

I. The particular Remedies of all the Passions are not to be here expected.

Forasmuch as the Happiness of Mans Life, depends on the right governing of the Passions, and that they may be accounted truly happy in this World, that have attained to a full Dominion over them; we are to consider, how their Excesses may be best avoided, and the ill use of them prevented. Not that I do intend here to prosecute the particular Remedies of all the Passions, which Reason prescribes for the subduing or moderating of them, because that would be a greater Task than I can here undertake, in this short Discourse of Ethicks; but only to set down the more general Remedies, to repress their force, and to overcome their Excesses.

II. And here the First thing we meet with is, that we cautiously and diligently enquire into the nature of the thing that is presented to us, and that we abstain from passing a Judgment concerning it, as long as we find our selves moved by any Passion, so as to be biast thereby to one Object more than towards another. For since all the Inclinations that proceed from them, are only the effect of a confused Perception, they cannot offer any thing, that is clear or distinct to our Mind: And therefore we must endeavour, if the time permit, to turn our Thoughts to some other Matters, for a Season, until the Commotion of our Blood be over.

III. I said, if the time permits, because when the Passion is violent, and the case requires, that without any delay, a present Resolution be taken; the Will must consider and weigh the Reasons, that oppose the said Passion, tho' it may be they appear inconsiderable and of small moment to us. For we are to lay this down for a certain truth, That the Passions are deceitful, and that their main drift is to impose upon us, and lead us into Errors. And tho' it may seem to be a very difficult thing, after that a Passion hath made its onset upon us, and put our Blood into a Commotion, to put a stop to the Course of the Animal Spirits into the Muscles, in order to execute the command of our Passions; yet is it not a thing impossible, but may be performed, by diverting our Mind from the thoughts it is upon, by representing to it the contrary Reasons. Thus when an Enemy sets upon us at unawares, such a suddain event affords us no time to deliberate: Wherefore in this case, if we find our selves seized with Fear, our business must be to turn our thoughts from the consideration of the danger we are in, by listning to those Reasons that tell us, that there is both more Safety and Honour in resisting an Adversary, than in giving way to him, or turning our back upon him. And on the contrary, when Anger seizeth us, and that we find our selves provoked to Revenge, and rashly to rush upon our Enemy, we must call to Mind, that it is a piece of great Imprudence to cast our selves away, when as we may preserve our Lives without Shame or Infamy, and that it is no Shame for a Man to recant, or to submit himself where the match is unequal, rather than to rush on rashly upon apparent Death.

IV. It is also very conducive to the governing of our Passions, to accustom our selves, whilst we are in a sedate and tranquil temper of Mind, to weigh and examin all the Good and Evil things, that any way may happen throughout our whole course of Life, and to discuss their nature and value, that afterwards upon occasion, we may be able with more readiness to form true Judgments concerning them, and certainly and without any hesitation discern, what ought to be avoided, and what to be embraced by us, whatsoever any rising Passion or Supervening reasons, may insinuate or suggest to the contrary. For if we direct and govern all the Actions of our Life, according to some certain and premeditated Judgments, it will not be difficult for us to repress the Violence of our Boiling Passions, and to break the force of them. For how weak soever we may be, and how easy soever to be overcome by our Passions; yet if we do but apply our selves to such thoughts as these, and often revolve them in our Minds, we shall at last come off Conquerors, and attain to an absolute Dominion over our Passions.

V. It will be of great use also towards the taming of our Passions, to curb our Desires, and not suffer them to Rove beyond the requiring of Nature. For tho' Desire be a peculiar Passion, yet it mingles some way or other with them all, so that he who can tame its unruliness, will easily cure the Distempers of all the rest. For all the motions of Desire as they are Solitary, and by themselves, are dark and languishing, except they receive light from abroad, and chiefly from the Goodness and Excellence of the Object, about which they are conversant. And forasmuch as some of the things that are desired by us, do altogether depend upon our selves, and some upon others, and some also partly upon our selves, and partly upon others, we ought very narrowly to examine, how we ought to carry our selves with relation to these several things, and what curbs are best to be made use of to restrain the great variety of our desire.

VI. As to those things which are in our Power, these may lawfully be desired by us, as long as our desires of them are well grounded, and proceed from Good and Vertuous motives; for seeing that they proceed from a perception of Good, and only tend to our Complement and Perfection, to endeavour the satisfaction of them, is to act conformably to Nature, and to follow the Dictates of Vertue. But who dares say, that any one can with too great eagerness pursue Vertue?

VII. But as to things that are forein to us, and in the Power, and at the disposal of others, our desires towards them can never be faint and weak enough: Yea we must strive, as far as lies in us, altogether to abstain from the prosecution of them, having our Mind fix'd on the Contemplation of the Great GOD, by whose Providence all things are governed and dispensed, and whose Boundless Goodness, Infinite Wisdom, and Infallible Decrees are only worthy of our continual Thoughts and Attention. Wherefore we must consider, that all whatsoever happens to us is necessary, excepting only those things, which it hath pleased GOD, should alone depend upon our Wills, and which by his Decree he hath ordain'd, should by such and such ways be conveyed to us.

And

And being thus persuaded, as we shall not desire the Goods of Fortune, so neither shall we fear its Evils, forasmuch as they are only such, by reason of our Opinion of them, and the Error of our Understanding; but shall rather willingly submit to them, as being designed for us by his unerring Providence, and infallible in their Contingency. And accordingly giving way to Time and Chance, we shall undauntedly expect whatsoever may happen to us, as being undoubtedly assured, that they cannot deprive us of the least part of any true Good we are in possession of; yea, moreover that they are very conducive to our *Beatitude*, if we know how to make use of them as we ought, and as becomes a *Philosopher*.

VIII.
We are to moderate our desires about those things which partly depend on us, and partly on others.

And as to those things which partly are in our Power, and partly at the dispose of others, such as *Health, the Government of our Families and Administration of State Affairs*, we must take care that we do not too eagerly desire the same, or be too earnestly carried out towards them, when they seem to be in our reach; but that we remember always so to curb our desires, that we only extend them to those things that are in our Power, and depend on our *Free-will*: So that if our endeavours chance to succeed, we shall obtain the thing we desire; but if not, at least we shall have the comfort that we have performed our Duty, and done what was in our Power; and therefore shall look upon them as *Impossible*, and since the obtaining of them is not in our Power, we shall suppose them not at all to belong to us.

IX.
Generosity is a great Remedy of the Passions.

Generosity may be considered as another general Remedy of our Passions, which being as it were the Key to all *Vertue*, so it is a powerful means to subdue and moderate our Affections. Now *Generosity* consists in this, that a Man do value and esteem himself to the utmost of his worth; for having this respect and consideration for himself, it will engage him not to omit any thing he ought to do, as well as from undertaking any thing unworthy the excellence and Dignity of his Nature. For considering that nothing properly belongs to him, besides the free disposal of his Will and Choice; and that nothing is praise-worthy or commendable in this Life, save only the due use thereof, he will suppose himself to have attained the highest step of Felicity, if he find in himself a fixt and constant Resolution and purpose to make good use of them; that is never to want a Will, to undertake or execute all those things, which he judgeth to be best, which in a strict and proper Sense is to follow *Vertue*. For tho' he hath this due esteem of himself, he does not therefore despise others, but rather persuades himself, that all other Men have the same Thoughts of themselves: And therefore he never undervalues other Men, and if by chance he discover any defects or weakness in them, he is more ready to excuse than carp at them, and to persuade himself, that they commit those Failings, not for want of a good Will, but for lack of knowledge, and due Information.

X.
The highest remedy against our Passions is the Love of GOD.

But the most powerful Antidote against our Affections, is the Love of GOD, which natural knowledge implants in our Souls. For this being the most pleasant and delightful of all the Passions, we can be affected with in this Life, and the most strong and prevalent also, it must consequently have the Power of ridding us from the Dominion

of all other Passions, and not only of curing all the Vices of the Mind, but also of removing all the bitterness of Bodily Sickness, and of sweetening all the Troubles and Afflictions of this Life, which are the inseparable Companions of all States and Conditions whatsoever. And how this *Divine Love* may be obtained by us, *DES CARTES* informs us in the 35 Epistle of his first Volume, to which I refer the Reader.

CHAP. XIX.

Of the Liberty of Mans Will.

After having spoken of the *Vertues*, and shewed the use of the Passions we might seem to have performed little or nothing towards a Blessed Life, if we should not now proceed to demonstrate, that Man is endued with a *Free-will*, and that it is in his Power to exercise *Vertue*, and make good use of his Affections. For there be some, that are so ignorant of themselves, and such negligent searchers into the source of their own Actions, that they attribute all things to a Blind Necessity or Fatality, and suppose Men to act from an imprest instinct, and that nothing is done by them which is not necessarily determined. But these Men do very well deserve to be tied to a Stake, and there last so long, till they beg those that beat them to stop their Hands, and confess that it is in their Power, to cease from beating of them, when they please.

For what is more contrary to daily experience than to believe, that it is not in our Power to Speak or hold our Peace, to stand still, or to walk, to reach forth our hand to a poor Beggar, or to pass him by unregarded? This is so notoriously manifest, that as *St. AUSTIN* saith, it is Sung by Shepherds on the Mountains; by Poets on Theaters, by Balladmongers in their Rings, by the Masters in Schools, and by all Mankind in the World. For if Men have no *Free-will*, to what purpose are Laws made? Why are Rewards promised to those that are Good, and Punishments threatened to the Bad, if the things for which they are rewarded or punished, were never in their Power, and that they sinned against their Will, or by the force of necessity performed some good service to their Country? Why are Exhortations used? Or why do we endeavour to excite men to *Vertue*, if we have no Strength of our own so to obtain it? And if like Children and Madmen, we want the power of chusing or refusing?

Moreover, if we do all things by a kind of fatal necessity, what will become of Prevarication and Sin? Or where shall we find any Transgression of the Law, if uncontrollable force be the source of our Actions, and if they be the result of Nature, and not of our Will? Necessity, say the Lawyers, makes void an Action, and he that Governs, must not be in the Power of any one. It is evident therefore that Men are free, and so far at their own dispose, that when Good and Evil are set before them, they may choose that which is Good, if it be represented to them under that Notion; or Evil, yet always under the appearance of something that is Good, if the said appearance do more strike their Understanding and attract their Will: Or when two good things are propounded

I.
How those who deny the free-will of Man may be convinced.

II.
Human Actions shew that there is a Liberty of acting.

III.
He that takes away mans Liberty of Will takes away Sin.

pounded together, they can chuse the one and leave the other, if it appear more suitable to them, and more excellent and worthy in it self.

IV.
If there
be no Li-
berty of
the Will,
all Delibe-
ration is
in vain.

But what need is there of so many words to make out a thing that is so Notorious and obvious almost in all *Human Actions*? There is nothing more common amongst men, than to deliberate and take *Counsel* in doubtful Affairs; not only the *Common People*, but even *Kings* themselves have recourse to this Expedient. For seeing that every one is more dull-sighted in his own business and concerns, than in those of another, *Princes* must make use of *Counsellors*, that may be unto them instead of *Hands* and *Eyes*, and may help them in all things. But pray, to what purpose are these *Counsellors*, if it be not in the Power of the King to take their Advice, or to change his Purpose? *Nature* hath made us *Teachable Creatures*, and bestowed upon us an Imperfect kind of *Reason*, which can be amended and perfected by good Institutions. And accordingly there is nothing that more strongly induceth men to love *Vertue*, and recalls *wicked Men* to that which is Right, than the *Conversation* of good Men, by whose Example *Vertue* is recommended and learn'd, and by degrees takes root in the *Heart*. But alas! how useless would it prove to converse with good Men, if it be not in our Power to imitate their *Actions*; and if for want of this *Free-will*, we cannot follow that which is Best? We must therefore be possess'd of a *Free-will* before any of these things can be advantageous to us; and as it is in our Power to recall our *Eyes* or *Mind* from any *Object*, so it is likewise in our Freedom to withdraw our *Affections*; except we will confess, that *Knowledge* was given us to no purpose at all, and that it is of no use to the governing or directing of our *Actions*.

V.
He that
takes away
the Free-
dom of
Man's Will,
banisheth
Vertue out
of the
World.

Human Society cannot subsist without *Vertue*, which being taken away, the Beautiful Order of the *World* must be overthrown, *Government* must degenerate into *Tyranny*, and all the Concerns of *Mankind* be expos'd to the tumultuous Motions of the *Passions*. Wherefore it is necessary, that *Vertue* be seated like a *Judge* over all, and to render to every one his due; to *GOD*, by *Religion*; to our *Country* and *Parents*, by *Love* and *Obedience*; to our *Fellow Citizens*, by various Offices of *Justice* and *Charity*. But take away the Liberty of our *Actions*, and all these things vanish, and there remains nothing in the *World*, but confusion and corruption of *Manners*. For how shall *Temperance* be able to contain her self, and suppress all inordinate *Desires*? What shall put *Fortitude* upon difficult and dangerous Exploits? By what means shall *Justice* pay what is due to another, and observe the *Rules* of *Equity*? If so be it is not in their power to abstain from *Pleasures* and *Lusts*, to avoid things difficult and dangerous, or to keep what is *another's* by force. We must therefore of necessity conclude, that the Power of *Free-will* hath been vouchsafed to man by *GOD*, and that in all his *Actions* he is not driven by *Necessity*, but led on by his own *Will*. For otherwise, why might not all the *Failures* and *Sins* of *Nature* and *Men*, be imputed to *GOD*, if he be the only *Agent* in the *World*? Or, why might not he be said to commit all *Evils* and *Crimes* that abound therein? It was therefore

necessary, that *Man* should be endued with *Liberty*, to the end that his own *Actions* might be recompensed unto him, and he receive the *Reward* or *Punishment* due to his *Works*.

But tho' every one doth experience this power of choosing in himself, and find that his *Will* in its determinations, doth not depend upon any created *Agent*; yet neither must it be conceived to be utterly independent; for tho' *Free Will*, as *DESCARTES* saith, if we give heed only to our selves, cannot but be conceived as *Independent*; yet if we consider the infinite Power of *GOD*, we must of necessity believe, that all things depend on him, and that consequently our *Free Will* cannot be exempt from his Dominion. For it implies a contradiction to say, that *GOD* hath created Men of such a *Nature*, that the *actions* of their *Wills* are independent of his *Will*; because this is the same, as if we should say, that his *Power* is both finite and infinite. *Finite*, because there is something that does not depend on his *Will*; and *Infinite*, in that he could make that thing independent.

But as the *Knowledge* of the *Divine Existence* must not take away the certainty of our *Free Will*, so must neither the *Knowledge* of our *Free Will*, make the *Existence* of *GOD* doubtful to us. For the *Independence* which we experience, and are sensible of in our selves, and which is sufficient to make our *Actions* worthy of *Praise* or *Reproach*, is not repugnant to a dependence of another kind, according to which all things are subject to *GOD*.

If any one should object here that *Passage* of the *Romans*, *The Good that I will, I do not; but the Evil I will, that I do*; and should from thence infer, that he who does not what he *Wills*, and does what he *Wills* not, cannot be said to be free. I Answer, that this saying of the *Apostle* is to be understood of the first motions of *Concupiscence*, which are not in our *Power*, neither are imputed to us as *Sin*; and therefore the *Apostle* subjoins, *Now if I do that which I would not, it is no more I that do it, but Sin that dwelleth in me*; which, since it took its birth from the first *Sin* of *Man*, and that it is the Cause, and as it were, the Mother of all the *Sins* we fall into, is therefore by the *Apostle* called *Sin*. Wherefore also the *Apostle* afterwards adds; *O wretched man that I am, who shall deliver me from the Body of this Death*, that is, from the hard Yoke of *Concupiscence*; and presently after answers his own *Question*, *the Grace of God through Jesus Christ*.

The Liberty
of our Will,
doth not
make the
Existence
of GOD,
doubtful.

VIII.
An Objec-
tion an-
swer'd.

CHAP. XX.

How, presupposing Gods Omnipotence, Men can abide Free in their Wills; and whether the Free Will of Man can be hindered.

FROM what hath been said in the foregoing Chapter, no small difficulty seems to arise, which must not be omitted by us. If it be true, will some say, that all things are subject to the *Divine Power*, and consequently, that all the works of our *Will* do depend on him, how then shall we be able to secure *Human Liberty*, when all things

I.
An Objecti-
on against
the fore-
going
Chapter.

that proceed from us are ordained by him, and cannot happen without his *Præscience*.

II. We shall resolve this Difficulty by saying, that *G O D* indeed is the *Total and Universal Cause* of all things, so that nothing can be done by any of his *Creatures* that doth not depend on him: yet is not this Causality of his exerted in all after one and the same manner. For in the Production of those things, to which neither our *Free Will*, nor that of any other *Created Agent* doth concur, we must say that *G O D* only had regard to his own *Will*, according to which he absolutely determined to produce them after such a certain manner, and such a determinate time. But as to those things which the *Will* of *Man* hath some power over, he did not singly regard his own *Will*; but had regard also in his *Decree* to the consent of our *Will*; and would have nothing absolutely to come to pass, without the presupposing of our Determination. For it doth not follow, that because the certain order of all *Causes* is manifest to *G O D*, that therefore nothing is left in the power of our *Free Will*, seeing that he himself could not be ignorant of our *Willings*; which he foreknew were the *Principles* of our *Actions*.

III. *DESCARTES* illustrates this by the Example of a *King* in an *Epistle* of his to *Elizabeth*, the *Princess's Palatine*. Suppose we a *King* to have forbidden all *Duels*, and that he certainly knew that 2 of his *Nobles*, the inhabitants of 2 different Cities, had a quarrel together, and to be so incensed against each other, that in case they should chance to meet, they would certainly fight one another; if I say this *King* should command one of them to take a *Journey* towards that *City*, where the other dwells; and at the same time give the other a command to go towards that place where the former is supposed to inhabit, he certainly knows that they cannot but meet one another, and consequently fight and break his *Command* or *Proclamation*; but yet for all this he doth not force them to it; neither doth his *Knowledge*, nor his *Will* neither of thus determining them to this *Action*, any way hinder them from fighting as freely, as they would have fought, if he had known nothing of all these particulars, or if by any other occasion they had chanced to meet with one another; and therefore he may with as much justice punish them for violating his *Edict*.

IV. Now what is lawful for a *King* to do, with respect to some of the *Free Actions* of his *Subjects*, the same *G O D*, whose *Knowledge* and *Power* is infinite, doth, with regard to all the actions of men. For before ever he sent us into this *World*, he exactly knew how all the Propensions of our *Will*s would be, because he himself put them into us; and also disposed all things without us in such a manner, that these and the other *Objects*, should present themselves to our *Senses*, this or that time, by occasion whereof he knew that our *Free Will* would determine us to this or the other thing. And this he would have to be so; but yet he would not force us to this. And as in the fore said *King*, 2 different degrees of *Will* may be determined; the one whereby he would that these 2 *Nobles* should fight together, in as much as he was the cause of their meeting together; and another whereby he would it not, or was against it, in that he had forbid *Duelling* by his *Proclamation*: in like man-

ner, our *Divines* distinguish 2 *Will*s in *G O D*, the one *Absolute* and *Independent*, whereby he will have all things to come to pass as they do; the other *Relative*, which respects *mans merit*, or *Guilt*, by which he will have his *Laws* obeyed.

Three things are commonly reckoned up by *Heathen Philosophers*, which may hinder the use of our *Free Will*, viz. *Fear*, *Ignorance* and *Force*. *Fear* seems to be an Impediment or Bar to *Liberty*, when it is not the fear of a vain man, as the *Lawyers* speak, but such as is grounded, and may light upon a constant and well resolved person, because it makes him do those things which he would never do, if he were left to himself, and were not shaken with fear.

But I do not at all approve of this Opinion, forasmuch as *Fear*, whether it be great or small, doth not so oppose *Liberty* as that it should wholly destroy it: Yea, if we heedfully mind the matter, we shall find that it is always in conjunction with a kind of *Willingness*, whereby it willingly performs that which *Fear* seems to extort from it. For 2 things are considered in *Free Will*; First, That we do it spontaneously, or of our selves: And Secondly, That we do it freely. The former of these *Modes* of *Acting* seems in some sort to be hindered by *Fear*; because we do that, which we would not, if we were not forced to it by the *Fear* of some impending *Evil*. But the latter is not at all hindered by it, because the nature of *Free Will* doth not consist in *Indifferency*, seeing that we do nothing so voluntarily and freely, as we do those things to which we are determined by an urgent *Cause*. As we see it happens to us when we are egg'd on by *Fear*; for though the *Object* then be displeasing to us, and that we would rather, if we might, choose the contrary; yet because of the impending *Evil* or *Punishment* we do greedily embrace it, and choose a lesser *Evil* before a greater. And therefore *Lawyers* are of opinion, that all *Contracts* are not made void by *Fear*, except they be accompanied with *Injustice* as appears *Instit. de Except. in Initio. Ex L. Mulier, §. finali quod metus causa. Ex L. ultima C. de us quæ vi*, and innumerable other places.

As concerning *Ignorance*, we shall the better be able to determine, how it may be said to hinder the use of our *Free Will*, by supposing a twofold *Ignorance*, *Vincible* and *Invincible*. *Vincible Ignorance* is that, which by the use of *moral* and *due Diligence* may easily be overcome. Now a *due Diligence* is that which ariseth from *Vertue*, or the *Love* of *Reason*, and not from any other ground or motive. As by Example, a *Merchant* having an usual *Contract* or *Bargain* offer'd him, doth not examine it, only seeing that he is like to gain by it, embraceth it, without any more ado, or concerning himself any further about it: and forasmuch as he hath not examined it, he doth not know it to be unjust. Now this *Ignorance* of the *Merchant* is *Vincible*, and doth not consist with *Vertue*; for if he had loved *Reason* above all things, he would have diligently examined the said *Contract*, and having found it to be offensive to *Reason*, he ought never to have consented to it, how gainful soever it might appear to be otherwise. But *Invincible Ignorance* is when a man cannot know that he is ignorant of, in the circumstances

VI. There be 3 things that hinder the use of our Free Will.

VI. Mans Liberty may consist with Fear.

VII. Of the twofold Ignorance Vincible and Invincible.

stances wherein he is for that time. As for Example, suppose we that SEJUS hath writ to his Friend CAJUS to assist him in such a *Business*, and that the Letter chance to miscarry, and never come to his *Hands*; in this case CAJUS will be under an *Invincible Ignorance*, tho' he hath used no diligence to the removing of it.

VIII.
How or in
what case
Ignorance
doth excuse
a Trans-
gressor.

Ignorance, with respect to a *Free Act* is found to be threefold. 1. *Antecedent*, which is before any consent of the *Will*, and this without doubt is *invincible*, neither can any blame be imputed to it: As if a man that is a *Hunting* should kill a *Man*, taking him to be a *Beast*; because 'tis supposed that he never intended any such thing. The other is *Concomitant*, which exists together with the *Act*, and doth accompany it, insomuch that it is the *Principle* of that *Action*; and the *Action* would have follow'd, tho' the said *Concomitant Ignorance* had not been: As if a man supposing himself to kill a *Beast*, should ignorantly kill his *Rival*, whom he hates from his Heart; and whom, if that *Ignorance* had not been, he would have kill'd notwithstanding. The *Third* sort of *Ignorance*, is *Consequent*; so called, because it follows the Consent of the *Will*, and therefore Voluntary, and therefore is somewhat of the same Nature as *Invincible Ignorance*: As when a man forbears going to Church, because by Neglect he never minds or enquires about the Time when he is to go. From these things thus briefly stated, it is apparent, that it is only *Invincible Antecedent Ignorance* that can make an *Action* Involuntary, since whatsoever follows from it was altogether unknown. For nothing is *desir'd* of *Man*, which is not first *known* by him: For the *Understanding* is like a *Servant*, that carries a *Torch* before his *Mistress*, the *Will*.

IX.
Ignorance
of the Law
of Nature
cannot be
Invincible.

But here we are to observe, that there can be no *Invincible Ignorance* of the *Law of Nature*, which by Natural Instinct is known to all; and therefore whosoever he be that transgresseth the same, can never be blameless. Whence is that Common Saying of the *Philosophers*, *Ignorance of the Law excuseth no man*: But that the *Ignorance of Positive Law*, whether *Human*, *Ecclesiastical*, or *Divine*, may render an *Action* Involuntary.

X.
The Elicit
Acts of the
Will cannot
be forced.

It remains next to be explained, whether there can be any Force or Violence that is capable of making the *Actions* of our *Will* Involuntary. To the better solving whereof, we are to suppose that *Human Actions* are twofold, *Elicit* and *Imperate*: Those are called *Elicit Actions*, which are immediately produced by the *Mind*, as from their *Principle*; such as are the Acts of *Nilling* and *Willing*. Others are *Imperate*, which proceed from another *Faculty* than the *Will*, tho' not without the Command of the *Will*, as *sensible Perceptions*, the *motions* of the outward *Members*. As to the first of these, it is evident that the *Will* cannot suffer any Violence, or that the *Elicit Acts* of the *Will* should be forced; for seeing that they proceed from the *Will*, as from their *Active Cause*, they cannot be subject to any Violence that proceeds from an *Outward Principle*, as *ARISTOTLE* saith, which can add no Force to the *Action*, since it is evident that the *Will* is an *Active Principle*, and adds or contributes to its own Acts.

But as for the *Imperate Acts* of the *Will*, they may be said to be Involuntary; for tho' they depend on the Command of the *Will*, and follow its Inclination, yet the *Faculties*, especially the outward *Members*, may be so hindered by the Force of an *External Agent*, that they cannot execute the Command of the *Will*; and accordingly we frequently find some *motions* produc'd in our *Bodies*, contrary to our *Will*s.

CHAP. XXI.

Of Human Acts, and of the Goodness and Pravity of them.

BY the Name of *Human Act*, every *Action* is not be understood that proceeds from *Man*, but that alone which is the effect of a *Free Principle* of *Acting*, or which is caused by the *Understanding* and *Will*. So that that is only to be accounted as an *Human Action*, whereof a *Man* is the *Absolute Lord* or *Disposer*, or which he hath in his free Power.

There be 2 *Principles* that concur to every *Human Action*, viz, *Understanding* and *Will*. The *Understanding* that shews the Way, and, as it were, carries a Light before his *Mistress*. For tho' the *Will* be an *Elective Faculty*, by which the *Mind* freely determines it self to doing, or not doing; yet it is first required, that the *Understanding* do before represent or propose the thing to her. For as nothing in general can be willed, except it be known; so nothing can be freely Will'd, except it be fore-known by the *Understanding*. Wherefore every *Error* that befalls our *Actions*, is chiefly caused from the wrong Perception of the *Intellect*: For if she never did exhibit ought to the *Mind*, but what was clear and evident, neither would the *Will* ever mistake in her Choice.

In every *Human Action* a twofold *Goodness* may be observed; the one *Natural*, which some call *Entitative*, which is in all things, inasmuch as they are partakers of *Nature* and *Entity*. The other *Moral*, which is nothing else but the Conformity of a *Human Action*, with *Right Reason*. As on the contrary, the *Moral Evil* or Pravity of an *Action*, is its deformity or swerving from *Right Reason*, that is, when it wants any Perfection, which according to *Right Reason* it ought to have. By *Right Reason*, I understand here a true Judgment of every thing, free from the *Paint* or *Fucus* of any *Opinions*, whereby the *Laws* of *GOD* and *Nature* are understood, and every thing rightly and prudently discerned, according to the Prescript of the *Law*. Whence it appears, that many *Actions* which agree with regard to *Nature*, do extremely differ with respect to *Manners*. As for Example, To kill a man, when it is done of a Mans own Will and Authority, is not distinguishable from that *Action*, whereby a man is put to Death by *Publick Authority*; but they vastly differ in a *Moral* respect, seeing it is lawful to Kill a man by *Publick Authority*, because of the *Justice* which is exercised in that act, whereby it comes under the Notion of *Good*; whereas to Kill a man by the impulse and instigation of ones own Will, is unjust and prohibited by the *Law* of *GOD*.

XI.
But Imperate
Acts
may.

I.
What an
Human
Action pro-
perly is,
and what
Principles
concur to
it.

II.
Two things
are requir'd
to a Hu-
man Action.

III.
Of the
Twofold
Goodness
that is
found in
Human
Actions.

IV.
What
makes any
Action
Morally
Good.

An *Action* therefore is accounted Morally Good, if it respect or have an Eye to Good, desired according to *Right Reason*. For *Human Actions* derive their Goodness from their Object, when it is supposed to be such as *Right Reason* prescribes and allows of: Forasmuch as an Action is not accounted Good; because the *Understanding* knows it, and the *Will* rightly desires it; but rather because the Object of it is good and honest; therefore the *Will* that is carried towards it is *Right*. Wherefore *Right Manners* do not make the Object Good and *Honest*; but on the contrary, a Good Object and agreeable to Reason, makes good *Manners*; and consequently *Human Actions* derive the formality of their Goodness or Pravity from it. And the same is to be said of *Evil Actions*, which owe their Evil to a shameful and dishonest Object; and accordingly the more shameful the Object, the more wicked is the *Action*. And forasmuch as all Objects are not Equal, but some excel others in Pravity, so neither can it be said that all Sins are Equal, it being certain that some far exceed others in Evil.

V.
The Good-
ness or
Pravity
of Actions
depends on
certain
Circum-
stances.

Neither doth the Good or Evil of *Human Actions*, solely depend upon the Object, but also on certain *Circumstances*; which are so called, because they always accompany, and as it were, guard and encompass our *Actions*, especially those that are outward, and are, as it were, so many Accidents observable in them. Of these there are commonly reckon'd up Seven, which are contained in these Verses.

Who, what, where, by what means; why, how and when,

These make or Good or Bad all Acts of Men.

VI.
Who.

Who, denotes the Person and Quality of the Agent; as whether, he who hath committed a Rape be a King or a Subject, a Citizen or a Stranger, a single or a married Man.

VII.
What.

What, intimates the Quality of the Object, about which the *Action* is conversant, whether the party on whom the Rape hath been committed, be a Virgin dedicated to GOD, or one at her own dispose.

VIII.
Where.

Where, shews the place where the Wickedness hath been committed, whether in the Church or in a Profane place.

IX.
By what
means.

By what means, points us to the Instruments or Companions a Man hath made use of in the committing of this Wickedness. As, whether he struck with a Sword, or with a Stick; whether he had any to assist him, and whether they were Clergy-men or Laicks.

X.
Why.

Why, makes out the Intention of the Agent; as whether a Man set upon another merely for gain, or to revenge an Injury.

XI.
How.

How, holds forth the manner of the Action; as whether a Man did hurt or wound another, being provoked by Wrath, or in his right Wits; whether he assaulted him basely and treacherously or fairly and openly.

XII.
When.

When, considers the Time when the Action was done, whether in the Night or in the Day time.

XIII.
Circum-
stances do
often

Which *Circumstances* are therefore said to concur to *Human Actions*, forasmuch as some of them do very signally increase the goodness or pravity of

them; yea, and sometimes quite change the kind of them. As for Example, when that which is stolen is something dedicated to GOD, or his Worship; this is not simply Theft, but Sacrilege, which differs in kind from Theft, as being supposed forbid by a Special Precept. And in such a case as this they lose the Nature of *Circumstances*, and take upon them the Nature of an Object, whence, as we said before, *Human Actions* derive their Pravity, and becomes worthy of Punishment.

Tho' the Duties of a Man and Citizen might seem to require a particular Place wherein to be treated of and so to constitute the Eleventh Part of this Institution; yet forasmuch as they belong to *Human Actions*, and presuppose Free-will, I have thought fit to subjoin them here; and keeping my self within the Number of these Ten Parts, to Treat of them by way of Conclusion. For this Work might well seem to be deficient, if after having explained the Nature of *Virtue*, (which according to the common Division we have distinguish'd into 4 Heads) and having enquir'd into the Nature of *Human Actions*, we should omit the Offices and Duties of Men, and not amply and distinctly Treat of these, which are the Consequents of his Liberty. Wherefore we shall now set down, what are the Duties of Man in General, and afterwards proceed to the Offices of a Good Citizen, and show what either of them ought to embrace as Good and Vertuous, and to reject as Shameful and Wicked, according to the Prescript of Nature; which I shall endeavour to perform with all the Brevity possible, and as far as the Bounds of this Institution will permit.

CHAP. XXII.

Of the Rule of Human Actions.

Since to the end a Man may act aright, it is necessary that he be Conscious of his Actions, or, which is the same, that he assent to his own Reason in the Chusing or Avoiding what is propounded to him; it will be of use to us to know what Conscience is, and by what Denominations it goes: As likewise what Obligation is, to whom it agrees; and how it comes to pass, that Mankind is bound to observe some Institutions.

By the Word CONSCIENCE we here understand, that Testification or Witnessing to Good or Evil, which every one experienceth in his own Mind: Or, as some describe it, it is that Act of the Intellect whereby a Man judgeth, that a thing ought, or ought not to be done. And this Act or Conscience, is denoted by several Names, according to the Motives or Reasons, whereby it is egg'd on.

It is called *Right*, when the Human Understanding is so well informed of things that are to be done or omitted, that it can give clear and distinct Reasons of its Perceptions, and such as cannot be doubted of or call'd in Question. Or, to express the same in fewer Words, which dictates that to be Good, which is Good; and that to be Evil, which is really so. And such a Conscience as this, is but rarely found amongst men, there being but very few that know the Causes of things, and that are so happy as to be able to reduce them to their Principles.

We

IV. We call that a *Probable Conscience*, when tho' we do truly assent to the thing offer'd to us, and do think that the same ought to be embraced or declined; yet we are not able to make out our *Judgment* by *Reasons*, but only derive the same either from the Authority of our *Superiours*, or received *Custom*, or the common tenour or course of a *Civil Life*.

V. A *Conscience* is said to be *Doubtful*, when it hangs, as it were, in equal poize or wavering, and doth not know which part to assent to: Which more especially is found in singular Cases; where *Reasons* on both sides present themselves, and we cannot discern which are to be prefer'd. Now in such a case as this, we do well to suspend our *Judgment* without determining any thing till the *Darkness* of our *Mind* be dispell'd, and that it clearly appear to us, what is consonant to the *Law* before us, and what is contrary to it.

VI. Lastly, We call that an *Erroneous Conscience*, when our *Understanding* embraceth *Evil*, instead of *Good*, or declines *Good* instead of *Evil*. And this either through *Vincible* or *Invincible Error*. *Vincible Error* is that which we may avoid by a diligent and careful Examination of the Case. *Invincible*, is that, which we cannot avoid by any care or diligence that it is possible for us to take. But this last *Ignorance* happens only in particular Affairs, which depending of many *Circumstances*, it frequently comes to pass, that we are deceived about them, or about the *Object* it self, and so fall into *Error* against our *Wills*.

VII. By the word *Obligation*, we are to understand nothing else, but that Tye of the *Law*, whereby we are of necessity compell'd to do something. For by it we do, as it were, gird up our *Free-will*, and tho' we very well know our selves to be free, and that we can chuse the contrary to what is propounded to us: Yet there is a kind of *Co-active Power* that sticks to our *Minds*, by means of the *Obligation*, which doth not suffer us to incline to it, and puts us in *mind*, that we shall sorely repent of it afterwards, in case we do not act according to the *Prescript* of the *Law*.

VIII. Amongst all *Animals*, *Man* only can be the Subject of *Obligation*: For *Beasts* being devoid of *Reason*, and destitute of the *Faculties* of the *Will*, can exert no free *Actions*; and therefore it would be in vain, to prescribe any Form to their *Actions*, seeing they can neither understand it, nor adjust their *Actions* by it. *Man* only therefore is capable of *Obligation*, and of receiving a Rule prescrib'd by his *Superiour* to Live by. I say, by his *Superiour*; for if a *man* were of such a Condition, as to be wholly at his own dispose, without being obnoxious to the Command of any, he could not be obliged to the performing of any thing by any *Law*; and if in that *State* he should follow the dictates of *Reason*, and abstain from some things; this would be imputable rather to his most *Free-will*, than to any *Obligation* lying upon him.

IX. Now to the end that this *Obligation* may be the more firmly impress'd upon the *Mind* of *man*, besides the *Authority* of the *Superiour*, it is sometimes fitting that Just Causes should be produced by him, which induce him to put this Curb or Restraint upon the *Liberty* of his *Subject*: For

he that only shews his *Power*, and will always have his *Will* to stand instead of *Reason*, may indeed strike *Fear* into a *Man*, and make him rather chuse to obey him, than to expose himself to danger: But when once this *Fear* is gone, and that the *Superiour* ceaseth to be frightful to him, he will soon return to his own *Inclinations*, and follow the *Motions* of his own *Will*, rather than those of another. But when the *Reasons* are discover'd, why he thinks fit to circumscribe the *Liberty* of his *Subject*; and that he makes it out, that it is his Interest that such *Laws* should be Enacted; yea, that many Advantages will thereby accrue to him, he will readily submit himself to them, and shew himself ready to obey his *Princes Commands*.

The Rule therefore which every *man* is to follow in his *Actions*, is the *Law* or *Decree*, whereby the *Sovereign*, in whom the *Publick Power* is lodg'd, binds up his *Subjects*, to order and regulate their *Actions*, according to his *Prescript*. Now that such a *Law* may be able to compel *men*, and exert its Force upon their *Minds*, it is necessary that the *Legislator* and his *Laws* should be known to them. For how will any one be able to pay *Obedience* to them, if they have no certain Knowledge, neither of the *Person* to whom they are to render it, nor to what they are oblig'd? True it is, that the *Laws* of *Nature* are engraven on the *Hearts* of all *men*, and are so many *Precepts* that are common to all *Nature*, and that no *Man* in his *Right Understanding* can be ignorant of the *Author* of them: But *Civil Laws* are not alike Notorious, as depending upon the *Free-will* of *Superiours*, as being such to which only some peculiar *People* are oblig'd; and therefore in order to their being of Force, they must be promulg'd and made known to all their *Subjects*. Which Promulgation is performed, either by the *Voice* of the *Legislator* himself, or by some of his *Deputies*, whose Authority is unquestionable; or any other way, according to the various Customs of different *Provinces* and *Kingdoms*.

Every *Law*, if it be perfect, contains 2 Parts: The one which determines what is to be done or omitted; the other, which declares the *Punishment* to be inflicted upon those that neglect to perform what is prescribed, or commit what is forbid. For seeing that *Human Nature* is prone to *Evil*, and is apt to be carried with more vehemence to things that are forbid, it would be to little purpose for any *man* to declare what is to be done, if there were no *Punishment* to follow the Contemner of the said *Command*: And so in like manner, it would be altogether to no purpose to threaten any *Punishment*, if there were not cause specified before, for which the said *Punishment* is to be inflicted.

Notwithstanding that *Laws* seem to restrain the *Liberty* of the *Subject*, yet they are so to be ordered, as that whatsoever is prescribed, may appear to be profitable and advantageous to the *Publick Good*. For it would seem unjust to oblige *Subjects* to the Observance of any thing that is not advantageous thereunto. Forasmuch as *Laws* are like *Remedies*, which ought always to be conducive to the good State of the *Body*, because they are appointed for that end: And in like manner, there ought to be nothing in the *Laws*, which doth

two things
in every
Law.

XII.
Laws are
to be En-
acted for
the Publick
Good.

not contribute to the good of the Community, because it is for that Reason that they were Enacted.

XIII. Tho' the Law be suppos'd a Common Precept, and a common Contract or Agreement (as the Lawyers express it) of the Commonwealth, according to the Prescript whereof those that live in the Commonwealth are to regulate themselves; yet some Persons may be peculiarly exempted from the observance of it; and this is express'd by the word *Dispensing*. The Power whereof belongs only to the Legislator, who as he hath the Power of Enacting Laws; so he only hath the Power of Abrogating or Dispensing with them, that is, delivering any one from the obligation of them. But above all things, it is the Duty of the Sovereign never ordinarily, or without urgent Cause to free any of his Subjects from the obligation of the Law; to avoid the Envy and Indignation this would be apt to cause amongst their Fellow Citizens.

XIV. From what hath been said, may be gather'd, that Human Actions, as they have a relation to the Prescript of Laws, do take to them several Qualities and Denominations. For those which the Laws pass by, without determining any thing concerning them, are called *Permitted* or *Lawful*, as long as they are not contrary to the Law of Nature, or the Reason that is in man. The Actions that are conform to the Law, and follow the Rules prescribed by it, are called *Good*; and those *Evil*, which are contrary to it.

XV. Now to the Goodness of an Action, it is requisite not only that it agree with the Law in some part, but that it be in all things conform to it: Whereas it is sufficient to the Pravity of an Action, if it be deficient in some one part only, and does not in all respect, agree with the Law.

XVI. The Law, as it is a Regulation of Reason, shewing Man what he ought to do, and what not, is twofold, *Divine* and *Human*. That is called the *Divine Law*, which is instituted immediately by GOD himself. And therefore ARISTOTLE saith, in his Third Book of *Politicks*, He who commands the Law to bear Rule, commands that GOD should bear Rule. *Human Law* is that which is Enacted by men, and is different according to the different Form of the Government Politick. Of which I have treated more at large in the Chapter of the Law of Nature.

CHAP. XXIII.

Of the Duty of Man towards GOD.

I. THE Action, which according to the Nature of the Obligation that lies upon us, we are to regulate according to the Prescript of the Laws, is divided into 3 Chief Parts, according to the several Objects it respects. The first whereof shews, how according to the sole Guidance of Nature, we are to carry our selves towards GOD; the other, how we are to demean our selves with regard to our selves; the last, how we are to comport our selves towards other men. For the whole Obligation of Man is compriz'd in these 3 Duties; so that he may be said to have performed whatsoever appertains to him, if he carries himself *Piously* towards GOD, *Prudently* to-

wards Himself, and Equally towards his Neighbour. Wherefore seeing that the Duties we owe to GOD, do precede the other 2, we shall first speak of them, and afterwards proceed to the other.

The Laws whereby Man is obliged towards GOD, may be reduced to 2 Heads: First, That he have right Thoughts concerning GOD, and a true Idea of his Nature and Perfections. In the next place, that he resign and conform his own Will to the Divine; and that he look upon it as the greatest of Crimes, to deviate in the least from his Good Pleasure. And from these two parts of Man's Duty towards GOD, many Propositions, both Theoretical and Practical, may be deduced, whereon Natural Religion is founded, and by which, according to the Etymology of the word, Religion, a man is ty'd and obliged.

The First thing we are to hold concerning GOD is, that he *Exists*; that is, that he hath an Actual Existence, and is the Principle of all other things. This being no more, but what is demonstrated to us by the Amplitude and vast Extent of the Universe, the unconceivable Variety of it, and the Beauty and Harmony of its Parts; since none of all these could have the constant Continuance and Regularity they are found in, except the World were at the Command of a most Wise Governour, and did persevere by an immutable Law. By this Contemplation alone of the World, the Philosophers of old attain'd to th Knowledge of GOD, as being fully convinc'd, that such an Exquisite and most absolute Work, could not proceed from less than an Omnipotent and most Perfect Being. If some Modern men, that aspire to that Name, seem to be of another Opinion, it is to be attributed to their Ignorance. For as a confus'd Perception of things, and Superficial Knowledge incline men to *Atheism*; so a clear and profound Knowledge of things, raiseth the Mind to the Veneration of GOD, and not only excites it, but even strongly compels it thereto. 'Tis the Fool only that saith in his Heart, there is no GOD. For whole Mankind, from the very Beginning, ever was in perpetual possession of this Truth; seeing there was never any Nation, (as TULLY expresseth it) so Barbarous or Savage, that did not own a GOD, tho' it may be they were not able to determine what kind of Being he must be. And accordingly JUSTINIAN, 2 F. de Just. & Jur. reckons Religion towards GOD, amongst the Laws of Nature, and the Right of Nations; forasmuch as all Nations agree in a general Worship of GOD, and, as it were, by the Attraction of this common Principle, are united and reconciled.

The Second is, That GOD is the Creator of the World, and that nothing is to be found in it, whereof he is not the Author. For since this glorious Fabrick of the Universe could not be its own Cause, what Contrivance, what Engines, what Leavers, what Servants could be employ'd in the Production of it, but the Omnipotence of GOD himself? Hence appears the Ridiculous and stupid folly of the EPICUREANS, who suppose that so many Miracles were the product, not of the Divine Reason, but of the fortuitous concurrence of Atoms. For how could these Atoms, in those immense Spaces, meet in such

The Legislator may dispense with the observance of the Law.

a manner; and be adapted together, as to compose *Animals* and *Man*, whereas we see they cannot be produced without the mediation of *Seed*? What Cause was there to dispose them rather to the forming of this *Body*, than another? What was there to determine them to the constituting of *Bones, Flesh, Marrow, Veins, Arteries, Nerves, Humours, Tendons, &c.*? We must therefore acknowledge a *Special Principle*, by whose Power this *World* was framed, and all the parts of it digested in the comly Order in which we see them.

V.
Thirdly,
That He
is the
Preserver
of the
World.

The *Third thing* we are to hold concerning *GOD*, is, that he is the *Governour* and *Preserver* of the *Universe*. As is evident from the admirable Order and Agreement of the Parts of it, which could not continue so long invariable, if they were not by some *Supream Cause* preserved in the same Condition. For daily Experience teacheth us, that whatsoever is made up of different Things, and are endued with different Powers, do stand in need of an *Upholder*, and will easily run into Confusion, except they be supported by an *External Agent*, and their Parts kept in their due Stations. And therefore the *Ancients* were of Opinion, that *GOD* had somewhat of the same place in the *World*, as a *Coach-man* in a *Coach*, the *Singing-Master* in a *Choir*, the *Steers-man* in a *Ship*, the *Father* in a *Family*, and a *King* in his *Kingdom*. And that consequently, those who deny that *GOD* takes care of this *World*, and that all things therein are managed by his Conduct, are as Criminal Delinquents against his *Divine Majesty*, as they who say, there is no *GOD* at all.

VI.
And, that
he hath a
Special care
of Man-
kind.

We are likewise to consider, that *GOD* not only Governs the whole *World*; but that he also Exerciseth a more *Special Conduct* towards *Man-kind*, and that he is the *Immutable Cause* of all the *Actions* which depend on the *Free-will* of *Man*. For since it cannot be demonstrated, that he doth *Exist*, except that he be considered as a most *Perfect Being*; and that he could not be so, if there were any thing in the *World* that did not proceed from him; consequently we can prove from *Natural Philosophy* alone, that not the least *Thought* can enter into the *Soul* of *Man*, without the *Will* of *GOD*, and except *GOD* had *Will'd* it should from all Eternity.

VII.
Fourthly,
That he is
most highly
Perfect.

The *Fourth thing* we are to be persuaded concerning *GOD*, is, that he is *Sovereignly Perfect*, and that no *Attribute* belongs to him that implies the least defect. For seeing that he is *Infinite*, he must of necessity include all those Perfections which the *Mind* of *Man* is capable of Conceiving; and consequently we must own him to be *Sovereignly Good* and *Wise, Eternal, Omnipotent, Immense*, and so *Perfect*, that it is equally impossible to add any thing to Him, or take any thing from Him. But forasmuch as the *Divine Perfections* cannot be comprehended by any *Human Understanding*, in order to the Expressing of them, we shall make use of such Terms, as shall more magnificently unfold his *Supream Excellence*, and impress upon us a greater Veneration. For when we hear that *GOD* is *One, Immense, Incorporeal, Immortal, Infinite, Incomprehensible, &c.* we seem to launch into a Boundless Ocean of Perfections, and are forc'd to confess, that the Amplitude of such an *Essence* can by no means be reached by our *Intellect*.

And accordingly they Sin against the *Law* of *Nature*, who say, that *GOD* sees things, before ever he did determine himself to Will them; that he consults the Order of his Acting, before he Acts; that his *Will* indeed is, that there should be no Monsters; but that the simplicity of the *Laws* of Motion doth necessitate him to suffer them; and other such like, which import Dependence and Imperfection in *GOD*.

VIII.
Nothing
must be
attributed
to *GOD*,
that in-
cludes ei-
ther De-
pendance or
Imperfe-
ction.

Wherefore we are to remove from Him whatsoever implies any Limitation or Defect, and all those *Affections* which imply or suppose the want or absence of any Good. And if we find, that *Passions* are sometimes attributed to *GOD*, as when the *Scripture* speaks of his *Favour* and *Munificence* towards those that are Good; and his *Vengeance* against the *Vicked*; we are to remember that the *Scripture* in these Expressions, accommodates itself to the Capacity of our *Human Understanding*. In like manner we find, that *Holy Writ* attributes to *GOD*, *Wrath, Jealousy, Indignation, &c.* by a *Metaphorical* way of Expression accommodated to our Weakness, and rather designing to represent to us the Effect of that Affection, than the Affection it self.

IX.
We must
remove
from *GOD*
every Im-
perfection.

In like manner, those also Sin against the *Law* of *Nature*, who attribute to *GOD* any *Figure*; because every *Figure* is determined and bounded. Those who say, that *GOD* is composed of *Parts*, or that he is a *Whole*; because all these ways of Speaking import *Attributes* that belong to *Finite things*; and those also who say, that *GOD* is in a *Place*, because nothing can be in a *Place*, but must have its Greatness or Bulk bounded on every side. Those also Sin against the same *Law*, who assert, That *GOD* Moves himself, or that he Rests, because both these suppose the being in a *Place*, which is inconsistent with *GOD*.

X.
Such as
Figure,
Motion,
Parts,
Place, &c.

Neither is it enough for *Man* to know *GOD*, but he must also worship and celebrate him. For the *Practical Propositions* whereof *Natural Religion* doth consist, are conversant about the *Worship* that is due to *GOD*, which is partly in the *Mind* of *Man*, and partly without it; that is, either Inward or Outward. By the *Inward Worship*, we understand the *Honour* that is to be given to *GOD*, in consideration of his *Power*, in Conjunction with *Goodness*. For *Veneration*, as was said before, is an Inclination of the *Soul*, not only to have high Thoughts of *GOD*, whom it worships; but also to submit and resign it self to him, with a kind of *Awful Fear*, to obtain his *Favour*. And therefore no *Man* Honours *GOD* more, or serves him with a purer *Worship*, than he, who by the *Holiness* and *Innocence* of his Life endeavours to become like him, and would rather dye a thousand Deaths, than to suffer that *Holy Image* of *GOD*, which he discerns and owns within himself, to be defiled by any *Crimes*, or stained with any the least *Vice* or *Immorality*. And from the Consideration of his *Glorious Majesty*, he is stirr'd up to desire him, as his *Author* or *Maker*; to love and call upon him, as his *Father*; to honour him, as his *King*; and to fear and reverence him, as his *Lord*.

XI.
GOD is to
be Honoured
by Man.

In order to the easie acquiring of this *Habit* of *Loving* of *GOD*, and the having a most profound *Fear* and *Reverence* for him; we must frequently reflect, that *GOD* commands us nothing, but what is for our Profit or Advantage, and that his *Power* and

XII.
After what
manner
GOD is to
be beloved
by us.

and Goodness are so Great, that He hath Created an infinite Number of Beings, which serve for our Preservation; which Consideration will fill us with so much Admiration, Respect and Gratitude for our Great GOD, that knowing him to be the Source of all True Good, we only and above all things shall desire to be united to him with our *Wills*, and to love him in the most perfect manner possible.

XIII. Neither are we only to render unto GOD the *Inward worship* of our *Hearts*; but we must also give unto him that which is *Outward*; which we then do, when in Thankful Remembrance of his Benefits, we render Thanks unto him; and acknowledge him to be our Beneficent Father, GOD and LORD; and by our *Hearts* or *Eyes* also lifted up unto Heaven, do admire his Power and praise his most Holy Majesty. When in a deep sense of our own Infirmities, we pray unto him, implore his Assistance, and humbly beseech him to help and succour our Infirmities; and that he would be pleased to bestow upon us those things he knows to be good for us, and to turn away from us all things that are hurtful. Whilst we abandon and resign our selves wholly to his *Will*, and in all things complying with the same, and embracing whatsoever happens to us, as that which from all Eternity was Decreed concerning us. Wherefore let our Modern *Upstarts* take heed, that they do not too curiously search into the Nature, Decrees and Government of GOD. But rather entirely persuade themselves, that he is most intimately acquainted with what is most Expedient for us; and that it is impossible, but that he who Loves all things, Does all things, Perfects all things, and Contains all things, should not always do the best of all in all Cases whatsoever.

XIV. Neither is it sufficient for us, to offer *Innocent and Holy Hearts* to GOD, and to pray unto him in the secret Retreats thereof; but it is moreover required, that we pay him our Devotions openly, and in Publick places. For who is there that believes GOD, and can be ashamed to pray unto him, to praise him, and to offer Himself, and all his Powers and Faculties, for a whole Burnt-Offering unto him? Fear or Shame in this case, is a mark of Degenerate Souls; neither can he be said truly to worship GOD, who is ashamed to render him the Veneration that is due to him, and openly to profess, what in the most inmost Recess of his Heart he owns and adores. And on the contrary, when in the Churches and Publick places of worship, we render him the Glory that is due to his Divine Majesty; testify our Devotion, and are Zealous for his Honour; we by our Presence and Examples do also incite others to exhibit the like Honour and Reverence to him.

CHAP. XXIV.

Of the Duties of Man towards himself.

I. MAN being most dear unto himself, and having his Eyes fix'd upon his own Good and Welfare, as the Center from whence all his Operations flow, and to which they return: It seems altogether superfluous to prescribe Laws unto him, to take care of himself, procure his own good, and advance his own interests. But forasmuch

as man was not born for himself only, but made by GOD for the good of Human Society, he ought so to behave himself as to be a fit Member of the Body Politick, and that as far as his state and condition permits, he be of use and service to the same. For no body is exempt from this Law; for how dull and stupid soever a man may be, and unfit for business, yet he makes himself obnoxious to the Laws, when he is not serviceable to the Community by some Art, Employment or otherwise. Every one must take care therefore that he be furnish'd with Vertue, Good Manners, and a sense of what is Good and Right: for as the Soul excels the Body in Dignity, and commands the whole man; so great care is to be taken in the improvement of it, to the end the Body may be obedient to its conduct, and perform its motions according to the Rules of Reason: wherefore every one is bound according to his fortune and natural gifts, to betake himself to some Profession, Art or Science, and choose to himself such a way of living, that he may not for the future, be burthensome to himself or others, or a useless member of the Society he belongs to.

And as we are to take care to furnish our Minds with Arts and Learning, so we are to bind our Body to its good Behaviour, lest being pamper'd it become unruly, and prove refractory to its Lord and Master the Soul. Accordingly we must take heed to feed it with necessary food only, and exercise it with labour, lest by intemperance in eating or drinking it run headlong into filthy Lust; and being dull'd and stupified by Idleness and inactivity, it become a clog and dungeon to the Mind. And forasmuch as the Passions do arise from the conjunction of the Soul and Body, and derive their force and strength from that unequal Society, all diligence must be used for the restraining and moderating the same, and timely quelling their first motions. For the Passions are like *Souldiers* that attack a place, who except they be beaten off at their first coming on, easily make themselves Masters of the Place, and take Prisoners, or cut down all they find in it.

Yet it is not lawful for any man to lay violent hands upon himself, to be delivered from the violence of his Passions, or from those Evils that are incident to the Body. For he sins against Nature, who being impatient of the Evils he groans under, cuts off the Thread of his Life, and because he cannot live as he would, will not live at all. Man must remember that he is appointed by God to be, as it were, the Guardian of his own Life, not the Executioner or Tormentor of it; to whom he proves faithless, when-ever he treacherously surrenders himself to the Calamity that assaults him, which he ought courageously to resist and overcome; or else at the apprehension of shame or danger, or being wearied out with pain or trouble, puts an end to his Life. For by this Despair, not only GOD is offended by the destruction of his Workmanship, but the Commonwealth suffers also by the loss of one of her Members. And therefore it is, that the Laws take up Arms against these their profest Enemies, and order them to be cast out without Burial, forbid any Pious Remembrance to be made of them; and if they fail'd in their design of dispatching themselves, brand them with

with a mark of perpetual *Infamy*. VALERIUS MAXIMUS tells us, that it was a Custom amongst the *Athenians* to make those who were sentenced to death to drink *Poison*, which afterwards was for good reason abrogated, for that it seems to be an unbecoming and unnatural thing, that a man, who above all things loves himself, should be made to hasten his own death, and contrary to the natural Law of self-preservation, should prove his own Executioner. We are to wait therefore till he who hath placed us in the Post where we are, do call us away, and dismiss us from the Theatre of the World.

IV. *A man is bound to resist him that sets upon him.* Man therefore being bound to preserve himself, it follows that he ought to defend himself from the Assaults of an Aggressor, and to repel his force by force, if there be no other way left for him to avoid it, or to flee from the danger. For tho' by killing of our Enemy, the *Commonwealth* suffers loss, and the same as if he who defends himself were killed; and that every man is bound to procure the common Good, Safety and Prosperity of the *Commonwealth*, and of every one of the Members thereof; yet this is only supposing that his person be not endanger'd thereby. For no Law can oblige us to betray our own safety, and conspire our own Ruin, to save a wicked person. Yea, every one hath a natural and inborn right, to stave off any violence done unto him, with all his might. For if it were otherwise, who could be said to be the Possessor of any thing he had, if it were lawful for Robbers to deprive him thereof, without his daring to oppose them, and to rescue his goods out of their hands? For what is it else to prohibit a mans defending of himself and his own Goods, but to drive Justice out of the World, and to bestow upon Thieves and Robbers that which is the property of other men?

V. *That we ought to spare even the Life of our Enemy* Yet must not we in this just defence of our selves endeavour to take away the Life of our Enemy, if there be any other way for us to avoid his fury; as for Example, by hindring his access to us, by getting into a safe place, or by exhorting our Enemy to desist from his intended Cruelty.

VI. *Especially if he repents and cries Pardon.* And if it happen that the Aggressor do repent of the Injury he hath done us, begs our Pardon, and promisseth to make amends for the hurt he hath given us; in this case, he that is affronted or set upon, ought to be reconciled to him, and leave all thoughts of Revenge. For his Repentance shews him to be changed, and that he is no longer an Enemy: And the very Law of Nature commands us to forgive the past faults of those who repent that ever they have affronted or offended us, and who ask Pardon for it. Except it should be made manifest that this Repentance was only the effect of force, and that the Offender did not desire Pardon, and to be reconciled, but only because his Arms or his strength fail'd him: For in this case, we ought to lay hold of him, lest recovering his strength he should set upon us unawares.

VII. *How he is to behave himself who lives under a Magistrate.* He who is obnoxious to the Laws, may lawfully be made an Example, whensoever time or place will permit a man to have recourse to his Superior, for his safeguard and protection against the violence and assaults of his Enemy. Hence it is that Thieves and Robbers are lawfully kill'd, ne-

cessity putting Arms in our Hands to defend our selves, and what belongs to us. But where we can have recourse to the Magistrate, we are to bring them before him, that offer us any violence or injury; it being only for want of this, that we may make use of the Right which the Law of Nature gives us, and by repelling force with force, take away the Life of the Aggressor.

VIII. *Thieves may be lawfully killed.* As we may kill a violent Aggressor, so likewise do the Laws of Nature permit us to kill a Thief, that endeavours to rob us of our Goods. For these external things are the means whereby our Lives are maintained, and in the preservation whereof our State and Honour depends. Hence Lawyers call these outward Good things the Life and Blood of Men, which may be defended at the hazard of another mans Life, as well as Life it self. And tho' in Cities sometimes the thing stolen may be recovered by the help of the Magistrate, yet no man is bound to suffer the taking away of his Goods, because he may probably afterwards recover them; forasmuch as he hath not only a right to recover them when stolen from him, but also to preserve and keep them from the violence of others. And if this be so, that a man may defend his Goods at the peril of the Aggressor, I see no reason why a Woman, whose Chastity is attempted, may not kill the Ravisher; seeing a Vertuous Woman hath nothing that is dearer to her in this World, than her Honour and Chastity, and that no greater loss can happen to her, than to be by force deprived of the same.

CHAP. XXV.

Of the Laws we are to observe with respect to other Men.

I. *The Duty of Man towards others consists in two things.* THE whole Duty of a Man is contained in behaving himself Reverently towards GOD, Prudently towards Himself, and Justly towards his Neighbour. The two foregoing parts of Mans Duty we have already spoken to, and now proceed to the last. The Duty therefore of a Man towards others, First of all consists in this, that he observe an Equality, and do not prefer himself before others. Secondly, That he hurt no man. For the peculiar Law of Man, as he is a Reasonable Creature, according to JUSTINIAN § Instit. de Just. & Jur. is reduced to these three Precepts, To live Honestly, not to hurt another, and to give to every one his Right. Now he gives to every man his Right, that doth not prefer himself to any; but being mindful of his Human Condition, embraces all with an equal Love in the like Circumstances. For tho' a man excel others in Vertue, exceed them in bodily Strength, be above them in gifts and endowments of Mind, and do more abound with Goods of Fortune; yet is he for all this never a whit the less bound to observe the Laws of Nature, nor hath he therefore any more Right to hurt others, than they have to injure him. For as Nature is benign and kind to all, and equally dispenseth to all the desire of Truth and Right; so likewise there ought to be an equal Charity maintain'd amongst men, and the same common Offices of Good-will one to another. For there is nothing more conducive to the preserving of a Sociable Life, than for men to do by others,

F f f f f

22

as they would have others do by them; and for them not to expect or require any thing from others, but what they would as willingly, that others should demand of them.

II.
Equality is
to be pre-
served a-
mongst all
Men.

In order to the putting of this Equality in practice, it will be very conducive well to weigh and consider our Nature and Original, viz. that we were all formed out of the dust or mould of the Earth, and came all of us into the World after one and the same manner; and that being nourish'd by the same Aliments, we after some years arrive at Old Age, and at last all of us alike submit to Death.

III.
We are to
return one
good turn
for another.

This Equality amongst men thus supposed, it follows, that if we desire the helping hand of others, and their assistance in any of our affairs, we must be every whit as ready to lend them ours, and to procure their good and advantage. For he would be unjust, that should make use of another's help for the promoting of his own Interest, and looking upon it as his due, should not be ready to do the same service to the party that had obliged him by his assistance. Wherefore as they take most care for the good and advantage of the Society, who do not allow themselves any more than they would gladly allow to another: so that person ought to be lookt upon as an overturner of the Society, who affects a superiority, and expects honour or Service from others, and in the mean time disdains to return the same again to them. Hence by the Law of Nations this Permutation or Exchange hath been introduced, whereby I willingly grant unto thee the thing thou dost demand of me, upon condition, that thou in like manner do grant unto me, another thing I ask of thee, having first made a tacit estimate of the value of both things with our selves.

IV.
No Man
hath Right
to prefer
himself be-
fore ano-
ther.

Those are defective in the performance of this Duty, who, because of their Riches would be prefer'd before others; and despising the Equality whereby Nature hath level'd all of us, and set us upon even ground, do conceit a vast distance betwixt themselves and others; whereas it would be much more becoming them to call to mind the manifold weaknesses incident to human nature; the Errors and faults they have formerly committed, and are still obnoxious to; the Passions that domineer over them, and to whose motions they are as much enslaved, if not more, than others. Moreover, forasmuch as there is nothing Praise-worthy in man, save only what proceeds from his Free Will, there is no reason why any one should prefer himself before another, since they may as duly make use of their Reason, and with equal constancy continue in the purpose of doing those things which Reason persuades and recommends to them. For in this firm purpose doth the very Essence of Virtue consist, and which may be found as well in a Commoner as in a Prince, in a Poor Beggar as in a Rich Man. Nothing more becomes a man of a generous temper, than virtuous Humility, which consists in this, that a man seriously consider Human frailty and weakness, which he finds in himself as much as in others.

V.
No Body is
to be despi-
sed or flout-
ed at by
outward

But their fault is yet more gross and inexcusable, who undervalue and trample upon others, not only by inward disesteem and contempt, but also by some outward signs, as by Words, Looks, Laughter, do flout at and vilifie others. Which

offence is the more criminal, forasmuch as this behaviour is exceeding provoking, making the party so derided to be inflamed with Anger, and to be strongly moved to seek for Revenge. For so impatient is the Mind of Man of Affronts, that many are not afraid to hazard their Lives to revenge them, and will rather violate a long continued Bond of Friendship, than to bear an open and petulant abuse. For a Man's Reputation and Good Name is wounded thereby; as we find daily, that he is oft undervalued by others, who suffers himself tamely and cheaply to be abused.

Another Duty every man is to practise towards his Neighbour, is to hurt no Body. For it is the Law of Nature, 206 F. de Regul. Jur. That no Man make himself Rich at another's Cost. The Equity of this Precept may be gathered from the consideration of Man, both as he is a Singular Person, and as he is a Member of the Commonwealth. For as it is contrary to Heat, to be the cause of Cold; and to Moisture to cause Dryness; so it is contrary to the Nature of a Just Man, to offend his Equal, or to provoke him by doing any hurt or injury. Thus DEMONAX, the Philosopher in Lucian, boasts himself, that he never went to Law, never was troublesome to any, but always was a Friend to all, and an Enemy to none. In like manner it is also the property of a Good Man not to hurt any. For Nature hath ordained a kind of Alliance and Consanguinity between Men; whence it is criminal and highly unjust for a Man to lie in wait for another, to betray or cheat him, or to invade what belongs to his Neighbour; because by this means the Communion between Mankind is dissolved, as the soundness and healthful state of the Body is overthrown, when a stronger part attracts the sustenance that belongs to all the rest to its self, and instead of only taking its due, usurps that which appertains to the whole Body.

When it is said that we are not to do any harm or damage to any: By the word Damage is to be understood; whatsoever may cause any detriment or inconvenience to any one; such as are the Taking away of what belongs to another, Depravation, Diminution, intercepting of the Rent or Income proceeding or hoped from any thing. Because it is not only the Possession of things that is rated or valued at a Price, but also the future perception of the Rents and Incomes of it, in case they are surely to come to our Hands. Wherefore every one that harms another, either in his Goods, or in his Good Name, is bound to make Reparation of the Damage he hath done to his Neighbour. For a Good Name is the greatest of all outward Good things; which being once lost, all other Enjoyments are lost together with it. Now a Man may damage another, either by himself, or by the help and assistance of others: but which way soever it be done, it is always imputed to him that is the Agent, and he is bound to make Reparation for it. Because it is agreeable to Reason, that he that hath done the Hurt, should make amends for it, and make good the Damage he hath been the cause of, tho' he did it by another; for he that does any thing by the ministry or help of another, does the same as if he acted it himself. But if many persons do equally concur to the doing of any Harm or Damage, they are all of them bound to make good

marks of
contempt &
derision.

VI.
No Man
must be
hurt by us.

VII.
What
Harm or
Damage is,
and how it
must be
made good.

good the same, according to their several Degrees of concurrence to it. In like manner he who by his Counsel, or Advice incites another to a *Crime*, or gives him the occasion of committing it, that himself may get profit by it, is bound to restore whatsoever damage or hurt this means may happen to the party offended. But the case is not the same with respect to him, who hath only given occasion to the doing of a thing, or assisted the Delinquents with his Counsel, without any advantage thereby accruing to himself.

VIII. *Whoever by his Negligence is the cause of the spoiling of any thing, is bound to make it Good.* Neither is he only bound to make good the Damage done to his Neighbour, who by falseness and design hath harmed another, but also who by his Carelessness or Laziness hath suffered this harm to come to him. For it is necessary in order to the preserving of *Human Society*, that every one do carry himself with such Caution, that he may be useful to the Society, and that he may not by his Idleness be a Burthen to any. He who by chance, and without set purpose doth hurt another, as when a *Man Fighting* among the thickest of his Enemies, doth by chance wound his Fellow Soldier that stands near him, without any such intent, or knowing him to be so, cannot be compell'd to the making good of the hurt he hath done him. For seeing that the fault was committed without his Will or consent, therefore neither can it be imputed to him; for there seems to be no sufficient reason, why he who hath committed a fault against his Will should be liable to be amerced, rather or more than he who is Wounded.

IX. *Masters are bound to make Good the Damage or Hurt done by their Servants.* Neither are we only obliged to repair the Damage we our selves have done to others, but also that which hath been caused by our Servants, Cattle or other Living Creatures. For seeing that Servants are parts of the *Commonwealth*, they are bound to the same Laws as their Masters are; and whereas they possess nothing whereby they might be in a condition, to make good the hurt they have done; it is but just that their Masters should be bound to repair it, or else to deliver them into the Hands of those whom they have injured. For otherwise a Servant, especially a Slave, would be at Liberty to hurt whom he pleased, if no reparation were to be had neither of him, nor of his Lord and Master. And the same may be said of our Cattle, or other Living Creatures that belong to us, as when our Cattle Trespass upon other Mens Ground, or when they chance to Kill or Wound any Man. For seeing that the owner of any Living Creatures, makes use of them for his own profit, and that they are gainful to him, it is but just that Reparation be required of him, if he hath a mind to keep them still; or if so be that he doth not value the said Creatures so high as the damage is rated, that then they be Killed. It is fitting that he who knowingly hath done any prejudice to his Neighbour, do freely offer Reparation to him, lest his Neighbour being offended and provoked, should think of returning like for like: So in like manner he who hath received the injury, ought to wink at it, and be ready to be reconciled with him that hurt him. He who doth otherwise violates the Laws of the Society, and breaks that Peace which is the Foundation and support of the *Commonwealth*.

C H A P. XXVI.

Of the Laws of Mutual Humanity.

Good-will is a Quality, that is inborn in the Minds of all Men; so that he seems to have shaken hands with Humanity, who is not ready to do good turns to his Neighbour. For it is a Law of Nature, that every one should bear Good-will towards others of his own kind; and, as far as his condition and circumstances will permit, endeavour to procure their Good. For since Nature hath made an Affinity and Kindred between all Mankind, joyning them together in a Brotherly Band, it is not enough for them that they do not hurt one another; but it is over and above necessary, that they assist and succour each other. Now Men become useful to others, either in their own persons, or by imparting such Conveniences or good things to them, as are beneficial and advantageous to them.

By our selves, or in our own persons we become useful to others, when from our very Child-hood we are educated in good Manners and Literature, and acquire those Accomplishments of Body and Mind, the fruits whereof may afterwards redound to the good of others; and our Actions procure Honour or advantage to the *Commonwealth*. And therefore they are injurious to *Human Society*, who lead a lazy and slothful Life, and indulging their Body only; consider none but themselves: And who with the Riches they have got, or inherited do Fat themselves like Hogs, minding nothing else, but to Live as long as they can, and to Glut themselves with Pleasure, and wallow in all manner of Luxury.

But they who lay out themselves for the Service, Honour and Advantage of the *Commonwealth*, ought to be had in high esteem by all the Members of it, whose Duty it is to promote as far as in them lies, all their good endeavours; and to take heed lest being moved by Envy, they despise the things they understand not, or which they themselves despair of attaining to. For what can be imagined more unjust, than to think ill of them, who are of use to their Country, and to hate those who lay out themselves in doing good to others, and make it their Business to promote the publick Good?

The things that we may bestow upon others are, such especially as we can part with, without any damage or prejudice to our selves, but are of great advantage to the Receiver. And accordingly the Law saith, whatsoever is of advantage to me, and is not at all hurtful to thee, the same it is not fitting that thou shouldst hinder me of; for this is the Dictate of Equity, tho' it be no due of Justice. It is a piece of a Malicious Nature in any one, to forbid others to draw Water at his Well standing by the way side; or to envy others that are in darkness to enjoy the light of his Candle; or who will not permit his Neighbour to kindle a stick of Wood in his Fire; forasmuch as all this may be done without diminishing of the Water in the Fountain, the Light in the Candle, or the Fire on the Hearth. Wherefore, when any one undervalues the possession of any thing belongs to him, and intends to make no further use of it, it is not only inhuman, but unjust to deny the same to another, and rather suffer it to be spoiled,

I. Every one is bound to be helpful to his Neighbour.

II. Who are useful, and who useless to the Commonwealth.

III. Who are to be honoured in a Commonwealth.

IV. We are freely to give those things, the bestowing whereof is no detriment.

spoiled, than that it should be of use and advantage to others. Wherefore according to the *Law of Nature*, tho' outward *Laws* be silent, all things that are of no use, belong to the *Poor*, and *Rich-men* are bound at the least, to bestow all those things on the *Poor* and *Needy*, which they leave off, as likewise the superfluous *Meat* of their *Tables*.

V. But forasmuch as this last mentioned, is the least piece of *Humanity* we can express to others, they act more generously, and shew themselves more to be *Men*, who are ready to do good to others, tho' with some detriment or prejudice to themselves. Only we must take care, that these our *Charitable Offices*, be not hurtful to those who receive them, and instead of being beneficial to them prove their *Bane*. Thus it is with good reason, that we refuse putting *Arms* into a *Madmans Hands*, deny one that is Sick of a *Dropsy* cold *Water*, are importunately troublesome to one that is Sick of a *Lethargy* to hinder him from *Sleep*, and keep *Mony* from him, who we know will go and throw it away at *Dice*. Because in the bestowing of *Benefits*, we are not so much to mind the *Will* of those who desire them, as of what use and advantage they will be to them.

VI. In our bestowings of *Benefits*, there must be no hope of receiving the like in lieu thereof; because *Vertuous Actions* carry their *Reward* along with them, and therefore are to be practised without any respect of gain, or advantage to be reaped from them. Thus we give to *Poor Seamen*, that have been *Shipwrackt*, whose *Faces* we shall never see again, and relieve and succour the miserable, meerly because they are so, and because it is a *Duty* of *Humanity* incumbent upon us, to take *Pity* on the *Calamitous* and *Miserable*. By the same motive, we sometimes bestow our *Benefits* secretly, without making our selves known to those whom we relieve, to comply with their *Shamefacedness*, and that they may rather seem to find it, than to receive it.

VII. In the receiving of *Benefits* it is required, that we be thankfully affected towards our *Benefactors*, and express our acknowledgment to them, and how ready we shall be upon occasion to return their kindness with advantage. Not as if it were necessary, that our return should be always of the same value, and estimate with the benefit received, for in many cases it is sufficient if only with a sincere *Will*, and grateful *Mind*, we acknowledge our *Obligation*, and are ready to make a return, tho' it may not be in our power to do it. Tho' indeed where *Men* are able, it is better to express their *Gratitude*, by returning the like good *Offices* and *Benefits*, besides the testifying of our thanks by words. For the great use of *Benefits*, is to beget a nearer Union and Love amongst *Men*, and to be an occasion for the exercising of *Benevolence* and *Liberality*. But if any one is unwilling to be engaged to another, he may refuse the offered kindness, or at least so handsomely decline it, as that he that offers it, may not take it ill, that his *Good-will* or *Kindness* is slighted.

VIII. A *Man* cannot be guilty of a more shameful *Vice*, than that of *Ingratitude*; inasmuch that there are no *Nations* so Barbarous, no *Manners* so Savage, but do condemn and detest it. For tho' an unthankful person be not injurious to another,

yet is he no less infamous than a *Thief*, a *Murderer*, or a *Traitor*; seeing that the very *Wild Beasts* themselves, when engaged by our care and kindness, are not wanting to express their thankfulness, not only in acknowledging it by their gestures, but often by defending their *Benefactors* in time of danger. And accordingly the *Law of Nature* ordains, that we never receive any *Benefit*, but with such an inward *Disposition*, that the *Benefactor* may never have any occasion to repent himself of having bestowed it upon us. The reason of which *Law* is, because if we receive a *Benefit* with a *Disposition* contrary to this, there will be no more *Kindness* to be found amongst *Men*, and all *Amicableness* will be banisht from amongst them.

But you'll say, if the abominableness of this Crime be such, why are not ungrateful *Men* impleaded, and why may not an *Action* be had against them?

To which I answer that the reason is plain, because a *Benefit* is a free *Gift*, and being a *Vertuous Action* must not be omitted, because of the unthankfulness of the *Receiver*. Besides, *Gratitude* cannot be lookt upon as a strict due, because it was not agreed upon contract, tho' there might be some hope of it. Moreover, if an *Action* might be had against an ungrateful *Man*, seeing there be so many of them in the *World*, all *Courts* of *Justice* would not be sufficient to hear or determine them, and the rather because of the manifold *Circumstances* which alter the *Benefit*, and encrease or diminish it.

CHAP. XXVII.

Of the Laws that are to be observed in Covenants and Contracts.

BY the word *Covenant* is meant the Consent, or Agreement of 2. or more to the same thing. And it takes its original from hence, because there are many *Benefits* and Good turns, to the Performance whereof we are obliged by the *Laws of Humanity*, which yet cannot be exercised without some Injury to our selves, and therefore it was necessary, that *Covenants* should be entred into, by which every one might demand his own, or require and expect what is anothers, but without his *Damage* or *Prejudice*.

It is required in all *Covenants*, that they who enter into them, stand to the Agreements they have made and consented to, and inviolably observe what they have promised. For otherwise, there would be an end of *Human Society*, *Friendship* would be banisht out of the *World*, and miserable *Men* would have no Refuge, whither to betake themselves in their *Calamity*. For what would become of all the good *Offices* of *Humanity*, and the freedom that is between *Friends*, if *Promises* should be broken, and *Mens Actions* should not agree with their *Words*? Besides, where *Men* are not as good as their *Words*, endless matter is turnisht for *Dissensions*, *Quarrels* and *Contentes*, because we cannot break our *Words*, without being *Injurious* to the other party concerned. And accordingly the *Law* hath so ordered it, that *Men* may be forc'd to perform their *Covenants*, and to pay what by their *Promise* they are obliged to.

We

III. We Oblige or Bind our selves 2 several ways, viz. by Promise and Covenant. A Promise is the Willing or Spontaneous Obligation of a single person to perform something; whereas a Compact or Covenant, is that whereby 2 or more do oblige themselves, to do something or other. A Promise may be divided into a Complete, or Incomplete Promise. We call that a Complete Promise, when he who promiseth any thing to another, is willing to be so far obliged, as to give him liberty to force him to perform his Promise. An Incomplete Promise, is that whereby a Man promiseth to perform something, yet without giving the other any Right to compel him to the performance of it. So that they who thus engage themselves to do any thing, are not so much bound by the Laws of Justice, as by those of Veracity. Tho' indeed Generous and Vertuous persons, without any such annexed Obligation, are always ready to perform their Promises, choosing rather to suffer some inconvenience, than not to be as good as their Word.

IV. It is requisite to the validity of a Complete Promise, that the pleading of ones word be Deliberate and Spontaneous; for seeing that he who promiseth, may be forced to be as good as his Word; he is inexcusable if afterwards he should complain of it: Because it was in his Power either to agree to it, or to refuse his Consent. Now a Man is judged to have consented, not only by External Signs, as by his Words, Handwriting, Nod, or other motions of his Body; but even by his Silence, if other Circumstances concur; because according to that common Saying, amongst the Lawyers, He who is silent, seems to consent.

V. To the end a Man may be in a condition to give his consent, it is required that he be in his right Wits, and in the use of his Reason, so as to be able to discern, whether the thing in Question be accommodate and fit for the end intended, and whether, what he agrees to can be performed by him. Hence it is, that the Covenants of Madmen and Fools, are looked upon as void and invalid; as also of Men in drink, if it be made appear that they were so far overcome by it, as not to be thoroughly sensible of what they did. For Consent supposeth a clearness of Perception; and he may rather be said to be seized or hurried away, than to consent or agree, who by a precipitant impulse, without consideration is driven to the doing of any thing. So that he would be looked upon as a Shameless and Unjust Man, who should go about to compel a Man to the standing to such alike Agreement, which at first was entred into by an invalid consent.

VI. As Reason asleep or overwhelmed makes void a Contract; so Error or Mistake doth weaken and invalidate it. For whosoever promiseth any thing to another upon condition, is not bound to keep his Word, in case the condition do not follow; because the want thereof makes void the Obligation. And if there be a Mistake in the thing, about which the Covenant is made, it thereby becomes invalid, not only because of the mistake that is found in it; but also because it is a contravention to the constitutions of Covenants and Agreements. For in order to the Selling, Letting, or Exchanging of any thing, it is necessary that the Buyer, &c. be fully acquainted with

the Condition and Qualities of the thing; forasmuch as without this knowledge, there can be no full consent; and accordingly he who is about to buy or hire a thing, if any faults therein be discovered, may break the Bargain, or force the other party to make good the defect, or allow a consideration for the Damage.

Covenants are also made invalid by Deceit or Malice, when a Man is Circumvented by some fraudulent trick, and drawn into Agreement. Therefore he who by Deceit is drawn in to Promise ought to another, is not bound to perform the same, except of his own Free-will, and without any fraudulent enticement he do agree to it; for then he is bound to stand to his Agreement, as long as there is no flaw in the thing, and that its true value be declared. For otherwise the Covenant becomes invalid, and it is in the power of him who finds himself aggrieved, to break the Agreement, or to demand a Compensation of the Damage he sustains by it. But if another, who is not concern'd in the matter, about which the Agreement is made, do mingle any thing of Deceit with it, neither of the Parties agreed being partakers with him, then the Agreement stands firm notwithstanding. But so as it is in the power of him that suffers by it, to demand Reparation of the loss he sustains by his Malice.

Fear, as it doth not take away the freedom of the Will, as hath been said in the 20th Chapter of this part; so neither doth it dissolve Contracts. The suffering or punishment that is threatned by the Sovereign or Magistrate, if we will not consent to such an Agreement or Covenant, cannot invalidate the same, except they should go about by any unjust force to compel us to it; because in this case the Injury they do unto me by the unjust fear they cast me into, makes them incapable of having any Right over me. And seeing that the Damage caused by another, ought to be repassed by him, by way of Compensation, that Obligation is supposed to be taken away, if no satisfaction be made for the thing, which ought presently to have been restored.

As to the nature of the things that are agreed upon, or are promised, many things are required. First, that they be such as are in our Power; for otherwise it would be an Argument of Madness or Dishonesty, for a Man to Promise or Covenant that which is not in his power to perform. For no body is bound to perform Impossible, according to that common Rule, There can be no Obligation to Impossible. For tho' at the first, when the Covenant was made the thing was possible, if afterwards by chance, without the fault or neglect of the party bound, it be made impossible, the Obligation is dissolved, and the Covenant becomes void.

Secondly, they must be things that are Lawful, for otherwise we cannot be obliged to the performance of them. For he that promiseth to give a Whore the meeting; or hath past his Word to Maim or Kill another, is not bound to keep his Oath or Promise. Because no Man can bind himself to any thing which it is not in his power to perform: Now the Laws have absolutely depriv'd him of any such power, nor will suffer him to execute that, which they plainly prohibit. So that if he be guilty, who promises that which the

VII. Agreements are made void by deceit and falseness.

VIII. Fear doth not always break contracts.

IX. About what things Agreements may be made.

X. They must be things lawful or permitted.

Law forbids, he is doubly so, who having Promis'd such things, does stand to his word.

XI.
They must
be such as
we have a
Right to.

Thirdly, They must be *Our things*, that is, we must have a Right and Propriety to them; because we cannot Promise any thing which belongs to another. But in case we have Promis'd to take care, that what we have Promis'd shall be performed by another, over whom we have no Command; we are bound to use our utmost Diligence, and to omit nothing (as far as in a Civil way we can) that he may make good what we have so Promis'd.

XII.
Promises
are made
two several
ways.

A Promise may be made 2 several ways, either Absolutely, or upon Condition. Now a Condition may be 2 ways consider'd, either as Possible or Impossible. An Impossible Condition is either taken Physically or Morally. A Condition is Physically Impossible, when considering the Nature and Order of Things, the Matter cannot be done; and Morally Impossible, when they are forbidden by Law, or contrary to the Laws of Honesty. And these Promises are either made by our selves, or by some Intervening Persons; which we likewise are bound to perform, in case they have carried themselves honestly and faithfully, and have done nothing, but according to our Order.

C H A P. XXVIII.

Of Special Compacts or Agreements.

I.
What a
Contract is

What a Covenant and Contract be often founded by Authors, and include, as ULPIANUS saith, the Consent or Agreement of two or more Persons; yet to speak more exactly, a Contract seems chiefly to consist in an Interchangeable giving and receiving; or to be chiefly conversant about things of Commerce.

II.
Of Con-
tracts No-
minate and
Innominate.

Of Contracts, some are called *Nominate*, as Selling, Buying, Lending, Letting, Pawning, &c. which have a particular Name whereby they are distinguish'd from others. Others *Innominate*, that have no particular Name belonging to them, but are only signified by the common Name of Contracts. And these are reducible to 4 kinds: I give that thou mayst give; I give that thou mayst do; I do that thou mayst give; and I do that thou mayst do. In all which Contracts, an Action is allowed in any Form of words, when a certain one cannot be assigned: For we find by Experience, that there is a greater plenty of Business or Affairs, than of Words.

III.
Some are
Gratuitous,
others Bur-
thenfom.

Secondly, Contracts are divided into *Lucrative*, otherwise called *Gratuitous*, that is, such by which Profit accrues to one of the Parties concerned, without the Intervening of a Merchandize or Price. And *Burthenfom* or *Chargeable*, in which both Parties have an Equal burthen charg'd upon them, and in which there is a kind of Recompensation. For it is the property of all burthenfom and chargeable Contracts, that the Parties concern'd in it, have an equal Advantage by it, and undergo a like Burthen. Inasmuch as if it otherwise happen, the Party who finds himself frustrated, hath Right to demand what is wanting to him, or else to break the Contract. And accordingly, it is usual in well-govern'd Cities, to have the prizes of every thing set and stated, to prevent all common Abuses in such cases.

Gratuitous, or *Lucrative Contracts*, are commonly reduc'd to these three; a *Loan*, a *Commission* or *Charge*, and a *Depositum* or *Trust*. A *Loan* is, when the use of a thing is granted to another, without any recompence therefore received or appointed. It is his concern who borrows any thing, that he be very careful of the thing that is Lent him, that it may not be put to any other use, than what is prescrib'd by the Lender; and accordingly is oblig'd to restore the same whole and sound; excepting so much only as it may be the worse for so long using. If the thing Lent, whilst it is yet in the custody of him that hath borrowed it, come to be lost or spoil'd, the Value of it must be restor'd by the Borrower to the Owner: But if it be of such a Nature, that it could not have been better kept, if it had been in the Owners keeping, the Borrower is not bound to make it good. Yea, if it so happen that the Borrower hath laid out any thing towards the mending or improvement of it, it is but Just that the Owner should repay it, besides those Expenses which always attend the ordinary use of any thing.

IV.
Gratuitous,
or Lucra-
tive Con-
tracts are
Lending.

A *Charge* is, when a Man takes upon him to perform a *Commission* he is charg'd with, without any hope of Reward. And he who undertakes any such Charge at the Instance of another, or of his own accord, must take care to be punctual in performance thereof. For seeing that no Body trusts his Affairs, but with a Friend of whose Faithfulness he is assured, the Undertaker ought to be very Solicitous to shew himself an honest and true Man, and that in all things he answer the Expectation of his Friend, and the Confidence he puts in him. Now he who undertakes any Command or Charge, must be allow'd for all the Expenses or Damages that may be in the Executing of the said Commands.

V.
A Charge
or Com-
mand.

A *Trust* is a Contract, whereby something is entrusted with another to be kept. The Person with whom the thing is entrusted, is called the *Depository*; who is to take great care, that the thing he is entrusted with, be not lost or spoil'd, and that he be always ready, at the Will of the Depositor, to restore it. Except it should be more for his Advantage to want it for some time, and that it be found better; because of some imminent Danger, to defer the restitution of it till a later date. But yet the Depository may not make use of the same, except with the Owners permission; if either it be such a thing as grows the worse for using; or if it be the Owners Concern that it be hid, and be not expos'd to the Sight of others.

VI.
A Pledge
or Trust.

The most Ancient of all Chargeable Contracts, and received by all Nations, is *Permutation* or *Exchange*, used before Money was Coin'd, to be the indifferent Price of all things. The Formality whereof is prescrib'd *Item pretium de Empt. & Vendit*: I willingly grant you the thing you desire of me upon this Condition, that you likewise do grant me another thing which I ask of you, according to the tacit Estimation of both the things made by our selves. Opposit to this Contract is *Donation*, whereby a thing without any Compulsion of the Law, and out of meer Benevolence and Good-will is bestowed upon another; forasmuch as it is not necessary that any Equality should be observed therein.

VII.
Burthen-
fom or
Chargeable
Contracts,
are Per-
mutation.

VIII.

Buying and Selling.

To Permutation belongs also *Buying* and *Selling*, whereby a thing is either purchased or let go for a *Price*: For by the former there lies an Obligation on the *Buyer*, to deliver the *Price* agreed on for the *Commodity*; as by the latter, the *Seller* is bound to let go the *Commodity* for the *Price*. Which is done many ways: As *First*, When there is a mutual *Agreement*, and the *Buyer* immediately offers his *Money*, and the *Seller* his *Merchandise*. *Secondly*, When tho' the *Merchandise* be immediately deliver'd, the *Price* is not to be paid till such a set time after. *Thirdly*, When after that the *Parties* are *Agreed* about the *price*, the *Merchandise* is not to be deliver'd till a certain *Time*. In which last *Contract*, it is consentaneous both to *Reason* and *Justice*, that if the thing should come to be lost or spoil'd before the prefixed time, the *Seller* should bear the loss of it. But if after that time expired, the *Buyer* neglect the taking of the *Commodity*, if any damage happen to it, it must be at his *Loss*.

IX.

Letting and Hiring.

Letting and *Hiring*, are near of Kin to *Buying* and *Selling*, whereby, for an appointed *Price*, the use or worth of a thing is granted. I said, for an appointed *Price*: For if (saith JUSTINIAN, *Inst. l. 3. Titul. 25.*) I give a *Fuller* Cloth to be dressed, or to a *Botcher* Cloaths to be mended, without the appointment of a *Set price*; but only that afterwards I shall give as much as shall be agreed upon between us; this *Contract* cannot be called *Letting* or *Hiring*, but allows an *Action* set down in a precise *Form of Words*.

X.

What is to be observ'd in Hiring.

About this *Contract* it is to be observed, that if in the *Time* of *Hiring* the thing be spoiled or perish, he who hires it, is not bound to pay the *Price* of it. In like manner, when a thing design'd to a certain *use*, which the *Owner* is bound to deliver safe and sound, does chance to suffer any loss or detriment, whereby it is made less proper for the *use* it is appropriated to: He who *Hires* it, may with *Justice* detract so much from the *Price* of it, as it is become less fit for its intended *use*; tho' this cannot be where the increase or incom of the thing is uncertain. As for Example, If a Man have hired a *Field*, whose *Fruits* have been spoiled by the Unseasonableness of the *Weather*; he is bound notwithstanding to pay the *Hire* he hath agreed for, tho' the *Incom* he has from it, for that *Year*, be little or nothing: For as a plentiful *Incom* doth not increase the *Hire*, neither doth it seem *Equal*, that a scarce Increase should diminish it; since it frequently happens, that one *Years* Barrenness, is compensated by the *Fruitfulness* of the next following.

XI.

Things lent.

Lending is a *Contract*, whereby a Man delivers something of his *Goods* to another, upon *Condition* that he, after some *Space* of *Time*, do restore to him as much of the same kind and goodness. *Things lent*, are such as are spent or consumed by *using*, and do consist in *Number*, as *Money*; in *Weight*, as *Gold*, *Silver*, &c. in *Measure*, as *Wine*, *Oil*, &c. The *Gospel Law* Commands us to *lend*, without expecting any *Gain* or *Advantage* to our selves there from: Which *Law* is transgress'd by the *Usurer*, who tho' he be bound to relieve the Wants of his *Neighbour*, doth by *Usury* gain thereby, and enriches himself out of the miserable Remains of *Shipwreck*, by an unnatural *Cruelty* to those of his own kind. I am not ignorant of the *Dis-*

inction the *Lawyers* make here, of the *Ceasing* *Gain* and *Emergent Damage*. And indeed his *Case* is different, who lends *Money* to one that desires it, not to deliver himself from his present *Necessities*, but that he may *Negotiate* therewith, and make a great advance of *Gain* to himself from the *Money* he hath borrowed; and of him, who being shut up in a *Prison*, and miserably *Poor* and oppress'd by a *Cruel Creditor*, desires to borrow a *Sum of Money*: For in this case, what he desires ought either to be given to him freely, out of *Pity* to his *Condition*, or at least be lent to him, without demand of *Use* for it.

There is also another sort of *Contract*, which is called a *Society Contract*, or a *Partnership*, and is the *Agreement* of 2 or more *Persons*, whereby something proper to make *Gain* with (as *Money*, *Work*, *Industry*) is contributed in order to a *Common Use* or *Advantage*. Now, to the end that such a *Society* or *Partnership* may be *Just*, 3 things chiefly are required: *First*, That the *Trade* or *Dealing* they intend be *Just* and *Lawful*; for no Man can be bound to that which is *Unlawful*. *Secondly*, That their *Shares* in *Gain* and *Loss*, be equally proportion'd to the *Shares* of the *Stock* laid in by the several *Members* of the *Partnership*; so as that his *Gain* may be greater that hath a greater *Share* in the *Stock*, as his less that hath a less; because by this means every ones *Due* is given to him. *Thirdly*, That the *Loss* in like manner be *Common*, and be equally divided amongst the *Partners*; tho' sometimes the *Contract* be so, that one contributes *Money*, and another his *Work* or *Labour* only; which frequently is *Equivalent* to *Money*. Wherefore the *Original Contract* is to be heeded, and how the *Parties* are agreed about their *Shares* of *Loss* and *Gain*.

CHAP. XXIX.

How many ways the Obligation, arising from Covenants, may be dissolved.

Seeing that *Obligation* is a kind of *Tye* or *Engagement* laid upon us by *Law*, whereby, as JUSTINIAN saith, We are of *Necessity* bound to pay some thing, according to the *Laws* of the *Society* we live in, the same is readily and *Naturally* taken away by *paying* or *satisfying* of the same. For thereby the *Duties* thence arising cease, as also the *Action* whereby a Man before was bound. To the end this *Payment* may be duly made, it is not necessary that it be done by the *Debtor* himself, but it is sufficient if it be done by another, in his *Name*. For a *Debtor* is quitted of his *Obligation*, if the *Money* be paid by another, tho' without the *Knowledge*, and contrary to the *Will* of the *Debtor*. Neither is it necessary always to pay the *Debt* to the *Creditor*; but it is sufficient if it be paid to any one appointed by him.

Secondly, An *Obligation* is dissolved by *Donation*, that is, by *Remission*, or *Forgiving* of the *Debt*; which is commonly done either by *Accertion* or *Imaginary Payment*, with the use of some *Signs* intimating a *Consent* or *Agreement*, which of old was in use amongst the *Greeks*; the *Debtor* speaking these Words, *You have receive so much Money*: To which the *Creditor* deliver'd his *Bond* or *Note*, answer'd, *I have received*. *Thirdly*,

XII. The Conditions of the Contract of a Society.

i. How Obligation may be taken away, by Solution of Payment.

ii. By Donation.

III.
By Com-
pensation.

Thirdly, Obligations are taken away by *Compensation*; as when the *Creditor* by a former Engagement was a *Debtor* to his *Debtor*, owing him something of the same kind and value. For in things deliver'd for use, an *Equivalent* is reckon'd as the same thing. Hence it is, that in *Actions at Law* of this kind, *Compensation* was always allow'd of; viz. an *Exception*, whereby any Man rids himself of his *Creditor*, by shewing that he is his *Debtor*; for a *Debt* is Compensated with a *Debt*, *Fraud* with *Fraud*, and a *Fault* with a *Fault*, and this very very Justly too, saith the *Law*; for we are rather not to pay, than to re-demand what we have paid.

IV.
By a con-
trary Will.

In the *Fourth* place, Obligations that are entred into by *Consent* or *Agreement*, are dissolved by a *contrary Will*. For suppose *TITIVS* and *SEIUS* have agreed together, that *SEIUS* should have a piece of *Ground* for 100 Pieces of *Gold*; and that before the *Money* be paid down, or the *Land* delivered, they should agree together to break their *Contract*; it is evident, that by this means that *Contract* would be dissolved. And this is common to all *Contracts*, which are made and ratified by *Agreement* and *Consent*, especially that of *Partnership*, which continues only so long as the *Parties* abide in the same *Mind*.

V.
By the in-
tervening
of a New
Agreement.

Obligations also are dissolved by the *Intervening* of a *New Obligation*, as if the *Debt* which *John* owes me, should by *Agreement* be made payable to me by *Paul*; because this *intervening* of a new *Person*, makes a new *Obligation* to take place, and annuls the former. Neither is it necessary, that this latter *Agreement* be advantageous; for tho' it were quite otherwise, yet would it notwithstanding make void the former.

VI.
By urgent
Necessity

An *Obligation* is likewise made void by *urgent Necessity*; and therefore a *Debtor* that is reduc'd to extream Want, is not bound to pay his *Creditor*, tho labouring under the same Extremity of Want; because in *Extream Necessity* all things are common, and the Condition of him who is in Possession is accounted the better of the two.

VII.
By breach
of Word
or Articles.

He that breaks his *Promise*, and doth not perform his *Articles*, doth rather break off the *Obligation*, than make it to cease. For seeing that all *Contracts* are mutual, and that the *Parties* are equally bound to perform what they have agreed to, when one breaks his word, there is an end of the *Contract*: For the *Pledging* of our *Faithfulness*, supposeth the *Faithfulness* of the other party, and is as a *Condition* in reference to the other. I shall perform what you require of me, if you do first what I require of you; and I will stand to my *Promise*, as long as you inviolably observe the *Agreement* we have made.

VIII.
Death.

Lastly, An *Obligation* is annul'd by *Death*, and any *Contract* ceaseth, when it rests only upon one *Person*, whereas the *Agreement* was made by two. For where the Subject is destroy'd, the Accidents which do attend it, must of needs perish likewise. Except that the *Heir* of the deceased Party, of his own inclination, or out of his respect to the Deceased, do take upon him to satisfy the said *Obligation*. Or, if by the *Last Will* of the *Dead*, he be bound to pay the *Debt* of the *Deceased* out of his *Estate*, and that he is made his *Heir* upon that Condition.

CHAP. XXX.

Of the Laws that concern Speaking and Swearing.

FORasmuch as *Covenants* and *Contracts* are performed by *Words*, and that it is necessary for the maintaining of *Human Society*, that mens *Minds* be made known by *Speech*, we shall add something here concerning the *Duties* to be observed in *Speaking* in general, and afterwards of those that are to be heeded in *Swearing*. The first thing to be observed in *Speech* is, that we do not deceive any one by our *Words*, or by other *Signs* used instead of them, for the expressing of the Sense of our *Minds*. For the *Truth* of our *Speech* or *Words* must be constant and inviolable, after the same manner as we find that amongst *Animals*, some outward *Species* do remain, whereby they discern things *Friendly* or *Inimical* to them.

To the end the *Præscript* of this *Natural Law* may be the better understood, we are to take Notice, that a double *Obligation* lies upon those that speak, with Relation to their *Words* or *Speech*. First, That those who use the same *Speech* or *Language*, do make use of certain and determinate *Words*, to signify such certain and determinate *Things*, according to the use of the *Language* that is received in the *Country* or *City* where a Man lives. For it is not lawful for any one, at his own pleasure, to *Coin* new *Words*, but must make use of those, which have been long approv'd of by *Use* and *Custom*, and signify things according as they are taken and understood by all. Secondly, That every one do so open his *Mind* to another, as clearly to manifest what he intends, and so as that the same may be clearly apprehended by him he speaks to. This *Obligation* may arise, either from a particular *Agreement* a Man hath made with another, to discover unto him what he knows about such a business. As when one Agrees with one that is *Master* of any *Art*, to be taught the same by him: Or, from the *Precept* of the *Common Law* of *Nature*, whereby a Man is bound to impart his *Science* to another; either for his *Profit* and *Advantage*, or to prevent some *Evil* that threatens him: Or, when by *Law*, whether *Perfect* or *Imperfect*, a man is bound to discover those things, concerning which he is *Interrogated*.

But if those to whom we speak be of such a *Temper*, that an open and simple Declaration may be prejudicial to them, or that it may give them occasion of hindring and opposing what we are about; it may be lawful for us to dissemble our *Minds* at that time, and to palliate our *Intentions*. For though it be our *Duty* to do good to others, yet are we not bound to do it, when we have good Reason to believe, that in so doing we shall be crost in the thing we intend. Neither is this to be call'd *Lying*; for tho' our *Words* do not exactly represent the Sense of our *Mind*, yet do they not of set purpose carry another Sense, than our meaning really is; nor hath he to whom we direct our *Speech*, any Right to understand or know them: Neither are we bound by any means to cause him to apprehend our *Intentions*. For it is frequently Expedient in *Human Society*, that the *Truth* should be hid, and that the thing which is about to be undertaken, should be kept from the Knowledge of many.

voided.

II.
Conditions
to be ob-
served in
Speech.

III.
When we
may dissem-
ble our
Thoughts.

IV.
Fiction is
no Lie.

From what hath been said, may be gathered, that he is not to be lookt upon as a *Lye*, who at play, by set *Words* and *Gestures*, endeavours to conceal his Intentions, to deceive the party he plays with, and to inveigle him to do that whereby he may lose the game. Nor he, who by *feigned Stories* and *Fables* deceives the *Minds* of *Children*, who are not yet capable of down-right *Truth*, with a design to excite them to the *Love* of *Virtue* and the *Hatred* of *Vice*. Nor he who imposes upon an *Angry Person*, comforts one that is *sorrowful*, or by colour'd *Speeches* persuades a sick person, that the *Medicin* he is to take is very grateful and pleasant. Because none of these are done with a design to deceive or wrong, but on the contrary, to do them good, and to ease them of that *Passion* which afflicts them. But the case is quite different where a man is bound to declare his *Mind* to another; because by using doubtful *Speeches*, or discovering only one part of the *Truth*, he becomes unfaithful, and sins against the *Rules* of *Justice*.

V.
What an
Oath is.

Our *Speech* is capable of being ratified and confirmed by an *Oath*. For an *Oath* is the calling of *GOD* to witness to the *Truth* of what we do assert. Or as others will have it, *It is a Religious Act, whereby we call upon GOD as the Supreme Truth, in witness to a thing, that is not sufficiently known to others.* And accordingly the very *Heathens* themselves knew of no stronger tie whereby to engage to be faithful and to speak the *Truth*, than that of an *Oath*. For they who take an *Oath*, do bind themselves by the *Aw* and *Reverence* they have for *GOD*, to be as good as their *Word*, and to stand to their *Covenants*. And forasmuch as they own that *GOD*, whom they worship, to be *Omnipotent* and *Omniscient*, it is to be believed, that no *Man* is found so wicked, as to dare to provoke his *Indignation*, and to engage his *Revenge*. Wherefore he also who swears by false gods, supposing them to be true, is bound to perform what he hath sworn, and if he breaks his word, he is *Perjur'd*.

VI. An *Oath* is either *Affertory*, when we make use of it to confirm an *Affertion* about a thing present or past; when no better way is found to discover the *Truth*. And such an *Oath* as this is required of *Witnesses* before a *Judge*, or from others, who some other way have any knowledge of the *Fact*. There is another *Oath*, which is called *Promissory*, when one by *Oath* promises any thing to another, and binds himself to the performance thereof. And lastly, there is another *Oath* of *Decision*, where 2. are that are in contest together, and presenting themselves before the *Judge*, one of them by taking an *Oath*, doth decide the matter in contest.

VII. That there may be an *Obligation* upon a *Man*, to keep his *Oath*, it is requisite, *First*, That he know the thing to be *true* or *false*, which he asserts or denies by *Oath*; or whilst he speaks, according to what he thinks, and is persuaded thereof, whether it be so or not. For he that swears to any thing which he judges to be so, his *Oath* cannot be blamed, because he speaks according to what he thinks and is persuaded. *Secondly*, It is requisite that he take his *Oath* *Seriously* and with mature *Deliberation*. And therefore he who repeats the words of an *Oath* to another, is not bound

thereby; but he that speaks them *seriously*, and with the posture and formality of those that take *Oaths*, tho' it may be, he intends nothing less in his *Mind*, than to be true and faithful to what he swears.

Wherefore I cannot assent to their *Opinion*, who suppose that a *Man* who is brought before a *Judge*, about a *Debt* of 100 pieces of *Gold*, which he owes to another, may swear falsely, in case he knows that the payment of that *Money* should cast him into extreme *Difficulties*. For they seem to suppose, that *GOD*, the *Sovereign* of *Truth*, may be produced as the witness to a *Lye*; as if he did not behold, and in due time would *Judge* and *Revenge* those, who, in so daring a manner, do affront his *Majesty*. For what else is it to deny a just *Debt*, but to deny *GOD* to be *Just* and *Equal*; and to promise impunity to *perjured Persons*? For if it be lawful for a *Man* to forswear himself, and to think one thing, and speak another, the validity and reverence of *Oaths*, and of all *Covenants* and *Contracts* will be banisht from the *Societies* of *Men*, and nothing but *Fraud*, *Deceit* and *Iniquity* will be found in all their agreements and dealings together.

Yet must not every *Oath* be taken for such, except that we be assured that it hath all the *Conditions* requisite to a *Valid* and *Lawful Oath*, and which ought to be rigorously, and not perfunctorily examined. For he, who out of *hatred* swears against another; or he, who being terrified by the *Threats* of an *Enemy*, doth confirm his *Promise* with an *Oath*, is supposed not to have sworn at all, seeing that he never did it with any voluntary *Deliberation*, but being hurried on by fear and *Passion* only. In like manner he, who promisseth somewhat to another indeterminately, and confirms his *Promise* with an *Oath*, is not bound thereby to grant to another what is dishonest, absurd or hurtful; because it is supposed, that he who hath made the demand is led by reason, and consequently would not desire any thing that is morally impossible or unjust.

CHAP. XXXI.

Of *Dominion*, and the *Duties* thence arising.

Nothing is more celebrated in the *Writings* of the *Antient Poets*, than their state of the *First Men* in the *World*.

The *Golden Age* was first, which uncompe'd,
And without Rule, in Faith and Truth excel'd.
As then there was nor Punishment, nor Fear;
Nor Threatning Laws in Brass, prescribed were.
Nor suppliant Crouching Prisoners shook to see
Their Angry Judge; but all was safe and free.

For they tell us, that at that time all things were common, and that the *Terms* of *Mine* and *Thine*, now too familiar, were not known. So as that the care and thoughts of all *Men* conspir'd only for the good of the *Publick*, and every one neglecting his own particular concerns, was only solicitous for the *Interest* and *Welfare* of the whole *Society*. But whatsoever they may talk of this *Community*, it appears, that from the *Beginning* of the *World*,

H h h h h

things

VIII.
We must
not swear
contrary to

of the
First Men.

things were accounted, as of right, belonging to him who was the first *Occupant*, and that every one did challenge that to be his own, which by his *Labour*, *Industry*, or *Good Fortune* he had got possession of. As it is evident in *Abel* and *Cain*, who, tho' they were *Brethren*, yet had each of them their distinct *Families* and distinct *Possessions*; for how else could they have offered a *Sacrifice* to *GOD*? Or how could that which was offered be common by them, be accepted and rejected? Wherefore we must conclude, that every one by an instinct of Nature, out of the *Love* he bears to himself doth affect the Possession of Goods, and is ambitious of a *Lordship* or *Dominion* over other things.

II. *Dominion is the Power or Right which a man hath over a thing, to dispose of it, as of a substance belonging to him.* Whence it is that a Possessor or Owner, can dispose of the things that are his, as it best pleaseth him, by giving them away, *Exchanging* or *Selling* them, and bidding any one else from making use of them, except they be such things as are proper to many, and belong to the *City*, or some other *Society*.

III. There are 2 General ways of acquiring *Dominion*, viz. *Originally* and *Derivatively*. By the former of those ways we acquire the *Dominion* of a thing by *Occupation*, when it did not belong to any one before, but was by the profuse Bounty of Nature exposed to the first *Occupant*, or him who first challengeth it for his own. For seeing that all things, at the Beginning, were produced for the *Good* of *Men*, and therefore may fall under their *Dominion*, it was ordered by a just Right, that things should be his who first claimed them, and that he should safely enjoy them, who had got them into his possession before all others. Wherefore, because under this name of *Occupation*, are understood *Fowling*, *Hunting* and *Fishing*; the *Birds* of the *Air*, the *Beasts* of the *Earth* and *Fishes* of the *Sea*, according to the *Law* of *Nations*, begin of right to belong to him who first takes them. For what before belonged to no man, that by *Natural Right* becomes his who first occupies or seizeth it, *Justinian Inst. l. 2. de Res. Divis.*

IV. Things also may be acquired by *Occupation*, if they be dereliquishd by the *Lord* or *Owner*, with the design of never esteeming them for his own any more, and consequently ceaseth to be *Lord* over them. But the case is not the same in things which during a storm, are cast into the *Sea*, with a design to lighten the *Ship*; for these do still continue to be the owners; because it is manifest that he did not cast them overboard, because he had a mind to be rid of them; but that by the casting of them into the *Sea* he might save the *Ship*, and consequently his *Life*.

V. The second way of acquiring *Dominion* is, either by *Tradition* or *Delivery*, as when a thing passeth from one to another. For nothing is more conformable to *Natural Equity*, than that his *Will* should stand, who has a mind to translate the *Dominion* of a thing that belongs to him, to another. And therefore of whatsoever nature a *corporal thing* may be, as the *Lawyers* say, it may be passed over to another, and being thus past over by the *Lord* or *Owner*, it thereby becomes alienated. Or by *Emption* or *Purchase*; and things

so acquired, by paying unto the *Seller* the sum agreed upon, or satisfying him some other way, as by *Promise* or giving him a *Pledge*. Or by a *bare signification of ones Will*; as if a man who hath lent, let, or deposited any thing with me, should afterwards tell me the same, or bestow it upon me: for in that he suffers it to be mine, I immediately acquire a right to it, as effectually as if he had by deed past it over to me. Or by *Succession*, as when a *Man* dies *Intestate*, for then all his *Goods* are devolved to his next *Heirs*. For it is agreeable to *Reason*, and conducive to the *Peace* of *Human Society*, that what a *Man* hath in his *Life-time* acquired by his *Labour* and *Industry*, should not be lookt upon as things dereliquishd, and so left to the first *Seiser*, but that they should be the *Heirs* of him who dies *Intestate*, that are nearest in *Blood* to him.

There is also another way of acquiring *Dominion* by long Possession, or *Prescription*; when a *Man* hath honestly acquired a thing, and hath possessd the same without Interruption, the Term of time set by the *Law*. Because according to the *Law* of *Nations*, that is lookt upon as dereliquishd and forsaken, which for so long a time hath not been challenged by any *Man*. And therefore after the Term, appointed by the *Law* is expired, he who is in Possession is not bound to restore the thing he hath been so long possessd of; but the *Dominion* or *Propriety* thereof is devolved upon him, and he may lawfully keep the same, not only in the outward *Court*, but also in the *Court* of *Conscience*, because the *Sovereign Magistrate* is supposed to have Power for the *Publick Good*, to enact, that after a long continued Possession, the *Goods* of one *Man* should be transferred to another, lest continuing so long doubtful, it should perpetually give occasion to fresh suits at *Law*.

The following *Laws* seem to have taken their Rise from the acquiring *Dominion* of *Corporal things*. The First whereof is, that no body disturb the Possession of another, but that he suffer him with *Peace* and *Quietness* to enjoy his acquired *Goods*: so as not fraudulently to be the cause of any detriment or damage to him, or by any way contribute to the taking of them away from him. By which *Law*, *Theft*, *Rapin* and other unjust *Subtractions* of *Goods* are forbid. So that not only the violent taking away of another mans *Goods* must be avoided, but also those which are clandestine, and the Owner is ignorant of.

Secondly, If the *Goods* of another be honestly fallen into our hands, without any fault of ours, we are to do our Endeavours to find out the true *Lord* and *Owner* of them, that they may be sent back to him, as soon as he shall be known to us. But yet there is no obligation upon us, to restore the same at our own Cost and Charges; but we may justly demand the Charges we have been at in keeping or restoring the same, and keep the *Goods* till the same be repaid us. But as to those things which we have honestly purchased, and have a clear *Title* to, these we are not bound to call in question before him, and, as it were, make known to all, whether he will account it amongst things that are lost; because we are assured of the *Equity* of the *Contract* or *Bargain* whereby they are become ours. Yet when we have certain knowledge, that any stolen *Goods*, have been deposited with

II. with us, without our knowledge, we are bound to restore the same, not to the Thief, but to the true Owner.

IX. The Third Law. Thirdly, If we have spent any Goods belonging to another, which we honestly came by, then only the Obligation lies upon us, of restoring so much to the Owner, as we have profited thereby; and if we have not profited by them, neither are we bound to restore any thing. The Reason is, because he who is honestly possessor of a thing, is not bound to restore the thing, upon the account of any unjust coming by it, since he both came by it and spent it honestly. Nor by reason of the meer receiving it, seeing that no more of it is left. Only he is bound to make restitution, if he be grown more Rich by it, that is, if thereby he have spared those charges, which otherwise he would have been necessitated to, or have something, which otherwise he could not have.

X. The Fourth Law. Fourthly, If any thing that belongs to another be acquired by a chargeable Title, it is the duty of the Possessor, to restore the same to its true Lord; neither hath he any Right, to demand of the Owner, the Money he hath laid out for the Purchase of it; but can only demand it of him, from whom he hath purchased the thing. Except it be made appear, that in all probability the Owner could never have recovered his Goods without being at some Charges, or that he hath of his own accord promised a reward to him, that should find them, or tell him news of them.

CHAP. XXXII.

Of the Duties of Married Persons.

I. Why Matrimony was instituted at first. THE first Divine Institution appointed for the Good of Man, was that of Matrimony, which accordingly hath been celebrated and esteemed in all Nations. For the order of Nature, and the necessity of Life do require, that Men should by Propagation preserve their kind; and by a continual Succession secure Mankind from utter perishing. Hence it is that Men take to themselves Conjugal Companions, and by means of the said meet-helpers, at once provide for their Posterity and Welfare. For seeing that Matrimony is nothing else but the Lawful Conjunction of a Husband and Wife, accompanied with individual intimacy and familiarity; whosoever enter upon the same, do it with intention of passing the whole course of their lives sweetly and pleasantly, by means of this mutual consent of Souls and Bodies: forasmuch as they would never desire it, but out of an inclination to propagate a Succession, and from hope of the Happiness they shall enjoy in that State.

II. All Impurity and Filthiness is contrary to Nature. About Matrimony we are to observe, that this vehement desire of the other Sex, was not put into Man by G O D, for the satisfying of his voluptuousness, which is base and infamous, and always drags Repentance after it; but to the end that married persons might live more happily together, and propagate Posterity, which is of absolute necessity for the continuation of Mankind. Whence it follows, that it is contrary to the intent of Nature to defile ones self by Lust, and to desire any other pleasures, but what the Nuptial Bed affords.

Forasmuch as Man is placed in this World, not as an absolute Lord, but only with permission to use and enjoy the things that are in it, without destroying or hurting the substance of them; an Obligation seems to lie upon him, to enter upon Marriage, that he may render to Nature, what he hath received from her, by begetting Childring to supply the room of his Parents and Ancestors. For Human Society cannot, without great inconvenience, permit the Propagation of Human kind any other way than by lawful Marriage; all other promiscuous and wandring Lusts being condemned, and punished by it, whereby either an unjust Heir is clapt upon an Estate, or a Virgin is vitiated. Yet is not every one therefore bound to Marry; seeing that the Nature of some is repugnant to it, and the habit and constitution of their Body does not comport therewith. But those only who cannot well live without a Wife, or who think they shall be more useful Members of the Commonwealth, by marrying, than if they should continue in a single state.

They who are married must stedfastly resolve never to break the Conjugal Bond, by any unlawful Lust; for by means of the said Marriage knot, the Husband belongs to his Wife, and the Wife to her Husband: so that he who separates them, ought to be lookt upon no better than a Murderer, and to be as severely punish'd. The Savages, who live in America, do prove this to be a law of Nature, by the keeping of their Nuptial Beds undefiled, Adultery being scarcely known amongst them; and if ever any be found guilty thereof, they have horrid punishments inflicted upon them. And tho' after Marriage the Husband be the Head of the Wife, and that by the Prerogative of his Sex he is to have the Dominion, and that all Domestick Affairs are to be ordered according to his Command and Direction; yet he is never a whit less obliged to keep his Conjugal Promise, than the Wife is; and if he happen to break the same, he needs not think strange if his Wife take the same course, and write after the Copy he sets her.

Forasmuch as a House or Family seems to be perfect and compleat in a Husband and Wife, and that the welfare of a Family consists in their Concord and Harmony; it highly concerns them diligently to mind their Duties. Now the Duty of a Husband is to love his Wife, and to be tender of her, as of a part of himself; according to that of Genesis, and they two shall be one Flesh. Neither is it sufficient that he make her the Companion of his Bed, but also of his Counsels, lest she should conceive her self to be contemned and slighted; and thereupon, out of Indignation, neglect her Family Affairs. If he admit her into Partnership of all his concerns, this will make her chearfully to undergo any pains or trouble, and ready to comfort, assist and help him in any occasion of Grief of Mind, Bodily Sickness, or outward Losses. But if a Man hath had the ill luck to meet with an ill natur'd Wife, he ought first of all to use his utmost industry to engage her to her Duty, by sweetness and fair means. And if after all, she continue in her perverseness, he may have recourse to a Divorce, or some other way the Law allows; or else by Patience endure what cannot be mended, especially seeing that he cannot divulge the faults

III. There is a kind of obligation upon Man to enter upon Matrimony.

IV. Married Persons are bound to keep the Faith they have pledged to each other.

V. The Duty of a Husband

of his Wife, without the hurt of his Children, the infamy of the Mother, and the disgrace of his Family.

VI. 'Tis the Duty of a Wife, not only to love her Husband, but to Honour him, to subject her self to his Command, as to her Head and Lord. And because she is more fit for the managing of Household Affairs, her business must be to take care of them, and to provide for the Convenience and welfare of all those that belong to the Family. And on either side is required union and concord of Mind and Body, that they may have but one will between them, and never be divided by any difference or contest. According to that of HORACE, Carm. 1. Od. 13,

O Happy thrice and more, that Faithful Pair,
In Bands of lasting Love that joined are;
Who without Angry Broils their days do spend,
Whose Love no sooner than their Lives shall end.

VII. To the begetting of this Concord, it is very conducive, that there be a Parity between the married Couple, and not too great an inequality of condition between them. For seldom are those Marriages found to be happy, where there is a great difference between the parties conjoin'd. Seeing that great disparity of Fortune, Age and Manners, are frequently the cause of as great differences and dissensions: but those above all other are frequently found the most unfortunate, that are contracted between persons of a different Religion. For as TERTULLIAN saith, how can it be imagined, but that the Faith must be weakened and obliterated, by continual and intimate commerce, with one of a contrary Belief? Wicked Discourse is apt to corrupt good manners, how much more the individual intimacy of Conjugal Cohabitation? How can a Believing Wife serve two Masters, Christ, and her Unbelieving Husband? Neither hath a Husband less cause to fear the Snares of an Infidel Wife, which SOLOMON himself, tho' the wisest of Men, could not avoid, and Children also being mostly left to their Mothers care, are in great danger to be inveigled with her sentiments. And what is worst of all, from the different Religions of Father and Mother, as from two Animals of a different Species, monstrous Births are commonly produced, being of no Religion at all, and such as prove unhappy Prodigies in the Church and Commonwealth.

CHAP. XXXIII.

Of the Duties of Parents and Children.

I. Of the Caution that is to be used in Conjugal Cohabitation. **F**Orasmuch as from the Individual Society, and Cohabitation of Man and Wife Children do proceed, and by means thereof the succession of Families, Kindred, Estates and Titles are perpetuated; it highly concerns Parents, that they behave themselves prudently in the Conjugal Union, lest by their intemperance their off-spring be vitiated. For it was not without Reason, that some have been reproached with this stinging Taunt, Thy Father begot thee when he was drunk. For the Vices of the Parents, are frequently transferr'd to their Children; and the very temper of their Bodies, is a cause either of the commendable, or perverse Manners of them.

II. The Duty of the Mother, is to take care that the Child in her Womb do not come to any hurt, and when Born, that she solicitously cherish it, and suckle it her self, and that she do not put it out to a Nurse, without urgent necessity. As soon as it comes to the use of reason, she must also endeavour to form its tender and pliable Manners, according to the rules of Vertue and Piety, and to instil into it the first Principles of Religion.

But because it imports little to have given Life to Children, and thereby to put them into a State, that is indifferent to either Vertue or Vice, except due Instruction be superadded, and the Hatred of the one, and Love of the other be inculcated into them; it is the Fathers Duty, to take care that they be timely taught, according to his Ability and Condition, and he must omit nothing, that may conduce to their advancement in Learning and Good Manners. If he be able, let him put them out to School, to the end that being out of their Mothers sight, and rid from her fondling of them, they may mind their Learning the better. But he must so resign the care of their Instruction to others, as not wholly to neglect it himself, but must have an Eye to the Progress they make, by prescribing what they ought to learn, and judging what may be omitted: Except he be assured of the Ability, Care and Prudence of the Masters, with whom he hath intrusted them.

IV. Another Duty of Parents is, that they take care of the Bodily Sustenance of their Children; and in case they want wherewith to maintain them, that then they take care to teach them such Arts, whereby they may be able to maintain themselves, without being burthenome to them. Neither must only Legitimate Children be maintained by Parents, but Natural also, that is, such as are Born without Wedlock. For according to the Law of Nature, they ought to be provided for by their Parents; and tho' they cannot be said to be Members of the Commonwealth, yet they are like Warts and Corns, which tho' they be no parts of the Body, yet are fed from the substance of the Body to which they adhere. And therefore l. 3. de mos. Test. Bastards are allow'd an Action at Law, whereby they may oblige their Parents to give them a Maintenance, as well as if they were Legitimate.

V. Parents likewise are obliged to bear an equal Love to all their Children, without putting any difference between them; for seeing they all of them stand in the same relation to their Parents, they ought also to be cherish'd with the same Love and Affection; neither is any difference to be made between them, as to their right of Inheritance, except the particular Prerogative of Primogeniture, and where the Laws of the Society, wherein they live do require it. Wherefore the Civil Law gives the Children power of bringing an Action of an inofficious Testament against a Father, who by his last Will bequeaths his Estate to others, passing by his Sons and lawful Heirs; and the Falcidian Law allows them the fourth part of the Estate to be equally shar'd amongst them. But yet it is lawful, and permitted to Parents to love them more, and bestow more upon them, in whom they discern more Obedience and Vertue; because this is no more than is due to their worth, they being no otherwise prefer'd before

II. The Duty of Mothers.

XI. The Office of Fathers.

before the rest of their Bretheren or Sisters, but as they are more worthy.

VI.
Children are under the Power of their Parents.

Parents by a natural right have power over their Children, for seeing that the care of them is by nature committed to the Parents, they would never be able to exercise the same, except they had Authority over them, to direct their Actions for their Good. And accordingly the best of Parents, do without any injury to them, force their Children to follow their Studies, to behave themselves as they ought, to leave the vicious inclinations of their Nature, and to do those things which for the future, may make them good, and profitable Members of the Commonwealth. Now whilst the Father is in this exercise of his power over his Children, there is besides a great Obligation incumbent upon him, that as he is the head of the Family, he take care also to impart Health and Strength to the rest of the Members of it; that is, that he recommend Virtue to them by his Example; and that he excel all the rest by his Life, more than by his Tongue or Instructions. That he deny and force himself, and that like an Eagle he provoke his young ones to fly; that he curb his Passions, that he may the more effectually excite them to follow the Footsteps of Virtue; and in a word, that he omit nothing whereby their tender springing Virtue, may thrive and flourish.

VII.
The Power of Parents over their Children is limited.

The power of Parents over their Children is bounded: For it is not lawful for them to kill the Birth of their own begetting in its Mothers Womb; nor when it is Born, may they neglect, much less destroy it. For tho' their Children proceed from them, and be form'd out of their very Substance, yet are they born in the same condition as themselves, and are capable of being injur'd by their Parents. True it is, that of antient time, Parents had the Power of Life and Death allow'd them over their Children, that they might be the more encouraged to take care of them. But this absolute Power to chastise the Vices of their Manners, that it might not last out too far, was restrained by Law; It being taken for granted, that Children are not only born to the Parents, but to the Commonwealth; wherefore l.4. ff. de re milit. it is enacted, that whosoever in time of War, shall refuse to send his Son to serve the Commonwealth, or that shall any way maim him, that he may be incapable to bear Arms, shall be banished.

VIII.
What are the Duties of Children.

The Duties, or rather the Debts which Children owe to their Parents are; First, that they Honour them, with all possible Observance and Obedience, and with an awful Veneration submit themselves to them. For it is their Duty to acknowledge their Preeminence, and their Dominion over them; from whence the Royal and Civil Power are originally derived. And this Honour is in a twofold manner exhibited unto them; Inwardly, by the Affection and Esteem they have for them; and Outwardly, by their Words in Speaking to, and of them with all Reverence and respect; by Signs and Effects, as by rising up to them, serving them, staying off Harms, and procuring their Good and welfare; by obeying their Commands, by submitting to their Will in all things, and by undertaking nothing without their Authority and Counsel.

In the Second place, Children are bound to succour and relieve their Parents, if they be Poor and necessitous, as being Debtors to them. This is that which Nature teacheth, and which obtains amongst all Men, by the Law of Nations. It is an ancient Law, quoted by SENECA, Controvers. I. Let Children maintain their Parents, or else be cast into Prison. Because Parents here on Earth, are instead of GOD to their Children, tho' they may labour under Adversity and Poverty. They are as Creditors, to whom tho' they be impious and contemners of the Laws, the Debt that is due to them must be paid notwithstanding. They are like so many Sovereign Princes, whose Actions and Counsels the Subjects may not pry into. And therefore Divines determine, that if a Man should meet with his Father and his Son in the same danger, and that he can only save one of them, he is bound to rescue his Father, rather than his Son. For to this he is bound by the tie of Blood, Reverence and Gratitude he owes to his Father; since he may have another Son, but cannot have another Father.

IX.
Children are bound to maintain their indigent Parents.

CHAP. XXXIV.

Of the Duties of Masters and Servants.

After that Men were multiplied by Generation, Servitude was introduced into the World, and they who were born free, were forc'd to own Superiors. For after that Dominion and Government, was come into the Hands of a few Men, many being compell'd by Poverty, or by the Dulness of their Intellectuals, did proffer their Labour and Service to great Men, upon condition of being maintained by them, and supply'd with necessities. Afterwards by the occasion of Wars arising between several Nations, and the longest Sword carrying it, it so happened that they who were taken in War, were made Slaves to those who had conquered them. And therefore the Latin word *Servus*, which signifies a Slave or Servant, is derived from *Servo*, which signifies to Save, because they were such as in War, were saved alive by the General. §.3. Just. de Jur. Person.

I.
The Origin of Servitude.

But this Custom is antiquated amongst Christians, and it is a received Law amongst them, that no Christians may be made Slaves. Tho' when Christians wage War against Infidels, and are taken by them, they make Slaves of them, because this is the Common Law of Nations; and this Servitude is a kind of Permutation for the Death, to which it was in the power of the Infidels to make them submit. For tho' it be contrary to Nature, to enslave a Man that is born free; yet it seems consentaneous to Natural right, that he who rashly takes up Arms against one that is more powerful than himself, and will not hearken to Peace, being taken Captive by the Conqueror, should be obliged to serve him, and be subject to his Command.

II.
How Christians become Servants.

The are 2 sorts of Servants; the one, of those who contrary to the Law of Nature, are entirely at the Will and dispose of a strange Lord or Master: Another are such, as let themselves to others for Hire, and give them their Labour for Remuneration or Reward.

III.
Two sorts of Servants.

IV.
The mutual
Duties of
Masters
and Ser-
vants.

The Master is bound to pay to his Temporary Hired Servant, the Wages he hath agreed with him for, and be as good as his Word to him; as the Servant on the other hand is obliged to perform the Work and Service he hath agreed to, and diligently effect whatsoever else he hath engaged himself to do. And forasmuch as in this their mutual Contract and Agreement, the condition of the Master is above the Servant, an Obligation ariseth thence in the Workman, to carry himself with all Reverence to his Master, according to the degree of Dignity, wherein he is placed above him. If he have not been faithful in performing, what he had engaged himself to do, or not diligent enough in his Work, that he willingly submit himself to his Correction, to receive the reward of his Negligence or Wickedness. If a Servant either driven by necessity, or of his own accord, have put himself into any ones Service, his Master is bound to provide for him accordingly. Neither can the Ingratitude, or Obstinate humour of the Servant deliver him from his Obligation herein; tho' for a Punishment of his Offence, he may diminish his allowance of Food, to chastize his negligence or sturdy humour. Yea if he should neglect the Commands laid upon him, and should refuse to go through the work he had undertaken, the Master may withhold part of his Wages, which he had agreed with him for.

V.
A Master
is bound
to pay for
his Ser-
vants.

A Master is bound to make Good the Damage done by his Servants: Because the fault of his Servant is imputed to be his; and according to the Lawyers, an Action may be had against the Master of the Bondslave, for any Damage Culpably committed by him: And accordingly the Master must either make good the Damage, or deliver his Slave to him who hath suffered the Damage. Thus the Master of a Ship is bound to make good the loss of it, in case it chance to miscarry in a Tempest; for want of a good Steersman. I added Culpably committed by him, because if the loss happen without his fault, neither the Servant nor Master are bound to make it good, except that it can be proved, that he is grown Richer by means of the said loss.

VI.
The care of
Masters to
wards their
Servants.

A Master must not suffer his Servants to be Saucy or Idle, and if he finds them remiss and negligent in their Work, he ought to reprove and chastise them. If they commit any Crime, he may punish them according to the quality of it, yet not over-cruelly. I call a too cruel Punishment, Maiming, Wounding, or such grievous beating whereby the Life of the Servant would be endanger'd, or at least the loss of one of his Members. It is only permitted therefore to a Master, to correct his Servant by a lighter sort of Punishments, as by beating him in such a manner, whence no hurt can redound to his Body. For seeing that Servants are subject to their Masters Chastisements, they ought to submit to that Punishment, he thinks fit to inflict upon them.

VII.
Servants
can enter
into Coven-
ants.

Servants notwithstanding the tie they are under, yet can enter into Covenants or Contracts, so that by this means they may be under an Active, as well as passive Obligation. For tho' Servitude do restrain the Power of Servants, and almost deprives them of Civil Rights; yet it leaves them in full possession of the Law of Nature, which by no means can be abrogated. And accordingly

JUSTINIAN tells us, *Inst. de Jur. Nat. Gent. & Civil.* That Natural Laws which are equally observed by all Nations, are the constitutions of the Divine Providence, and as such do always continue firm and immutable. Whence it follows, that both Servants, and those with whom they have contracted, are in the Court of Conscience bound to the Observation of their Agreements, and the faithful performance of what they have engaged themselves to do.

Servants have no power to alienate their Masters Goods, no not so much as to give an Alms; for seeing that no Administration of their Goods is committed to them, and that it is a piece of Injustice to relieve the Poverty of the Indigent out of the substance that belongs to another, it is clear that they cannot bestow any thing upon the Poor; without it can be probably supposed, that they have their Masters consent for it; or that the necessity of the Indigent be so extrem, that it may seem to plead an excuse for the irregularity of the fact.

VIII.
Servants
cannot ali-
enate the
Goods of
their Ma-
sters.

Servants are not bound to obey their Masters, in those things that are Evil in their own Nature, that is, which are contrary to the Laws of Nature or Nations, or to the Law of GOD, whatever advantage either themselves or their Masters might hope to reap from it. Because we are never to do any Evil that Good may come of it. Wherefore they who either by their command or advice, do intice their Servants or others to Evil, or that put an occasion of doing mischief into the Hands of others, to the end that they may get some advantage thereby, do greatly Sin in so doing, they making themselves guilty of the Crime, who persuade or command it.

IX.
Servants
are not
bound to
obey their
Masters in
any thing
that is E-
vil.

CHAP. XXXV.

Of the Right of Sovereign Dominion, and the different forms thereof.

THE Right of Sovereign Dominion, besides what is Paternal, took its Beginning, when Men like Beasts, lived in the Fields, Woods and Caves of the Earth: for being wearied with this irregular kind, they began to think of entering into Societies, and voluntarily divesting themselves of their Liberty, committed themselves to the disposal of the whole Company, preferring the Judgment of the Community before their own. The Power being thus placed in the Hands of the Multitude, they took care for the particulars belonging to it, that the great and powerful might not oppress the weak and needy; and that all the Members of the Society might enjoy the same Freedom of Living. But forasmuch as in process of time, it was found very inconvenient, both as to the deliberating about, and deciding of Affairs, to gather the suffrages of the whole Multitude belonging to the Society; they agreed that this Power should be settled on one Person only, or on a few. Whence a threefold form of Government took its Rise; so that now, as TACITUS expresseth it, all Nations and Cities are Governed by the People, or the Great and Chief Men, or by Sovereigns; so that the Supreme Power is sometimes in the Hands of a single Person, or of a few, or in the Hands of the Body of the People.

II.
Of the
three kinds
or forms
of Govern-
ment.

When the *Sovereign Command* is in a *single Person*, this is call'd *Monarchy*, because he *Governs* the whole *People*, and himself is commanded by none; as the *Kingdom of France, Spain, &c.* When the *Supream Power* is lodg'd in a *Council* of a few select *Citizens*, this is call'd *Aristocracy*; such as obtains in the *Commonwealth* of the *Venetians*. And lastly, When the *Command* is in the *Hands* of the whole *Body* of the *People*, it is called *Democracy*, or a *Popular Government*; such as is in *Holland*. Every one of these *Forms of Government*, hath its own *Peculiar* and *Fundamental Law*, which it more particularly insists upon; *Democracy*, that of *Liberty*; *Aristocracy*, *Security* and defence from the *Common People* and *Tyrant*; and *Monarchy*, *Sovereign Power*, employ'd for the safeguard of the *Publick Good*.

III.
The War-
thiness of
Monarchy.

Monarchy therefore is, when the *Supream Power* is lodg'd in one *Person*, on whom all the rest do depend. Altho' this *Form of Government* may agree with the other two, yet doth it excel them both, as possessing more *Advantages* than either of them. For *Monarchy* hath this *Peculiar* to it self, that it is more free in the *Exercise* of its *Power*, and can deliberate and determine without any set *Time* or *Places*, it being at the *Kings Liberty* to *Deliberate* or *Determine* at any time, or in any part of his *Kingdom*. Moreover it is obvious, that in *Kingly Government*, *Counsels* are carried on, as well as resolved, with greater *Secrecy*; Executed more readily; *Factions* and *Seditions* more easily prevented and crush'd; and *Safety* and *Liberty*, which the other *Forms of Government* so much affect, doth more abound, and is more lasting than in the two other *Forms*.

IV.
In it all
things are
better ad-
ministrated.

If there be any *Deliberation* concerning the *Peace, Union*, and the *Highest Good* and *Interest* of the *People*, the *Power* concentred in One, will be able better and more readily to effect it, than the resemblance only of this *Unity* in many can possibly do it. Besides, that *Form of Government* must needs be the best, which most resembles the *Eternal* and *Undivided Government* and *Empire* of *Almighty GOD*: As also, because he whose *Command* continues as long as his *Life*, doth thereby become perfect in the *Art of Ruling*, and looks upon the whole *Body* of the *People* as his own *Family*, and embraceth and cherisheth them with a *Paternal affection* and *tendermess*.

V.
What a
Tyrant is.

The opposite of such a *Prince* as we have now described, is a *Tyrant*, who either gets into the *Throne* contrary to the *Laws* and *Customs* of the *Kingdom*; or, who being lawfully advanc'd to it, doth only mind his own private *Good*, and fills the *Society* with *Dread*, *Poverty*, and *Calamity*. He who, contrary to *Law*, aspires to the *Sovereign Dignity*, and leaves nothing unattempted to obtain the *Kingdom* he has in his *Eye*: He who by the *Massacres* and *Destruction* of the *People*, the *Proscription* of the *Grandees*, and the taking away of their *Lives*, makes his way to the *Throne*; without being asham'd of oppressing and grinding the *People*, or of destroying the *Innocent*, so he may but obtain what he hopes for. For *Monarchy* is not always such as it ought to be, but by the *Vices* of wicked *Princes*, is often turned into *Tyranny*. But certainly, the *State* of a *Tyrant*, whatever he may think of himself, is very miserable, who dreads those whom he oppresseth, and flees those

whom he persecutes, the *Fear* he puts his *Subjects* into, recoyling back upon himself. Seeing, that as *SENECA* saith, it is unavoidable, but that *He whom many fear, must fear many*.

Neither is *Aristocracy* subject to less *Inconveniences* than *Monarchy*; whilst *Wicked Men* out of an ambitious desire of *Rule*, do by unjust *Means* endeavour to get into the *Senate*; following that *Maxim*, *If Right be to be violated, let it be done for the obtaining of Rule and Government*. Whilst by the *Prevalency* of a *Faction*, unworthy *Persons* are *Elected*, and *Vertue* and *Desert* post-pon'd: Whilst those few that have the *Power* in their own *Hands*, do only mind the enriching and aggrandizing of themselves, and without being solicitous for the *Good* of the *Subject*, do treat them no otherwise, than if they were their *Slaves*.

Neither is *Democracy* subject to less dangerous *Distempers*; as when the *People* in whom the *Power* is lodg'd, manages the *Government* in a turbulent and tumultuary manner; when the more *Rich* and *Powerful* part of the *People*, do oppress and devour the lesser *Fry*, condemn the *Magistrate*, violently seize the *Goods* of others, without having the least regard to those that are *Good* and *Innocent*: When they make *Laws* from an itching desire of *Novelty*, and soon after as inconsiderately annul them again: When they *Enact* and *Decree* that one day, which they abrogate the next; and *exaugetate*, what but a while ago so highly pleased them: Or, when *Men* unfit and of no *Capacity*, are raised to the highest *Charges*: And, when *Men* of an insolent and insulting *Temper*, do pronounce unjust *Sentences*, and enact burthenfom *Decrees*, and afterward maintain and execute them by unjust *Rigour*.

VI.
The Defects
of Aristo-
cracy.

VII.
The Incon-
veniences
of Demo-
cracy.

CHAP. XXXVI.

Of the Duties of Sovereign Princes.

IT is very much for the *Interest* of the *Commonwealth*, that He who either by *Nature* or *Chance* is destined to the *Government* and defence of *Society*, should not only excel others in *Vertue*, but also in *Knowledge of Business*, especially of those which appertain to his *Function*. For how shall a *Man* be able to perform that he doth not understand? Or prescribe *Laws* to them, whose *Temper* and *Inclinations* he is not at all acquainted with? Wherefore it ought to be his great concern to mind this only, and contemning his *Pleasure* and *Divertiments*, to exercise himself in those things which conduce to this end.

The first thing therefore that is to be minded by him that has the *Sovereign Power*, is, that the same has not been committed to him for his own sake alone, but for the *Publick Good*. For as the great End, as *CICERO* tells us, of the *Master* of a *Ship*, is a *prosperous Voyage*; that of a *Physician*, the *Recovery* of his *Patient*; that of a *General*, *Victory*: So the End of a *Governour*, is the *happiness* and *welfare* of the whole *Community*, that so his *Subjects* may abound with *Riches*, be expert at their *Arms*, *Renowned* abroad, and *Vertuous* at Home.

I.
Knowledge
of Affairs
is necessary
to a Prince.

II.
The great
aim and
design of
a Prince,
must be the
Publick
Good.

III. Virtue and Wisdom is requisite in a Prince.

IV. Piety, Justice, Valour and Clemency, are the necessary Vertues of a Prince.

IV. Piety, Justice, Valour and Clemency, are the necessary Vertues of a Prince.

I. Knowledge of the Law is requisite in a Prince.

II. The Duty of a Prince in time of Peace, is to take Care of Religion

A King will the more readily obtain this End, if he endeavour to excel all others in *Vertue* and *Wisdom*, as he is above them in Place and Dignity. For seeing that the whole *World* are apt to imitate the Manners of their *Prince*, and his *Vertues* or *Vices*, are commonly the Copies his *Subjects* write after; it is his greatest Interest to pursue *Vertue*, and lead a Good Life, that he may not be the Cause of Corrupting his *Subjects*, and encouraging them to *Sin* and *Wickedness*. Besides, how will a *Prince* ever be able to keep up his *Authority* and *Dignity*, if he be accounted Flagitious and Vicious? Or with what Face will he be able to prescribe *Laws* of *Temperance* to others, who lives in the continual breach of the *Laws* he prescribes?

Of all *Vertues*, none is more necessary to a *Prince*, than that of *Piety*, to the end he may obtain of the Great *GOD*, by whom *Princes* Rule, *Ability* and *Wisdom* for the bearing of the Great Burthen that lies upon him; as well as that by means thereof, he may more powerfully engage to himself the *Hearts* of his *Subjects*, by their being persuaded, that he must needs be the peculiar Care of that *GOD*, whom he serves with so much *Religion* and *Devotion*. He must likewise be adorned with *Justice*, that he may Administer the Affairs of his *Kingdom* with *Equity*, Punish the Wicked, Reward those, who by their good *Services* have defended or promoted the Interest or Glory of the *Commonwealth*, and with a constant and unchangeable *Will*, give to every one his due. He must also be qualified with *Valour* and *Clemency*, that by the one he may keep Ill-men to their *Duty*, and by Fear restrain those who are apt to be *Factionous* and *Seditious*, and to disturb the Peace of the *Commonwealth*: And that by the other, he may be ready to Forgive, and gain the *Hearts* of his *Subjects* by his Goodness and Benignity. *Liberality* also is a *Vertue* that well becomes a *Prince*, as being of use to him, not only for the obliging and rewarding of his Good *Subjects*; but also to acquire the Reputation of *Bountiful*, which is so generally taking, and so highly esteem'd amongst Men. But yet a *Prince* must be prudent in the Exercise of this *Vertue*, so as to make choice of Worthy Persons, on whom to bestow his Munificence, lest by gratifying Base and Undeserving Men, he stir up *Envy* and *Hatred* in the *Hearts* of his *Subjects*, and expose himself to their Reproaches and Contempt. In a word, There is no *Vertue* which is not necessary for him, who is plac'd on high to be an Example to others, and whose private *Sins*, by their spreading Contagion, come to be *Epidemical Vices* of the whole *Commonwealth*. For who stands in greater need of *Prudence*, than he whose *Function* it is to deliberate concerning things of the highest moment? Who hath occasion for a more unchangeable Truth and Faithfulness to his *Word*, than he, who is greater than the *Laws*? Who ought to be so qualified with a more resolved *Constancy*, than he who is entrusted with the Concerns and Welfare of all? Who wants a higher degree of *Continence*, than a Person to whom every thing is subject? Or whom doth *Vertue* become better than him, who hath all Men to be his *Spectators* and *Witnesses*?

Another *Duty* of a *Prince* is, that he be well acquainted with the Temper and State of his *Kingdom* and *Cities*: Because the way of Governing is not every where alike, and according to the different Condition of *Kingdoms*, different *Laws* are to be Enacted accordingly. In the First place therefore, he ought to know what are the *Fundamental Laws* of his *Kingdom*; whether the Government, to which he is elevated, be purely *Monarchical*; or whether it have an alloy of *Aristocracy* and *Democracy*? What part the *Nobles* have of the Government, and what the *Commons*? And in the next place he ought to know the Largeness of his *Kingdom*, the *Situation*, *Commerce*, and *Strength* of it: Who are the *Neighbours* that bound upon his *Kingdom*, and what Profit or Inconvenience may accrue to him from their mutual Friendship or Discord.

A *Prince* also ought to be well informed concerning what passeth in *Foreign Countries*, that he may be the more ready to counterwork and oppose their Designs, to the prejudice of his *State*. For seeing that *Civil Societies* are as in a perpetual State of *War* and *Hostility*, and that in this State Men are not obliged to keep their *Treaties*: When one of the Parties gives occasion to the other, to distrust his Faithfulness; it is highly necessary, that a *Sovereign* have good Intelligence concerning the Enterprizes and Designs of *Strangers* against his *State*, to the end, that if he find they intend to break their *Treaties* with him, he may not think himself obliged to keep his. And so to be always ready, either for *Peace* or *War*.

It is a great Argument of the *Prince's Prudence*, to make choice of Wise *Counsellors*, Men Eminent for their *Honesty*, *Great Experience*, *Faithfulness* and *Prudence*. He must also take care, that he be not offended with *Truth*, if any thing be spoke or advis'd by them contrary to his *Mind*; but let him embrace and encourage *Sincerity*, and contemn and hate *Flattery* wheresoever he meets with it.

He ought also to take great heed, that his *Officers* and *Lieutenants* keep within the bounds of their *Duty*, and that they may not be injurious to any. That those who are the *Governours* of *Cities* and *Provinces*, do not enrich themselves by oppressing of the *Subjects*: That the *Chief Commanders* of his *Army*, keep their *Souldiers* within the bounds of due *Discipline*, not suffering them to violate the *Martial Laws* without present Punishment: That the *Judges* exercise *Justice*, and render to every one what belongs to them. Of all which things, I have handled at large in my Treatise of the *Best Government*, to which I refer my Reader.

But forasmuch as the *Duties* of a *Prince* do relate either to a Time of *Peace* or *War*, we must also treat of them in particular. His first *Duty* therefore in Times of *Peace* is, that he take care to promote the Honour of *GOD*, and encourage *Religion* and *Godliness*, and suffer no Innovation in Matters of *Worship*. By which means he will have *GOD* to favour him in all his Undertakings, and will engage his *Subjects* to have a great Esteem and Veneration for him.

V. A Prince ought to be well acquainted with the Nature of his Kingdom.

VI. A Prince also ought to be well informed concerning what passeth in Foreign Countries.

VII. A Prince stands in need of Faithful Counsellors.

VIII. A Prince must have an Eye to the Administration of his Chief Ministers and Great Officers.

IX. The Duties of a Prince in time of Peace, is to take Care of Religion

In

X. In the *Second place*, he ought to be careful in encouraging and promoting all *Arts*; not only those which are surnamed *Liberal* or *Ingenious*, and which are of great Advantage and Honour to the *Government*; but others also, which we call *Mechanical*, and especially those that are of greatest use to the *Commonwealth*, and bring the greatest Profit and Riches to the *Kingdom*; as are those of *Agriculture* and *Navigation*, whereof the former furnisheth his *Subjects* with the Necessaries of Life; and the latter carries on *Trade* with *Foreign Nations*, and is a means of enlarging his *Dominions*, and bringing *Treasure* to his *Coffers*. And what is more, *He that is Master of the Sea, may in some sense, be said to be Master of the Land also.*

XI. *Thirdly*, A *Monarch* must be careful to observe the *Peace*, and other *Treaties* he hath made with other *Nations*, so as never to suffer the same to be violated. For nothing is more shameful or hazardous to a *Sovereign*, than to break his *Word*; because by this means he teacheth his *Subjects*, upon occasion, to serve him after the same manner, and to revolt from him.

XII. *Fourthly*, He must make it his business to be always provided of a good *Army*, to prevent the *Faction* of any of his *Nobles*; or to suppress the *Conspiracies* or *Rising* of any other of his *Subjects*. I understand by *Faction*, a *Company* of *Seditious Persons*, which have united themselves for the carrying on of some design, without the permission of him who governs the *State*.

XIII. He must also be mindful to curb and restrain *Ambitious persons*, and such who have a disposition to *Rebel*, and to put the *State* in confusion. For seeing that there are in all *Governments*, Persons who suppose themselves more wise and able to manage the *Publick Affairs*, than those who are charged with them, they will not be wanting by all manner of ways to defame and reproach their *Conduct*; and not finding their *Ambitious desires* satisfied in the present state of *Affairs*, would be ready to overthrow the *Settlement*, if the *Prince* were not always in a readiness to oppose and crush their *Designs*.

XIV. *Fifthly*, In case it happen so, that he be not in a condition, to break the grown *Faction* in his *Kingdom*, that then he make use of Men esteemed for their *Piety* and *Worth*, before that he have recourse to *Arms*, that by their *Authority* and *Favour* they may appease the *Minds* of these *Mutineers*, and bring them to *Reason*. And in case they are stubborn, and will not acquiesce in their *Reasons*, nor give ear to their *Exhortations*, that then he resolve to vindicate the *Contempt* of his *Authority* by force of *Arms*, and to crush the *Rebellion* in the *Egg*, lest being grown strong, it prove troublesome to him, and render the *Sore* incurable. To this end it will be very conducive, if the *Sovereign* take care, by all means, that his *Subjects* may be eminent for *Vertue*, and abound with *Riches*, and be plentifully stored with all the *Conveniences* and *Necessaries of Life*, but yet without *Excess*. For as *Physicians* tell us, that *Diseases* are caused by *Intemperance* or *Excess* in *Eating* or *Drinking*: So the *Corruption* of *Manners*, the *Contempt* of the *Laws*, and the *Insolence* of the *People*, is often caused by the too great affluence of *Riches*; except the *Prince* takes

care to prevent it, by engaging the *Rich* to contribute liberally to the *Necessities* of the *Poor*, and by the abundance of their *Wealth*, relieve the *Wants* of their *Indigent Neighbours*.

But because the *Sovereign Majesty*, as *JUSTINIAN* saith, must not only be armed with the *Laws*, but also fenced with *Arms*, that he may be in a condition to govern his *Kingdom* successfully in times of *War*, as well as *Peace*; he is to take care, that he do not engage himself in any *War* rashly, nor indeed without urgent *Necessity*. As a *Physician*, who hath no recourse to actual *Cauteries* or *Amputation*, till he hath in vain attempted all other *Means*: Whether therefore a *Prince* design to engage himself in an *Offensive War* against any, or that he resolves only to be on the *Defensive*, he ought to make an exact estimate of his *Force*, and duly consider whether he be in a condition to execute the *Exploit* he intends, or to resist the *Force* of him that attacks his *State*. For if he find himself too weak for his *Adversary*, it will be great *Imprudence* for him to attack his *Enemy*, lest by being worsted, he give an occasion to his *Adversary* to *Invade* that rightfully, which before he could not do without great *Injustice*. Wherefore in this case, it will be his *Wisdom* by *Mediation*, to prevent the *Invasion* of his *Enemies*, and chuse rather to lose something of his *Right*, than to hazard the *Loss* of his whole *Kingdom*. For *Right Reason* teacheth a *Man*, to seek for *Peace* by all possible means, and that he never ought to prepare for *War*, till he find that there is no hopes of obtaining a *Just* and *Honourable Peace*. But on the other hand, when a *Prince*, after extream *Provocations*, hath taken up *Arms*, and driven the *Invader* out of his own *Kingdom*, let him enter that of his *Enemy*, and endeavour to make them repent of their *Folly*, and bring them to *Reason*: But yet so, as that he may do nothing contrary to the *Requirings* of *Religion* and *Reason*.

After that he hath gotten the *Victory*, let him take care to spare the *Innocent*, and those who have not shewed themselves *Inhuman* and *Cruel* in the *Wars*. It is the part of a *Man of Valour*, saith *TULLY*, to look upon them as *Enemies* who contend for the *Victory*, but to consider those that are *Conquer'd*, as *Men*; to the end that *Valour* may put an end to *War*; and *Humanity*, on the other hand cherish and promote *Peace*. Whereas, on the contrary, it is perfect madness to destroy those *Things* or *Persons*, that do not diminish the strength of the *Enemy*, nor increase that of the *Conquerour*: For he who thus inconsiderately and barbarously wastes all before him, doth not look upon the things he destroys to be his own, but to belong to another.

CHAP. XXXVII.

Of the Duties of Citizens.

MAN is so great a *Lover* of *Society*, and doth so much delight in the *Company* of such as are like him, that he can scarcely frame himself to live alone. But forasmuch as *Society* cannot be long preserved without *Peace*; and *Peace* is the *Fruit* of *Union*, and *Union* supposeth *Order*; *Order*, *Distinction*; *Distinction*, *Dependence*; and *Dependence*, *Authority*: Hence it came to pass,

XV. What are the Duties of a Prince in reference to War.

XVI. What a Prince is to do after Victory.

i. Whence Cities had their Rise.

that Men came together, and first lesser Societies, and afterwards greater were formed which gave name to Cities.

II. The Duties of a Citizen may be reduc'd to two kinds, viz. General, or Particular. The former of these, take their rise from the common Obligation, by which they are obnoxious to the Civil Government: But the latter proceed from the particular Duty, to the performance whereof every one is bound, according to the calling he is in, or the Function impos'd upon him. The General Duty of Citizens respects either the Magistrature, that is, the Governours or Rulers of the City; or the Body of the City, that is, the Members thereof.

III. A Citizen is bound not only to obey the Magistrate, but also to be faithful to them, and shew all Honour and Reverence. For it is but reasonable and becoming that he should express his Respect to those, whom he knows do excel him in Dignity. Since Dignity took its name from the latin word *Dignus*, because they were thought worthy to bear Rule over others, and to take care of the Government. And accordingly it is very agreeable to reason, that those who are subject to their Command, being content with their condition, be Enemies to all novelties or innovations in the State, and acquiesce in their Decrees, rather than in those of any other. That they put a good interpretation upon all their Actions, and be not too curious searchers into their Lives and Actions, but in all things willingly submit to their Commands.

IV. A Citizen performs the Duty he owes to the whole City, whilst he prefers the Weal and welfare of it, before his own, and desires nothing more, than that it may enjoy full Safety and undisturb'd Happiness. Whilst he cheerfully contributes his Wealth and Fortune for the preservation of it; being ready to expose his Life to mortal dangers for the Defence of it, and to hazard a Part for the Preservation of the Whole. Whilst he omits nothing, that may serve to advance the Glory and Honour of it, and lays out all the Strength of his Soul and Body, to render it Illustrious and Magnificent.

V. A Citizen dischargeth his Duty towards his Fellow-Citizens, whilst he behaves himself Kind and Benevolent to all, and makes it his business, to maintain and preserve the exercise of Peace, and mutual good Offices between them. Whilst he shews himself Affable and Courteous to all, and difficult to no body, being always ready to succour, help and assist them, whenever any occasion presents it self, or Necessity requires it. For seeing that the Laws of Cities are design'd and intended for the common Good and advantage, every one promotes his own Interests, whilst he endeavours that of the Publick, and takes the ready way to procure his own welfare and Prosperity, whilst he lays out himself for that of the Commonwealth, and every particular Member of it. Wherefore he doth not torment himself, to see the more splendid Fortunes his Fellow-Citizens enjoy, nor the high degree of Dignity to which they are exalted, nor that affluence of Riches wherewith they are bound: But remembering himself to be a Member of the City, considers all that to be his own, which he sees the rest of his Fellow-Citizens enjoy.

The Special Duties are such as belong to every particular Citizen, or are peculiar to some only. As to the first of these, it is a Duty incumbent upon all, that no Citizen take upon him any Publick Office, or stand for it, but what he is fit for, and able to discharge. For what Man, that is altogether ignorant of Chirurgery, will be so mad as to undertake those Operations, whereon the Life of other Men depend? Or where is he, that being altogether ignorant in the Art of Navigation, will undertake to carry a Ship to the East-Indies? But the place is offered me, without any of my own seeking. What then, is it to be supposed that others are better acquainted with my abilities than I my self am? A Blind Man will never be able to guid and lead the Blind, and he who by his presumption, makes himself the cause of the hurt and damage of the whole Society, draws the Guilt of the Publick Ruin upon himself.

Counsellours, and those who with their advice assist the Rulers of the City, ought to use their utmost diligence, that nothing may be hid from them, that is conducive to the Good and welfare of the City. They must freely and boldly declare, what they know to be necessary for the safety and flourishing condition of it; but without being byast by any corrupt Affections, and without being dazled with the Fortune and Dignity, mind only the persons of those they speak to, left by flattering their Rulers they make themselves vile and contemptible, and by being led aside by their depraved Affections, they dishonour and abuse the Majesty of their Function, and poison and taint the Minds of their Governours. Let them solicitously keep themselves from being corrupted by Gifts and Bribes, and shew themselves upon all occasions, as impenetrable and immoveable as a Wall of Brass, against all the Attacks of the most powerful and insinuating dint of Money. Let them also be the greatest contemners of Pleasure, and being wholly intent on the good and advantage of the Commonwealth, prefer the safety and interest thereof, before any of their private concerns.

Those persons who are dedicated to the Service of GOD and his Worship, must above all things take care to lead an Innocent and Holy Life, and converse amongst their Parishioners with all Gravity, always mindful of the Character they are invested with, and that they are taken from amongst Men, to transact their concerns with GOD; to be as it were Intercessors with GOD, and Mediators to interpose between Men and the Divine Wrath: That they be careful to avoid all novel Doctrins, and never deliver any thing to the People that is contrary to sound Doctrine, and primitive Christianity.

Professors, whose Duty it is to teach and instruct others, must take care that their informations be built on good and sound Principles, and that with their utmost endeavours they avoid Falsehood and Errors. Let them also decline the Perverse Humors of some, who pretending to be free, and engaged to no Mans Opinion, are ready to teach and defend the most opposit Opinions, and to blow Hot and Cold from the same Mouth. They must also be very cautious, that they broach no Opinions that are inconsistent with the Peace of Society, or that may occasion any difference betwixt the Citizens. Let them also shun all discord amongst

VI.
The Special
Duties of
a Citizen.

VII.
The Duty
of Coun-
sellours.

VIII.
The Duties
of Priests
or Mini-
sters.

IX.
The Duty
of Profes-
sors.

amongst themselves; and consider that they go the ready way to expose the Respect due to their Function, by being divided in their Sentiments, and sowing the *Seeds* of dissension and *Discord* in those places, which should be the seminaries of *Vertue* and ingenious *Literature*. Besides, what credit can be given to their informations, if all that they teach be no better than *Problems*, and where the Affirmative and Negative are equally made void? Wherefore, it is their Duty to neglect all those *Doctrins* and *Opinions*, which are of no use or advantage to the *Commonwealth*, and derogate from the honour due to their *Profession*.

X.
The Duty
of Generals
or Com-
manders
of Armies.

Generals, who are entrusted with the *Command* of the *Forces* of the *State*, ought to take care that the *Souldiers* that are lifted be strong and vigorous, both as to their *Age* and *Constitution*, and must provide for their being well exercised and versed in *Military Discipline*, and to harden them to all *Warlike Labours* and *Difficulties*. As likewise to furnish them with *Arms*, *Offensive* and *Defensive*; and above all things provide sufficient *Magazines*, and *Stores* of *Provision* and *Ammunition*, that their *Designs* may not miscarry for want of these necessities. They must also have *Spies* at hand, to discover the *condition* and *designs* of the *Enemy*, and by this means be able to choose fit occasions to set upon them, or intercept their *Recruits* or *Provisions*. They must also have an *Eye*, that their *Souldiers* be not defrauded of their *Pay*, by the extortion of the *under Officers*, for otherwise they will never be able to restrain them from *Plundering* and *Robbing*, nor to keep them from *Tumultuous Insurrections*.

XI.
The Duty
of Souldiers.

The *Duty* of *Souldiers*, on the other hand is, that they be content with their *Pay*, and abstain from *Plundering* and *Spoiling*, or vexatious oppressing of the *Country People*, with whom they are *Quartered*. That they willingly endure the trouble and wearisomness of *Marches*, and the *Labours* of the *Camp*, considering that they do all this for the good and safety of the *Publick*, wherein their own is included. That they take heed of running *Rashly* and *Headlong* into dangers; as well as of *Cowardly* declining them, when they are called to

face them; that they never stir from the *Post* assigned to them, for the greatest danger, and rather choose to dye Honourably, than to live reproached.

They who are sent to *Negotiate* the concerns of the *State* to *Forein Courts*, must be persons of a quick *Wit*, and very *Circumspect*; not easily giving credit to *Rumors*, but being able by their *Sagacity* to discern vain and false *Reports*, from true and solid; neglecting the talk of the *Common People*, and above all things, taking great heed not to discover any thing, which it is their *Masters* interest should be kept *Secret*. Whilst they are in *Forein Courts*, let them never lend an easy *Ear* to the *Suggestions* of great Men, and be impenetrable by any thing of *Bribe* or *Corruption*.

They who are the *Receivers* and *Treasurers* of the *Publick Monies*, must take heed of oppressing the *Subject* in their gathering of it; must not be too exact and rigorous in the levying, or by their *Avarice* extort more from their *Fellow-Citizens*, than is their due to pay. When by the Authority of their Superior, they are charged to pay any Sum, that they do it readily, without putting the *Expectants* to any expence of *Time* or *Money*, before they can receive it. And never defer the payment of any *Salary* or *Reward*, tho' to their greatest *Enemies*, after they have received orders for it.

All these *Special Duties* *Citizens* are obliged to perform, as long as they continue in the exercise of those *Functions*, to which they are annexed, and from whence they proceed; and cease upon their discontinuance, viz. when either the *Officer* is put out of his place, or resigns it, or that the *Charge* itself be discontinued, as being thought no longer necessary. In like manner the *General Duty* of *Citizen* ceaseth, when leaving the *City*, and settling elsewhere, he ceaseth to be a *Member* of it: Or when for some *Crime* a person is *Banished* from the *Society*; or when being taken *Prisoner* by a *Conqueror*, he is carried away to a strange *Country*.

The First Part OF THE HISTORY OF NATURE. OF BODIES.

CHAP. I.

Of a Body Extended.

I.
The Ex-
istence of
Bodies is
evident to
our Senses.

THO' our Senses are often mistaken, and being deluded by false Representations, do circumvent our Mind; yet have we no safer way by which we may arrive to the Knowledge of Corporeal things, than when with their assistance we measure their Dimensions, and by Signs conveyed through our Eyes, discover their Existence: For it is by their Advertisements we come to know, that Matter consists of 3 Dimensions; and that the Parts of it are capable of various motions, have different Forms, and do diversly affect the Organs of our Senses. For tho', it may be, what is presented to our Eye, be only such in outward Appearance, and be represented to us quite otherwise than indeed it is; yet must not we therefore suppose it to be no more than a Phantasm, or some vanishing Appearance, and such as is not to be ranked in the Catalogue of Things; seeing it is necessary that something that is Bodily, must lye hid under that shell or outward Appearance, and which really is the basis and foundation of the Figure we see; tho' because of its distance, or for other Reasons, it may not be perceived such as indeed it is, but takes to it self another Appearance, that it may arrive at the Organs of our Senses.

II.
The Senses
are not
deceived,
as to the
Matter or
Subject of
things.

There is no question, but that he to whom a Square Tower, viewed at a distance, appears to be Round, hath something that is Material or Substantial conveyed unto his Organ; since it is impossible that either a Square or Round Figure should be seen, without any thing to support it, or that might be the Subject of it; it being a plain Contradiction, that a Mode should be taken from Matter, and exist without it: For indeed if we well consider the Nature of a Mode, we shall find that it cannot so much as be in our Thought conceiv'd as separated from it. For tho' we can have a clear perception of Substance, whether Material

or Immaterial, without their Modes; yet by no means can we conceive those Modes, without the said Substances, since it is their very Nature to affect and diversifie Substances.

Wherefore the Ancient Philosophers did demonstrate, that a Body consists of a concurrence of Figure, Magnitude and Resistance; because they found nothing but Matter was extended in Length, Depth and Breadth; nor any other thing besides it, that could not abide its like in the same place with it, but pusheth it thence, and excludes Penetration. For herein do Material Substances differ from Spiritual, because the former fall under our Senses, carry a bulk with them, and are subject to the Touch. By the word Touch, we do not only understand the Sense so called, which is peculiar to Animals, and whereby they feel External Bodies; but that more general, whereby 2 Bodies touch one another with their Surfaces, and whereby they are intimately close to one another. For it is the property of Material things only, to touch and be touched, and to be joyned together by a kind of middle Term; which is so evident, that it cannot be question'd by any that either make use of their Imagination, or perceive any thing by the Senses: As LUCRETIVS in his First Book tells us,

*That Bodies are, we all from Sense receive,
Whose Notice, if in this we disbelieve,
On what can Reason fix, on what rely?
What Rule the Truth of her Deductions try,
In greater Secrets of Philosophy?*

But some it may be will object here, that a Spirit also is Extended, and yet is excluded from participating of the Nature of a Body. To which I Answer, That when a Spirit is said to be extended, this is not to be understood according to the threefold dimension of Bodies, which we imagine; but with respect to its Power and Energy, whereby a Spirit diffuseth its active Force, sometimes through a larger, and at other times through a lesser part of the Bodily Substance; so that in case there was no Body or Space, a Spirit could

III.
The Opinion
of the
Ancients
about the
Nature of
a Body.

IV.
How a
Spirit is
said to be
extended.

never be understood to be extended, that is, to have, or correspond with any dimensions.

V. Whether there be any Vacuities in Bodies.

The only difficulty that remains to be resolved, is, whether besides the *Bodies*, whose Nature, we have said, doth consist in Extension, there be any *Vacuity* in Nature, destitute of all Matter, which yet enjoys the properties of *Longitude*, *Latitude* and *Profundity*. GASENDUS, who hath made it his business to restore the *Doctrine* of EPICURUS, and hath made himself famous by raking these *Emptinesses* out of the *Darkness*, wherein they had for many Ages been buried, in his *Animadversions* upon the *Tenth Book* of LAERTIUS, concerning EPICURUS his *Physiology*, doth both by *Reasons* and *Experiments* endeavour to prove, that there are *empty Spaces* in the *World*; which tho' they do not actually contain any *Body*, yet are so dispersed amongst *Bodies*, as to be ready to admit *Bodies* and contain them. Much after the same manner, as a *Vessel* is said to be *Empty*, when it is destitute of any *Liquor*, which yet it is capable of receiving. For if this *Liquor* chance to be emptied out of the *Vessel*, the inward *Surface* of the *Vessel*, which before contained the *Liquor*, must needs remain *empty*; except some other foreign Matter come in to fill up its sides, and be commensurate to the *Dimensions* of the *Body* that fill'd it before. He confirms his Opinion by the Example of a *Heap* of *Wheat*, betwixt the grains whereof many *little Spaces* intervene, which are not taken up by them, forasmuch as their *Surfaces* appear to the *Eye*, to be distant from each other, it being impossible they should lye so close together, but that they must leave some *Intervals* destitute of any *Bodily Substance*.

VI. A Physical and a Mathematical Body do not differ.

BUT GASENDUS doth not seem, in this his Assertion, to have warily enough consider'd the Nature of a *Body*, which doth not only consist in a *Physical* or *Natural*, but also in a *Mathematical Extension*; and which is of that intimacy to it, that it cannot so much as in *Thought* be separated from it. So that *Extension* is Reciprocal with a *Body*; and as there is no *Body* which doth not consist in *Length*, *Breadth* and *Depth*; so there is nothing commensurate to those 3 *Dimensions*, but hath also the Nature of a *Body*.

VII. The Distance that is between Bodies, or the parts of a Body, do not prove a Vacuum.

BUT some will say, We find *little Spaces* betwixt the *particles* of *Bodies*, which because of the diversity of their *Sides* cannot be filled up by them. I grant it; but will it follow from thence, that those *Intervals* or *Spaces* must therefore be *Empty*, or destitute of any *Bodily matter*? For why may they not be fill'd with *Air*, or some other Matter more subtil than it? For if the said *Parts* be distant from each other, and take up *different places*, how can they be conceived to be distant, or truly said to be so, by means of an *Empty interval*? Seeing that according to that Saying amongst *Naturalists*, *Something must always intervene between those things that are distant*. For, seeing that *Distance*, which cannot be found but between things more than one, is a kind of *Relation*; and that every such must have a *Foundation*, it is necessary that the said *Relation* rest on a *real ground* or *basis*: Forasmuch as a *Non-entity* hath neither *Affections* nor *Operations*; and consequently, that which is *Nothing* can never constitute the *Distance* of *Bodies*.

Neither must we assert with some, that *Distance* is founded in the *Bodies* themselves; that are distanc'd from each other, and that *Possible Repletion* is sufficient to constitute it. For from this Supposition we might lawfully infer, that they are at a *Distance* from one another, which way soever they are posited or disposed, seeing that the same *Foundations* do still remain, whether they be distant, or touch one another. Wherefore *Distance* must be assigned to something that is different from the *Bodies* themselves; which seeing it cannot be *Immaterial*, for that it is unextended, we must have recourse to something *Corporeal* that must be the Cause of it.

VIII. Possible Repletion is not sufficient to constitute Distance.

I know very well, that some *Philosophers* do not approve of our assigning triple *Dimension* to be a *Substance*; they looking upon it to be no more than a *Mode*, or *Accident*. For who doth not consider the *Extension* of a *Stick*, to be only a *Mode* of it, and that the *Stick* is the *Subject* or *Substance* which supports it? But it will be easie to shew, that this *Error* is only deriv'd from our common way of expressing our selves; and that it is every whit as absurd to assert it, as if a *Man*, hearing some speak of the *Royal Palace*, should imagine these 2 words to mean 2 things, and that one of them was a *Mode* of the other. But to the end, that all the difficulty we meet with in this business may be cleared out of the way, we shall only take notice, that such is the Nature of a *Substance*, that it can exist without a *Mode*; whereas a *Mode*, on the contrary, doth so depend upon *Substance*, that it cannot exist without it. Now it is apparent, that the *Extension* in a *Stick*, can be without a *Stick*, seeing that there are many *Bodies* that have not the *Form* of a *Stick*, which notwithstanding have *Extension*; but there can be no *Stick*, which is not *extended*. And therefore it is so far from this, that *Extension* can be said to be the *mode* of a *Stick*; that we must rather conclude, that *Extension* deserves the Name of *Substance*, and that the Being of a *Stick* is only the *Mode* of it.

IX. Extension is that which constitutes Material Substance.

Hence it is apparent how foolishly they Talk, who consider *Mathematical Points* in an *Extended Substance*, and will needs have the divisibility of it to be bounded by an indivisible Term or Boundary. For if in any *Line*, by *division* we come to the last *Indivisible*; that being once taken away, if you divide the other *Parts* after the same manner, you will at last come to the like indivisible or unextended *Terms*; and afterwards having made a like *division* of all the rest, you will find nothing else in this *extended Line*, but *Indivisible* or *Mathematical Points*: Which is not only contrary to *Reason*, but also destroys the *Notion* we frame of *Extended Beings*.

X. Nothing that is Indivisible can be conceived to be in a Body.

BUT the *Epicureans* will Object, That the last *Resolution* of *Natural Compounds*, is into the least *Natural Bodies* or *Atoms*; for that otherwise every *Body* would be divisible into *Infinite*, which they suppose to be an Absurdity. For that every thing which is *Divisible*, can only be divided into those *Parts*, which are *actually* in it; and consequently, that if *Bodies* be infinitely divisible, they must have *actually infinite Parts*: And so all *Bodies* will be *actually infinite* in their *Extension*, which no *Man* in his *Wits* will undertake to assert.

XI. An Objection of the Epicureans.

I intend

XII. I intend to give a full Answer to this Objection, in the Fourth Chapter; but shall here demand of these Defenders of EPICURUS, whether an Atom, which they contend is Indivisible, have any parts; or whether it be destitute of all parts, and consequently of Extension? If they affirm the latter, then their Atom doth not differ from a Mathematical Atom. If they affirm the former (for it cannot be denied, seeing that every Atom is endued with triple Dimension, and hath its particular Figure) it is obvious to enquire, whether the parts of an Atom consist of other less parts, and so on to Infinity; or whether at last we must come to the least parts, which admit of no further Division. If they maintain this, they embrace the Opinion of ZENO, and so will be bound to maintain and defend a Mathematical, and not a Physical Atom, which indeed is no better than a meer Fiction; but if they chuse rather to maintain the other, there is nothing in Bodies that is altogether indivisible, nor any Atom, whether it be called Mathematical or Physical.

XIII. Besides, an Atom cannot be conceived to have a Figure, and several Angles really and intrinsically different from each other; for if so, it could not be Indivisible, and consequently no Atom. For is it not evident, that all those things that can be conceived by different Ideas, and that have a real independent Existence, can also be divided and separated from each other? And cannot the Infinite Power of GOD, at least, do as much as our Finite Intellect can conceive? Now our Understanding can conceive 2 Angles of the same Atom under several Notions, and know one of them without knowing the other; and conceives also that several Angles of the same Atom do subsist independently of each other; and therefore it is not to be question'd, but that GOD, by his Omnipotence, can separate these Angles from each other.

CHAP. II.

The Arguments of EPICURUS Answer'd, whereby he endeavours to prove, That there are empty Spaces interspers'd between Bodies.

I. EPICURUS, who confounds Place with a Vacuum or Empty Space, and supposeth that all Bodies have their residence in those Vacuities, is of Opinion, That except there were such, Bodies would have no places to exist or move in. For since a Place is commensurate to the thing placed, and the hollow Surface of that, must be equal to the outward Surface of this: As also, that Place is accounted Immoveable, and that it is repugnant for it to be removed from its position; it follows that Place must always continue the same, even after that the Body, which fill'd it before, is removed elsewhere, and successively takes up other Places; and that therefore it is necessary, that the same be left Empty, and do preserve its Parts immoveable.

II. But EPICURUS was mistaken, in that he supposed a Place to be a Space subsisting of it self, which is equal to the Body placed, in Magnitude, and really distinct from it: For if we precisely have regard to the Notion of a Place, we shall find it

to be nothing else, but a certain Respect of the Situation of a Body, to the Neighbouring Bodies about it; or to others more Remote, from whence it takes its immobility. So that to say a thing is in a Place, or acquires a new Place, is no more than to say, that it attains or acquires such a Situation, with respect to other Bodies. And it is a meer Mistake of the Mind, to imagine a Place to be a certain Capacity or Interval, which Bodies enter into, and leave again; forasmuch as Bodies do indeed bring their places along with them, and upon their Removal take them away again. And therefore we say, that a Body takes up some space, forasmuch as it is of such a Bulk amongst the other parts of the Universe, and is ranked amongst Material things: And that it quits a place, when it ceaseth to keep its Magnitude, Figure and Situation between such and such determinate Bodies.

Another Argument, whereby EPICURUS endeavours to establish a Vacuum, is taken from the Nature of Motion. If, saith he, there be no Empty space in Nature, neither is it possible that there should be any motion; and consequently the whole Universe would be nothing else, but a stiff immoveable Mass, and unable to admit any Bodies into it self. For supposing all Spaces to be full, a Body will be incapable of removing it self from one place to another, but by thrusting another out of its place; so that if we suppose any Body to be moved, it must of necessity thrust another, at least of equal bigness with it self, out of its place; and that also must do as much for another, and so it will be necessary to allow a Process to Infinity, except that some Empty spaces be allowed, into which the Bodies that are in Motion may enter, and, as it were, take up new Lodgings.

This Argument of EPICURUS might be of some force, if there were no other motion, but that which is made in a Strait Line; and if when one part of the Matter is moved, the other following were moved for ever; but daily Experience teacheth us the contrary, and that indeed there is another Motion, that is, a Circular, by which a Body, when it is made, doth drive another out of its place, and that again another and another, till it come to the last Body, which enters the place of the Body that was first moved. Now this Circle can be performed without the supposal of any Vacuum. As suppose we the hollow Circle XYZ, fill'd with 12 Bullets, whilst the first of them A moves, it pusheth on the second B, and that the third, till by continual pushing, the place which was left by the first Bullet, be fill'd by the last Bullet C. And thus we see how motion may be without granting any Empty space, to which Bodies might betake themselves.

If you Object with GASSENDUS, that the Bullet A cannot move, except the twelfth Bullet C be moved also; and that C cannot move, because, in order to its motion, it is necessary that A do possess the place of B, which as yet is not conceived to be empty, and that therefore as long as B continues unmoved, neither can A be moved; and that consequently all the Bullets contained in the Circle will continue unmoved.

upon their Removal take them away.

III. Whether there can be any Motion, without allowing an Empty space.

IV. In every Motion, a whole Circle of Bodies moves together.

Figure 1.

V. An Objection against the Circular motion of Bodies.

VI.
The Ob-
jection An-
swer'd.

I Answer, That this Objection of G A S S E N-
DUS is built upon a false *Supposition*, whilst he
imagins that the *Bullet C* cannot move, except
there be some *Empty Space* whereto it might
betake it self, when it begins to move; since it
may so happen, that at the same *moment* when *A*
enters the place of *B*, *C* may leave its former
place; so that whilst the *Bullet A* passeth towards
B, it pusheth *B* forwards, and *B* that which is next
to it, &c. unto *C*, which at the same instant enters
the place left by *A*.

The thing will be more evident in a *Grind-stone*,
or in an *Iron Circle*, which is moved about its own
Center; for since every part of it doth at the
same instant possess the place which is quitted by
the fore-going, we see there is no necessity to have
recourse to a *Vacuity*. For if this may be done in
an *Iron Circle*, why may it not as well be done in
another, partly consisting of *Wood*, and partly of
Air? Why may not the *Body A*, which we sup-
pose to be *Wooden*, push the *Body B*, which is
Airy, out of its place, and *B* again that which is
next to it, and that again another till it come to *C*,
which will take up the place of *A*, at the very
same time that *A* quits it? The same may be
illustrated by the *Circling* of the *Water* about a
Ship under *Sail*.

VII.
Why Water
sometimes
mounts up-
wards.

Accordingly we find, that as much *Liquor* as
runs out of any *Vessel*, so much *Air* must of ne-
cessity enter into it; and except there be an open
vent for the *Air* to enter, it will be in vain to
endeavour to draw the *Liquor* out of the *Vessel*;
because wherever this *Circular motion* is hindred, it
is impossible for a *Body* to remove out of its place.
Thus when the *Air* is drawn out of a *Pipe*, the
other end whereof stands in the *Water*, the
Water immediately mounts upwards, notwith-
standing that that *motion* is contrary to its *Gra-
vity*.

VIII.
All Bodies
move toge-
ther, tho'
it be in an
Unequal
Circle.

And that it happens thus in every *Circle*, is
easie enough to be conceived, especially where this
Circle is supposed to be perfect, so that all its *Parts*
are at an equal distance from the *Center*. But the
same doth not seem to happen where the *Circle* is
unequal, and whose *Spaces* are different in breadth
and narrowness, as appears in the *Circle E F G H*.
But this Difficulty is easily solved, if it be con-
sider'd that all these *Inequalities* may be compen-
sated or made up by swiftness of *motion*. For sup-
pose we the *Space G* to be 4 times broader than
the *Space E*, and double as broad as the *Space F*
and *H*, it must necessarily follow that the matter
must move 4 times more swiftly at *E*, than at *G*,
and twice as swift at *F* and *H*; and thus, because
the swiftness of the *motion* makes amends for the
narrowness of the *place*, there will in the same
Space of *Time* as much *Matter* pass through one
part of the said *Circle*, as through the other: So
that there is no necessity at all to feign *Empty
Spaces*, or to admit of *Condensation*.

IX.
It is not
necessary,
that all
Motion
should be
Circular.

But when we say that *Bodies* move in a *Circle*,
we must not be so understood, as if we suppos'd
that all *motions* were either *Oval*, or perfectly
Circular; but only that they are called *Circular*,
because the last *Body* which is moved by the im-
pulse of another, doth immediately touch the First
Mover; tho' the *Line* which is described by all the
Bodies that are moved, by the *motion* of that one
Body, be very crooked and irregular.

From what hath been said, an account may be
given of that Experiment so common with Boys,
viz. how it comes to pass that a little round piece
of *Leather* is able to lift up a great *Stone*; the
Reason whereof is, because the *Stone A*, hanging
on the *String B*, by means of the *Leather C*, to
which it cleaves or sticks fast, cannot fall down
from the *Leather*, without the *Air* that is under
the *Stone* be first driven out of its place, and come
into the place of the *Stone*, under the round bit
of *Leather*: But forasmuch as before the *Stone*
can fall down from the *Leather*, there must be a
slit or opening between the *Stone* and the *Leather*,
before there comes to be a greater *Interval* be-
tween them, capable to receive or admit the *Air*,
as being thicker and more expanded, because of the
intercurrent *Aethereal Matter*; it so happens, that
because the *Circle* of *Bodies* is hindred, the *Stone*
of necessity must stick so long to the *Leather*, till
the *Air* be driven away from under the *Stone*, and
get in betwixt the *Leather* and the *Stone*.

X.
How it
comes to
pass, that
a little
round piece
of *Leather*
wretted, is
able to lift
up an hea-
vy *Stone*.

Figure 3.

The Difficulty we have to conceive the *motion*
of *Bodies* where there is no *Vacuum*, proceeds from
a *Supposition* we have taken in, that *GOD* at the
Beginning divided *Matter* into *Equal parts*, *Round*,
Square, *Triangular*, &c. According to which Con-
ceit, we cannot imagine how possibly they could
move, without leaving *Empty spaces* between them.
And indeed, granting this *Supposition*, it could not
be otherwise: But indeed we must go upon a quite
contrary *Hypothesis*, and conceive that *GOD* at the
Beginning, divided the *Matter* into *Unequal parts*,
infinitely differing in *Bulk* and *Figure*; which
suppos'd, it will be easie to comprehend that a
Body may move where there is no *Vacuum*, but all
full of *Bodies*, as well as in a *Vacuum*; for let it
be *Square*, *Round*, *Oval*, or of any other *Figure*
whatsoever, the *Spaces* which are between it, and
the *Bodies* that surround it, will not be empty,
because there will be always *Particles* of *Matter*
Subtil enough for to enter and fill them, and be-
sides will be endued with sufficient agitation to
break them; and by breaking of them, reduce
them to *Figures* proper to fill the places they are
to enter.

XI.
Whence
the Diffi-
culty we
have to
conceive
the Motion
of *Bodies*,
in a *Space*
full of *Bo-
dies* doth
arise.

CHAP. III.

GASSENDUS his Experiments exami-
ned, whereby he endeavours to prove, that
there are *Vacuities* in *Bodies*.

There is no question, but that *Experiments* are
the best *Proofs* of *Philosophical Truth*, and
that those *Principles* are most likely to be true,
which are built and founded upon *Natural Phae-
nomena*, and have them to be the *Witnesses* of their
Evidence. And therefore it is that G A S S E N-
DUS endeavours to prove the *Existence* of *Empty
Intervals* in the *World*, by *Arguments* drawn from
Condensation and *Rarefaction*. Suppose, saith he,
a *Wind-Gun*, and that the *Bore* that contains the
Air is of the length of 2 *Fingers*; there is no
question, but that as much of the *Air* is therein
contained (if no *Empty Spaces* be interspersed be-
tween the *Parts* of the *Air*) as the *place*, or *capa-
city* of the *Bore* is able to contain; so that there
is no part of the *place* so little, to which a part of
Air, of equal *Bigness*, doth not answer, and con-
sequently

I.
Gassendus,
his Expe-
riment
drawn
from a
Wind-Gun,
to prove a
Vacuum.

sequently the parts of both must be equal in Number.

II. Suppose also this Number to be 1000, then let the Air be compressed with an Instrument fit for that purpose, and by that means be reduced to the measure of a Fingers length only. What order will these parts of Air afterwards keep, when at that time, of the parts of Place, there are not above 500 left? Or shall we suppose that 2 Bodies are crowded into one and the same place? This is repugnant to the Laws of Nature, since Impenetrability is the Property of a Body; and it is as much a Contradiction for 2 Bodies to be in the same place, as for 1 Body to be in divers places. Wherefore if the Particles of Air, contained in the Bore of the Wind-Gun, be shut up in a more narrow place, it is necessary that their Sides and Angles should be more closely lodg'd, and fill up the Intercepted Empty spaces; which being once fill'd, it cannot be thought strange, if by this means the Interval be made so much the lesser, and less protuberant than it was before.

III. But GASSENDUS in alledging this Experiment, doth not seem to have heeded the Proceedings of Nature; for tho' naturally Penetration be repugnant to Bodies, yet must not we infer from thence, that there are Empty spaces in Bodies, which may receive the ambient Air, or contain any other Matter; seeing that it is very possible, that amongst the thicker parts of Air, there may be some more Subtil matter, which coming forth from the Pores of Bodies, may make that the Space which seems to be fill'd, may admit other Air. Because the Air that is thrust in by force, doth drive out the Subtil matter; which giving way to it, doth break forth through the Pores of the Gun. Wherefore the Compression of the Aairy parts doth not proceed from the filling of the Empty spaces, but from the Expulsion of the Subtil matter, which gives way to the parts of Air; whilst they come nearer together, and either make the Pores less, or quite take them away.

IV. For this is a Consequence which is deduced from the Nature of a Body or Matter, that when a Body appears under a less Bulk than it seemed to be of before, tho' it doth not appear that any part hath been taken away from it; we must conceive that some very Subtil matter is come forth from the Pores of that Body, and thereby have made the Parts come closer together, and reduced the whole Body to a less compass.

V. The next Experiment produc'd by GASSENDUS, is that of an Aeolipile, which is an Instrument made of Copper, or of some other Metal; the whole hollow whereof is at first fill'd with nothing but Air, which becomes so dilated by being set near to the Fire, that the greatest part of it, breaks forth from it through the Hole D, which Hole is afterwards plung'd into a Vessel full of Water; and as the Air of the Aeolipile becomes condensed again by the Coldness of the Water, the Water riseth to fill it. This being done, care is taken so to place the Aeolipile, as that the lower part of it may rest upon glowing Coals, which causeth the Water that is contain'd in it to be rarefied into Vapours, the first whereof being push'd on by those that follow them, make their escape together with the Air through the said Hole D, with so much swiftness, that they pro-

duce a very sensible Wind, which continues to blow continually, till all the Water be evaporated, or that the Heat do cease to rarefie the Water into Vapours.

Let us suppose therefore the Aeolipile A B C D E, and one part of it A B C, to be fill'd with Water, and the other A E C with Air: Now the Enquiry is, how it can be, that tho' the Water which is contained in this Vessel being rarefied by the Fire, do break forth with great violence through the Hole of it; yet the whole hollow of the Aeolipile, doth still continue as full of Matter as it was before. For if the parts of Air A E C, and the parts of Water A B C, were equal in number before the Aeolipile A B C D E, was put near the Fire to be heated; the remaining parts, after that some of them have been evaporated, must needs take up more place: And therefore like as a Heap of Dust being toss'd with the Wind, becomes diffused and spread abroad like a great Cloud, because of the Air that is intermixt with the particles of Dust, why may not the particles of the Air and Water contain'd in the Aeolipile, being put into agitation by the little Bodies that have been introduc'd, take up the whole Space, which before was taken up by the interspers'd Vacuities?

But to this I answer, that there is no Consequence in all this, because the parts of Water A B C, contain'd in the Aeolipile, are not therefore dilated, because they take up the Empty Spaces, which before were intermixt with the parts of Air A E C; but only because the Aeolipile being set upon the Fire, the heat thereof sets the particles of the Water in motion, and makes them to push against each other, and with great striving endeavour to get further from each other. For the Subtil matter, which hath been introduced by means of the Fire, doth distend and dilate their Pores; so that such as are more closely compressed, and do strive to disentangle themselves, break forth with violence through the Hole D, towards F, and resemble the Blast of Natural Wind. Wherefore the Dilatation of the Water, upon the Surface A C, is only to be attributed to the Subtil matter, which is entred through the pores of the Aeolipile, which agitating the particles thereof, doth not permit them any longer to hang together; according as GASSENDUS himself doth acknowledge in these Words; And this by the Activity of the particles of Fire, which being entred into, and most swiftly tossed between the Sides of the Aeolipile, do not suffer the Parts of the Water to rest; but drives them up and down, this way and that way, so as that they seem to fill the whole Space.

There is yet another Experiment whereby GASSENDUS supposeth that Vacuities are certainly proved: For he considering that a determinate quantity of Salt only could be dissolved in such a Measure of Water, and that having taken in as much as it can, it leaves the rest of the Salt undissolved; this he thinks cannot be solved any other way, than that the Salt being separated into very small particles, doth every way penetrate the Water, and fill the Empty Spaces that are in it; which being done, the further dissolution ceaseth in the same manner, as a Stomach that is already glutted with Food, doth cast up whatsoever is super-added. And forasmuch as the Particles of Salt are not all of one Figure; for those of Common Salt

VI. The second Experiment of Gassendus against a Vacuum, fetch'd from an Aeolipile.

VII. The Experiment of the Aeolipile explained.

VIII. A third Experiment fetch'd from the Dissolution of Sales.

are Cubical or Four-square, those of Atom 8 Corner'd, &c. Spaces of a different Figure must be assigned to them; and that there are such, may be easily proved, because Water already impregnated with common Salt, doth notwithstanding afterwards dissolve and take in Atom, Salt Armoniack and Sugar. Which admission of several Bodies, cannot be imputed to any other Cause, but those Empty spaces which are between the parts of the Water; because when they are once fill'd up, the Water can dissolve no more of these Salts, as having no Vacuities where to bestow them.

IX.
How Salt
is dissolv'd
in Water.

This Experiment would be of some service to GASSENDUS, if he could persuade us, that the Bulk of the Water is not at all increased by the dissolving of Salt, and that it takes up the same Space it did before; whereas indeed daily Experience teacheth us the contrary. For tho' in a Cup full of Water, a certain quantity of Salt may be dissolved, without spilling any of it, yet not without some spreading of its Surface: For it is evident, that by the putting of Salt or Ashes into Water, the Surface thereof swells, and jets out in the midst, in the manner of a Globe. As may be seen in a Weather-Glass, or Glass-Pipe, into which if any Salt be infused, the Water presently increaseth and mounts higher.

X.
Why a cer-
tain and
determi-
nate quan-
tity of
Water, can
dissolve a
certain
quantity
of Salt
only.

But you'll say, If there be no Vacuities in the Water to admit the particles of Salt, how comes it to pass that it is satiated with a certain quantity of it, and rejects all the rest? This may easily be answer'd, by supposing that the parts of Salt are stiff and inflexible, whereof those of fresh Water are very soft and flexible. For when the parts of Salt lye athwart one another, they give occasion to the parts of the fresh Water to run or slide between them, and like Rings to encompass them round, and to dispose them so that they may the more easily glide between them, and continue their motion, than if they were all alone. For the parts of Water being entangled with the parts of Salt, the Subtil matter, by whose force they are agitated, have no other business, but to carry them swiftly round the particles of Salt, which they embrace. Whereas, when they are alone, and constitute the fresh Water, they are so confounded together, that the Subtil matter is forced to employ part of its strength, in variously bending and plying of them; seeing that without the impulse thereof, they continue immovable, and cannot be separated from each other. Forasmuch therefore as the parts of fresh Water are finite, and that the virtue they have to move themselves is limited, it must necessarily happen that after they have encompassed a certain number of the parts of Salt, they will not be able to overcome the resistance of the rest; and therefore the Water being as it were satiated, will not be able to dissolve the superadded Salt; because there are no more flexible parts of the Water, to surround or embrace the particles of Salt, by winding of themselves round about them, and by that means cause a liquefaction of them. This is manifest in Common-water and Aqua-fortis, which can only dissolve a determinate quantity of Salt or Metal; so that if after they have received this proportion, if one should but cast in over and above one grain of Salt, it will remain as much undissolved, as if it was laid up in a dry place.

XI.
The Reason
of all

And for this Reason it is, that hot Water that hath run through Nitrous Earth, and thereby be-

come a Lye, by having taken in a quantity of Crystallizations. Nitre, being removed from the Fire, and let rest for some time, many of the Atoms of Nitre, separated from the rest, begin to cease from motion, and sticking to the inward Sides of the Vessel, do constitute the wonderful 6 Corner'd Bodies; whence we may easily apprehend all the Crystallizations of the Chymists, and how they are done.

It remains now only, that we endeavour to assign the Reason of that Experiment, which TORRICELLIUS made at Florence, as GASSENDUS informs us; which take as follows: Having taken a Glass-pipe of 3 Foot long (according to the description of it in the 17th Chapter of the 5th Part of our Philosophical Institution) 7 Fingers breadth, and 9 Inches long, fill'd with Quicksilver, and having stop'd the Mouth of it with his Finger, he dipt it into a Vessel with Quicksilver, and then found that upon taking away of his Finger, all the Quicksilver did not run out of the Pipe into the Vessel, but continued in the Pipe to the height of 2 Foot and almost 3 Fingers breadth, after having made some Vibrations upwards and downwards, and in the mean time leaving the upper part of the Pipe, not only destitute of Quicksilver, but of any other Body whatsoever.

This Experiment, tho' it be highly esteemed by some, as that which seems manifestly to evince a Vacuum; yet is it of no account with those who admit pores in Bodies, which are penetrable by the Subtil matter, and take up those places which are quitted by Grosser Bodies. For such is the Nature of the Matter of the First Element, that it doth not only pierce Glass, but even Diamonds and Steel it self, and any other hard Bodies whatsoever. For tho' Glass may seem to be destitute of Pores, yet it cannot be question'd but that it is endued with continual Pores, without any interruption; which is evident from its Transparency. For when it is in fusion and liquid, the Subtil matter flowing around all its parts, doth form innumerable pores in them, through which the Globuli of the second Element do enter, and diffuse the Action of Light every where. Where tho' that Space in the Pipe, which is relinquish'd by the Quicksilver, seems to be Empty; yet nothing hinders, but that it may be fill'd with some very Subtil matter, which is not subject to our Sight. Neither was GASSENDUS ignorant of this, who in his Explication of this Experiment doth allow, that the Bodies of Heat and Cold can penetrate into the Hollow of the Pipe. And he holds the same concerning the Light, which he owns to be a Corporeal Substance, and a very thin and Subtil matter which passeth through the Sides of the Glass. Wherefore it is without all Reason, that from hence he endeavours to prove Empty spaces, seeing that in those Intervals that are fill'd with Subtil matter, there is as much room to admit other Bodies, as if it were altogether empty, and without any Body at all in them.

Moreover who doth not know, that Nothing is not capable of any Properties; but if Fire be apply'd to the upper part of the Pipe, we shall find a like Rarefaction to be produc'd there, as we perceive in the Weather Glass, and by means whereof the Quicksilver is driven downwards. When it is very clear, that there is some true Matter there, which is the Subject of this mutation.

That there
is no Va-
cuity in
the Glass-
Pipe.

XVII.
There are
no Bodies
in Nature,
that are
exactly
perfect.

XV.
How the
Existence
of such a
Subtil
Matter
may be
proved.

Now such a *Matter* as is much more subtil than *Air*, not only *PLATO* and *ARISTOTLE*, but all the ancient *Philosophers* have owned, which enters the *pores* of all *Bodies*, and intimately influences it self into them: For by means hereof the *Juices*, which during the *Winter season* the *Earth* conceals in her Bosom, being agitated upon the approach of the *Spring*, do pierce the *pores* of *Plants* and *Seeds*; but after that the too great increase of *Heat* hath more dilated the *Pores*, or that the *Cold* hath overmuch straitned them; then the *Juice* either passeth directly through them, or by reason of the narrowness of the *Pores*, cannot enter them at all; and consequently the *Seeds* or *Plants* must dye. So that in the whole *Vegetation* of *Plants*, we meet with nothing, but a *motion* derived from this *Subtil matter*, and proceeding according to certain *Rules*: So likewise it is an effect of this *Subtil matter*, that *Glass* taken out of the *Furnace*, and set in a *Cold place*, presently breaks to shivers, because the *Pores* of the outward *Parts* are sooner shut up by the *Cold*, than those which are more inward; and therefore the greater parts of the *Subtil matter* that are shut up in them, hinder the *Egress* of the rest. Neither probably is there any other *Reason* to be assigned, why *Glasses* break of themselves. And to this we may likewise add, that it is from this *Subtil Ether*, that *fluid Bodies* are enabled to preserve their *Mobility*, and do presently corrupt, whenever their *motion* is disturbed or interrupted: For the principal Office of this *Substance* is, to dispose and incline the *Parts* of *Bodies*, and more especially such as are *fluid*, to the *Laws* of its *motion*. Neither can any thing else preserve the certain and natural *motions* of any *Body*. Conclude we therefore, that nothing hinders, but that the *Subtil matter* may enter through the *Pores* of the *Glass*, and fill that part of it which the *Quicksilver* hath left.

XVI.
The fifth
Argument,
taken from
united Bo-
dies.

LUCRETIVS seems to have found out a stronger Argument than all the rest, for the Proof of a *Vacuum*, which is this: If two most exactly polished *Bodies* be apply'd to each other, and touch one another, it will be impossible to remove the one from the other, but that at the same Moment the whole *Surface* of the one would be removed from the whole *Surface* of the other. For tho', it may be, in one part of the said *Surfaces* they might be more distant than in another; yet as soon as they began to open, they would no longer in any part touch each other, save in the opposit extrem Line: For otherwise the said *Bodies* could not be smooth and even, but crooked and uneven, which is contrary to this *Hypothesis*. Which being supposed, let the *Air* move with never so great swiftness, yet it can only successively pass the *Space* which is from the utmost Edge of the *Surface*, to the midst of these *Bodies*; and therefore it is necessary, that at that point of *Time* wherein the *Air* passeth the Edge or Brim, there must be conceived an *Empty space* reaching to the midst of the *Surface* of those *Bodies*, which is not filled, but during the Consequent Moments of *Time*.

XVII.
There are
no Bodies
in Nature,
that are
exactly
polisht.

GASSENDUS takes this Argument to be convincing, and that it doth not admit any Answer; but if we well examine what it supposeth, we shall discover it to be false and without any ground. For it supposeth 2 *Bodies* exactly polisht, when himself (*Phys. Sect. I. Lib. 6.*) denies, there can be

any such: For tho' *Marble*, *Iron*, *Wood*, and other such like *Bodies*, in which we can perceive none of the least unevenness, neither by our *Touch* or *Sight*, seem to be most exactly polisht; yet *Reason* will tell us, that they must of necessity be very uneven, because all this polishing is the effect either of *Grains* of *Sand*, or of the *Prominencies* of *Files*, which cannot but leave *Cavities*, and consequently an uneven *Surface* behind them. And therefore it is not at all probable, that there can be found any 2 *Bodies* so even, hard and perfectly polisht, as that no *Air* should be intercepted betwixt them. But if ever 2 *Bodies* exactly polisht happen to be joyned together, then can they not be separated by pulling the one of them upwards perpendicularly, but it will be necessary to draw the upper *Body* away *Sideling*, and by this means the separation of these *Bodies* is performed, not in a moment, but successively; so that the *Air* doth not easily and readily succeed in the place that is left by them.

CHAP. IV.

Of the Divisibility of Bodies.

EPICURUS, who asserts that *Material Substance* is compos'd of *Atoms*, and to which he assigns the Rise and End of *Things*; imagin'd that *Bodies* were capable of being divided so long, till at last we come to such smallest *Bodies*, as by reason of their *Solidness*, do exclude any further division, and by no *Natural Force* can be any more resolv'd into *Parts*, as *AUSONIUS* hath it:

The Principles of all this Building tight,
Are very small, and such as scape our Sight;
Consisting all of Ranks of Atoms fit,
Which solid are, nor parting do admit.

This Opinion *GASSENDUS* endeavours to defend, deriving his Argument from the Dissolution of *Concrete Bodies*: For as we see, saith he, that Nature resolves *Bodies* into exceeding small *Particles*, and in this dissolution proceeds only to a certain number of them; so we ought to conclude, that Nature doth not still divide *Bodies* smaller and smaller to *Infinity*, seeing that her *Force* is bounded, and within a short time becoms exhausted, and ceaseth; and therefore after the utmost of her Activity there must remain *Indivisibles*, and that cannot admit any further Partition.

I know very well, that *GASSENDUS* doth not attribute a *Mathematical Indivisibility* to *Atoms*, but only supposeth them to be *Indivisible*, because of their *Solidity*, and the indiscernible cohesion they have of their *Parts*; but which way soever *GASSENDUS* may endeavour to explain *EPICURUS* his Sentiment, *Indivisibility* seems to be repugnant to the Nature of a *Body*. For *Divisibility* is the Property of every *Material Substance*, and so intimate to it, that it doth immediately and essentially follow the same: For if we carefully heed the Conception we have of a *Body*, we shall find it to be something *Extended*, and *Commensurate* to 3 *Dimensions*: But how can it be that that which is *Extended*, and consists of *Longitude*, *Latitude* and *Profundity*, should not be *Divisible*? Conclude we therefore, that every

Body

I.
Divisibility
is a Pro-
perty that
agrees to
all Bodies.

II.
Gassendus
his Opinion
concerning
the Divis-
ibility of
Bodies.

III.
An Indi-
visible
Body is a
Contradi-
ction.

Body is Divisible, and capable of an indefinite Division, so as that it can never be exhausted by any Partition whatsoever.

IV. *Forasmuch as infinite Points are assignable in a Body, it must follow, that every Body is infinitely Divisible.* This Division is variously demonstrated by Mathematicians: We shall give you one Instance, that may serve instead of the rest. Let us suppose parallel Lines A B and C D, and the same as to their length Indefinite, and a Fingers breadth distance from each other: This suppos'd, the Line E F, which intervenes between the foresaid Parallel, and that perpendicularly, must of necessity be a Fingers breadth long. Then taking the Point A, of the Line A B, which we will suppose also to be a Fingers breadth distance from the Line E F; let us take above the Line C D, to the Right hand of the said Line E F, as many Points as we please: As for Example, G, H, D, &c. distant from each

Figure 4. other at pleasure; and let us conceive, that from the Point A, so many Right Lines do proceed, as to reach to the several Points G, H, D, &c. This granted, it is manifest that the Line A G, will cut the Point I, of the Line E F; the Line A H, the Point L, a little Higher, and the Line A D, the Point M, which surpasseth the former, or is drawn about it; and so of the rest. But because the Line C D, is Infinite, and that therefore an Infinite number of Points may be taken in it, it follows, that all the Lines that shall be drawn from the point A, to all the foresaid points, will denote Infinite points in the Line E F, and they different amongst themselves, and which will still more and more approach to the End E, yet so, as that none of all the said Lines will ever pass through the point E; because it is suppos'd that the Line C D, is parallel to the Line A B. Whence we conclude, that since an Infinite number of Points can be assigned in a certain determinate portion of Matter, that Matter is infinitely divisible.

V. *How it comes to pass, that all Bodies are not Equal, seeing that all are infinitely Divisible.* Some one or other, it may be, will object in favour of GASSENDUS his Hypothesis; that if it belongs to the Nature of a Body, to be Divisible to Infinity, it will follow, that any Body will be equal to another, which is double its Bigness: But what greater absurdity can there be, than that 2 Bodies of different Magnitudes should be Equal? and consequently it must be false likewise, that they are both of them Infinitely Divisible. The Major is evident, because there is an Infinite Divisibility in the Smaller Body, as well as in the Greater, which notwithstanding is twice bigger than it.

VI. *A Finite Mind cannot determine any thing concerning that which is Infinite.* This Objection may be answer'd, First, by saying with DES CARTES, in the First Part of his Principles, Article 26, That we need not trouble our selves too much, to explain or extricate these Difficulties, which are not proportionate to our Intellect, and which cannot perspicuously and distinctly be conceived by us. For it appertains only to Infinite Mind, to understand that which is Infinite, and to determine any thing concerning it. Wherefore it would be a great piece of Folly, to reject the clear Notion we have of the Nature of a Body, as false; because we are not endued with an Infinite Understanding, and therefore cannot comprehend that which is Infinite. Wherefore also DES CARTES considers all those things wherein we can perceive no Bounds of Extension, not as Infinite, but as Indefinite; because they can be indefinitely divided, and we can never come to the last part of them.

Or, Secondly, we may give this Answer to the foresaid Difficulty, that the Divisibility which is in the lesser Body, is not so much as that of the greater Body, which is twice as big; that is, the lesser Body cannot be divided into Parts, that are as big as those into which the greater is divisible; but yet it may be divided into as many; because Bodies are not said to be Divisible with regard to their Continuous Quantity, but with respect to their Discrete Quantity; for the Thousandth part of one Body may be divided into other 1000 parts, no less than the whole Body: Forasmuch as the Divisibility of a Body, or its aptitude to be divided, is not diminished by actual Partition, no more than the Faculty of Writing or Painting grows less in a man, whilst he writes upon Paper, or paints upon a Board or Cloth.

VII. *Two Bodies of different bigness, may be divided into as many parts the one as the other, tho' not into as great parts.* It will seem a Paradox to some, that there should be as great a number of Parts in the little Body of a Mite, as in that of a Horse, an Ox, or an Elephant; yet if we will be pleased to make use of a good Microscope, we shall find that the Body of a Mite is every whit as Organical, as that of the most bulky Animal; for we find it hath a Bill, with a long Trunk, wherewith it pierceth the Skin, and draws Blood thence for its Aliment. It is seen also sometimes to cast forth Dung, of the bigness of a Flea; besides which many Asperities may be perceived, as well on the outside, as on the inside of its Skin, and 2 branching Horns on its Forehead, and 6 Feet on each side, like to those we see in Crabs, long-wise extended from the sides of it, 2 whereof support the fore-part of this little Animal, and the other 4 the hind-part. But tho' all these outward parts of this little Animal be considerable for their number, yet are they but very few, if compared with many parts which lye hid in the inside of it. For it must have a Stomach, Guts, a Heart, a Brain, wherewith to perform the Functions of Life. It must also have Veins, by which its Aliment may be conveyed throughout all the parts of its Body; Arteries, to convey the Vital Spirits; and Nerves, to convey the Animal; besides, Muscles, Tendons, Joints, and innumerable other parts conducive to its Nourishment; Sensibility and Capacity of moving itself, and exerting all the other Functions of Life. All which Parts, tho' they be very small, yet are they no less divisible than those which are much greater, because they are extended, and separable into Parts.

VIII. *There are innumerable parts in the Body of a Mite.* Wherefore seeing that the Demonstrations concerning the Divisibility of the Matter are clear and evident, we may assert, that there may be Bodies, yea, and Animals too, still less and less than others, and that into Infinity, tho' our Imagination can frame no Conception of them: For why might not we say with sufficient certainty, that all Animals are in little in their Seed? Seeing that we see in that which we call the Treadle of an Egg, (which was never set upon) a Chicken, which for ought we know, is entirely formed; and that we see whole Frogs in the Spawn of Frogs. It is also very probable, that in the Bud of a Mustard-seed, and of the Kernel of an Apple, by Example, there are infinite Trees; because it not only contains the Tree, whose Seed it is, but also a vast number of other Seeds, which it may be, contain within them also other Trees, and other Seeds; which other Seeds do probably contain still other and more Trees,

IX. *GOD can produce Animals infinitely lesser and lesser, than others.*

Trees; and other Seeds, as fruitful as the first were, and this to Infinity.

Neither may we only conclude, that Plants are contained in the Buds of their Seeds, but that all the Bodies of Men, and of Animals, that shall be born for the future, even to the end of the World, probably were produced from the first Beginning of the World: I mean, that the Females of the first Animals, have probably been created, with all those of the same Species, which they have already brought forth, or shall do to the end of the World.

CHAP. V.

Of Loose and Close Bodies.

I. A Sponge, by letting in of Water, or any other Liquor, swells and is puff'd, and spreads it self into a larger Bulk.

Some suppose that a Sponge is rarefied by the increase of some new Quantity; as if nothing of Foreign Matter did enter into it, but only that some supervening Quantity doth separate the parts of the Sponge, and increaseth its bigness. But who can believe that when Water is rarefied, and in a manner turned into Air, it is only thus dilated by the increase of new Quantity? Who perceives not that the Sponge sucks in Moisture, and hides the same within it self, which afterwards upon the squeezing thereof, runs out again; whereupon the Parts come closer together. A Sponge therefore becomes rarefied or dilated, when the parts of it are somewhat removed from each other, and that the Pores of it are fill'd with supervening Water. And the same Sponge again grows close, when its Parts are brought nearer together, by the Expulsion of that Matter, which before kept them at a greater distance. So that a Sponge may not only be said to be a Loose Body, whilst it is dry and free from all Moisture; but also, and more especially, when it hath all its Pores fill'd and stuff'd with Foreign Bodies.

II. Glass becomes dilated to a greater Space by Heat, than Metals; and of Metals, Iron is more dilatable than Copper; Copper, more than Silver; Silver, more than Gold; and Pewter more than Lead.

The Reason of all which must be fetch'd from the greater Porosity of those Bodies that are more light than others; for the more Pores there are in any Body that is capable of being Rarefied, the more Bodies may insinuate themselves into it, and by this means it becomes rarefied or distended.

III. The Curious Searchers of Nature observe, that the Motion of Rarefaction is more intense at the beginning, and more slow and remiss towards the end thereof. They produce several Experiments to prove this; and more particularly from that of Weather-Glasses, expos'd to the Heat of the Sun, uniformly, and continually applied to them; or set in Water that is kept in the same degree of Heat.

The Reason whereof is, because Rarefaction being caus'd by the admission of some thin Substance into the Pores, the more the said Pores are dilated by the violent ingress of new Matter, the more the Parts of the Body rarefied become distended, and therefore do still more and more resist and oppose any further distension.

IV. Gates and Doors frequently cannot be shut or opened, in Moist weather, without some difficulty:

Whereas the contrary happens in the Boards whereof Barrells are made, which when expos'd to the Air in Dry weather, do open and make the Vessels to become leaky.

The Reason is, because Gates or Doors do swell in Wet weather, for that the Water, or the Air fill'd with watry Vapours, penetrates the Pores of the Wood, and distends the Sides of them, which being dilated, the whole Bulk of the Body must needs be distended likewise, and take up a greater Space than it did before. In like manner Linnen-Cloth is rarefied by the Accession of Water, Water by that of Air, Air by that of Ether, and Ether by that of a more subtil Body, if any such there be, and by this means take up more Room than they did before.

Thus also the Strings of a Violin, or other Instrument, do swell in Moist weather, as appears by their breaking, and by the difficult winding of the Pegs. In like manner wooden Bowls are apt to get Slits, if they be put into Water, and the Water penetrate them. Some very credible Authors relate, that Earth taken up from those parts that are near to the River Nile, do increase every day in weight, from the time when that River begins to swell, until it be arrived to its greatest height. Which cannot proceed from any thing else besides the Air; which being condensed at that time, and clogg'd with watry Particles, doth increase the weight of the Earth.

By the same means an Obelisk at Constantinople, which was got out of its place, was put to rights again; for the Artificer, who had undertaken the Work, having caus'd very strong and thick Ropes to be tied to the Obelisk, and fastned to some strong Hold fast, caus'd the said Ropes to be moistned, by pouring great quantities of Water upon them, which caus'd them to swell, and consequently shortning their length, lifted up the Obelisk to its former situation upon its basis. For Ropes, consisting of long and twisted Threads, by admitting the Moisture into their Pores or Intervals, the more they swell in thickness, the more contracted their length is.

It is after this manner that Mill-Stones are separated from the Rocks. For they make abundance of Holes about the said Rocks, into which they drive wedges of Wood that have been dried in an Oven; which Wedges being placed around in the form of a Cylinder, according to the bigness that we would have the Mill-Stones to be of, when Moist weather comes these Wedges swell, and by their swelling separate the Mill-Stones from the rest of the Rocks; so that it is evident, that this Separation is made by the Vapours, which would be very difficult to perform any other way.

The Staves of Barrells take up less room in Dry weather; for seeing that their Parts are agitated by Heat, some of them fly away into the Air; which being gone, it is no wonder if the rest come closer together, and do not take up so much place as they did before.

Take a Bar of Iron, for Example, of 2 Foot long, and a Stick or piece of Wood of the same bigness; then put the Iron Bar into a strong Fire, till it be red-hot, and then compare it with the piece of Wood which was of the same dimensions with it, when it was first put into the Fire, and you'll find the Iron to have been increased, not only in Breadth, but in Length also, and in both

that Gates and Doors do easily shut in dry weather, and more hardly in Moist and Rainy.

V. Why the Strings of an Instrument do swell by the Moistness of the Air.

VI. How an Obelisk, moved out of its station, was put to rights again.

VII. How Mill-Stones are separated from the Rocks, and what they were a part.

VIII. Why the Staves of Barrells are contracted in hot and dry weather.

IX. A Bar of Iron put into the Fire, swells and becomes distended.

to exceed the Piece of Wood which was equal to it before; but as soon as it is grown cold, we shall find it restor'd to the same dimensions it had before it went into the Fire.

The Cause whereof is the subtil Body, which enters the Pores of the Iron, viz. the particles of Fire, which dilate it to a greater Extension. For the parts of Fire being in continual motion, must needs distend the Sides of the Iron Bar; which when expos'd to the Air, and being cooled, returns to its former Extension, because the particles of Fire leaving its Pores, and those of the Air entering into them, and not being moved with the swiftness and violence that those of the Fire are, they do less distend them, and consequently the Bar of Iron must take up less room than it did before.

X. Hence also it is, that with a Red-hot Iron, or with a piece of Packtred dipt in Brimstone and set on fire, Glasses are cut; because the particles of the Glass being agitated by the heat of the Fire, require a greater Space, and consequently drive their contiguous Parts further from them. And it is for the same Reason, that Metals in fusion swell, and take up more room than they did before.

XI. Water, by the virtue of the Sun, is lifted up into the Air, and becomes thereby so diffused, as to take up a greater Space than it did before; for if we may believe the account that some give us, an hundred Water turned into Vapour, fills a Space 100 times larger than that was which it took up before.

The Cause of which Diffusion is not to be attributed to the parts of Water, as some falsely do imagine; since it is impossible that the Dimensions of a thing should be increased, except that some other Body be added to it. And consequently the Water becomes dilated, when its Parts remove farther from each other, and so give way for the entering of some Foreign Body between them. After the same manner as when a Heap of Dust, by the Wind is lifted up, and dispersed in the Air. For this Expansion is not to be attributed to the particles of Dust; but to the Air, which fills the Intervals between them, and separates the particles of Dust from each other.

XII. Condensed Bodies, and such as after Rarefaction are reduced to a less Room, are commonly of a white Colour; as Butter, Grease, Oil, and such like.

The Reason whereof is, because in Condensation those particles are expell'd, which swell'd the Grease or Oil into a greater Room, whereupon their parts must needs come closer together, and be contracted, as it were, into small round Pellets, which afterwards, like so many round Looking-Glasses, do reflect all the Light, and produce a white Colour in the condensed Subjects. For there are two things especially, by means whereof Bodies acquire a white Colour: The First is, That they consist of little and innumerable Surfaces, disposed to receive and reflect the Light in such a manner, as that it may suffer no loss, either by Refraction, or by the mixture of Shadow. The Second is, That the whole Light which shines upon a Body be reflected, without having any Beams swallowed up in the Pores of it. To the effecting whereof little round Bodies do conduce most; as will appear, when we come to speak of Heat.

New Beer or Wine, if it be put into Bottles, doth swell and work with that Violence, that it frequently breaks them.

Which Fermentation is caused by the Heterogeneity, or the Diversity of the parts of Liquor; which cannot unite together, by reason of the variety of their figures, and therefore endeavour to extricate themselves from the Society of each other. And that this is the true Cause of the Fermentation of Liquors, appears from hence, that after these Liquors are separated from their Heterogeneous parts, they are no longer agitated with any such tumultuary Motions; as is evident in Burning Spirits, Distill'd Water, and the like; which may be kept a long time without suffering any Change. For the Spirit of Wine being kept closely stopp'd, is not capable of any agitation of its parts; but if a little Turpentine be mixed with this Spirit, the parts presently begin to tumultuate, and endanger the breaking of Vessels Hermetically sealed.

If Bread be made out of the Flower of grown or sprouted Wheat, it will ferment and rise without the addition of any Leaven of Yest.

The Cause whereof is, because the stiff and sharp particles of sprouted Wheat do infold themselves; and, as the Chymists express it, are in their greatest Exaltation: Wherefore, as soon as the Dough begins to grow hot in the Oven, the parts thereof become tumultuously agitated, and driving the resisting Bodies before them, do in a manner precipitate them, and by this means the Bread becomes spongy and light.

Let a Weather-Glass be fill'd with Aqua-fortis; but so as that when fill'd, there may be some Space left, taken up by the remaining part of the Air, which was before in the Glass, Tube or Pipe: You'll find that this part of Air, being dilated by a more intense Heat, upon the recess of the Aqua-fortis, retiring it self into the lower Head of the Tube, will fill the whole Capacity of the Tube; and that on the contrary, by Cold it will be contracted into so narrow a room, as that the whole Tube almost will seem to be filled with the Aqua-fortis.

Which Variety proceeds from the continual ingress of new Matter through the pores of the Glass, which doth so rarefie the impure Air contained in the Glass, that by the separation of its particles from each other, it drives the Aqua-fortis, being unable to resist its place; whereas upon the egress of the subtil Matter through the Pores of the Glass, the particles of the Air coming then closer together again, the Aqua-fortis returns to its former place, being drawn into it by the Air that enters at the lower end of the Glass. And if the weather be very Cold, that part of the Air which is in the upper part of the Glass, upon the recess of the subtil Matter, doth so greatly decrease, as that the whole Glass becomes fill'd with the Aqua-fortis.

A Chest-Nut put into the Fire, first swells, and soon after bursts, giving a great Report: Which doth not proceed from any foreign Matter that enters the Chest-Nut, but from the grosser parts of it, which the action of the subtil Matter entering into the Pores thereof, separates from each other, and doth so agitate, that at last they burst the Shell with a great noise.

XIII. What is the Cause of Fermentation in New Beer or Ale.

XIV. Bread made of sprouting Corn ferments of it self.

XV. How the Air comes to be condensed or rarefied in a Weather-Glass.

XVI. Why a Chest-Nut cast into the Fire breaks with a great noise.

Of Bodies.

XVII.
How a
Marble
Pillar was
broken to
shivers.

In like manner, a vast *Marble Pillar* mentioned by *CABÆUS*, was broken all to shivers, by kindling a *Wood Fire* round about it: For the heat of the *Fire* rarefying the *Air* contained in the *Pores* of the *Marble*, makes, that it cannot be lodged in the narrow Room it took up before, and therefore in striving to get forth into a large Space, it breaks and rends the *Marble* to pieces.

XVIII.
The vast
dilatation
of a grain
of Gun-
powder.

This *Dilatation* of *Bodies*, is the Cause sometimes that a very small *Body* becomes diffused into an incredible distension; as we see in *Smoak*, *Vapours* and *Flame*, which *Dilatation* is so great, that one Grain of *Gun-powder*, according to the Demonstration of *Job. Chrysoft. Magnennus*, when kindled, becomes dilated into a *flaming Sphere* 3804 times greater than it was.

CHAP. VI.

Of Hard and Fluid Bodies.

I.
Whence
the Hard-
ness of
Stones and
Gems does
proceed.

BOdies are distinguished by *Hardness*, as *Stone*, *Wood*, *Whet-stone*, *Pumice-stone*, *Gems* or *Precious Stones*; some whereof are broken with ease, and others not without great difficulty.

We account those *Bodies* *Hard*, the parts whereof are at Rest together, and are so closely united, as that they are not interrupted by any other *Matter* moving between them. And accordingly those things are accounted the most hard and firm whose parts are inflexible, and touch one another. And therefore *Precious Stones*, tho' they all agree in this, that the *File* will not touch them; yet some of them are harder than others. For some of them are polished with *white Lead*, others with *Copper*, others with *Emery*. Thus we find a great difference there is betwixt a *Diamond* and *Crystal*, tho' both of them proceed from the same Matter, and grow in the same places; because *Crystal* is much more soft, its *Parts* being not yet firmly grown together, but agitated with various Motions. Whereas the *Diamond* is much more firm and compact, by reason that its insensible parts do more immediately touch each other, and are more intimately and close entangled by mutual cohesion.

II.
A Hard
Body sus-
pended in
the water
moves
more
swiftly in
a Right
Line, than
the Water
it self doth.

When a *Hard Body* is suspended in the *Water*, if the *Water* move in a right *Line*, the said *Hard Body* will move more swiftly than the *Water* following the same *Line*.

The Reason whereof is this, because all the parts of a *hard Body* have but one and the same determination, and the several parts of the *Water*, or other *Liquor*, have every one of them theirs, which greatly retards their motion in a *Right Line*.

III.
A Hard
Body, that
swims upon
the water,
moves more
slowly than
it self doth.

And on the contrary, a *hard Body*, that swims upon the *water* of a *River*, moves less swiftly than the *River*: For tho' all the parts of the *Hard Body* have but one only determination, and those of the *Water* have many; yet is this over and above recompensed, by the less degree of Solidity in the said *Body*, which is the Cause that it keeps above the *water*, and so has fewer parts of *water* to push it forwards, and more of *Air* or subtil Matter to resist its motion.

Bricks, made of *Clay*, become harder by being burnt or bak'd in the *Fire*; notwithstanding that after their *Burning* they have larger *Pores*, and that their parts are further distant from each other.

I suppose, that this hardness of the *Bricks* is caused by the action of the *Fire*, which not only drives out of their Cavities the parts of *water*, which I conceive to be long and slippery, like little *Eels*; but also all their other fluid Parts, which are not very close joyned together. Whence it comes to pass that these being taken away, the remaining parts come closer together, wherein the Nature of *Hardness* does evidently consist.

From this new entanglement of the Parts it comes to pass, that many *Plants* in *Brazile*, which whilst they stand in the Ground are very soft and flexible, being pluckt up, within a short time after become inflexible and very hard. I remember to have read somewhere of a certain kind of *Clay*, which as long as it lies at the bottom of *Rivers*, and is covered with *water*, is very pliant; but being taken up into the *Air* grows hard immediately, and becomes very firm and stiff.

Yea, what is more, we find sometimes that *Pieces of Wood* are turn'd to *Stone*, and that by means of a petrifying Juice, which being got into the pores of the *Wood*; and the watry parts of the said Juice being exhaled, leaving the *Earthy* and *Stony* parts in the Pores of the *Wood*, impart to it the Weight, Hardness, and other Affections of *Stones*. For *Wood* thus changed into *Stone*, becomes thereby almost 6 times more ponderous than it was before; and the remaining parts of *Wood* are so closely entangled and joyned with the superadded Sandy particles, that they can no longer be consumed by the *Fire*.

It is an unquestionable Truth, that *Bodies* which are agitated with a slow and intestine motion, do in process of time grow more hard and solid. For the *Wood* whereof *Musical Instruments* are made, require much time before they can be brought to the highest disposition and fitness for that use, even from the time of 20 to 80 years sometimes. They who make *Vessels*, and other *Urensis* out of *Guajacum*, tell us, that they must let it lye 20 years before it be fully fit for some of their uses. So much time is required, that all the Volatile and watry Particles being exhaled, the solid Parts may come more closely together, and attain that fit firmness and dryness which is necessary for them.

Water becomes congealed into *Ice*; *Broath*, *Blood*, and the like into *Jelly*, and attain all of them to some degree of Firmness. Which happens, because their Particles, upon the ceasing of the outward agitation hang together, and more closely embrace one another. For *Blood* and *Broath* become more firm by the Exhalation of their thinner Parts, the thicker staying behind, which being closely entangled together, are fixed by the rest. The same we experience likewise in *Oil of Anniseeds*, which in the heat of *Summer* continues fluid, and stands in need of a *Vessel* to contain it; but at the approach of *Winter*, when the Solar Beams do more weakly beat upon the *Earth*, it becomes a *hard Body*. So likewise *Milk*, which of its own Nature is fluid, and doth easily insinuate it self into other *Bodies*, yet becomes coagulated

into Cheese, when the slender, stiff and sharp Particles that are in the Rennet, have penetrated the substance of the Milk, which by agitating the particles thereof, drive the branchy flexible parts together, and by their weight expel the smaller particles of Whey out of their places. Milk also is turned into Butter, when the parts of Cream being agitated by perpetual Churning, are separated from the rest, and by their Branchy particles entangling together, do unite into one continuous Body.

IX.
Why Water riseth higher in the lesser Branch of a crooked Glass-Pipe, than in the greater.

Figure 5.

The water which is in a Crooked Pipe of Glass, riseth higher in the less branch of it, than in the greater. Because there are more Lines of Air, that act upon the Liquor that is in the great Branch, than upon that which is in the lesser: Whence it follows, that if the Liquor stop in the great Branch at A B, it will not stay in the lesser at G E, which is level with A B, but will mount upwards towards D, where I suppose that the weight of the water, which is above the Level G E, doth compensate or make good the inequality of the pressures of the Lines of Air, which act upon both the Branches. Wherefore seeing that this Inequality is by so much the greater, by how much the Mouth of the little Branch is less, or narrower, because the lesser the Hole is, the less power the Air hath to exert its activity upon it; therefore the less the Hole is, the higher will the water mount above the Level. This is no more than Experience confirms to us: For when the Pipe is about the thickness of a Quill, the water mounts only the height of 2 or 3 Lines; whereas if it be so small that scarcely a Horse-hair can enter it, the water will mount the height of 10 or 12 Inches above the Level.

X.
Salt is dissolved in Water, by the motion of it.

Salt melts in Water, notwithstanding that it is more ponderous than Water, and sinks to the bottom.

Which happens, because the parts of Water being in continual motion, do insinuate themselves into the particles of Salt, and having dissolved their connexion, do separate them from one another and spoil their Continuity. For this melting or dissolution of Salt, cannot be brought about without motion: For tho' the Water, which is contain'd within the Hollow of a Glass-Vessel, seems not to move; yet considering the fluidity of Water, we must conclude, that some of its insensible Parts are continually moving upwards and downwards, as well as from side to side of the Vessel: By which agitation the parts of the Salt become dissolved, and are separated from each other.

XI.
How Metals are dissolved in the Stygian Waters.

Thus also Metals are dissolved in Acid Spirits, and that within a short time. And for the same Reason it is, that when Oil of Tartar per deliquium is insill'd into these Stygian waters, it produceth a great ebullition or effervescence. And it is for no other Cause, that Bread or any other spongy Body, if it be but slightly dip't in water, is spoiled thereby, than this, that the Particles of the water being in continual agitation, do enter the Pores of those Bodies, and by this means make a separation of their parts from each other.

XII.
How fluid Bodies come to be hard.

Liquid Bodies do frequently become hard and firm: Thus the white of an Egg, by boiling, becomes hard.

This Hardness proceeds from the Contexture and Figure of their parts, whereby they are so

adapted together, as to cling to one another as it were with Hooks and Holdfasts, so as that afterwards they can no more continue their motion. Thus the most highly Rectified Spirit of Wine, and the Rectified Spirit of Urine, being poured together, joyn and coagulate in the form of Snow. Because the dissolved Sulphur, which constitutes the Spirit of Wine, having insinuated its little Branches into the Pores of the sharp Volatile Salt of the Spirit of Urine, doth so link the parts together, and reduceth the Pores of that Compound to such a narrow compass, that the Matter of the First and Second Element, which passeth through them, is not capable of imparting to those Liquors their ordinary Fluidity; and by this means are reduced to the consistence of a kind of Hard Body. The same effect is also produced by mixing Spirit of Wine with the beaten White of an Egg. And it is for the same Reason that Spirit of Turpentine, after reiterated Distillations, is turned into a hard Body.

Common-water, that hath run through Earth that is impregnated with Nitre or Saltpeter, and set upon the Fire to boyl, continues as Liquid as ever; but being removed from the Fire and grown cold, it sets a Mass of Salt, and becomes Crystalliz'd.

The Reason whereof is, because the Water being grown cold, many of those particles of Salt, which were agitated by the heat of the Fire, cease their Motion, and coming closer together, embrace one another; and by this means are Crystallized, and return to their former figure: Alom yielding 8 Corner'd Crystals; Salt Armoniack 6 Corner'd; Sea Salt, Cubical or Square; Salt Nitre Pyramidal; and other Salts, Crystals of other Figures.

When any Sour Liquor is poured into warm Milk, immediately the Curds are by this means separated from the Whey; as appears in that Drink so familiar amongst us here in England, called Sillibub.

This Separation happens, because Milk is not altogether fluid, but is of a somewhat thickish consistence, whose Pores are encompass'd with grosser parts, which are the Curds, whereof Cheese is made: And therefore when any sharp or subtil Liquor enters the same, such as Vinegar, Cider, or the like, it drives away the grosser Particles, that fill the Pores, which thereupon joyning together, become separated from the Wheyish part. The same also happens when Milk is kept so long that it turns sour; for then, without the assistance of any Rennet or foreign Liquor, it is precipitated and falls down to the bottom, especially if it be set near the Fire; because when Milk grows stale, its thinner parts become fluid, and being sowed with the warmth, serve instead of sour Liquor or Rennet, to run the Milk together.

Oil cannot be washed out of Cloth with water, but Lie must be us'd, or Soap, which is not so fluid as water, but by its consistence appears to be endued with a far less degree of Motion.

The Cause whereof is, because the Parts of Water, as to their Figure, differ from those of Oil, and therefore cannot penetrate or divide each others Parts: For the particles of Oil are Branchy, whereas those of Water are slippery, and much in the shape of Eels: For which Reason also they enter

XIII.
How common Water, impregnated with Saltpeter, grows hard.

XIV.
How a Sillibub is made.

XV.
How a Lead is melted.

XVI.
How Oil cannot be taken out of a Cloth by Soap.

enter the pores of a Cloth stained with Oil, and leave the particles of Oil untouched. For Water hath not the force to enter into Oil, or to penetrate into the inmost parts of it, and consequently cannot carry off any parts of the Oil with it. Whereas Lie, because of the Salt that is mixed with it, doth readily perform it; for the parts of Salt being stiff and inflexible, and therefore like so many Darts piercing into the parts of Bodies, doth easily loosen the particles of Oil, and being mixt with water, easily carries off the Oil with it. And hence it is that Soap is of so great use, for the taking of Spots or Stains out of Cloaths, because it consists of Salt, Oil and Water. For the little particles of Oil, because of their familiarity, are easily united, which the water extracts by being joyned with the particles of Salt.

XVI. When any Liquor is put into a clean Glass Vessel, having an even Brim, and fill'd up to the top, the Surface of it appears plain and even; but not so when the Vessel is only fill'd in part, because then the surface of the Liquor seems to be concave or hollow in the midst.

The Cause hereof is, because the Air in the former case doth with an Equal force press upon the Liquor; nor can any Reason be assign'd, why it should press one part of it more than another. Whereas in the latter case, the Air being whirl'd round about the Glass with water, whilst from abroad it enters into the hollow of the Glass, it is not so much dispos'd to turn its Force towards the Sides of the Glass, as to continue its motion towards the midst of the water; and consequently presseth the Liquor more in the midst, than towards the Sides of it, which therefore are somewhat higher than the midst, which by the greater pressure of the water sinks somewhat lower.

XVII. But if you pour into a Pipe, or other Vessel, somewhat more water than it is well able to hold; because that part which is ready to spill over the brims of the Vessel, is more expos'd to the Air, than that which is elsewhere; therefore the Air drives it by its pressure more towards the midst, where is the fittest place for it to swell or rise higher. Thus we see that the water in this Pipe or Vessel swells above its brim, and that the swelling or Rounding thereof comes nearer to a perfect Round in a small or narrow Pipe; because where the Vessel is very large, the Force of the Air is not strong enough, to overcome the weight of such a great quantity of water.

XVIII. A Leaden Bullet being laid upon a Cushion, or a pendulous Anvil, is more easily beaten flat, than upon an Anvil that stands fast and immovable.

The Reason is, because it is not sufficient to the beating of a Bullet flat, to strike it with a great force; but it is over and above requisite that this Force continue for some time, that the parts of the Bullet may have leisure to alter their situation: But when such a Bullet is laid upon an immovable Anvil, the Hammer leaps back almost the very same moment it strikes the Bullet, and so hath not time enough to flat it, as it hath when it can continue longer upon it, as when it is laid upon an Anvil or other Body that gives way to the stroke of the Hammer, and doth not by its Solidity immediately beat it back. Thus the Shin-bones of a Sheep are more easily broke upon the

hand, than upon an Anvil; because the Hand, by giving way to the force of the stroke, assists the breaking of it.

When Air is blown into a Leather Ball or Bladder, it makes it to become hard, tho' the Air of it self hath nothing of Hardness in it.

The Reason is, because the parts of Air that are pent up in a Leather Ball, or Bladder, being unable to penetrate the Parts thereof, are by this means so much compress'd, that thereby they are forced to change their figures, and bend like so many little Bows, which endeavour to return to their former and natural posture; and by this means so distend the Ball, and make it feel hard to the Touch.

Fluid Bodies, that communicate with other fluid Bodies, are Heavy, proportionable to their Height, and not according to their Breadth. As for Instance, Let us suppose a Vessel full of water ABCD; having 2 Openings or Mouths of unequal bigness E and F, to which are solder'd 2 Pipes likewise unequal, such as G and H. This supposed, if you pour the same Liquor into the said 2 Pipes to the same height, both the Liquors will be in an Equal poise.

The Reason is, because their Height being the same, they are in proportion to their Thickness; that is to say, if the Hole E be double to that of F, there is also twice as much Liquor in the Pipe GE, as there is in that of HF; whence it follows, that the Liquor of the great Pipe cannot sink 1 Thumb's breadth lower, but it must make that in the lesser Pipe to rise 2; nor can that of the lesser sink lower by 2 Thumb's breadth, but it must make that in the greater Pipe to rise 4 Thumb's breadth, which makes an equal quantity of motion on either side, and consequently the water continues in equal poise in both the Pipes.

A Hard Body, for Example a Beam of Wood, being in the midst of a Pond, continues unmoved; and except by outward force it be put into motion, it always observes the same distance from the Bodies that surround it.

Which proceeds from hence, for that the Parts of the Fluid Body, which every way encompass the Wood, are toft with various motions, some upwards others downwards, some to the Right, and other to the Left; so that the Wood receiving all their contrary motions, rests in an equal poise between them all; since there is no cause that might incline it one way more than another. But if the whole Fluid Body tend one way, the Wood will be forc'd to comply with its motion, and be carried along with it; because in this case the Contrariety of the motions in the water is removed, by the waters running one way only.

The Plaster wherewith the Walls of Houses and Roofs are cover'd, grows hard by its being mixed with water, and by this means acquires a firmness, which it never had before.

Some do imagine the Cause hereof to be from the sudden evaporation of the parts of Water, which by being sublim'd into the Air, leave the rest of the Body hard: But Experience teacheth us the contrary; for if Plaster of Paris be weigh'd whilst it is almost Liquid, and be afterwards weigh'd again, after that it is grown hard, it will be found to have lost nothing of its weight.

XIX.

How a Leather Ball or Bladder is made hard, by the Air that is blown into it.

XX.

Liquid Bodies are ponderous, proportionably to their height.

Figure 6.

XXI.

Why a Beam of wood lies unmoved in the water, tho' the parts of the water are in continual motion.

XXII.

Water sometimes conduces to the Hardness of Bodies.

For my part, I suppose this Hardness is produc'd, because in the *Plaster* there are many *Pores*, which the *Fire* hath formed in it, and are such as that the thicker *Particles* of *Air* cannot enter into them, because they have not strength enough to remove those Obstacles which they meet with in the *Plaster*; which yet the *particles* of *Water* can do. Whence it comes to pass, that the *water* having been variously agitated with the *Plaster*, by flowing about the Grains or Clots of it, variously opens the *Pores* of it, and divides it into much lesser parts than it was before: And forasmuch as these *Particles*, by being reduced into most fine powder, have acquir'd more Surface than they had before, when they were yet in *Clots*; being now joyned together by a more immediate contact, they do constitute a *hard Body*.

XXIII. Why Cement becomes as hard as Marble.
And it is for the same Reason, that a *Cement* made of *Flower*, the *White* of an *Egg* and *calcin'd Stones*, turns as hard as *Marble*, wherewith the Sides of that wonderful *Fish-Pond* at *Cuma* is walled. So likewise it is a thing well known, that the *Powder* of *Flints* and *Loadstone* being mixed with the *white* of an *Egg* and *Sanguis Draconis*, doth within a few days become an exceeding hard *Mass*.

XXIV. Why Aqueous Liquors are easily resolved into Vapours; but fat and Oily Liquors not so.
Aqueous and *volatile Spirituous Liquors* are easily resolved into *Vapours*; whereas *fat* and *oily* are not without much difficulty exhaled. The Reason is, because the parts of the former, are endued with very simple *Figures*; whereas those of *fat Liquors* are of more intricate *Figures*, like *Branches* of *Trees*, by which means they hang and cling close together, and therefore cannot without difficulty be separated from each other.

CHAP. VII.

Of Rough and Smooth Bodies.

XXV. Many Bodies that appear smooth and polish'd to sight, are rough notwithstanding.
Marble, *Steel*, *Wood*, &c. appear *smooth*; but yet are found to be *rough* by the help of a *Microscope*.

The Reason is, because *Bodies* are commonly polish'd with the help of very hard *Powders*, the grains whereof cannot but leave *Cavities*, and consequently *Unevenness* in the Surfaces of the *Bodies* so polish'd. *Pumice-stone* is also made use of to this purpose; because by its *Roughness*, it rubs and wears off the *Prominences* of the parts. And with these *hard Powders* always some *Water* or *Oil* is mixt, which prepares the *matter*, and conveys the *powder* into all the *Cavities* of the *Stone*, or other Subject that is to be polish'd. But however, after all the pains that is taken, *Art* can never so polish *Bodies*, but that some insensible *Prominences* and *Subsidences* will still remain.

XXVI. Why two polish'd Marbles are not without difficulty separable from each other.
Thus *Glass*, *Crystal*, and the like, tho' they seem to be the smoothest of all other *Bodies*. Yet may truly be said to be *Rough*; for tho' *Glass* be made by fusion of the smallest particles of *Ashes*, yet forasmuch as they are irregular and angulose, they cannot be so bent by the force of *Fire*, as to cling closely together, and by this cohesion, to lose all their own *Figures*. For tho' the protuberant Corners of *Glass* may be worn off somewhat, yet can they never be so adapted, but that some of them will get out beyond their Fel-

lows. And tho' this *Unevenness* of the parts of *Glass* be not visible to us, yet must we not therefore deny it, because we know that our *Senses* are not sufficient to discover all the Affections of *Bodies*, and often mistake in those things, which *Reason* proves to be most clear and evident. A *Line* drawn upon a *Paper* doth appear *strait*; which beheld through a *Microscope* is found to be crooked, and to have many *Inequalities*.

In like manner, there are many other *Bodies* which to our *Sight* and *Touch* seem to be absolutely smooth, whose *Surfaces* notwithstanding are made up of most thin prominent *Filaments*, with their *Intervals*, according to the demonstration *Microscopes* afford us of them. Thus Mr. *HOOK* hath demonstrated the strange asperity and roughness of the *Point* of a *Needle*, and the smoothest *Edge* of a *Razor*, *Micrograph. Obs. 1 & 2*. Yea, all *Metals*, how polish'd soever, and *Lead* also, notwithstanding its great compactness, represents great *Asperities* to the *Eye* that consults them, assist'd with a *Microscope*.

Bodies that have a *Rough surface*, commonly cast a *whitish* Colour; but being moistned with *water*, they draw to a *blackish* Colour.

The Reason is, because *Rough Bodies* consist of many *Faces*, many whereof are so turned towards us, that howsoever the *Rays* of *Light* fall upon them, they reflect copious *Beams* to our *Eye*, and consequently produce *Whiteness*. But when the *Surface* of a *Rough Body* is wetted with *water*, these *Unevennesses*, or *Faces* are taken away, which before did reflect the *Rays* of *Light*, and consequently must make it appear of a *darker* Colour.

Polish'd Bodies reflect the *Rays* they receive towards one part, which therefore becomes more bright and shining than the rest, which rather appear obscure and darkish.

Which proceeds from hence, because the *Expansion* or *spreading* of the *Rays* reflected from *Bodies*, is produced from the various *Inclination* and *Eminence* of their *Parts*. And therefore *Artificers* do cut and grind *Diamonds* into several *Angles* and *Surfaces*, that from them the *Light* might be variously reflected and diffused. Thus *Silver Vessels*, when boil'd in a *white-wash*, become white as *Snow*; but if after this, any part of them be polish'd, they lose their *whiteness*, and become *brown* and *darkish*, and like *Looking-Glasses*, reflect their *Rays* towards one place only; because the eminent particles, which were the cause of their *Roughness*, are taken away by *polishing*, and therefore it cannot be otherwise, but that that *Light* which falls upon them, must be directed to one certain place. As we see in an *Iron Breast-piece*, which being polish'd, at sometimes, appears very bright and resplendent, and at others *dusk* and *dark*.

Two Pieces of *Marble* exactly polish'd, do so closely cling together, that the lowermost of them by its own weight cannot fall down from the uppermost; no nor in case a much heavier weight be applied to it, to draw it down, nor can it be separated from it, but by very great force. The Cause hereof is to be fetch'd from the weight or spring of the *Air*, which presseth the two pieces of *Marble* together. Wherefore seeing that the parts of all *Bodies* that are here with us,

III. The most exactly polish'd Bodies are Rough.

IV. Rough Bodies generally cast something of a white Colour.

V. Smooth Bodies have one part more shining.

VI. Why two polish'd Marbles are not without difficulty separable from each other.

are prest against each other, by the superincumbent Air, or the ponderous Exhalations and Effluvia of Bodies, it is obvious to conceive how much the simple Contact of the small particles of any Body, according to their whole Surfaces, doth conduce to the causing and preserving of the firmness of Bodies; not precisely, because the parts do touch one another; but because, together with that Contact, there always is an outward Cause, viz. the weight of the pressing Air, which is able to preserve that Contact, till by a greater Force supervening they be separated from each other.

VII. Some Bodies are very subject to grow mossy and mouldy, as Houses that are cover'd with Tiles or Thatch, the outside of Walls, and Ground that hath not been tilled of a long time.

This Mossiness and Mouldiness is caused, when the lesser particles in their Exhalation out of Bodies, are seized by the Groffer and Bigger, and are hindered from flying away and leaving the Body; for by this means, being mutually entangled, they stick fast to the Surface of it, and turn into a kind of Down. Thus we find, that old Trees breed more Moss than others, because their Juice is not so well digested as to spend it self all in Branches and Twigs; but because of its weakness is stop'd in its way, and covers the Bark of the Tree with a kind of mossy Down.

VIII. A Pumice-Stone, and several other sorts of Stone, are not capable of being polish'd.

The Reason is, because the Pumice-stone is a porous Body, and its pores are so wide, that the parts of it can never be brought by any Art to the smoothness of polish'd Bodies; but after all that can be done towards the polishing thereof will appear rough to the Touch.

IX. From what hath been said, we find reason to conclude, that there is no Body which can be said to be absolutely smooth. For, First, the most smooth and polish'd Bodies have Pores, and consequently so many Cavities, which are inconsistent with absolute Smoothness. Secondly, The Artifice that is used for the polishing of Bodies being performed by Whetstones, or very hard Powders, cannot but leave some Unevenness upon them, as we find by the Microscope in the Surface of the most polish'd Steel, or the smoothest Edge of a Razor. And so likewise it cannot be otherwise, but that hard Powders, used by Glass-Grinders, must leave streaks and furrows, tho' imperceptible, to the unassisted Eye. So that whatsoever is commonly spoken of the smoothness or evenness of Bodies, must only be understood with respect to the Senses, but not absolutely.

X. Polish'd Bodies exceed Rough Bodies in the force of Acting and Resisting, as may be seen in Knives and Swords, which when Rusty, cannot cut or penetrate Bodies so well, as when they are whetted and smooth.

The Reason is, because Rough Bodies have their Surfaces very uneven, some of their parts jetting out, and others subsiding: Which Unevenness of the Surface is a great hindrance to motion, and is the cause why the Bodies that are struck against them, do more faintly rebound from them. Thus we find, that a Ball will rebound much further from a smooth, than from a rough Body, which those that play at Ball are very well aware of;

and accordingly, neither can it be any wonder that a smooth and sharp Knife doth cut better and more readily, than another that is all cover'd with Rust.

CHAP. VIII.

Of Transparent and Opaque or Dark Bodies.

SOME Bodies are almost wholly pervious to the Rays of Light, and reflect but few of them: Others resist the free passing of the Beams, and in some parts only suffer the Beams to pierce them.

This Transparency of Bodies consists in the direct or strait position and ranging of their Pores, without any respect had to the Neighbouring Bodies, whether they be continuous or contiguous, because they make no change in the case. For supposing this strait position of the Pores, a luminous Object, will as well affect our Eyes, as a Colour'd will, and impress its Image on our Brain. But when this situation of the Pores comes to be changed, then the Beams of the luminous Body are either not transmitted at all, or do not clearly exhibit the Image thereof, but confusedly and diffusedly; because they pass through the Body, not in Rank and File, but in a tumultuary huddling manner crowd through it.

Glass is more transparent than Paper, and admits a more free passage to the Light.

The Reason is, because tho' in Paper, as well as Glass, there be pores which admit the Light coming upon them, yet are they not ranged after the same manner. For in Paper the pores are irregular and confus'd, by reason of the various entanglement of the Threads whereof it doth consist, which obstructs the Action of the Light, for those pores which are open on the utmost Surface, as they go deeper, are obstructed by crossing Filaments. But in Glass there is such an Arrangement of parts, that the pores are all continued in a strait Line, so that the Light most readily glides through them, according to that of the Epicurean Poet

—nor can the Beams of Light
Through any Body freely reach our Sight,
Except the Pores in straight Lines be rang'd,
As they're in Glass—

For Glass, when it was first made, and was yet in fusion, the particles of the Fire piercing it every way, formed innumerable pores in it, through which the Globuli of the second Element finding a free passage, are able to transmit the Action of Light, which consists in their pression, every way in strait Lines.

There are several ways whereby Transparency may be produced: First, By melting: Thus we find that Snow and Butter by being melted, become transparent. Secondly, By the intrusion of some proper Body, by means whereof a due position of the Pores is introduc'd: Thus Paper anointed with Oil transmits the Light, and is made Diaphanous. Thirdly, By Resolution: Thus we see that the Waters or Spirits distill'd from Opaque Bodies, as of Roses, &c. are transparent. Fourthly, By Concretion or Coagulation, by which means the Diamond and

I. Why some Bodies are more transparent than others.

II. Why Glass is more transparent than Paper.

III. Transparency may be acquir'd several ways.

and *Crystal* attain their perspicuity. Fifthly, By polishing and wiping off the *Dust*: Thus *Glass* by being polished, and after it is polished by being dusted, becomes transparent, and affords a free and undisturbed passage to the beams of *Light*.

IV.
How *Glass* is made more dusk and obscure, by the addition of new parts.

The perspicuity of *Glass* is diminished by the same degrees, as it increaseth in Thickness and Bulk.

The Cause whereof cannot be assigned to ought else, but the *Inequality of the Pores*: For seeing that *Glass* is not altogether transparent, but consists of many thick parts, which reflect the Beams of *Light*; it cannot be otherwise, but that many of its pores must be obstructed by the addition of new Matter, and consequently the Action of *Light* hindered. As we see that a man may, through the joining of his *Fingers*, perceive Objects; but if he lay the *Fingers* of his other *Hand* athwart them, they will stop those little *slits* or gaps through which he could see Objects before. In the same manner, tho' a thin *Glass* does readily transmit the beams which fall upon it; yet will it stop and hinder the Sight, if it increase considerably in thickness, because its pores by this means are interrupted and are made unequal. And it is evident, that the *Inequality of the Disposition of the parts* alone is sufficient to render that *Opake*, which before was *Diaphanous*. Thus we find that the *Grains of Indian Sand*, beheld through a *Microscope*, are not only pellucid, but sparkle like *Diamonds*; but when by being heaped together they can no longer give free passage to the *Light*, they shew *Opake* or *Dusky*.

V.
How *Vintners* fine their *Wines*.

It is a thing common with *Vintners*, to fine their *Wines*, that is, to make them clear and pellucid, by means of *water-Glue*, ordinarily called *Izinglass*, and the whites of *Eggs*; making use also sometimes of *Alabaster*, and calcin'd *Flints*, for the same end.

For the first of these, consisting of *Viscous* and *Tenacious parts*, do easily entangle the *feculent* parts of the *Wine*, and sink with them to the bottom: And the other, have a *Precipitating* force or virtue; and therefore entering the *Pores* of the *Wine*, do precipitate the more dreggy parts of it. In like manner they correct *Ropy-Vines*, by adding to them *burnt Alom*, *Quicklime*, *Plaster of Paris*, *Salt*, and the like; for all these produce a new *Fermentation* in the *Liquor*, and so cause a separation of the grosser parts, which are sent down to the bottom. And by this means the *Vine* recovers its former consistence and pellucidity.

VI.
How *Water* is more opake than a *Mist*.

Tho' *Water* seem transparent to the *Eye*, yet is it less perview to the *Light*, than a *Mist*: For if a man, from the top of an *high House* or *Tower*, look down towards the *Earth*, he will be able to perceive it through a *Mist*; whereas he finds that his *Eye-sight* cannot pierce to see the bottom of a *River*, where the distance is as great from the Surface of the *River* to the bottom, as from the said *high Tower* to the ground. And therefore *Divers* witness, that after they are got 12 or 15 *Cubits* under *water*, they can neither perceive the *Sun*, nor any thing else. Which is an evident Argument, that the *Water* is an *Opake Body*, and much more dusky than a *Mist*.

The Reason hereof in *Water* seems to be the

Thickness of its parts; which being irregular, and of unequal Figures, easily hinder the *Globuli* of the second Element from passing through them in strait Lines. For we must conceive a *Body* to become *Opake*, when the said *Globuli* cannot pass through it, but by oblique ways, and when their course is stopt by thwarting particles. Now a *Mist* is more transparent than the *Water*, because it consists of thinner parts, and such as are more ready to comply with the motions of the subtil Matter, and easily make way for them: For tho' the parts of the *Mist*, as well as the *Water*, be irregular; yet they differ in the Magnitude, because the particles of a *Mist* are more fine and subtil, and not so closely entangled, as those of the *water*. Whence it is that the *Globuli* of the second Element move them with more freedom, and more easily thrust them out of their places; which is the true Reason why a *Mist* doth less oppose the transmission of *Light*, than *Water* doth.

Vine, *Milk* and *Blood*, with many other *Liquors*, are *Opake*.

VII.
Why many *Liquors* are opake.

And the Reason is, because they are not pure and simple *Liquors*, but are throng'd with many *Heterogeneous Bodies*. It is a thing very notorious, that *Vine*, when it is distill'd, leaves many *Bodies* behind, which will not rise in *Vapours*. And this is the reason of the great clearness of *Spirit of Vine*; for being by *Distillation* freed from all its *Heterogeneous parts*, which were an hindrance to the free passage of the *Rays of Light*, it becomes wholly transparent, and that in the highest degree. *Milk* also is *Opake* for the same reason; for we find that when the *Curds* are separated from it, the *Whey* is in a great measure *Diaphanous*. And the same is to be said of *Blood*, and other such like *Liquors*, which never appear thick or troubled, but when some strange *Bodies* are mixed with them, which obstruct or come athwart their *Pores*.

Beer, *Ale*, and other *Liquors*, after fermentation become clear, and are not thicker or more troubled at the bottom, than at the top.

VIII.
How *Liquors* are made clear and transparent.

And this, because the Matter of the second Element, moving in the pores of *Liquid Bodies*, do continually drive the particles of the third Element out of their places, till they have so disposed of them amongst others, that they do no more resist their motion, than those others do; or if they cannot so dispose them, till they have wholly separated them from the rest. Thus we see that *New Wine* doth not only cast some of its dregs upwards towards the Surface, and precipitate others of them downwards (which might be attributed to the Lightness or Heaviness of the particles so separated) but also to the Sides of the Vessel. And the same estimate is to be made concerning pure *Liquors*.

So for the most part *Urine* is clear and transparent, whilst the *Heat* helps to keep the pores more lax and open, and consequently leaves a more free way for the *Light* to pass: But when either the pores are contracted by *Cold*, or stopt with various little *Bodies*, they are the cause of the Opacity of the *Urine*. For indeed, there are but very few *Liquors* which are without any *Opake particles*.

IX.
Why *Urine* is sometimes clear and transparent.

And

X. And for the same Reason it is, that our *Hands*, during the *Winter*, are more dirty; because the *particles* that should exhale through the *Skin*, continue sticking under it, and that because of the greater constriction of the *pores*, so that the exhaling Matter is hindred from flying away into the *Air*: Whereas in *Summer* time, when all the *pores* are open, all these gross Exhalations are carried up into the *Air*, and consequently leave the *Hands* clean. Wherefore in *Cold* weather it is good to wash the *Hands* with warm water, to help to open the *pores*.

XI. *Crystal*, if it be cast into the *Fire*, or for a Minute or two be cover'd with *hot Ashes*, it loseth its *Diaphaneity*, and seems to degenerate into a quite different *Body*; neither can it afterwards, by any known Art, be reduced to its former perspicuity.

Which can only be attributed to the *particles* of *Fire*, which violently rushing into the *pores*, do break their order, and consequently produce a new ranging of the parts. Now this confused disposition of the *Parts*, destroys perspicuity; as shall be shewed more at large, when I come to treat of *Qualities*.

XII. It has been found by Experience, that from the mixture of 2 clear *Liquors*, a *black Body* doth arise: For the Infusion of *Galls*, which is clear, being mixed with a solution of *Vitriol*, makes *Ink*.

The Reason whereof is, because the *particles* of both these *Liquors* being mixed together, do so intimately close and unite, that by the closeness of their ranging, they hinder the passage of the *Beams* of *Light*. For in either of these *Liquors* there are certain little *Bodies*, which when joyned together, neither transmit the *beams* of *Light*, nor suffer them to reflect from the *Body*, but do, as it were, wholly swallow them and keep them Prisoners. But if you add to the *Ink*, *Aqua fortis* or *Spirit of Vitriol*, it will become clear again, like *Spring-water*; because the *particles* of this new infused *Liquor*, do separate the contiguous *Bodies*, and open the shut up *pores*. But if *Oil of Tartar per Deliquium* be added to the changed *Ink*, it will be restored to its former *Blackness*; because *Oil of Tartar* joyns it self with the *Spirit of Vitriol*, and the *particles* of the *Galls* and *Vitriol* do again embrace each other. It is also from the same Cause that *Spirit of Wine*, in which *Annis-seed* hath been boil'd, when mix'd with *water*, yield a *white Colour*; and *Oil of Tartar*, when mixed with *water*, becomes troubled and opaque; that is, because the order and disposition of their *Parts* is troubled, and the passage of the *Aethereal matter* hindred, by little super-added *Bodies* that obstruct the *pores*.

XIII. Hence it is that when we write with the clear and transparent Infusion of *Vitriol*, the Letters do not appear at all, except that the Paper hath been done over with the Infusion of *Galls*; but a Pen dipt in the *Spirit of Vitriol* will efface these Characters, which will appear again when drawn over with a Pen dipt in the *Oil* or *Liquor of Tartar*. And the cause is much the same in other *Colours* produced from the mingling of 2 clear *Liquors*. Thus the *Salt of Tartar* dissolved per *Deliquium*, being poured into a solution of *Calcin'd Tin*, gives a *blew Colour*; the same added to a solution of *Lead* in distill'd *Vinegar*, yields a *white Colour*; and being dropt into an Infusion of *Mercury Sublimate*, affords a *yellow*;

Antimony Calcin'd with *Nitre*, and boil'd in common *water*, leaves the *water* that is strain'd from it clear and transparent. All which diversity proceeds from the various disposition of the *particles* whereof these *Bodies* are compounded, which causes the *Rays* of *Light* to receive a different Reflection from their several *Surfaces*.

CHAP. IX.

Of Bodies that are Bended and Pressed together.

A *Bow*, made of *Steel* or *Wood*, being bent, returns to its former state.

The Reason whereof I suppose to be, because the *pores* of the *Bow*, by the bending of it, becomes so narrowed, that the *subtil Matter* cannot freely pass through them; and therefore pushing against them with greater force than ordinary, strives to make its way through them, as formerly. Now this may be done several ways; for if we conceive the *pores* of the *Bow*, before it was bent, to have been of an even wideness from beginning to end, but that by being bent the ends of the said *pores* are narrowed, it is evident that the *subtil Matter*, which passeth freely through that part of the *pores* which is widest, when it comes to the narrow Extremities, will endeavour to disentangle it self, and pass further. But if the *pores* of the unbent *Bow* be supposed of a round figure, and that by the bending of it they are reduced to an Elliptical figure, the *subtil Matter* will exert its endeavour, to bring them to their former round figure, and consequently will restore the bent *Bow* to its former state. For tho' the *Globuli* of the second Element, with respect to their bulk, are but of little force to shake the sides of the *pores*; yet because they continually croud in great numbers into the Cavities of the *Bow*, striving to make their way through them, all their Forces being joyn'd, and conspiring to this end, are sufficient to effect it.

And it is for the same Cause that *Iron-wire*, made to wind spirally in Rings, like a *Serpent*, and shut up in a *Box*, as soon as the *Box* is opened, it leaps out of the *Box*, like a *Serpent*, shooting it self at some body. Thus also the bended *Boughs* of *Trees*, as soon as they are let go, fly back with great force and violence, so as to carry vast weights up with them: Because by this bending the parts of the *Boughs* are compressed together, which upon the impulse of the *subtil Matter*, striving to enter the compressed *pores*, are driven to their former state and posture.

On the contrary, a soft *Plant*, such as is the *Elder*, flies back but a little; a *Hazel-tree*, which is harder, more; because the foresaid *subtil matter* passeth with more ease through the open *pores* of the former, and with greater difficulty through the straiter *pores* of the latter. Thus *Glass* that is bent, returns with greater force; because the parts of it are not joyned by the mutual entangling of their Branchy *particles*, as those of *Plants* are, but only by their *Surfaces*: And therefore when the figure of the *pores* of *Glass* is changed, the *subtil matter* exerts a more forceable impulse to restore the same. A Proof whereof we have in a *Plate* of *Iron*, which by being much hammer'd, acquires

P p p p p

I. What is the Reason that a bent Bow, as soon as slackned, returns to its former state.

II. Why Wires and the Boughs of Trees, that are bent, return to their Natural posture of themselves.

III. Some Bodies upon their being bent, rebound or fly back more strongly, others weakly.

this force or spring to fly back. Thus likewise the Air it self, by being compress'd and pent in *Pneumatick* or *Hydraulick Pipes* or *Instruments*, when it is left to its liberty again, it dischargeth the *ullets* or *water* with as much force, as before it had been pent in and compress'd; and all this from the attempt of the *subtil Matter*, to restore the changed *pores* to this former state and figure.

IV.
Why all
the wa-
vings this
way and
that way,
take up
the same
space of
Time.

A *Cord* or *String* fastned at both ends to fixed *Bodies*, being forced from its situation, runs out and returns, or waves this way and that way in the same measure of time, tho' it doth not always measure the same space of place.

The Reason is, because, as in a *Body* that hangs down, the several *motions* of the several *Excursions* are equal to the time of their *Returns*; by the Altitude of that *Circle*, the *Arcs* whereof are described by the hanging *Body*. So in like manner in a stretched *Body*, all the *Moments* of time wherein the *middle part* of the *String* waves out one way, are equal to that one time, wherein the other *Extream*, in case it were cut loose, would strait pass through the whole length, and come to the place of the other, to which the unchanged force would still draw it back.

V.
Why the
Excursions
of a string,
are not
equal to
the degree
of its being
stretched.

If you demand, why a *String* that is as long again, if it be equally stretched, doth make its *Excursions* as slow again as another. But if the *String* be stretched as much again, it doth not make its *Excursions* as swift again; but to the end it may do so, the force of the stretching must be 4 times as great.

I Answer, that forasmuch as all the *Excursions* of every *String*, be they of what length they will, are equal to one and the same straight *Trajection*, the *Trajection* in the former case, must needs be made in a double proportion of time; because a double *Space* is taken to be run through by the same motive *Force*. But in the latter case it cannot; because when we take three equal things, *viz. Time, Space*, and the motive *Force*, it must necessarily follow, that supposing the same *Space* to remain, as much as the time is diminished, so much the motive virtue must increase; and that there be the same proportion of the space to the time, as there is of the motive virtue to the space: Therefore it must follow, that if the space be in such a proportion to the time, as 2 to 1, the force must be to the space, as 4 to 2; and therefore must not have the proportion to time of 2 to 1, but of 4 to 1.

VI.
Why Sticks
break after
that they
have been
long bent.

Some *Bodies* that have continued long bent, do break, when we endeavour to reduce them to their former posture; as we find in some *Sticks*, which break whenever we go about to straiten them again.

The Reason whereof is, because the *subtil Matter*, whilst it endeavours to separate the *particles* of *Bodies* that resist its motion, must not only overcome the Resistance of them, but of the *Bodies* that surround it. And forasmuch as every thing endeavours to continue in the state wherein it is, and that *Bodies* which have been once put into motion, do continue in the same; so it is that the *subtil Matter* cannot shake them, without superadding more force to them, and increasing their strength; and so it comes to pass, that dashing more strongly against the said parts, it altogether separates them from each other.

A *Bow* that hath been long bent, especially if it be made of *Wood* or *Steel*, doth in process of time lose its force of flying-back, and continues in the same state, to which by bending it hath been reduced. A long Plate of *Lead*, bent in manner of a *Bow*, doth not fly back at all, but continues in the crooked state in which it is put.

The Reason why a *wooden Bow*, that hath been long bent doth not fly back, is, because its parts are not so hard, but that the *subtil Matter* can easily form new *pores* in them for its own passage; but a piece of *Lead*, bent like a *Bow*, cannot start back: For seeing that the parts of *Lead* are soft and flexible, they do easily suffer themselves to be penetrated; so that the *subtil Matter* can easily form new *pores*, and being able to pass freely, doth not make any attack upon the parts, whereby it might cause them to fly back. For as drops of *Water*, falling perpetually, do make an impression even upon the hardest *Stones*; so by the continual impulse of the *subtil Matter*, against the sides of the *Oval pores* in the bent *Lead*, they are adapted and accommodated to the free admission of the said particles, so as to let them go through without any Resistance.

It is observed by some, that a *Bullet* discharged from a *Gun*, doth more penetrate a *Body* at 100 Foot distance, than at 10 or 20.

The Reason whereof is, because the *Bullet* being so soon beaten back, hath not space enough to perform so strong an effect: Something in the same manner, and for the same reason that a *Hammer* less flattens a *Bullet* when lying upon an *Anvil*, than when it is laid on a *Cushion* as before was mentioned, Chap. 5. Of hard and fluid *Bodies*.

It hath been observed, that when a *Vessel* fill'd with *Liquor* is emptied into *Bottles*, and afterwards the *Liquor* is poured out of them into the *Vessel* again, it will not fill the *Vessel* as much as before; and that it is more conspicuous in *Wine*, than in *Water*.

The Cause whereof is, because the *Liquor* is not so much compress'd in an open *Vessel*, as in *Bottles*; and because in the former the *Liquor* meets with nothing almost, but parts of its own Nature; whereas in *Bottles*, the parts of the *Liquor* meet more with the parts of the *Bottle*, which so keeps them in, and compresseth them, that they cannot display themselves, as otherwise they would. As the *Liquors* are compress'd by the Sides of the *Vessels* wherein they are contained; so likewise on the other hand are *Bodies* compress'd by the *Liquors* that are in them; but yet so as to be equally compress'd in all the parts of them; because the parts of the *Matter* are kept in by each other in Equal poise, neither are they more press'd in one place than in another.

For the same Reason it is also, that a pair of *Bellows* with the Sides of it clapt together held under water, the *Nozzle* of it standing out, cannot be displayed or opened; forasmuch as the sides of it are compress'd by the surrounding water, which will not give way, no not tho' great force be made use of for that purpose, especially if the *Bellows* be somewhat deeply sunk under water. Thus if you take a *Kessel* full of *Quick silver*, and fasten to it a long *Ripe*, the top whereof stands out of the *Water*, it will be so compress'd at the bottom

VII.
A *Lead* that con-
tinues long
bent, at
last loseth
its force,
of return-
ing to its
former
situation.

bottom

bottom of the *Water*, that it will cause the *Quick-silver* to rise somewhat in the *Pipe*.

XI. *Why the Air breaks forth with such violence out of those Pneumatick Vessels, wherein it hath been comprest.* Air that hath been comprest in a *Pneumatick Engin*, breaks forth thence again with extream Violence; as is seen in those *Engins* which cast up *water* to a great height, or shoot *Darts* or *Bullets* at a great distance.

Some take the Reason hereof to be, that the *Air* being strongly prest upon, is received into some empty Spaces; which before separated the parts of *Air* from each other. But suppose it to be so, what is the Reason that when the Hole of the *Pneumatick Vessel* is opened, the *Air* breaks forth so violently? For if every part of *Air* retire it self into those empty Spaces, and preserves its former Extension, where is the Compression? And what is it makes the *Air* leap back with so much violence, if by being received into those empty Spaces, it does suffer no Violence?

The Cause therefore of this *Elastick-virtue*, is, because the *Air* being thus comprest, its parts are not capable of dilating themselves as formerly: For being all of them flexible, and moving independently on their *Neighbours*, they must every one of them have, as it were, a little *Sphere*, which may be sufficient for them to perform their *Circular motion* about their own *Center* in. But being comprest, they can have no such *Sphere* or *Space* to move in, since every one of them enters into the other place, and so hinder one another.

And whereas the force of the *Globuli* of the *second Element* continues still to be the same, and shakes the parts of the *Air*, as much as before; they with their *Extremities* hitting against each other, and driving one another out of their places, at last joyn their forces, and make a general onset to deliver themselves from the said Compression, and procure more room for themselves.

Hence it is, that the *Air* which is comprest in a *Pneumatic Vessel*, whereof I have given the *Figure* in the *Sixth Part* of my *Institution*, *Chap. 14.* having *water* at the bottom of it, doth violently break forth, mounting up to a very great height.

XII. *How it comes to pass, that the Air may be comprest in a Leaden or Pewter Vessel, but not in a Glass.* *Water* contained in a *Glass* cannot be comprest, at least sensibly; which yet may easily be done, when it is in a *Vessel* of *Lead* or *Pewter*.

The Reason is, because the Compression of the *water* is always performed by the Expulsion of some *subtil Matter*, which lay hid in the pores of the comprest *Body*. Now because the *Air*, which is contained in the *water*, cannot pierce through the pores of the *Glass*, as it can those of *Lead* or *Pewter*; therefore this is the Reason, why *water* is capable of being comprest in a *Vessel* of *Lead* or *Pewter*. Thus we see not only, that *water* is squeezed out of *Wool*, *Sponges*, and other such like *wet Bodies*; but likewise out of *Green-wood*, and *Air* out of *Dry-wood*, when they are comprest by being put into *water*; as is apparent from the *Bubbles* arising to the Surface of the *water*.

XIII. *A Bladder that is blown up with Air, being comprest, returns to its former state of inflation.* A *Bladder* blown up, being comprest, riseth again. Because the *particles* of the *Air*, which are shut up in the *Bladder*, being in continual motion, and whirling about their own *Centers*, they consequently cannot, without difficulty, suffer themselves to be compressed; and therefore as soon as the pressure ceaseth, they are extended again by the

Agitation of the *subtil Matter*, and consequently dilate the *Bladder*, as before.

From the same Cause it is, that a *Wind* breaking forth from the hollow of *Mountains*, doth with so much violence storm in the open *Air*; and that a *River*, where its *Banks* are narrow, runs with the greater force and swiftness: For the *wind* and *water* being compressed in those more narrow Spaces, do endeavour to deliver themselves from the Force that is upon them.

Hence it is likewise, that *Cloth* and *Leather* that hath been violently stretched out, return to their former Brevity; because many of their pores being straitned by that Extension, cannot suffer the *subtil matter* to pass through them, without a forceable and violent motion: Wherefore, as soon as the said violent Extension doth cease, the pores return to their former laxity; and the *particles* that surround the said straitned pores, by means of the *subtil matter*, are reduced to the bounds of their former Extension.

A *wet Finger* drawn about the *Brim* of a *Glass* full of *water*, or any other *Liquor*, first makes the *water* to wave a little, and to rise up in a small *Dew*, and being continued, will cause the *water* to leap over the *Brim* in great drops.

The Cause whereof is, because by this drawing of the *Finger* round the *Edges* of the *Glass*, the hard, but flexible parts of the *Glass* are pressed, and consequently the pores straitned, so as that they are no longer able to make way for the *Celestial matter* to pass through them. But as soon as the *Finger* is removed to other parts of the *brim* of the *Glass*, the *subtil matter* presently reduceth the pores of the before pressed part to their former wideness: And from this repeated compression of the *particles* by the *Finger*, and their Extension by the entering of the *subtil matter*, there is first caused an agitation of all the parts of the *Glass*; afterwards a swelling and waving of the *Liquor*; and lastly, the leaping up of the drops of it over the *brim* of the *Glass*.

The *Coarctation* and *Dilatation* of the Pores of a *Body*, do much contribute to its *Elastick force*.

Thus if we wipe the *Convex surface* of a bent piece of *Glass* with a hot *Cloth*, it will by this means become the more bent and crooked. But we shall find the effect contrary, if we wash the *Concave surface* with *Hot-water*, or wipe it with a *Hot-cloth*, for then its *Crookedness* will be diminished; because the *particles* of the *Fire* do dilate the pores of the *Glass*. This being much the same effect which we find, when having fill'd a *Glass Vial* with a long and narrow *Neck*, up to the middle of the *Neck* with *water*, we dip the same in *Hot-water*; whereupon we shall find that the *water* in the *Glass* will sink a little; because the heat hath dilated the pores of the *Glass*, and thereby made the *Vial* a little wider: But if you let it continue in the *Hot-water*, then the *water* which is in the *Vial* being heated likewise, will rise higher again: But the contrary will happen when you dip the *Vial* into *Cold-water*; for the pores of the *Glass* being straitned by the Coldness of the *water*, the *Liquor* in the *Glass* will rise higher.

XIV. *Why the Wind that is pent up in a narrow space, blows more violently.*

XV. *Why Leather that is extended by force, returns to its former length.*

XVI. *Why the drawing of ones Finger about the Brim of a Glass, makes the water contained in it to leap up.*

XVII. *The Dilatation or Coarctation of the pores of a Body, doth conduce to the Elastick force of it.*

XVIII.
What is
the Reason
why Glass
Drops,
when one
end of
them is
broke off,
the whole
immedi-
ately breaks
into small
Dust.

Figure 7.

Little bits of *solid Glass* are brought out of *Prussia*, which are commonly called *Glass-drops*; the figure of them somewhat resembling a long *Olive*, with a crooked Neck, not much unlike the *Retorts* Chymists use, save only that it is solid and without any Cavity, as is exprest in the figure A B. These *Glass-drops* were formerly made of a hard and thick sort of *Glass*, but are now made of *Crystal-Glass*, which being melted, and drawn out of the Melting-Pot with a *Glass-Pipe*, and being dropt into a *Pail of water*, becomes formed into these *Drops*, because of the *Clamminess* of the *Matter*. If these *Drops* be let fall into *warm-water*, the *Drops* will be better and more easily formed. Now it is a very wonderful thing to see a solid piece of *Glass*, which scarcely can be broke with the repeated strokes of a *Hammer*, yet when broke off a little above the end or point of it, or being filed in the more distant parts at 1 or 2, doth immediately break into small *Dust*, to the great admiration of the *Spectators*. When indeed the end or point of it 3 is broke, it does not always fall into *Dust*; but if the thicker part of the Neck 4 is broke or snapt off with a pair of *Pincers*, the whole *Drop* flies into small *Dust*, not without some noise.

This notable Effect cannot be assigned to any other Cause, than the *subtil matter*, which upon the breaking off of the Point 4, doth immediately rush into the pores of it with so much violence, that finding no out-let, it exerts its force upon the Neck of the *Drop*, and breaks it into the finest *Powder*. For seeing that this *Glass*, like a *Drop*, is at first of an *Oval figure*, and afterwards pointed, and at first drops into the *water* in greater quantity, and afterwards in a fine *String*, the pores that are in the Point of it, must needs be uniform and like one another; whereas those that are in its other parts must be as various, as being more remote from the *surface*: For the deeper they are in the *Glass*, the wider they are; and this, because the Point being so thin and slender, is uniformly condensed by the *water* inward and outward, and perforated by the *subtil matter*; whereas the thicker parts have their outsides cooled and condensed, before their inside. The utmost Point therefore 3, may be broken either with a *Hammer*, or with the *Hand*, without any pains or

wonder; but the other parts 4, or A, cannot be pierced with a *Bodkin* or *File*, before that the whole *Drop* fly into *Powder* with a great noise: For because of the straitness of the pores that are in the *surface* of it, and the dilatation of those that are about the middle, the *subtil matter* rushing vehemently from the middle of the *Glass* to the outsides of it, dasheth away the *partieles* of the *third Element*. For Experience teacheth, that any *Glass* that is cooled after this manner doth fly to pieces in small *partieles*: For the parts of the *Glass* that are about the midst of it, being wider, and growing narrower, as they approach to the *surface*; it must follow that the *subtil matter* penetrating the more narrow pores, doth dash against them with that violence, that it makes the *Glass* fly into small *Dust*.

But if this *Drop* be afterwards heated again in the *Furnace*, and suffer'd to cool by degrees, the now mentioned wonderful effect doth not follow; because in this case the foresaid Pores are all uniform: According as we find it happens in *Steel*, which being a second time heated in the *Fire*, doth thereby acquire uniform pores throughout, still retaining the Hardness it had before. Wherefore also when the Point of it is broke off, there is no reason for its breaking into pieces, because the *subtil matter* finds its way open through the uniform pores of it. But the contrary happens, when being put into the *Fire*, it be not suffer'd to become red hot; for tho' then when the Point 3 is broke off, or the part 4, it doth not fly into *Powder*; yet if the breach be made nearer to A, the same effect will follow by the Reason before given.

It is observed, that all *Bodies* which are dilated by an *Elastick virtue*, do exert a greater force at the beginning of their *Dilatation*, than at the end of it. The Reason is, because these *Bodies*, at the beginning, are supposed to be more compressed, than afterwards when they are more dilated. Now it is plain, that whilst they are more compressed, their *Elastick virtue* or *Spring* is so much the stronger, and they do the more endeavour to dilate themselves, so that they must needs exert a greater force at the beginning of their *Dilatation*, than in the progress of it.

the begin-
ning of
their Dila-
tation, than
at the end
of it.

The

The Second Part OF THE HISTORY OF NATURE. OF QUALITIES.

CHAP. I. Of Qualities in General.

A Student of Philosophy ought to abhor nothing more than to assert things which he doth not understand, or to endeavour the Demonstration of what he cannot define. But yet there be many that are guilty of this fault, who endeavouring to defend the opinion of some of the *Antients* concerning *Qualities*, do attribute such a Nature to them, which we can have no conception of. For of what use is it to tell us, that a *Quality* is that whence things are said to be *Quales* or such like? What *Old Woman* is there that doth not know as much? Is there any *Country Fellow* so blockish, that doth not know that by *Whiteness* things are made *White*, and by *Redness*, *Red*? They would do much better to acquaint us wherein precisely the Nature of a *Quality* doth consist, how it doth affect the *Subject* it belongs to, and after what manner it is diffused through the same. Let the *Peripateticks* therefore in good earnest tell us, what *Representation* they frame in their *Minds* of a *Quality*, and trouble us no more with their *Words*, which serve only to darken and fully *Truth*. Is *Quality* any thing *Physically*, or really distinct from the *Substance* wherein it is? Or is it superadded to the things that are denominated from it, as some new *Entity*? Let them therefore explain its *Genuine Nature* to us, and do it in such a manner, as that what they express in *words*, may be intelligible to us. If they cannot do this, which indeed I suppose is a thing impossible for them, why do not they quit these frivolous *Qualities*, and following the *Laws* of *Nature*, espouse more *Intelligible Principles*?

What is more *Intelligible* than *Quantity*, *Motion*, *Situation*, *Figure* and *Rest*? By which all natural effects may be made out, even the most abstruse and difficult of them. A *Watch* is moved, and without any outward force, measures and shews the *Hours*. A *Key* locks a *Door*, and

opens it. Is there any necessity to conceive a faculty in a *Watch*, that may set its *Wheels* a-going? Or in a *Key* any thing really distinct from it whereby the *Lock* is opened? What *Man* in his wits will not confess that it is more consonant to Reason, to attribute the constant motion of a *Watch* to the *Steel Spring*, the disposition of the *Wheels* with their figure and contexture; and the power of shutting and opening that is in a *Key*, to the *Figure* and Ranging of its Parts; than to have recourse to *Qualities*, which they can never explain nor conceive? But this is to run out beyond what I have here designed, which is not to assert the Nature of *Qualities* by *Arguments*, but to confirm the same by *Experiments*.

The *Sun* hath a power to harden *Clay*, soften *Wax*, melt *Ice* and *Butter*, to resolve *Water* into *Vapors*, to whiten *Linnen*, to tan the *Skin*, to ripen *Fruits*, to hatch the *Eggs* of *Fowl* and *Silkworms*, and sometimes to produce I know not how many various effects. All which are not any distinct *Powers* or *Qualities* in the *Sun*, but only the results of its *Heat*, which according to the different Texture of *Bodies*, and according to the different concurrence of *Cooperating Causes*, is variously determined.

The Purest *Spirits* of *Vine*, when joined with the most highly Rectified *Spirit* of *Urin*, become united together in the appearance of *Snow*, which is caused by nothing else but a new Texture of Parts: As when the *Spirit* of *Nitre*, mingled with detonated *Nitre* resolved per deliquium, is turned into *Saltpeter*. Or, as when the *Spirit* of *Salt* being beaten with the *White* of an *Egg*, doth communicate to it hardness, which it had not before.

When the *Sea* is tost and beaten with *Winds*, it changeth its Colour, and what was a *Seagreen* Colour before, does now appear *White*; as the same is Elegantly described by *LUCRETIVS*.
As in the Sea when the mad Ocean Raves,
And white Curles rise upon the foaming Waves.

Q q q q

Now

III.
There are no Qualities in the Sun that are really distinct from it.

IV.
The Difference of Bodies proceeds from the different Figure and Contexture of their Parts.

V.
The Sea-water changeth its Colour by Agitation only.

Now who can be imagin'd so weak in his Intellectuals, as to attribute this change to any supervening *Quality*? For what Agent should effect this alteration? Or by what means could a real Entity be diffused through such a vast conflux of *Water*? The *Sea* therefore becomes *white* by being turned into *foth*, that is, by the variation of its parts in their *Magnitude*, *Situation* and *Figure*, and rising into little *Bubbles*; whence the reflected light being conveyed to our *Eye*, represents a *white* Colour.

VI. Thus, if *Mercury Sublimate* be put into hot *water*, and a few drops of *Spirit of Urine* dropt into it, and then filtrated, it becomes white like *Milk*. Thus *Red Lead* and *Coral*, by the infusion of *Oil of Tartar*, acquire a *white* Colour. Thus *Gold* being mixed with *Silver*, if afterwards it be separated by *Aqua Fortis*, a black *Powder* falls to the bottom, its first Colour being *black*. Of which change no other cause can be assigned, than the *Figure*, *Texture* and *Order*, &c. of the *Parts*. For as *LUCRETIVS* expresseth it,

In Bodies so,
As their Seeds, Figure, Order, Motion do,
The things themselves must change and vary too.

VII. Put *water* into a strong *Pot* or *Vessel*, and having luted its *Cover* to it, and let it stand for some time upon *Burning Coals*, then remove it, and let it grow cold; then set it to *boil* again as before; and you'll find that by the repeating of these alterations several times, the *Colour*, *Taste* and *Smell* of the *water* will be changed.

This change in the *water* proceeds from nothing else, but the new *Order*, *Figure*, *Position*, &c. of its parts. For the force of the *Fire* separating the particles of the *Liquor*, makes them to acquire another position than they had before, by which means different qualities are induced into the *water*, and they made to affect our senses in a different manner from that they did before.

VIII. How many sorts of *Plants* do we see grow out of *water* only, into which they shoot their *Roots*, and attracting it for their nourishment, do encrease in weight, grow up, and spread their *Branches*. And indeed it is a matter of wonder to see hot and *Caustick* *Plants*, such as *Crowfoot* is, growing and encreasing in, and from the *water* alone; neither can this change be assigned to any thing else, but the meer change of the *Figure* and contexture of the *Parts*. Thus from *churn'd Milk*, without any other accession of a new form, but by a pure transposition of *Parts*, *Butter* and *Buttermilk* are produced. Thus *Glass* is made of *Sand* and *Salt*, and *Roman Vitriol* of *Salt* and *Copper*; for as *Sand* gives *Glass* its firmness, so *Copper* or *Iron* afford the same to *Vitriol*.

IX. And for the same reason it is that *Oysters*, in the hottest *Months* of *Summer*, have the appearance of *Blood* in them; which Colour towards the approach of *Winter* vanisheth, because then for want of heat, the *Oysters* cannot concoct the *Alimental Juice* to that high degree, as to produce *Blood*. And suitably to this *Physicians* tell us, that the *Redness* of the *Blood* proceeds from the acidity of the *Vital Saline Spirit*; much in the same manner, as *Fuleps* by the instillation of a few drops of *Spirit of Vitriol*, acquire a *Red* Colour.

X. If you drop a few drops of *Oyl of Tartar* into an infusion of *Sena-leaves* in *warm water*, the *water* will presently turn *Red*, and become of a *purple* Colour, tho' there be no such Colour, either in the *Water*, *Leaves*, or *Oyl of Tartar*.

The Cause of which *Redness* is, for that the *Oyl of Tartar*, piercing into the substance of the *Sena*, doth so agitate and separate the parts thereof that it makes way for the most minute particles of the *water*, to enter the *Pores* of the *Sena*; and changing their *Texture*, make the Beams reflecting from them to exhibit to our *Eye* a *Red* Colour. And that this *Redness* is by this means produced, may be plainly evinced, because another *Oyl*, for instance, that of *Vitriol*, being infused in the said *water*, will not produce the same effect; because it wants the power to penetrate the substance of the *Sena*, and separate its parts so, as to make way for the *Particles* of the *water* to enter.

And the same may be applied to other *Qualities*, as *Heat*, &c. for our *Touch* assures us, that there is an extream heat, in *Seygian waters*, or *Corrosive Chymical Spirits* when *Metals* are dissolved in them. And in the *Spirit of Nitre*, poured upon the butter of *Antimony*, or the filings of *Lead*; when yet the said *Corrosive Spirits*, as well as *Metals*, are both cold.

XI. An *Apple* when dash't against another *Apple*, or when bruised by falling down to the *Ground*, or being thrown against a *Wall*, that part of the *Apple* which is bruised will be found to differ from the rest in *Smell*, *Taste*, and other *Qualities*; and this change is so great, as that it seems to be quite of another nature, than the other part of the *Apple*.

Which change proceeds only from the Transposition of its *Parts*, for no new thing is superadded to it by its bruise, but only the parts of the *Apple* are altered from the *Position* they had before. So likewise we see what a great change is produced in *Vine*, when it is changed into *Vinegar*; of which notwithstanding no other cause can be assigned, but a flight exhalation of some of its minute parts, or rather the change of their *Configuration*, by being shaped into little pointed *Swords*. And as by the exhalation of some parts this change is caused in *Vine*, so no less an Alteration of things is often produced, by an accession of new parts.

Thus an *Apple* or *Pear*, by being rolled hard upon a *Table*, doth grow soft, and of a sweet Taste, by a gentle distribution of the *Spirits* into all the parts of it, as the *Chymists* express it, the unequal Distribution whereof is the cause of a harsh and sour Taste in *Fruit*. For hard Rolling is a mean between *Concoction* and simple *Maturacion*. But of this we shall treat more largely in the *Part concerning Plants*.

CHAP. II.

Of Heat.

Water, which when cold is without motion in a *Pot* or *Kettle*, when it is hung over a *Fire* and boils, riseth up to the brim of it, when as before it scarcely filled one half of it.

X. *Oyl of Tartar dropt into an Infusion of Sena-leaves, changes the colour of it.*

XI. *Why two cold Bodies mingled together do sometimes produce heat.*

XII. *An Apple thrown against a Wall, doth acquire new qualities in that part where it hath been bruised.*

I. *Why boiling water riseth up to the very brim of the Vessel, when before it reached only half The way.*

The Reason is because the *heat* of the *Fire* doth put the parts of the *Water* into *Motion*, and separate them from each other, and is the cause why by reason of the admission of *Air*, or some other insensible matter, they can no longer be contained within the same bounds as they were before, but require a greater space for them to display themselves in. For it is common to all *Bodies* that are rarefied, to encrease in bulk by the reception of the *subtil matter* into their *pores*; and more especially where the *Rarefaction* is caused by some considerable *Heat*, which puts the parts into *Motion*, and separates them from each other.

II.
Why the heat of the Sun is commonly vivifying and vegetative, and that of the Fire destructive.

The *Heat* of the *Sun* promotes the vegetation and vivification of *things*; whereas the *heat* of the *Fire* is rather destructive, and generates nothing by its activity.

The Reason whereof is, because the *heat* of the *Sun* is moderate, and because of its distance and perpetual circling about the *Earth* very gradually dispenst. Whereas the *heat* of *Fire*, because it cannot reach far, and before it can produce any considerable effect, must approach nearer to *Bodies*, than is for their preservation, doth presently vanish, and either through the ignorance, or impatience of *men*, cannot be kept in that *temperature* which is necessary to the *vegetation* of *things*. But if so be, it can by the Art and Industry of *Men* be reduc'd to a due *Temperature*, then nothing will hinder but that *Eggs* may be hatched by it, *Plants* produced, *Insects* generated, and all *living things* cherished by the warmth thereof.

III.
A thing that is Lukewarm only, seems hot when touched with a cold Hand.

A *Lukewarm Body*, touched with a *hot Hand*, seems cold to us; and *hot* when we touch it with a cold *Hand*.

Which different *Sense* doth not proceed from the thing that is *Lukewarm*, but from the *Hands* that touch it; for tho' the same force be in the *Lukewarm Body* to agitate both hands; yet because the commotion of the parts of the *hot Hand*, doth exceed the Agitation that is in the parts of the *Lukewarm Body*, it makes the *heat* of the *Lukewarm Body* to appear or feel cold. For the Agitation of the *Particles* of any *Body* considered in themselves, is not called *heat*, but only so far as it affects our *Sense* of *Feeling*.

IV.
Why the same Baths are sometimes judged hot, and at other times cold.

So they who enter *Baths* distinguish by different degrees of *heat*, having continued for some time in those that are *Lukewarm*, before they enter those that are *more hot*, find that that *water* which at first was so *hot*, that they could scarcely bear it, doth now seem *cold* to them; because their *Body* being thorough *hot* by the heat of the *Baths*, can no longer be affected by a *weaker heat*. Neither is it to be questioned, but what seems to be *hot* with *Scythians*, who live in a very cold *Air*, would be esteemed cold to *Ethiopians*, that live in a very *hot Climate*.

V.
Cellars and Caves under ground, are not hot in Winter-time.

Wherefore 'tis a *mistake* in some, who conceive that *subterraneous places*, as *Cellars*, and the like, are *warmer* in *Winter*, than in *Summer*; seeing that this difference of *heat* proceeds only from our *Body*, which is differently affected in *Winter*, from what it is in *Summer*: And we do not mind that the same thing may appear cold to one that is *hot*, and on the contrary, *hot* to one that is *cold*. For if it be so indeed, that *Subterraneous Caverns* are *hot* in *Winter*, whence is it

that the *Oyl* that is kept in them congeals, which it doth not in *Summer*, when yet they appear to be *cold*? *Subterraneous places* therefore are judged to be *hot* in *cold weather*, because our *Bodies* are *cold* when we enter into them; and in *Summer*, *cold*, because at that time our *Body* is *hot*.

A *Molten Metal*, and especially *Gold*, burns more strongly than the *Flame* whereby it is agitated, and whence it is put into its *heat*.

VI.
Why Gold burns more violently than Fire.

This proceeds from the compactness and closeness of the parts of *Gold*, which being fat and thick, cannot be dilated, or very little, which is the reason that it both *burns* more vehemently, and retains its *heat* longer. For the *particles* of the *Fire*, are as it were shut up in the *Gold*, without being able to disentangle themselves. Whence it is that a *Man* cannot touch *Gold* in *fusion*, with his *Hand*, but that the *Skin* of it will be shrivel'd up and burnt immediately. And on the contrary, *Iron* produceth a greater *heat* in *Aqua-fortis*, than *Gold* it self doth, because this *Liquor* enters the softer parts of *Gold* with less force and violence. For the same Reason *boiling Oyl* burns more violently than *Water*, because of the *Connexion* of its fat and unctuous parts, which do more tenaciously keep the *particles* of *Fire* enclosed, and suffer them not to get away.

A *Nail* struck with a *Hammer*, and driven into the hardest *wood*, doth not feel *hot*, whilst it is entering the *wood*, but is only perceived to grow *hot*, by those strokes of the *Hammer* that light upon it, after that it is driven home.

VII.
Why a Nail does not grow hot by the strokes of a Hammer, till after it be driven home.

The Reason hereof is evident from the Nature of *Heat*, which doth not consist in the direct motion of *Bodies*, but only in the Agitation of the *Insensible Parts*. So that it is apparent, that the *Nail* cannot be *heated*, as long as the *whole* of it is in motion, and is entering the *wood*; but when it is driven home, the *Strokes* that afterwards light upon it, put the insensible *particles* of it in motion, wherein the nature of *heat* consists. But the contrary happens when *wood* is sawed with a *Saw*, or bored with an *Auger*, because then the *Saw* and the *Auger* grow *hot*, and not the *Wood*, because in this case the insensible parts of the *Saw* and *Auger*, are moved and not those of the *wood*.

When a piece of *Iron* is filed, it is observed that it will grow *hot*, but the *File* remain cold.

VIII.
Why the Iron that is Filed grows hot, and not the File it self.

The Reason is, because the *File* excites a great commotion in the parts of the *Iron*, which produces *heat*. And tho' the parts of the *File* do suffer the same force, as the parts of the *Iron*, yet because they are much longer than it, they do not with the very same *Teeth* touch the same part of the *Iron* twice; but there is always some space of time between the gratings of the parts of the *File*, during which, that part of the *File*, that began to be heated, loseth its *heat* again.

IX.
Why the Axeltree of a Coach or Cart grows hot, and not the Iron-plate that goes round the Wheel, because tho' it describes greater lines, yet are not its parts agitated amongst themselves, like that part of the Wheel, which rubs continually against the Axeltree. Because the Essence of heat doth not consist in the swiftness of the motion, wherewith any Body is moved, but in the violent and various agitation of the insensible parts of it.

So likewise the *Axeltree* of a *Coach* or *Cart* grows *hot*, and not the *Iron-plate* that goes round the *Wheel*, because tho' it describes greater lines, yet are not its parts agitated amongst themselves, like that part of the *Wheel*, which rubs continually against the *Axeltree*. Because the *Essence* of *heat* doth not consist in the swiftness of the motion, wherewith any *Body* is moved, but in the violent and various agitation of the insensible parts of it.

of Bodies. Thus the Bullet discharged from a Great Gun, and most swiftly moved, doth not burn the wood which it penetrates, nor the Bullet discharged from a Cross-bow, doth not fire a dry piece of Linnen that it is shot through; because tho' both these Bullets be most swiftly moved, yet are not their parts put into any agitation.

X. Why the Breath we breathe with open Mouth into our Hand doth heat it, but if we blow it forth with vehemency through our Mouth almost shut, it is cold, and cools, suppose hot Pottage, or any thing else.

Our Breath causeth heat, when it is breathed forth gently, that is, when it consists of parts variously agitated, and when it unequally lights against the hand. For the heat of Bodies is nothing else but the various determination of their insensible parts, whereby they are moved this way and that way. But the Breath we blow from our Mouths, drives out the heat from any Liquor; because it is swift and determined to one part only: For by this means the most subtil parts of the Liquor, cannot separately continue their own proper motions, because they are all driven and determined by the blast of our breath to one part; as the motion of all the parts of a River is determined one way.

XI. Why Quicklime grows hot when water is cast upon it, to that degree, that it burns more violently than a Flame.

The Reason is, because the Pores of the Lime-stone which before only were open to the passage of the Globuli of the Second Element, have been more dilated by the Fire; so as that afterwards they were free to admit the particles of water also, but yet only such of them as were surrounded with the matter of the first Element, which rushing against the hard Particles of the Quicklime, do shake and separate them, especially if there be any store of them, and they do from divers parts, rush against one and the same part of the Quicklime. And in like manner we see that an Artificial Stone made of Pitch, Tarr, Tartar, Brimstone, Saltpeter, Sarcocolla, and Oyl of Peter, equal parts, and as much Quicklime as all of them, mixed with the Yolks of Eggs, and kept for some days buried in Horse-dung, if it be sprinkled with fresh water doth break forth into a flame.

XII. Why the heat of Quicklime exceeds the heat of a Flame of Fire. The heat caused in Quicklime, by the aspersion of water, is more violent than the flame that proceeds from Fire, because the Quicklime consists of branchy particles, which when they are separated from them the matter of the first Element, which surround the particles of water, do violently strike the hand, piercing and rending the Skin like so many Needles. And for the same reason a Coal, whose parts are intangled with long and various branchy parts, produce a greater heat than Flame doth. Thus melted Metal, and more especially Gold, burns more strongly than Oyl, and retains its heat much longer; because Gold consists of a more close and compact unctuous matter, and therefore is less subject to be dilated, and to let the particles of Fire it hath received to fly from it.

XIII. Why a Red Glass is commonly cut with the Edge of a red hot Iron, or with a Packthread dipt in Brimstone. The Reason is, because the Red Glass is commonly cut with the Edge of a red hot Iron, or with a Packthread dipt in Brimstone, for the reason that the heat of the Iron or Brimstone is more violent than the heat of the Glass.

The Reason whereof is, as was before said, that the parts of the Glass being agitated by the heat, require more room, and therefore drive the neighbouring Bodies from them. For it is impossible that the parts which are heated, should move swiftly and circularly, without taking up more space. This is evident, as in all other Bodies, so even in the most compact Bodies of Metals, which do somewhat swell, and become distended by heat.

Liquors, that of themselves are cold, when pour'd together produce a great heat. Thus Spirit of Vitriol added to Oyl of Turpentine, grows very hot. It hath been also observed that Spirit of Wines, by degrees added to Aqua-fortis, or Spirit of Nitre, doth cause a great and lasting heat.

Which Heat is caused from the diversity of the parts whereof the Liquors do consist; as being of such Figures, as that upon their mixture, they can the better join together, than when they are separate and by themselves, and that in this closing together, they swim upon the matter of the first Element, at least at the time that they are perceived to boil or effervesce. Which may be confirmed from hence, that after their ebullition is ceased, it is evident that many of them are grown together, constituting several hard Bodies. In the same manner, Oyl of Vitriol, when cold water is pour'd upon it, grows hot; and Aqua-fortis into which Salt Armoniack hath been infused, doth contract a heat, by casting into it some bits of Brimstone. Thus the Spirit of Salt Armoniack and Tartar, and the Filings of Lead, or the Oyl of Vitriol, and the Filings of Steel joined together are productive of heat. And which may seem more wonderful, Ice it self being put into the Oyl of Vitriol, causeth so great a heat, as to send forth Smoak. And so Fruits also, as Cherries, when put into Spirit of Nitre, produce a considerable heat.

XV. We must not here omit a notable experiment, which is, that if you mix half a pound of Flower of Brimstone, with the same weight of Filings of Steel, and put this mixture into cold water, stirring it now and then, it will cause so great a heat, that the vessel will be too hot to be touched. Thus Quicksilver prepared after a peculiar manner, and amalgamated with Gold, doth give such a heat, that it cannot be endured.

XVI. In like manner the Stone MAGNESIA, which in hardness resembles the Loadstone, when put into the Oyl of Vitriol, stirs up a great heat, which is encreased by repeated affusions of water, and like Iron communicates a Red Colour to the Aqua-fortis, sends forth a sharp and stinging fume; and when some of it is put upon Molten Glass, presently the Glass swells, which is common to it with Copper and Iron. Thus if you cast a little Filings of Brass into a great Bottle, in which there is only a small quantity of Aqua-fortis, there follows such an effervescence, that the Bottle seems to be full, and produceth so great a heat, that the Bottle cannot be touched.

XVII. Sometimes two hot Bodies mingled together, produce a third of a different Nature: For if you pour the Spirit of Nitre, which is very hot and piercing, upon Lixivious Salt, the product of this conjunction will be Saltpeter, which cools rather, than is productive of heat.

The that is cold.

XIV. How Heat comes to be produced by two cold Liquors mingled together.

XV. The mingling of Brimstone with Steel, produceth heat.

XVI. The Stone Magnesia dissolved in Oyl of Vitriol, produceth heat.

XVII. Two hot Bodies mixt together, produceth sometimes a third, that is cold.

The Cause whereof is, because the particles of Nitre and Salt become so intangled together, as that they lose their sharp points, whereby before they were used to dissolve Bodies. For the Bodies of the Nitrous Spirit, which before were volatile, and were easily sent away into the Air, being now kept down by the fixt Salt, can no longer fly away. And therefore it is no wonder that the Spirit of Nitre loseth the power of heating which it had before, and ceaseth to be Corrosive.

XVIII.
How Snow comes to be condensed by heat.

Notwithstanding that, it is the property of Heat to rarefie Bodies, and by loosning of their parts, to make them take up more room: Yet, for all that, we find that it doth condense Snow and Clouds. The Reason whereof is, because the filaments of the particles of Ice, whereof Snow doth consist, being more thin and slender than the middle part of them, they are consequently upon the approach of Heat, more easily dissolved, and bending themselves this and that way, because of the agitation of the subtil matter that surrounds them, they embrace the neighbouring particles of Ice, without quitting those they were intangled with before; and by this means constitute a more compact substance than they did before.

XIX.
The same effect is produced by heat in the Clouds.

This effect is still more clearly discoverable in the Clouds; for since the particles of Ice, whereof they consist, are at a greater distance from each other, and leave greater Intervals between them, they cannot approach to their neighbouring particles, but that at the same time they must be separated from some other; and therefore when they are bent, must needs take up less room, and consequently constitute a more close and compact Body.

XX.
Heat turns Lime and Ashes into Glass.

Lime and Ashes, by the heat of the Fire, are turned into Glass: For the Crystal Glasses of Venice are made of Stones which are found near the River Ticinus, and brought from Parva, with an equal quantity of the Ashes of an Herb, which the Arabians call Kall, and which grows in the Desert between Alexandria and Rosetta.

The Effect of reducing these to Glass, is never produced, but by a long continued Fire, and that in the highest degree: For seeing that the particles of Lime and Ashes are thick and irregular, they cannot so lie upon one another, as to stick or cleave together. Wherefore a strong Fire must be employed, to exercise its activity upon them; for then, whilst the thinner particles of the Third Element, together with the Globuli of the Second Element, are laid hold of, by the matter of the First Element, and proceed to move most swiftly about them, their Corners are by little and little worn off, and their surfaces being made more smooth, and some of them bended, flowing over one another, they no longer touch each other now in some points, but are joyned with their whole surfaces, and so sticking together, constitute that Body which we call Glass.

CHAP. III.

Of Cold.

NO Body, how cold soever it may seem to the Touch, is wholly devoid of Heat. For water, which to our sense is most cold, is proved not to be destitute of all heat, because of the Vapours and Steams which we see do arise from Rivers and Pools, even in the Winter time, and in the Night time.

I.
No Body is altogether destitute of Heat.

The Reason is, because Cold is nothing else but the want of Heat; and as Darknes is the privation of Light, which is the companion of Heat, or the effect of it; so Cold seems to be nothing else but a privation of the said Heat; and therefore that which we call Cold, is nothing else but a more remiss degree of Heat.

It happens sometimes in very Cold Weather, that Mens Hands, and other parts of their Body grow numb'd; which when they come near the Fire, are seized with very sharp pricking and shooting pains.

II.
Why a Hand be- numb'd with cold, when held to the Fire, is seized with ex- trem pain.

The Reason whereof is, because the particles of Fire, being in continual motion, do with violence run a-tilt upon the Nerves of the Hands, or other Members that are benumb'd with cold, and wound them as it were with so many pointed Lances. Which Vellication of the Parts cannot be without causing great Pain. Wherefore to restore a Hand benumb'd with cold, we must not presently expose it to the Fire; but first gently rub it, and endeavour to bend and move the Joints, that by this means the chased blood may be recalled, and the parts that were asleep or benumb'd, may again come to themselves. Wherefore in Swedeland, Denmark, and other cold Countries, when any one chanceth to be thus benumb'd with cold, or in danger to be seized with a Gangrene, they presently put the part into cold water, or Snow, for by this means the pores that were shut up by the cold, are opened by degrees, and make way for the banisht vital Spirits to return to them again, whereby the parts are soon after recovered to their former state.

Thus BARCLAY tells us, that when King JAMES I. was in Denmark, and that by the cold, the end of his Nose, and the Lappets of his Ears were become without all feeling, and almost mortified, he by the advice of the Inhabitants, applied Snow to them, to preserve them from a Gangrene.

III.
What hap- ned to K. James I. in Denmark.

The Reason of this cure of frozen and benumb'd parts is, because the grossest matter of the Second Element, which got out by their pores, when the cold began to shut them up, cannot re-enter again, in order to restore to those parts their former softness, without destroying their connexion, which might cause a mortification or Gangrene, which is avoided by rubbing the parts with Snow, because the Snow contains nothing in its pores besides the most subtil matter of the Second Element, which is very proper and fit to open by degrees the pores of the congealed parts, till they be wide enough to let the more gross matter of the Second Element pass through them also.

IV

Rrrrr

Nei

V. Neither can any other Reason be given, why *frozen Apples* being put into *cold water*, are restored to their former condition, than that the *cold water* doth gently dissolve the congealed *Humour* in the *Apples*, and consequently causeth that effect of the *Cold* to cease.

V. During the most violent *Cold* of *Winter*, the *Air* is most thin and serene; but when the *Cold* is more remiss and moderate, it is generally *Misty*. The Reason whereof is, *First*, because *extream Cold* doth more condense the thick *Vapours* of the *Air*, and by this means makes them to fall down, and consequently leave the *Air* more clear and serene than it was before. *Secondly*, Because *extream Cold* shuts up the pores of the *Earth*, by which means the *Vapours* are hindered from exhaling thence, and darkning the *Air*. Whereas *moderate Cold* produces a *cloudy* and *misty Air*; because the weak *Heat* which is joyned with that *Cold*, raises up *Vapours* from the *Earth*, which it is not strong enough to discuss or dissipate.

VI. Some *Bodies* never quit their *Coldness*, as *Marble*, and such like, which in the *hottest* season of the year feel very *cold*. So likewise *Ice* retains its hardness in the *Summer*, and is as *cold* then as in the *Winter*.

These familiar Instances make out, that *Cold* is nothing else than *Rest* or privation of *motion*. For the parts of *Cold Bodies* do cleave and stick fast together, so as to constitute a most close and compact Compound. But how doth it come to pass, that *Marble*, *Ice*, and other *Bodies* of like Nature, do preserve their *Coldness*, at all *Seasons*, in the same intense degree?

I Answer, That this proceeds from the *Heavenly Globuli*, which penetrate their pores; for the largest of them being endued with a stronger force of moving, do produce *Heat*: Whereas the lesser of them, which are inferiour in Force to others, do communicate *Cold* to *Bodies*, as will appear from the Experiment. *Marble* therefore is thus *Cold*, because the pores thereof are so strait and narrow, that they can only admit the very least particles of the most subtil Body, excluding the greater that cause *motion*. And forasmuch as *Water* does never freeze, except when the Matter which runs between its parts is more subtil than ordinary, it so happens that the pores of *Ice*, which are then formed according to the bigness of these particles of the most subtil matter, by this means become so narrow, that they shut out those particles that are never so little greater. And this is the reason why *Ice* continues to be most intently *cold* in the midst of the greatest heats of *Summer*. This also may be perceived by the Dissolution of it; for *Ice* doth not melt like *Wax*, whose flexible particles, give way to the Agitation of the *Fire*, and by the force thereof are separated: For the narrowness of its pores hinders the *Heat* from entering to its inward parts, save only as the outides of it melt away, and are broken by the force of it.

VII. Put some *Water* into a *Glass*, and lay *Snow* mixt with *Salt* round about it, so as to touch the sides of the *Glass*; and as soon as the *Snow* and *Salt* begin to dissolve, the *water* will be turned to *Ice*, not only in the *winter* time, but at any other time of the year.

The Reason of this Experiment is, because the greater *Globuli* of the second Element, which by their agitation are the cause of the *waters* fluidity, being of more force than those which run betwixt the parts of the *Snow*, and finding a more convenient place for themselves to move in, the stiffer and smoother particles of the *Salt* and *Snow* do necessarily tend that way: And forasmuch as Nature doth not admit a penetration of *Bodies*, and that all motion is performed by means of a Circle, the lesser *Heavenly Globuli* contained in the *Rain* and *Snow*, upon the approach of the greater, strive to get out, and to return to the places they have left, through the pores of the *Glass*. But because these *Globuli* are not sufficient to continue the motion of the *water*, consequently thereupon it becomes congealed, and acquires the coldness and hardness of *Ice*. And on the contrary, the *Snow* mixt with the *Salt*, dissolves and runs to *Liquor*, because it is agitated by the greater *Globuli*, which before, by their motion, kept the *water* liquid.

And probably it is for the same Reason, that *Spirit of Wine*, which is hot of its own Nature, doth cure Inflammations and the *Squimzy*; and also cools and heals the part that is scorched with *Gunpowder*; viz. because the *Spirit of Wine* hath its pores so disposed, that being applied to the enflamed part, it only admits the lesser *Globuli* of the second Element, which by their more remiss and soft agitation of the parts, do assuage the pain.

Thus the Inflammation of the *Emrods* are cured with a *Toasted-Onion*, or fulminating *Gold* mixt with *Brimstone*. For the Juice of the *Onion* being very sharp, with a mixture of *Sowness*, as *Salt Armoniack* and *Tartar* also are, which enter the composition of fulminating *Gold*, draw forth from the part affected, the *Humour* that is analagous with them, and mixt with it. It is a thing also owned by *Physicians*, that *Diseases* of *Men* may be communicated to *Animals*, by reason of the analogy of parts. Thus Mr. BOYLE tells us of a *Potters Son*, that was cured of the *Kings-Evil* by a *Dogs* often licking of it; the Disease having been by this means transplanted in the *Dog*.

Cold doth great harm to *Plants*, and if we may speak with the Ancients, doth scorch and burn them up like *Fire*.

This indeed is commonly ascribed to *Cold*; but if we diligently weigh the matter, we shall find that according to Truth it can be no more than the remote cause of this effect; because it rather proceeds from the *Heat* which follows upon the breaking of the *Frost*. For seeing that the heat cannot enter the pores of the *Plants* that are shut up by *frost*; neither can it restore to their inward parts that degree of softness, which they had before their congelation; since the said *Frost* hath spoiled the connexion and situation of the other parts, and therefore there cannot but follow an entire change of the whole, that is made up of these parts.

But yet sometimes it happens, that some certain parts of *Plants*, do without hurt endure *Cold*, as when the pores of *Plants* are shut up by *Cold* before that they begin to bud; for before that time they do not so much abound with that watry Juice, and their pores however narrowed by *Cold*, are

VIII. Whence it is that the Spirit of Wine doth cool.

IX. Diseases cured by likeness and sympathy.

X. Cold is very hurtful to Plants.

XI. Why sometimes the contrary happens.

are still open enough to give entrance to the subtil matter that may agitate the parts. For it is not necessary that their contexture should be destroyed by it, which are the first that bear the onset, before the Inward parts be set upon.

XII.
Why is cold Body, such as Marble, cooled the Air that is near it.

The Air that surrounds a cold Body, as Marble, is colder than that which is farther from it.

The reason whereof is, because scarce any but the most subtil matter hovers about Marble, either that which is about to enter the pores of it, or which flows out from it: And because this subtil matter, because of the tenuity of its parts, is not able to move the thicker particles of the Air, that might cause the Sense of Heat in us; for this Cause it is that the circumambient Air is perceived to be cold.

XIII.
What is the Reason of the cold Air that is about Fountains.

And it seems to be for the same Cause, that a cool Air is perceived about those Fountains, whence the water leaps up with great force; viz. because the thicker parts of the Air, which serve to excite Heat, are seized, and carried away by the water gushing forth, so that nothing but the Ethereal matter is left there.

XIV.
Why Cold makes the water in a Weather-Glass to mount upwards.

When Water, or Spirit of Wine, tinged with a Red or other Colour, is put into a weather Glass; this Liquor doth of it self rise or fall, according to the coldness or heat of the Weather.

The Peripatericks assign the Cause of this Effect to be the condensation of the Air, which is in the upper part of the Pipe; and that thereupon the water is forced to move upwards, that it may fill up the Empty space which the Air hath quitted. But what, shall we conclude then, that an insensible Body, such as the water is, can be so solicitously concern'd for the good of the Universe, that lest Nature should suffer a Vacuum, it rather mounts upwards, in downright contradiction to its own ponderosity? Wherefore they speak with a great deal more of probability, who say, that in Weather Glasses the Air is condensed, and the water driven upwards by the incumbent weight of the Air. For in these Glasses the Elastic virtue of the shut up Air is very much lessened, by which means the Circumambient Air does more press the Water, than the Spring of the pent up Air can bear.

XV.
The Frost rarefies water.

Water is dilated by Frost, and takes up more space than it did before, whereof we have an evident instance in a Glass-vessel with a long Neck, for when we expose such a Vessel fill'd with warm Water to the Winter cold, the Water will sensibly sink down or decrease, until it be come to a certain degree of Coldness: And not long after, it will begin to swell again and mount upwards till at last being bound to its good behaviour by Frost, it stands still and remains immoveable.

The cause of this Rarefaction is, because the particles of the Liquor that are shut up in the Glass, before they begin to be Frozen by Cold, grow Stiff, by reason of the lessened Motion of the subtil matter, and take up crooked Figures; and therefore cannot cleave so closely together, as when they were soft and pliable. And hence it is, that being vehemently shaken by the subtil matter, they cannot reduce themselves to so narrow a room as they had before, but require a larger wherein to dilate themselves.

It is worth our observing, that Frozen Water by reason of its Dilatation does commonly break the Glass-vials wherein it is contained; especially if the upper part be Frozen first: Because the Water being dilated by Frost, sticks fast to the sides of the Glass; so that when the Water that is under it comes to be congeled likewise, it breaks the Glass, because it finds no room wherein to expand it self. But we find a quite contrary effect, when Water is Frozen in the bottom of a Vessel, first by Snow and Salt laid about it: For then the upper part of the Water doth by little and little mount higher, and by this means prevents the breaking of the Glass.

Wherefore it is no wonder, if sometimes great Vessels of Marble are broken by the freezing of the water that is contained in them, which CAESARUS tells us he hath been an Eye-witness of. Nay, what is more, Artificers sometimes find by Experience, that some of their Copper Vessels have been broken for no other cause. It is also an Observation of the Noble and Ingenious Mr. BOYLE, that the space of Frozen water hath been increased a ninth or tenth part more than it was before; for else, how could it be that Iron Pipes, such as are made use of for great Guns, fill'd with water, and shut up with the greatest care and industry, should break by being exposed to the cold Air? As hath been often experienced in England, and other parts of Europe.

Neither must it seem any strange thing to us, that the subtil matter should not be able to bend the stiff particles of the water, when yet it hath force enough to move them; forasmuch as a lesser Force is required to move Bodies, than to bind them: For we can easily with our Hand thrust a Bar of Iron out of its place, but find our selves altogether unable to bend it.

This will also inform us with the Reason, why the Ground that is frozen riseth higher, and bursts into many flits, to the great damage of tender Plants, whose Roots are often pluckt up; except these Chinks in the Ground be cover'd either with Snow, or some seasonable warm Rain. For the Frost raiseth and distends the particles of the Earth and Water, and so makes them take up more room, than if they continued in their Natural figure.

As it is the property of Cold to Rarefy the Water, so it is endued with another quite opposite to this, which is that of condensing almost all hard Bodies. For as Heat rarefies Bodies, by making their parts that are circularly moved, to remove somewhat farther from each other; so Cold, which is opposite to it, is the Cause why these Bodies are condensed, by keeping their parts at Rest, or by making them lose the determination of their Circular motion. Thus we find by Experience, that the most hard and compact Bodies, such as Metals, Glass and Marble, do sensibly contract themselves in hard Frosts, and become more brittle than before, and upon a Thaw return to their former state.

It is also from the same Cause that men, who swim in Cold water, or otherwise affected with the Circumambient cold Air, are almost continually provoked to make Water; because the Contraction, which is an effect of the Cold, is communicated to the Bladder, and so causeth the

XVI.
Why water freezing in a Glass, does sometimes break the Glass, and at other times not.

XVII.
Why sometimes very strong Vessels are broken by the freezing of the water that is contained in them.

XVIII.
What the Reason is of the stiffness of the Particles of Ice.

XIX.
Why the Ground that is frozen riseth higher.

XX.
Cold also Condenses hard Bodies.

XXI.
Great Cold provokes frequent voiding of Urine.

list to make water. And therefore if the Hand of one, that is fast asleep be dipt in Cold water, it causeth him immediately to let go his water. And for the same Reason it is, that those who come out of a warm Bed, as soon as their Bodies come to be exposed to the cold Air, find themselves to stand in need of making water: For as soon as the motion of the particles is allayed by Cold, and the parts thereby contracted, the same is also communicated to the Bladder, which thereupon endeavours to rid it self of its burthen.

XXII. Ice may be so preserved, as to retain its hardness all the Summer over, so as that it will scarcely melt when laid near the Fire.

The Reason hereof is, because the pores of Ice are so narrow, that it can admit nothing, save only the particles of the most subtil matter, and consequently by excluding all greater particles, hinders the Heat from entering to the inward parts, save only as the melting of the outward parts make way for it.

XXIII. Cold Bodies, such as the Air, often change the water they touch into Ice.

The Reason is, because cold Bodies, by their Touch, do not only lessen the motion of the insensible parts of the water, but also forasmuch as they contain many icy particles, that is, smooth and stiff, they make the greater Globuli to pass out of the water into the pores of the cold Bodies; and on the other hand, cause the little Globuli to pass out of the cold Bodies into the water. And forasmuch as these little Globuli, because of their remiss degree of motion cannot preserve the water in its fluidity, their motion by this means ceaseth, and by this Rest of their parts are changed into Ice.

XXIV. Extream Cold is of that Malignity, that it is the Cause of the Corruption of Bodies, changing their Colour, and spoiling all their Comeliness and Beauty. This we see not only in Eggs and Fruits, but also in Wood and Stone, which with Frost are sometimes made so brittle, as to be unfit to be used in the Building of Houses.

Frost causeth this Putrefaction in Bodies, by dilating the watry parts wherewith the pores of Bodies are fill'd; because by this dilatation the fibres and other solid parts, are broken or distorted. For nothing else can be understood by Corruption, but the Transposition of parts, when those which were joyned, are separated, and enter upon new Combinations. Hence it hath been observ'd, that when the Eyes of Animals have been frozen, the Crystalline Humour hath become of a white Colour, whereas it was transparent before.

And from the same cause it is, that Men in Russia, and other cold Countries, do lose their Nose, Ears, and othe parts of their Body, by the Rigour of the Cold, which mortifies and putrifies the parts, as before hath been said.

XXV. Such is the Power of Cold, that it sometimes perverts the Order and Texture of the parts of Bodies. For to what else can we impute, that great Beams of Timber in very Cold Countries, are to that degree frozen, that except they be thawed with a moderate Heat, they split to pieces, and are altogether useless for Building? Whence is it that Marble, laid upon the Ground to dung it, does never obtain its end more, than when it is frozen by extream Cold? For the Moisture that

was contained in its pores being by this means dilated, the Texture of its parts becomes dissolved; so that whenever a good Shower falls, they are the more easily dissolved and mingled with the Earth.

And on the other hand, Cold preserves some Bodies from Putrefaction; whereof the Swallows are an incontestable Proof, which being stiff with Cold, and in appearance no other than dead, are kept all the Winter over in many of the Pools of Poland, without the least taint of Corruption.

The Reason of this is, because Cold, whose Nature consists in Rest, doth restrain the motion of the parts, and consequently hinders their separation from each other: For the dissolution of parts is the ready inlet of Corruption, forasmuch as thereby the whole Texture of the Body is disorder'd.

In like manner we find, that all manner of Meats and Drinks, are better preserved in Winter, than in Summer; and that Flowers and Fruits are kept for a long time untainted in Snow and Ice-Houses. Hence it is also, that Dead Bodies cover'd in the Snow, continue a long time without putrefying. In Iceland they customarily expose their Fish and Flesh to the Air, and when they are thoroughly hard and dry, preserve them untainted a great while without any Salt at all added to them; because the Cold keeps their parts at Rest, and suffers them not to be separated from each other.

CHAP. IV.

Of Heaviness and Lightness.

IF two Bodies of a round Figure, the one of Lead, the other of Wood, of the same or different bigness, should be let fall from the same Horizontal Line at the same moment of time, they will both of them come to the Ground at the same time; neither will any diversity be perceivable in their Descent, which GASENDUS saith he hath frequently observed.

No other Cause of this uniform motion can be assigned, but the equal propension of the Celestial matter, to withdraw it self from the Center of the Earth. For tho' the said Matter doth always, in an equal space of time, and with all its force recede from the Center; yet doth it not wholly exert its Power upon the Bodies it meets with, but only that part of it which answers, and is equal to the Body it lights on. And forasmuch as there is great difference in Bodies, in respect of their Composition: Some of them are more solid than others, having less pores, which can only admit the most subtil particles of the Matter of the first Element, and very few only of the Globuli of the second; such as are Gold, Quicksilver, Steel. And others are more loose, or less solid, as Wood, and the like, which because they have more lax and open pores, do contain more Celestial matter, and therefore do more readily comply with the motion of the Heavenly Globuli.

But to Apply this to the matter in hand: If the Celestial Matter, which is in the Leaden and Wooden Body, should be taken away from them, and

XXVI. The Cold preserves some Bodies from Putrefaction.

XXVII. The Cold preserves some Bodies from Putrefaction.

XXVIII. The Cold preserves some Bodies from Putrefaction.

I. Two Bodies of unequal Bulk are moved with an equal motion, if they be Spherical.

XXIX. Two Bodies of unequal Bulk are moved with an equal motion, if they be Spherical.

XXX. Two Bodies of unequal Bulk are moved with an equal motion, if they be Spherical.

and that the *Terrestrial Matter*, which is mixed with the *Heavenly Globuli*, should likewise be removed from them, that which remains of the *Celestial Matter* in every subordinate *Body*, and exerts its force upon the same, acts upon the remaining part of the *Terrestrial Matter*. For the *Leaden Body* being more solid, and consequently more able to resist, stands in need of a greater force of the *Celestial Matter* to press it downwards; whereas that which is less solid, will be carried down with a less force, and consequently they will both of them come down to the *Earth* with an equal swiftness. For to the equality of *motion* nothing else is required, but that the *Celestial Matter* be proportionate to the *Terrestrial*; which latter, when it is greater, the greater activity is required to overcome its *Resistance*; and when it is less, a less force of the *Celestial Matter* will serve to push the *Body* downwards.

II. Wherefore if a *Body* that is more *heavy* than the *water*, be put into it, it presently sinks to the bottom; but if it be lighter, according to the different degrees of the said *Lightness*, either it swims on the top of the *water*, or only some part of it sinks into it. Thus an *Earthen Vessel*, filled with *Air* swims upon the *water*; because it is lighter than it, being compared with a like proportion of it. Whereas the same *Vessel*, filled with *water*, sinks to the bottom, because compared with a like proportion of *water*, it is heavier than it. Hence it is that when a *Cup*, with the *Mouth* downwards, is put into the *water*, it doth not go to the bottom, because the *Air* contained in it is the same as if it were one *Body* with it, which being lighter than the *water*, must needs swim on the top of it, without sinking, till the *water* have entered the hollow of it.

III. But this seems to contradict another Experiment, whereby we find that the *Grains* of *Gold* and *Silver*, tho' they be more heavy than so much of *Aqua-fortis* or *Regalis*, yet do not sink in it. But this is to be ascribed to the *Saline Bodies* which are diffused through the said *waters*, and which, as it were by a continual chain from the bottom to the top, do support each other, and so bear up the *Grains* of *Gold* or *Silver*. That this is so, may be confirmed in that, when common *water* is poured to them, after the dropping in of some drops of *Oyl* of *Tartar*, immediately the *Grains* of the *Metal* sink down to the bottom.

IV. *Liquors* that have communication by *Pipes* that contain them, do gravitate upon each other, not according to their *Breadth*, but according to their *perpendicular Height*.

The Reason is, because these *Liquors* are like so many hard *Bodies*, put into the 2 Scales of a *Balance*, whereof the one cannot go down, without causing the other to rise proportionably: For as these hard *Bodies*, tho' of unequal bulk, are nevertheless of equal weight, when their force is equivalent thereto, so likewise the *Liquors* contained in *Pipes* that communicate with one another, tho' they be of unequal breadth, yet must needs be of equal poise, when they are of an equal height. As for Example, in a *Vessel* of *Liquor*, closed on all sides except only 2 holes, if one of them be fourfold bigger than the other, and a *spout* adapted to each of them, the force of one pound of *Liquor*, forcing the little *Spout*, will

equal the force of 4 pound weight, forcing the greater, which is supposed 4 times larger than the other, so that whatever proportion there may be between the holes, if the force applied to the said *Spout*, or *Pipes* be equal to the holes, the *Liquors* will be in equal poise.

When we say that *Liquors* that Communicate together are in equal poise, when their heights are equal, this is to be understood only, when the 2 *Pipes* are filled with the same *liquor*: For if the *Liquors* be different, their height will be in the same proportion as their weight: So that because *QUICKSILVER* is almost 14 times more heavy than *water*, one thumb breadth of *Quick-silver*, will weigh very near as much as 14 thumbs breadths of *water*.

A *Stone* or *Ball* falling down from the Top of the *Mast* of a *Ship* in its full course, or tost up by one that rides on *Horseback*, falls down at the foot of the *Mast*, and on the hand of the *Rider*.

The Reason is, because the *Ball* in its descent or ascent doth not describe a *Right*, but an *Oblique Line*. For though it seem to them who are in the *Ship* to be *Perpendicular*, yet is it indeed *Crooked* or *Parabolical*. Which any one that pleaseth may experience by casting up a *Ball*, or other thing into the *Air*, whilst he is riding in a *Coach*, for he shall find that the same, notwithstanding the progressive motion of the *Coach*, will fall directly into his hand; but if he shall command the *Coach* to stop immediately, he will see that the *Ball* doth not tend directly upwards, nor fall down perpendicularly, but obliquely, and so describes, as it were an *Arch*, or *crooked Line*, the one end whereof will be there where he casts up the *Stone* or *Ball*, and the other end, where he catches the same again. But the Reason why the *Ball* appears to him, to tend directly upwards, is because that as much as he moves forward, so much the *Ball* is advanced also. Now the Cause why the *Ball* deviates from a straight motion to a crooked is, because its motion is derived from a twofold moving force, viz. from that of the *Arm* casting it upwards, and from that of the *Coach* or *Earth* impress upon the *Arm* *Horizontally*.

All *Bodies* that are not of a *Round Figure*, are carried downwards by an unequal motion, as is evident in all *Square*, and other *Corner'd Bodies*, which tho' they consist of the same matter, and are of the same Bulk, yet differ in their motion, and unequally move downwards.

This difference of motion is caused by their *Figure*; which tho' it cannot be said to be the cause of their being prest downwards, yet doth much conduce to the diversity of their motion. For things that are *Rough*, do more slowly fall through the *Water* or *Air*; and the broader their surface is, the greater resistance do they make against the *Body* through which they pass; because they do not divide it uniformly and steadily. Thus *Water* and *Ice*, are kept hanging in the *Air*; and greater *Flocks* of *Snow* congealed by cold, are more slow in their descent than drops of *water*. And it is for the same reason that *Birds*, with their spread *Wings*, keep themselves poised in the *Air*, viz. because the *Air* opposeth a greater resistance to a spread or plain extension, and hinders its falling down.

V. When Liquors are said to be of equal poise.

VI. Why a Ball falling down from the top of the Mast into a Ship under Sail, yet falls down plumb at the foot of the Mast.

VII. Square Bodies do unequally descend to the Earth.

VIII.
Why the
Bodies of
some per-
sons drown-
ed, do after
some time,
rise up to
the top of
the water.

Drowned Bodies do after some space of time rise from the bottom, and swim at the top of the water.

This Effect is commonly attributed to the breaking of the Gall, but this I look upon only as a Fable. Wherefore I suppose that the true Reason why drowned Bodies rise to the top of the water is, because that the water entering into their Bodies, doth extend the Membrans thereof; by the expansion whereof, many other Cavities also are opened, which by taking in the Air, are distended to a greater space: for such Membrans as these, because of the connexion of their parts, do reject the water, and can only be filled with Air. By which means the Bodies having got greater extension, and made more light are driven upwards, and so swim on the top of the water.

IX.
New laid
Eggs are
heavier
than stale
ones.

In like manner it is the entering of Air, that makes Eggs to be lighter when they are stale, than when they are new laid; for when they are newly laid they are top-full with their own substance, without any air; but when they grow stale, some particles of the White and Yolk do exhale, and leave an empty space, into which the subtil Air enters, and it may be the more gross also, through the pores of the Shell; so as that it must not seem strange to us, if they do not sink in the water as deep as they did when newly laid.

X.
Why the
dead Bo-
dies of Men
swim with
their Faces
upwards,
and those
of Women
with their
Faces down-
wards.

Accordingly also, the reason is evident why Female Bodies swim on the water with their Faces downwards, but those of Men with their Faces upwards. For Women having greater Bellies, and more Cavities in them, besides their Breasts, which are of a Spungy Substance, do take in more water in those parts, and therefore by the weight thereof are turned with their Body downwards: Whereas Men have more narrow Bellies, lesser Breasts, and strait Urinary Passages, with large Lungs and broad Shoulder-blades, which are the cause why their Bodies should swim with their Faces upwards.

XI.
How Men
may best
hinder
themselves
from
drowning.

Wherefore Men, if whilst they are swimming, they find themselves in danger of being drowned, they can do no better for the avoiding of that danger, than to extend their Chest, and hold their Breath. And therefore Fishes, that they may swim with the more ease, have Bladders blown up with Air in their Bellies. And in like manner Bees, that they may the more lightly hover in the Air, have the Trunk of their Body fill'd with Air.

XII.
Burnt
Bricks are
heavier,
than they
were before
they were
burnt.

It is found by Experience, that burnt Bricks are heavier than unburnt.

The Reason whereof is, because the pores of unburnt Bricks are wider, and filled with Air only after that they are dried: Whereas Bricks after that they are burnt, have many Cavities, of such a bigness as is fit to admit the particles of water that run into them, when they are exposed to the Air to be cooled. For there is always great store of these particles in the Air, and which intruding themselves into the pores of the Bricks, do create their heaviness. A confirmation whereof may be, that if the same Brick be weighed as soon as it comes hot out of the Brick-kiln, it will be found more light, than after it hath been for some time exposed to the Air; and if afterwards it be put into the water, it will still be found more

heavy, because the particles of the water which are entered into its pores, cannot get out.

If a Stick be plunged into the water perpendicularly, it riseth up again with the greater force, as the water is higher.

The Reason of this is to be fetched from the nature of Gravity: For seeing that the Stick cannot move upwards, but only in as much as it is driven up by the water, it must follow that the greater the force of the expelling Body is, so much the more strongly the Stick must rise out of the water: Now this force is by so much encreased, by how much the weight of the expelling water is greater, by the force whereof it drives up the Stick; and therefore it follows, that the higher the water is, with so much the greater force is the Stick driven upwards, and so much the swifter it ascends.

The motion of Heavy Bodies is encreased according to uneven numbers: As if suppose a Stone fall down one Ell in the first moment of time, in the second it will fall 3, in the third 5, and in the fourth 7, and so on according to the following uneven numbers.

The Reason whereof seems to be, because the heavy Body, in the first moment of time hath by little and little acquired one degree of swiftness. Wherefore at the beginning of the second Time, having that degree of swiftness which it acquired, it will pass through as much space again, as it did in the first moment; and moreover by little and little acquiring force by its weight, by means whereof it passeth also through an equal space to that which it measured during the first moment; it must needs follow, that being now moved by both these forces together, it will pass through a triple space to that it pass'd at first. At the third moment of time likewise it hath two degrees of swiftness, whereby it measures four times as much space as the first was. And in the mean time also by this innate Gravity, whereby it is continually pressed, doth acquire another degree, whereby in like manner it measures the space of another Ell. Being therefore thus furnished with three degrees of swiftness, it passeth through 5 times as much space, as it pass'd at the beginning; and so afterwards continues to make its progress by uneven numbers, because the acquired degrees of swiftness always continue the same, as well as its natural heaviness.

The Times being 1, 2, 3, 4, 5, 6, 7, 8.

The Intervals or Spaces are 1, 3, 5, 7, 9, 11, 13, 15.

It is the common received opinion, that the Bodies of Animals, after death, are more heavy than when alive.

The Cause of this change is commonly attributed to the want of Vital and Animal Spirits; which being supposed, not only to be active, but also very light, do seem to diminish their Gravity. And forasmuch as Flame is lookt upon as the most light of all Bodies, no wonder if some have ascribed the Lightness of Living Bodies to that Flame, which being diffused through the whole Body of the Animal, doth vivify it, and is therefore called Vital. But however, notwithstanding, this Reason seems probable, yet I would have us rather trust to Experiment, than to this Reason. For Mr. BOYLE, for a trial, weighed a Mouse alive with a Packthread tied about its Neck, where-

dies be
more heavy
than Li-
ving.

wherewith it was strangled immediately after, and when dead, was found to have lost of its former weight $\frac{1}{12}$ of a grain. And the same thing was experimented by him in a *Whelp*, which alive weighed 10 or 11 ounces, and being strangled, was found 4 grains lighter. Which Experiments absolutely contradict the common opinion, that *Dead Bodies are more heavy than living*, and that by the loss of *Spirits* they acquire a new degree of *Gravity*.

XVI. An Arrow shot into the Air upwards, descends from its point of Elevation with the like swiftmess, as it was shot up thither by the Hand of the Archer, tho' not in the same manner.

The Reason is, because an Arrow, in the beginning of its ascent, is not carried with more swiftmess, than towards the end of its descent: Nor on the contrary more slowly towards the beginning of its Descent, than at the end of its Ascent, and therefore it is necessary that the Descent of the Arrow should be as swift as its Ascent.

XVII. A square piece of Wood, and another of Lead being let fall severally, make an unequal descent, but if the Wooden Square be laid upon the Leaden, they will both descend with equal swiftmess.

The Reason why a Square Piece of Wood, and another of Lead do descend unequally is, because besides the force of the subtil matter driving downwards, there is a greater force in the square piece of Lead to resist the Air, than there is the Wooden Square. For if the square piece of LEAD be of 16 pound weight, and the Wooden Piece of 1 Pound, and the resistance of the Air as two, forasmuch as both the Cubes are supposed to be of the same magnitude, the Proportion of the Lead, must have the same proportion to the resistance of the medium, as 16 to 2, and of the Wooden Cube, as 1 to 2. And therefore it is necessary that the Leaden Cube should fall down more swiftly: but when the Wooden Cube is laid upon the Leaden, so as that no Air comes between them; the Gravitation of them both must needs be equal, since they have both the same Resistance, and the medium makes way for them both at once.

XVIII. Water, like to Light Bodies, mounts upwards through the Leaky Bottom of a Ship.

For seeing that Water is heavy, and presseth upon the Body it lies upon, it cannot be but that the water which flows about the bottom of the Vessel, must be thrust away by the water that lies above it. For the parts of water which are above, press downwards by their weight or heaviness, and force that which is under them, to enter through the Leak into the Ship; so that if there was a Pipe fitted to the said holes, there is no question but the water would rise up through the same, as it doth in Fountains.

XIX. Bodies are very different from one another in weight; as Quicksilver is much more heavy than water; neither are there any metals but differ from each other in this Quality. Thus Gold, if we will believe GASSENDUS, is 10 times heavier than Earth; Lead, 7 times; Silver, 5 times; Pewter or Tin, 4 times; Loadstone, 3 times; Whetstone as heavy again, &c.

And forasmuch as it is frequently of great use, to know the weight or heaviness of several Bodies, I shall here subjoin a Table, exhibiting the just weight of different Bodies, according to the Pa-

ris weight that every Square Foot of them weighs.

A Cubical Foot of	Pounds
Water	72
Wine	70 $\frac{1}{2}$
Oyl	66
Tin	532 $\frac{1}{2}$
Iron	575
Copper	648
Silver	744
Lead	828
Quicksilver	977 $\frac{1}{2}$
Gold	1368
Earth	95 $\frac{1}{2}$
Bricks	130
Sand	132
Stone	140
Marble	252
Irish-slate	156
Salt	117 $\frac{1}{2}$
Honey	104 $\frac{1}{2}$
Wax	68 $\frac{1}{2}$
Air	$\frac{1}{12}$ of an ounce.

All which different degrees of Ponderosity of Bodies proceed from the various Make and Texture of their parts, whether inward or outward. For it cannot be questioned but that there be many Pores between the Particles of all Bodies, through which the subtil matter passeth continually from the abundance or fewness whereof the diversity of Bodies doth arise. Hence it is that Quicksilver is found to be so much heavier than Water, because it hath fewer of these Pores. For tho' we may imagin, that Water and Quicksilver consist of parts that are of the same bigness, and that their motions are alike, yet will their diversity clearly appear to us, if we consider the particles of Water to be like a soft and slack String, and the parts of Quicksilver, as having fewer Pores, to be like hard twisted Strings, that are much more stiff and hard. And the same is to be understood of those metals which are several times heavier than the Earth, since that all difference proceeds from the multitude or paucity of their Pores that admit the subtil matter, and do variously dilate and contract themselves in compliance with its motions.

Lead sinks more slowly in the Water, than in the Air; and a Log of Wood which is very burthenom to the party that carries it, rests on the surface of the water, and scarcely seems to be of any weight at all.

A twofold weight may be understood to be in Bodies, the one Absolute, and which is not subject to any alteration, as being indistinguishable from the Body, and cannot be encreased, but by the addition of parts to it. Thus Gold is heavier than Lead, because its parts lie more snug and close together, and have straiter pores. The other weight of Bodies may be called Relative, which varies according to the different position of the matter; and according to this notion of Gravity, Lead is said to be less heavy in the Water than in the Air; because the water doth more strongly resist it, and by that means detracts much from its weight. Thus Wood swims upon the top of the Water, and doth not sink till it putrefie and corrupt, be-

XX. Lead seems more heavy while it passeth through one Body, than through another.

because the *water* is heavier than *wood*, and drives it up to the *surface*. For the *parts* of *water*, in the same bulk, are more than twice as many as the *parts* of *wood*; and according to the *Laws* of *Nature*, *Things* that exceed in number, cannot be driven forwards by those that are fewer. Thus it hath been observed, that a *Young man* that weighed 130 pounds, did not weigh in the *water* above 8 Ounces.

XXI.
How we
may know
the differ-
ent weight
of Bodies.

And on the contrary, if a *heavy Body*, as for Example *Copper* do much exceed *water* in ponderosity (for it is accounted to be 9 times heavier than *water*) it will lose a 9th part of its *Gravity*. So that if *Copper* should be hung up by a string first in the *Air*, and afterwards in the *Water*, then the 9th part of the weight is to be removed out of that *Scale* which hangs in the *Air*, that there may be an Equality. And by this means we shall easily perceive the true weight of every *Body*, and how much more heavier it is than the *water*.

XXII.
The differ-
ent Hea-
viness of
Bodies in
the *Air*,
and in the
Water.

So in like manner it happens that those things, which when weighed in the *Air*, are in equal poise, do lose the said Equality when put into the *water*, by Example *Copper* and *Lead*: For *Lead* put into the *water*, takes up a less space than *Copper* of the same weight; and therefore when both these *Bodies* are weighed in the *water*, the *Lead* must of necessity out-weigh the *Copper*, with which it was in equal poise in the *Air*. And by this means it will not be difficult, to know what *Metals*, according to their bulk, are heavier than others. For if when they are weighed in the *Air*, neither of them exceed the other in weight, and that when put into the *water*, they are not in the same equal poise, that which out-weighs the other, according to its bulk, must be supposed heavier.

XXIII.
Respective
Gravity
may be
changed;
but absolute
cannot.

Whence it follows, that the *respective Gravity* of a *Body* may be changed, whilst the *absolute* still continues the same: As suppose we put into one of the *Scales* of a *Balance* 100 Pounds, and in the other 50, then the *absolute Heaviness* of the first weight will be always of 100 Pounds; but the *respective Heaviness* will be only of 50 Pounds; nay, it will be no more than 20 or 30 Pounds, if we put in the other *Scale* a *Body* of 80 or 90 Pounds. And for the same Reason, if we hang the weight of 100 Pounds at the end of a *Standard*, tho' the said *absolute weight* continue, yet may the *respective* be changed every moment; according as the weighing *Body* is nearer or farther from the fixed Point, than that weight is, which is at the other end of the *Standard*.

XXIV.
Heavy
Bodies
increase
their mo-
tion in
falling.

Heavy Bodies do not move equally in their Descent, but accelerate their motion; as is evident in *Stones*, which according to the greater distance from whence they fall, make the stronger impression upon the things they light on.

The Reason is, because a *Body*, at the beginning of its motion, moves but little; for the *subtil matter*, which takes up its place, and which alone acts upon it, does not drive it downwards with that swiftness wherewith it endeavours to withdraw from the *Center*: But when the *Body* begins to descend, the *subtil matter* which is under the *Body*, and which with great endeavour strives to get above it, doth continually drive it downwards, and adds new degrees of Swiftness to those it had before.

Or else we may say, that the motion of *Heavy* things is accelerated; for that *Bodies* in their descent do acquire a new Force. For tho' they pass but slowly at the first moment of their motion; yet at the second they must move more swiftly, because they retain their former motion, and receive an augmentation of it from the Action of the most subtil Matter.

Thus when a *Bullet* or *Pellet* is by the blast of our *breath* driven through a *Pipe*, the *Breath* that proceeds from our *Lungs*, doth with repeated Onsets strike against it, whereby the first impulse impressed upon it is increased, and new degrees of Swiftness added thereto, whereby it becomes more vehement than it was at first.

Hence it is also, that the *water* which by Example is fallen down 3 Foot and an half, hath its Force once and half as much increased, more than that *water* which hath made a descent of one Foot only; and that consequently the *water* which gusheth out of a *Pipe* fill'd to the height of 3 Foot and an half, must run twice and an half faster, than when it runs from a *Pipe* that is only full to the height of one Foot; for that by that time it is come to the end of the *Pipe*, it will have acquir'd in its descent twice and an half more Swiftness, than it would have got, if it had only made a descent to the 4th part of the *Pipe*.

Nevertheless, we must not imagin that the notion of *Heavy Bodies* doth increase continually, so as to have no bounds of its augmentation: For the *Air* resists the motion of *Bodies*, and blunts their force. Hence it is that a *Bullet* discharged from a *Canon* at a great distance, doth less hurt, than if it were shot nearer. And so likewise we see in the *Pneumatick Engin*, that when all the *Air* is pump'd out of it, *heavy Bodies* do fall with a great force at the first, and do exert the entire force of their *Gravity*: Like as *Bodies* cast up into the *Air*, in the beginning of their motion, do exert the whole Swiftness they have received.

A *Pail* full of *Water*, in a *Well* or *Pool*, loseth all its *Gravity*; seeing that with the least force it may be removed, this way or that way, upwards or downwards, without almost any perception of ponderosity.

The Reason is, because the *parts* of *water*, whilst they are mingled and hang together, do do not press one another; for being all of them equally solid, they are all equally prest towards the *Center* by the *Celestial matter*; and therefore the *Pail*, because of their equal pressure, is with the least force moved any way. In like manner a man that is sunk under *water*, is not sensible of any ponderosity; because the *Waters* which lie upon him, are less pressed by the *Heavenly Globuli* that run between them, than the man himself, who is a more solid *Body*, and consequently less pervious to the subtil matter.

Which is the Reason why *Divers* cannot come to the bottom of the *Sea*, without *Weights* hung upon them; because they are equally pressed by the *water* that surrounds them, and as much born up by that which is beneath them, as they are thrust down by that which is above them. So that if a *Diver* being at the bottom of the *water*, could apply and fasten to his *Arm* or *Thigh*, the lower part of a long *Pipe*, the other end thereof standing

standing out above the *water*; so that the *water* could not come in between them, that part of his *Body* would presently begin to swell, it being free from the pressure of the *water*; and the *Blood* would run thither from the other parts of the *Body*.

XXIX. Hence it is also that a *Body* is more born up by *Running-water*. For the force of swiftly *Running-water*, doth make the ponderosity of the *Body* almost insignificant; as we see in things that are thrown or cast upwards. Wherefore we find, that a *Body* doth more easily swim on the top of *Running-water*; because there are many more parts of the *water* that resist its sinking, since continually other new parts succeed to support and keep it up. And this is the foundation of the *Art* of *Swimming*.

CHAP. V.

Of Taste.

I. **H**ard Bodies, such as *Stone, Iron, Lime, Harts-horn, &c.* are insipid, and do not at all affect the *Tongue*.

Because the particles of *Hard Bodies* cannot be separated from each other, and consequently be mingled with the *Spittle* in our *Mouths*. For when *Bodies* are so compact that they cannot dissolve and furnish those particles, which by the Vehicle of *Moisture*, may be conveyed into the pores of our *Tongue*, no wonder if they be insipid. For tho' *Sugar*, when melted, affords a *sweet taste*; yet when the same is brought into solid and compact pieces, it affords no taste at all, because its parts cannot readily be separated, to impress any taste upon the *Organ*. So for the same Reason *Pills*, when they are swallowed whole, are scarcely perceived, because they do not stay long enough to have their outward parts dissolved, without which they cannot affect the *Organ* of *Taste*.

Thus *Turpentine* boiled, and made into *Powder*, is lookt upon to be insipid; because the more subtil parts of it cannot be diffused or mingled with the *Spittle*: Whereas in its *Liquid* form, it exhibits a *bitter taste*. So that Experience teacheth us, that nothing else is wanting in these *Bodies*, to make them *Savoury*, but only the division of their parts; seeing that the *Salts* which enter the Composition of *Glass*, were savoury before they were compacted into that hard consistence, and that *Metals* reduc'd into very small powder, tho' before they were insipid, do now yield a most strong and intolerable taste.

II. Almost all *Bodies* are distinguishable by their tastes; as *Honey* is sweet, *Wormwood* bitter, &c.

The general Cause of all *Tastes* and *Savours* depends on the greatness and figures of the parts of *savoury Bodies*, which are capable of being diversified after an infinite manner of ways: And forasmuch as *Bodies* are in a manner all of them composed of parts that are of a different bigness and figure, it must not seem strange to us, that we meet with so great a variety of *Tastes*.

III. This difference of *Tastes*, is sometimes caused by the various agitation of the parts of *Bodies*; for we experience that *hot Meat* is more savoury than cold, because heat increaseth the motion of

the parts of the *Body*; and besides, it is certain, that the more any *Body* is moved, the more fit it is to move another *Body* that toucheth it: And therefore it cannot seem strange, that *Meats*, when hot, are a great deal more savoury to us, than when they are cold. This is the Reason also why *dressed Meats* are far more savoury than raw, because the heat of the fire that dresseth them, divides them into lesser parts, whereby their figures are changed, and so make them to be of a very different Taste from what they were, when Raw.

Sweet things do sooner fill than sharp. Thus we find that *Milk-meats, Sweet-meats, Butter, Honey, &c.* do sooner satisfy our Appetite, than *sowre and sharp things*.

Some suppose the Cause hereof to be, because *Sharp things* do afford little Nourishment, and much Excrement; but this Reason seems of no force, because *Digestion* does not immediately follow upon the taking down of our food: But the Cause why *Sweet things* do sooner glut the Appetite, than *sharp and sowre things* is, because these latter are made up of parts whose surface is very rough and rugged, that is, which have many Angles or Inequalities, which make them fit to twitch and vellicate the *Bodies* they touch or apply to; and by this their vellicating of the *Stomach*, do stir up the Appetite: Whereas *Sweet things* consisting of smooth Bodies, and such as gently affect the *Stomach*, without exciting of the Appetite, do presently fill and satiate.

Fire procures a sharp Taste to Meat; for we find that *Roast-meat* doth with more sharpness strike the *Tongue*, and affords a more grateful taste.

For it is evident that there is no food, but contains some Salt, which is in a manner equally diffused throughout the whole Mass of it. Whence it is, that when *Meat* is agitated by the heat of fire, some part of this Salt is carried to the outside, and exhales with the other *Liquid* parts, and constitutes that *Smoke* which we see proceeds from *Meat* that is a *Roasting*. But whereas they are only the insipid particles that fly into the Air, those of the *Salts* can scarcely rise 2 or 3 fingers high; but that by their weight they are forced down again to the surface of the *Meat*, and there produce that sharp taste which we experience in *Roast-meat*.

Things harsh and sowre, set the Teeth on edge; as unripe Fruits, harsh Wines, Verjuice, and the like.

The Reason is, because the fixt Salts that are in these Bodies, being entangled in a gross Sulphur, compose together with it parts, whose Surface is bristled with many Hairs variously bent, which entering into the pores of the *Tongue*, shut up the parts thereof.

Bitter things, as *Orange-Peel, Venice-Treacle*, and many purging Medicines do heat; but Sowre things, such as *Juice of Orange, Sowre Grapes, &c.* do cool.

Because Bitter things consist of sharp Salts, and gross Oils, which being agitated together, do excite and preserve heat; whereas the parts of Sowre things are long, stiff and pointed, and rather stop the motion of the fiery particles, than promote it, and for that Reason are esteemed of a Cooling Nature.

Tittt Unripe

IV.

Sweet things do sooner cloy the Stomach, than Meat of a sharp taste.

V.

The Fire excites a sharp taste in Meat dress'd by it.

VI.

Sowre and Harsh things set the Teeth on edge.

VII.

Why Bitter things do heat, and Sowre, cool.

VIII.

Why un-ripe Grapes and Fruits are harsh.

Unripe Fruits seem very harsh at the first taste, and cause a Roughness on the Tongue; but afterwards they turn sweet, and acquire a pleasant relish.

The Reason is, for that Fruits, before that they are ripe, do consist of longish parts, which by their motion do, as it were, cut the fibres of the Tongue, and contract them; and afterwards they grow ripe by means of the fire or the heat of the Sun, which digests their raw Juice, and by exhaling the Heterogeneous parts, reduceth it to sweetness. For it is evident, that there is a continual resolution and division of parts in Fruits that tend to maturity, by means whereof they lay aside their hardness and harshness, and after perfect Concoction become soft and pleasant.

IX.

A Tongue that is either too dry, or too moist, can taste nothing.

A Tongue that is parch'd and over-dry, hath little or no taste; and so likewise when it abounds with over-much moisture.

The Reason is, because Taste doth not only consist in moisture or dryness apart, but in a mixture of them both. And therefore it is no wonder, if a too dry and parched Tongue, cannot perceive the taste of solid food, seeing that the same cannot be macerated or dissolved without moisture, which is necessary in order to the Sense of Tasting. For the Tongue being a spongy and porous part, stands in need of moisture, which is the vehicle of Savours. Moreover, in a dry Tongue the fibres are too much contracted, and thereby are made unfit to receive that affection, which the savour of things doth impress on it. And on the other hand, a Tongue too moist, is not fit for the reception of Tastes, forasmuch as the Tongue, which is loose and spongy, having its pores already filled with Humour, cannot well admit that which conveys the Savoury particles of the food, and by this means cannot perceive the taste of it. And it is for this very Reason, that we cannot relish Wine after having eaten some sweet thing, and that in order to recover our taste we eat salt meat, that may open the pores of our Tongue.

X.

Why we find no relish in those things which we eat often.

Some find that they lose the relish of those things, which they feed too frequently upon, and that either because these common Aliments do leave some of their particles in the Tongue, which render the little Nipples of it immoveable; or, because the Soul gives less heed to those motions that are ordinary and common, than to those which are new and unfrequent.

XI.

Why we can better discern Tastes in the Morning.

Tastes are better discerned in the Morning, especially before we have eaten or drank any thing, that can byass the Tongue to a mistaken Verdict.

Because at that time the Tongue is like fair Paper, and as yet unting'd by any Savours. For that which receives, must be free from a Taint of the thing received. Which is true not only in the Taste, but also in Hearing, Smelling, and all the other Senses: For by right, the Sense of Hearing is sharpest, and Blind men do better retain things than others.

XII.

Persons sick of the Jaundise, cannot rightly discern the taste of things.

Men sick of the Jaundise, suppose all things to taste bitter.

The Reason is, because the Gall is diffused through their Tongues, which infects their Spittle; for the Gall consisting of sharp particles, doth so corrupt the Spittle, that it communicates a bit-

terness and an ungrateful taste to all the Food that is eaten, as if something of Soot were mixt with it. The Cause of which Depravation is, because the Raw humour, which runs through the Veins and Arteries, betakes it self to the Tongue, because of its loose and spongy Flesh, and filling the pores of it, vitiate the taste of all received Aliments. Which is the Reason why Physicians commonly order their Patients to put out their Tongues, that they may view the colour and disposition of it; for seeing that that Member, proportionable to its bulk, contains abundance of Blood, it accordingly also admits a considerable deal of the morbid Matter, which there discovers it self by its Colour, and consequently also the Sickness which disturbs the Body.

The Juice of unripe Grapes constitutes that which is called Verjuice, which is of a soure and somewhat harsh taste; whereas the Juice of ripe Grapes is sweet, and with a pleasant briskness accosts the Palat.

The harshness of Verjuice proceeds from the Roughness and Inequality of its parts; for because the Juice of unripe Grapes is not sufficiently concocted, they retain a great deal of Crudity, which is owing to their long and inflexible particles.

Hence it is that the Verjuice which is made of Crabs, is a good Medicine to help the weakness of the Eyes; because its particles being like so many little grains of Sand, do wipe off the filth of the Eyes, and by this means restore the Visive faculty to its former clearness. And the same Reason may be given of the Water of some particular Fountains, which by reason of their Acrimony do not only purge the Eyes, but also the Optick Nerves, that so the Rays of Light may be the more freely transmitted.

But New Wine is sweet, because it hath been sufficiently decocted by Heat, and all its parts are smooth and even. And as to its muddiness, that is only caused by those Heterogeneous parts, which are not yet separated from it; which as soon as they are either precipitated to the bottom, or raised up to the top, by fermentation, the Wine becomes clear, by admitting the Heavenly Globuli.

All Fruits are distinguishable by their taste, some of them having a harsh bitter taste, others a harsh soure, other a soure, and all of them a sweet taste after they attain to their full maturity.

This difference of Tastes in Fruits, proceeds from the various Texture of the particles, and the different structure of the Plants that bear them. For grafted Trees bear more delicate Fruits than others, because the Alimentary Juice is more exactly strained through the double twisting and weaving of their fibres. The Harsh-soure taste therefore of Fruits proceeds from this, that their Parts are not yet sufficiently strained and digested; and because the surface of them, as was said, is bristled with many little Hairs, diversly bending this way and that way, which entring into the pores of the Tongue, do hurt them up. As we find in the taste of Quinces, Medlars, and generally of all unripe Fruits. Other Fruits afford a smart or sharp taste to the Palat, because their particles are long, stiff, and very subtil; by which means they prick

prick and divide the *Tongue*, and dilate the same with some kind of sense of heat. *Ripe Fruits* do generally afford a *sweet taste*, because the *Juice* of the *Plant* whence they proceed hath been well strained, and lost all its Crudity by the agitation of the heat of the *Sun*. Wherefore also such *Fruits* as these do pleasingly smooth and stroak the *Tongue*, and with a grateful softness enter the pores of it.

XVI. *Nothing is of more obvious Experience, than that the same food is not alike grateful to all; and that frequently what is very pleasing to some, is very distasteful to others.*

Which proceeds from the different disposition of the *Organ*. For they whose *Tongues* are furnished with stiff and less pliant fibres, will be less exact in discerning the *Taste* of things, because they stand in need of a greater Force to move them: Whereas those whose fibres are more delicate and tender, do more exactly distinguish them, because the least Vellication is sufficient to affect them. Somewhat like that which is found in the *hands* of those that are grown hard by much labour, which without any sense of Pain do handle *Briars* and *Thorns*, when those that have tender *Hands* cannot, without great pain, so much as touch them.

XVII. *Hence it is that sometimes the same person, upon some alteration in the Organ of his Taste, caused by Age or Sickness, finds a different Taste in the same Objects from what he formerly perceived in them: For the Texture of his Organ being changed, the particles of the Bodies do no longer accord with it, but cause a kind of rout and confusion in it. And it is for the same Reason that young Women, and such as are with Child, do sometimes take delight in some Meats which they formerly abhorred.*

XVIII. *Whence it is that different men are pleased with different Savours, and that there must be different Savours to please the same person at different times and seasons. For one loves sweet Savours, others sour; one man delights in the taste of Wine, another abhors it; and the same person that is greatly pleased with the taste of it, when he is in Health, doth loath it when he is sick of an Ague or Fever, because the fibres of his Tongue are otherwise disposed than they were before. This is visible in Girls, and Women big with Child, especially in the first Months after Impregnation, who frequently delight in, and long for those things which before they abhorred, or at least had no inclination to, forasmuch as the particles of those things enter more smoothly, into the pores of their Tongues than before.*

XIX. *From what hath been said, we have reason to conclude, that it is a great Errour to place the taste or savour of things in the savoury Objects, as some Peripateticks do: For besides that in so doing they ascribe to an Inanimate Body, a way of Existence which doth not agree with them, the consequence of this Opinion is, that 2 Men would never be able to find a different Taste in the same Object, which is contrary to Experience. So that we must conclude, that the Power of perceiving Tastes belongs to the Soul, as well as that of feeling Pleasure or Pain; and consequently, that Taste is nothing else, but a certain perception or sensation, which is exerted by the Soul, by the*

motions which Meats produce in the Nerves of the Tongue.

CHAP. VI.

Of Smelling.

SO great is the Affinity between Taste and Smelling, that they are produced and affect the Organs almost in the very same manner. For we find that *Animals* hunt out their Prey by their Scent, and by the same distinguish what is good, from what is hurtful to them. Thus the Smell of *Catmint* allures *Cats*; *Fennel*, *Serpents*; *Bazil*, *Scorpions*; *Rue*, *Weezels*, &c. As on the contrary, they avoid what is harmful to them by the help of the said Organ. Thus *Serpents* flee from the Scent of *Galbanum*, *Scorpions* abhor *Wolves-bane*; *Flies*, *Brimstone*; *Goats*, *Bazil*; and *Ants*, *Organy*.

The Cause of this Sympathy, or Antipathy, must be derived from the Organ of Smelling; which receives the diversity of Odours, according to the different affection and disposition of its fibres. For if the Steam that proceeds from an odoriferous Object, be delicate, and doth smoothly affect the Nerves of the Nostrils, it will cause a grateful Odour; but if the said Nerves be more rudely shaken or vellicated, this gives an unpleasing Scent. For Odour is nothing else, but the thin and insensible parts of Bodies, which being separate from each other, fly up and down in the Air, and being by the drawing-in of our Breath received into our Nostrils, do excite a motion in the Extremities of the Nerves. So that the diversity of Motions, produceth difference of Odours; and as the fibres of the Organ are more softly or roughly struck upon, accordingly are they diversified. For this Reason we find, that *Roses*, *Musk*, *Ambergris*, and such like, afford a sweet Smell; because the Steam that proceeds from them, consists of subtil and flexible Filaments, which easily enter the Organ, and without any roughness are communicated to the Nerves. But *Brimstone* affords a strong and unpleasant Smell, because of the Ruggedness and Unevenness of its filaments. For *Brimstone* being very easily inflammable, we must suppose it to consist of many fat Steams, which being mingled with a sharp Matter, do make the filaments rough and prickly, which cannot but affect the fibres of the Organ unpleasantly and painfully.

And on the contrary, when the strong Scent of *Brimstone*, is dulled by the joyning of some other Body with it, a grateful Odour is produced. Thus tho' *Civet* in a bulk, and by it self, have a very strong Scent; yet if 3 Grains be mixed with 10 Grains of *Ambergris*, and one Drop of the Juice of *Lemons*, and ground together, it will produce a most rich and grateful Perfume. In like manner, *Musk*, when it is by it self, yields a strong and overcoming Scent; but being mixt with some of the Spirit of *Roses*, it affords a most pleasing and delightful Smell. And they who bring *Musk* from the *Indies*, after that the Smell of it is in great part exhaled, do wrap it up in the Skin of the Animal from whence it is taken, or in *Bladders*, and hang it up for some days in some stinking place, having first made several Holes in

I. *Animals, by their Sense of Smelling, discover what is good or hurtful to them.*

II. *How sweet Scents may be produced from strong and unpleasant things.*

the said *Skins* or *Bladders*; and by this means recover the *Musk* to its former fragrancy. Forasmuch as by this Fermentation, its parts are so separated and attenuated, that they cannot but gratefully tickle the Organs of Smelling.

III. And it is for the same Reason, that the *Oyl* of *Roses*, drawn by *distillation*, being put into *water* in a considerable Quantity, hath almost no odour at all, but being mingled with the *Salt of Tartar*, it makes a fluid composition, whereof some part being put into *water*, yields a very great and sweet perfume; the reason whereof is, to be ascribed to the *Salt of Tartar*, which being a very powerful *Alkali*, exalts the *Oyl*, and renders it more volatile, and consequently more proper to be attracted together with the *Air* in *Respiration*.

IV. When a *Man* is too near to *odoriferous Bodies*, he cannot so well perceive their *Effluvia*. And therefore it is that *Flowers* do smell more sweetly when they are at some distance from the *Organ*, than when they are too near it.

The Cause is, because the *smell* or *odour* of *Objects* doth not consist in their more gross and moist, as before hath been said of *Taste*, but in their thin and dry parts; and therefore he who is too near to the *odorous Object*, doth not only take in the steams that proceed from it, but also those that come forth from the *Earth*. But if he be somewhat further at a distance from it, he receives nothing but the more vivid and subtil steams, because the *Groffer* cannot go far off, but soon fall down to the *Earth* again. Wherefore some distance is necessary, that the more brisk particles of the *odorous Object*, may freely and purely exert its power, and excite a grateful *smell*.

V. Hence it is that *Perfumes* cannot be so powerfully perceived when we are too near to them; for they consisting of nothing else but a steam, flowing from the *odoriferous Body*, by passing through some interval it becomes more purified and discharged from its more thick and terrene particles, which dull and allay the sweetness of the *odour*. As we find that *Wine* mixed with *Water* is less tasted, because *water* doth break and allay its force.

VI. Plants in hot *Countries* shed a far more fragrant *odour* than in *cold*. Thus it is known that in, *Syria*, *Arabia*, the *East-Indies*, &c. many *Spices* are produced, and that the *Fruits* of the *Trees* that grow there, have more lasting and pungent *odours*.

The Reason is, the *heat* of the *Sun* in those *Countries*, which conduceth very much to the briskness and sweetness of *odours*: For by means thereof the *Alimentary Juice* of *Plants* becomes exalted and depurated in the highest degree; and thereby prepared to yield copious matter for those *odoriferous steams* proceeding from the *Leaves*, *Fruits*, and *Flowers* of them. For it is certain that *odours* consist of *Sulphur* or *Salt*, and that those *Bodies* which abound with these, do shed more abundant *odours*. Because heat is a great strengthner and exalter of the *Sulphureous Parts*, causing them to exert their force with greater efficacy; for after that the *watry Humour* is separated, the remaining substance is more thoroughly concocted, and consequently yields a more fragrant *odour*. And therefore in order to the preserving

of this *Fragrancy*, we make use of *Oyl* wherewith to cover them, or else shut them up in *Boxes*, to hinder the vapour from exhaling continually. For we find that all *odorous Bodies* do smell more strongly when they are *hot*, than when *cold*; in the *Day* time, than in the *Night*; in the *Spring*, than in *Winter*; and in *Summer*, than in the *Spring*, because then their parts are in greater motion.

For the same Reason it is, that *Fruits* attain a more grateful *scent* by being prepared with fire; and that all things smell sweeter during the *heat* of the *Summer*, than when they are congealed with *cold*; because then their *Sulphureous Parts* are lockt up: whereas in hot *Seasons* the same is agitated and diffused through the *Air*. And therefore we find that there are very few *Seeds* that afford any sent from them: for being of a very compact substance, and consisting of a clammy substance, they do not easily send forth any *Effluvia*. And on the contrary, we find that *Contusion* or *Bruising* is a great means to excite that sweetness of *odour* which is found in dry things. Thus the pricking of the Rinds of *Citrons* or *Oranges*, renders them much more odorous. And *Spanish Wax*, which is without *odour* before it be put to the *Fire*, becomes very odoriferous, by the resolution of some of its parts into *Smoke*. The same may be said of *Incense*, *Myrrh*, and many other *odoriferous Gums* and *Drugs*, which do not exert their fragrancy till they be dissipated into *Air*.

All *Men* do not smell alike, for some yield a very fragrant and pleasing *odour*, which *Historians* relate concerning *Alexander the Great*, whose *Sweat* was very pleasing and grateful to all that smelt it. Whereas others stink, or scent very strongly; which is observed of *Flat-nos'd Persons*, who are commonly tainted with loathsome steams proceeding from them.

A *Sweet Odour* proceeds from those persons, whose *Alimentary Juice* is exactly and thoroughly concocted; which then happens, when by the agitation of the *Body*, the *Pores* are opened, to let out the particles of any crude *Humours*. The same may also be an effect of the *Temperament* of *Men*, as when *Heat* is greatly predominant in them; for if the said *Heat* be free, and is disentangled from any superfluous *Humour*, it cannot fail of producing a *sweet odour*. Now that such was the *Temperament* of *Alexander the Great*, is evident from his inclination to the excess of *Anger*, the continual exercise of his *Body*, and the smoothness and thinness of his *Skin*. But when on the contrary, the *Alimentary Juice* is not well digested, or by some means or other becomes depraved, this must needs produce an abominable and loathsome *smell*; such as we perceive commonly in *Flat-nos'd Persons*, whose steams are observed to be very nauseous; and that because the *Pores*, through which the *Snot* or *Sniwel* is conveyed from the *Brain*, is too much straitned, and by reason thereof putrifies and corrupts there. For *Corruption* is the most genuine cause of *Stinks*.

And accordingly some smells are very refreshing, and conducing to *Health*, whereas other are very inimical to *Nature*, and our *Vital Spirits*. Thus we are told that there is a People in the most remote Borders of the *East Indies*, about the Springs of the River *Ganges*, called *Astomi* or

VII. Heat conduceth very much to the sweetness of Odours.

VIII. What is the Cause of that sweet or strong smell which proceeds from some persons.

IX. Of the various Virtue and Nature of Odours.

Montbleß, who (if we may give credit to some Historians) live only by the odours they take in from Flowers and Fruits. So likewise it is notorious, that there be many Scents which recall Persons that are in a Swoond; and more particularly the smell of Vinegar: And every body knows how much Cats are delighted with the Herb Nepota, or Catmint; which acceptableness and congruity proceeds only from the odour of these things. And on the contrary, some smells are the cause of distraction, as it is related of the Sabæans, that they used to be stupified by odours: And of Cats, that they became mad by the smell of some Ointments: because these exhalations cause so violent an agitation in the Organ, that thereby the natural Temperament of the Brain is destroyed, whence proceeds that tumultuary confusion of the Spirits.

X. Rose and Orange-flower Water, with other such sweet like Waters distilled from Flowers, keep their sweet smell all the year, except only when the Flowers, from whence they are drawn, are most fragrant, for then they lose their Scent.

The Cause whereof is, not because those Waters are indeed destitute of all Odour at that time: but the Earth then abounding with Flowers, which diffuse their steams throughout the whole Air, the Organ of Smelling is so much charged with them, that it cannot be affected with the smell that proceeds from those waters; and upon this account they are supposed destitute of all smell.

XI. Tinctures, Essences, &c. of Roses, Cinamon, and such like odoriferous Bodies, retain the same smell, which the things themselves had before.

The Reason is, because the nature of Odour consists in a certain texture of Sulphur and Salt. By Sulphur, the Chymists understand a Fat and Oily Substance, which according to its various mixture in various Bodies is different. Now since this Substance may by Chymical Art be extracted from Bodies, it must not be thought strange that it retains the same Odour, which the Bodies themselves before did.

XII. They who have got a Cold, do in a manner perceive no Odours at all.

Because the Rheum doth so obstruct the Pipes of the Olfactory Organ, into which the Odorous Steams use to insinuate themselves, that they can no longer enter them. For in this case the obstruction sometimes is so great, that there is no passage left in the Nostrils to draw ones Breath; and therefore it is no wonder, if the Nerves, being filled with this humour, cannot admit the Steams proceeding from odorous Objects, or if they do, yet cannot receive any due impression from them.

XIII. In Cold Weather, odorous Objects do more weakly affect our Organ of Smelling.

This is, because in Winter time the pores are obstructed and contracted, so that their odorous Steams do not then break forth from the Bodies to which they belong. To which may be added, that the Air is thicker and more gross at that time, which therefore the odorous Steams are less able to penetrate. Hence it is that Congealed Bodies shed no fragrantcy or smell at all, because by reason of the obstruction of the Pores, the Steam cannot disperse it self in the Air, nor affect the olfactory

Organ. Whereas on the contrary, in the Summer-time, smells are much better and strongly perceived, because the intense heat doth then agitate and excite the particles, and sends them in greater abundance to the Organ. We observe also, that according as the wind is for or against us, so we either smell odorous Objects, or not smell them; for when the wind comes from those Objects, the smell of them doth more strongly affect the Organ; whereas when it is contrary, it carries the said odorous Steams from us, so as that we perceive no Scent at all.

Many Beasts excel Men in the sense of Smelling; and more especially Dogs, who not only exceed Men, but all other Beasts in this regard.

The reason whereof may very probably be ascribed to their Organ of Smelling, as abounding with very fine and subtil Fibres, and those more fitly disposed for the reception of Odours. For it is observed that the Olfactory Organ of Dogs is drier than that of other Creatures; because their Snot doth not flow the ordinary way, but through some Pores, which may distinctly be perceived at the end of their Noses. Or else the cause of this more quick Scouting that is in Dogs, may be attributed to their not being subject to those gross Fumes arising from the Stomachs of Men, who feed upon such various sorts of Meat, which hinder the reception or perception of the subtil odorous Steams proceeding from Objects. Hence it is that Dogs, that are too much conversant in Kitchens, and are too much fed, do by degrees lose their Sagacity, and become much inferior to those who are kept shut up, and are only fed with Food, proper for hunting Dogs.

Neither is there any question to be made, but that if Men lived only upon vegetables, they would far excell others in this Sense, who fare more deliciously, and pamper themselves with Flesh and variety of Meats. Thus Sir Kenelm Digby, in his Treatise of Bodies, relates this story of one John of Liege, who fleeing into the Woods to avoid the violence of some Soldiers, lived there many years, feeding all the while on Wild Apples, Acorns and Roots; who after he had been carched by some Country People, after having attained the use of speech, he declared to them, That as long as he lived in the Woods, he could by his smelling find out his Food, and distinguish that which was good, from that which was hurtful; that by the same he was aware frequently of Hunters that had a design to take him, and by this means oft escaped their Hands. Which Example makes it evident, that the quickness of the Sense of Smelling is spoiled by the vapours of divers and dainty Viands; and the chief reason why Men are inferior to Beasts in this Sense is, because their Diet is not so simple as theirs is.

It may also be allowed, that many Animals do exceed Man in this Sense, because of the vivacity of their Organs; as it is evident in Ravens, Vultures and Dogs, which by their Sagacity pursue their Prey, or follow the footsteps of their Masters: Tigers, who by their smelling, follow them who have taken away their Whelps: Roughfooted Pigeons, who by the same sense, fetch back their Young, tho' carried into some House above 200 paces distant from them. Neither is it any

XIV. Dogs exceed Men in the quickness of Smelling.

XV. Why the Sense of Smelling is weaker in Men than in Beasts.

XVI. Some Animals are signal for their quickness of Smelling.

contradiction to what is here alledged, that Dogs in hunting, are sometimes at a loss, because this only proceeds from the great distance either of time or place in which the Odour is diffused; or when the odorous Steams are carried away by the Wind, or being mingled with other Steams, produce a confusion.

XVII.

How some odorous Bodies may retain their Sent for a long time.

It is certain that odorous Bodies by continual expiration, become flabby and are consumed; because their substance is continually wasted and dispersed by the exhalations that proceed from them. Yet as to the great, and almost inconceivable subtilty of these Fumes, we have a very pregnant demonstration, in a piece of Ambergris, which after a continual expiration of odorous Steams for several years together, doth to our senses appear to be of the same Bulk. So that it may seem probable, that these Fumes do by a continual Circulation return to their source again: Much in like manner as we have shewed in our Institution of Philosophy, that the Striate Matter moves circularly about the Loadstone; according to which Hypothesis it may be made out, that an odorous Body may continually shed its exhalations without losing ought of its substance by that means.

C H A P. VII.

Of Sound.

I.

Liquid Bodies when dash'd together, make a noise.

Sound doth not only proceed from hard and solid Bodies, but also from fluid, and which because of the pliability of their parts, do give way to the motions of other Bodies. For the Air, when it is struck, conveys a Sound to our Ears; the Waves when they dash against each other, cause a great noise; and all Waters, according as they run through a plain Channel, or are interrupted with Rocks and Stones, make a different impression upon the Nerves.

The Reason is, because the parts of the Air, as well as of other liquid Bodies, by their beating against each other, become divided into innumerable small particles, which being most swiftly moved, and dashing against each other, must needs produce a Sound. For a Sound is nothing else but a trembling and waving motion of the Air: And as we see that by the throwing of a Stone into the water many Circles are formed, which uniformly extend themselves to the Shoar or Banks; so likewise the Sound that proceeds from Bodies that are struck, is by reciprocal vibrations propagated through the Air.

II.

How a Sound comes to be dispersed round.

Which will more clearly appear in the Figure. Let there be supposed a String that is struck, which may be conceived as a Cylinder, whereof the semisection will make an half Circle, M B R, so as that whilst it restores it self, every one of its points are moved with a strait motion, and by parallel Lines, as A B, P C, O D, N E, M F. Let us then suppose in the several points of this Section some particles of pure Air, or Moisture, which may be considered as Globuli, or small round Bodies L, K, I, H, G, &c. which touch the Section in the points B C D E F: Now if right Lines be drawn from the Center A, through the foresaid points, they will terminate in the Centers of the Globuli; and if one Globe fall upon another, it will move the same by a Line joining

the Centers of both together. So that the Arc M B, of the Section of the Circle, diffuseteth that most light matter according to the Angle M A B, and in like manner the Arc B R, according to the Angle B A R.

Thus we observe that our Breath, when gently sent forth from our Lungs, is not heard, nor when it is easily blown through a Pipe, because there are none of those frequent wavings, between the sides of the Wind-Pipe and the Pipe, which are necessary to convey the strokes of them to the Organ. In like manner, as we see that a Hammer gently applied to the Anvil, doth produce no sound at all, because the Air is not sufficiently beaten back or undulated, as to produce that frequency of motion that may reach the Ear.

Musical Instruments are commonly made hollow, and often approach to a Spherical Figure. The Reason is, because the passing and repassing percussions of the Air, are multiplied in a Hollow, and therefore do the longer detain and please the Ear. For in hollow Bodies, not only the outward Air is agitated by frequent concussions, but also the Internal. The depth also of Musical Instruments is of great use, because then Sounds are the better mingled in them, and one part being agitated, doth more easily make the other parts partaker of the Motion.

Thus Hawk-bells, by reason of the slit and holes they have on their sides, do yield a greater Sound, than when in the open Air we strike upon any Brass Vessel; because the Sound of the Bell being pent up within the sides of it, doth break forth whole and strong. And it is for the same reason, that Musick within doors in cold weather is more agreeable, because then the Strings or Wood of the Instruments are more wrinkled, as it were, and become more hollow and porous. And on the other hand it is observed, that the Sound of Musical Instruments is not so distinct in Chambers that are hung, as in those that are Vain-scotted, because the Sound doth more briskly rebound from a smooth and hard body, than from that which is soft and yielding. For indeed all soft Bodies are less fit for the generation of Sounds, and do easily transmit them. And it is for the same Reason, that the Sound of hot Iron is more dull, than that which is cold, even because it is more soft, and the parts of this latter do yield more frequent vibrations.

A person that is Deaf may perceive the Sound of a Lute, or any other Instrument, whilst he holds the Neck of it between his Teeth.

Some have conceived that this is to be attributed to some conveyances, reaching from the Mouth to the Ears, which carry the Sound thither, and impress the same affection upon them, which is transmitted by the Organ of Hearing. But that this is not so, is apparent, because the same effect doth not follow when we hold our Mouth open. Besides, if this were sufficient, why might not sounds be perceived by the touch of the Forehead or Nose; seeing that from these parts there be passages to the Ears, and an equal communication between them?

Conclude we therefore, that the Sound of a Lute can therefore be heard or perceived by those who hold the Neck of it between their Teeth, because the vibrations of the Strings being transmitted

III.

Why the Breath that is sent out of our Lungs is not heard.

IV.

Why Musical Instruments are commonly hollow.

V.

The make of the Instrument, and the Place, do conduce to the variety of Sounds.

VI.

What is the Reason that a Deaf Man can perceive the Sound of a Lute, whilst he holds his Teeth upon the Neck of it.

Book 2. Part 2. Chap. 7.

mitted from the *Lute* to the *Teeth*, are from thence communicated to the *Membran* that covers the *sockets* of the *Teeth*, and presently after shaking the *Drum* of the *Ear*, by means of the shut up *Air*, do also agitate the *Connexion* or *Chain* of the 3 *little Bones*. For a *Body* is then properly said to yield a *sound*, when being struck, it performs several *Vibrations* by a tremulous motion, which by the *Vehicle* of the *Air* is diffused through the *Bodies* that are between the *sounding Object* and the *Organ*. For there is a consent betwixt the *Nerves*, which are disperst throughout the inward parts of the *Mouth*, and those which run through the *Muscles* of the *Ear*. An Argument whereof is, that harsh and grating *Sounds*, do stupifie and signally afflict the *Teeth*.

But of all *Sounds*, none are more ungrateful to the *Ear*, and indeed intolerable, than the skreaking Noise of a *Saw*, or the *fling* of *Iron*.

The Reason whereof is, because the *particles* of the *Air*, which strike against the *Ear*, do, because of their irregular *figure*, too violently vellicate the *fibres* of the *Auditory Nerves*, so as that thereby they are in danger of being broken, and sometimes break actually, whence that troublesome and painful Sensation doth arise. The same also, tho' in a less degree, is caused by the hearing of false *Tones*, which is extremely offensive to a *Musical Ear*. And accordingly, by means of the foresaid *Sounds* the *Teeth* are sometimes set on edge; forasmuch as by this inordinate undulation of the *Air*, the *Nervous fibres* which are at the *Root* of the *Teeth*, are in a manner loosed and separated from their former stability.

If 2 *Lutes* or *Citterns*, whose *strings* are made *Unison*, are placed at some distance from each other, when the *strings* of the one are smartly struck, those of the other tremble also, and that so strongly, that they will shake off a bit of *Paper* laid upon them.

The Reason is, because the *string* being struck by a certain number of *Vibrations*, shakes the *Air*, which lighting upon the *Unison strings* of the other *Instrument*, doth shake it likewise. And this more especially, if the said *strings* be consonant in an *Eighth* or *Fifth*, for then their *Vibrations* will be less confused, and agree in their certain and frequent *Intervals*. For in an *Eighth*, all the *Vibrations* of a more lax and longer *Chord* or *String*, agree with a *Second*, *Fourth* and *Fifth* of a more stretched and shorter *Chord*; in a *Fifth*, with a *Third*, *Sixth* and *Ninth*, and so of the rest.

Wherefore this *Trembling motion* never follows where two *Strings* are differently tuned: Whereas *Concords* do not only excite each other, but others also, by reason of the similitude of their *motions*, and do so assist each other, as mutually to impart the same *Affections*. As may be experienced in any *Musical Instrument*.

It is a common Report amongst the *many*, that there is a *White Gunpowder*, with which *Guns* may be discharged without giving any *Report*.

This, tho' very confidently asserted, appears to be a meer figment. For it is impossible that the pent up *Air* should be able to break forth without making a *Noise*: For that which is of such a force as to be able to drive a *Bullet* with as great swift-

ness, as the *Flame* breaks forth from the *Gunpowder*, must needs strike the *Air* with a like force, and consequently produce an answerable *Sound*.

Of all *Animals*, *Men* and *Birds* only are able to make *Musical Sounds*.

The Reason hereof must be fetch'd from the structure of the *Throat* and *Wind-pipe*, the *Rings* whereof in *Men* and *Birds* are capable of being contracted and extended. For there is a double recurring *Nerve* in the *Wind-pipe*, which turning round about it, doth by the help of some of its *Branches* move the *Rings* of it downwards; and forasmuch as the same is terminated in the *Nerve*, proceeding from the *Plexus Ganglioformis*, it moves the folds of the *Wind-pipe* upwards. So that whilst the *Rings* of the *Wind-pipe*, by means of the recurrent *Nerve*, are moved downwards, it causeth a deep or *bas* *Tone*; which becomes more high and shrill, when the said *Rings* are raised higher by the *Branches* of the 6th pair of *Nerves*, disseminated in the *Wind-pipe*; because the *Wind-pipe* being strained by this means, doth in a manner break the *Sound* that passeth through it.

If a *Lute* be play'd upon near a *Smoaking-Candle*, the same motion of the *Strings* will be communicated to the *Smoak*.

The Reason hereof is, because the trembling *Vibrations* of the *Strings* do move the fluctuating *Air*, by the reiterated onsets whereof, the *Flame* (which of it self is very moveable) begins to be shaken, and to conform it self to the motions of the *Strings*. Hence it is, that when a *Ray* of the *Sun* is let in into a *dark Room*, and a *Musical Instrument* be plaid upon near the said *Ray* or *Sun-beam*, the *Motes* in the *Sun* will be seen to leap and skip in the *Air*, and, as it were, to dance to the *Musick* of the *Instrument*. The same may be also observed in the *Water*, when the *Surface* of it is very smooth and even; for then upon the *Noise* of *stringed Instruments*, it will become ruffled and curled. The same also may be observed in 2 *Glasses*, into which if we put *water* to the height of 1 or 2 *Fingers* breadth, and bring them to an *Unison*, (which may be easily done by the *Ear*, in drawing our *Finger* round the *Edge* of them;) for then, if we fix a *Crooked-Pin* upon the *Brim* of one of the *Glasses*, we shall see it move and skip, as we press the *Brim* of the other *Glass* with our *Fingers*.

Musical Sounds are not so conducive to provoke *Sleep*; as the *Humming* of *Bees*, the *Noise* of the *Wind*, the *Murmur* of *Running-water*, and an equal and smooth *Tone* of *Reading*.

For seeing that the *Sound* is diffused from the *Sonorous Body* to the *Drum* of the *Ear*, and from thence to the *Acoustick Nerve*, and so to the *Brain*, the Center of the *Nerves*, and last of all from thence to the *Arteries*, *Veins* and *Guts*, it cannot be but that the *Blood* and the *Spirits* must be moved also: And because *Musical Sounds* are not carried with an Equal Course, nor do pass by the *Ears*, they do affect the Sense of *Hearing* more than other *Sounds*, and more awake the *Attention*, which is the reason that they are not so fit for the provoking of *Sleep*.

without Noise.

X. Why Men and Birds only can give forth Musical Sounds.

XI. The Smoak of a Candle, is agitated by the motion of the Strings of a Musical Instrument.

XII. Tones, or Musical Sounds, are not so proper to cause sleep as some other Natural Sounds.

XIII.
Musick
corrupts
Manners.

Long Experience hath taught, that soft and Effeminate strains of *Musick*, are very proper to corrupt the Manners of men: Whereas, on the other hand, the Sound of *Cornet*, *Trumpets* and *Drums*, do fill Men with a Courageous and Warlike Spirit.

For seeing that *Human Affections* are nothing but *Sensations*, produced by the motion of the *Spirits*, we need not wonder that the *Sound* arriving at those *Vessels* in which the *Passions* are generated, should produce various *Passions*. And forasmuch as the *Manners* of Men commonly follow their *Passions*, it is evident that *Sounds* must needs be of great use, either for the corrupting or correcting of Mens *Manners*. Accordingly *PLATO* was of Opinion, that all soft *Tunes* ought to be banished out of a well-governed City. And the *Lacedaemonians* assign'd a great Punishment to those that used any soft or effeminate kind of *Musick*; and made a *Law*, that none should play upon a *Harp* that had above 7 strings.

XIV.
Why upon
the stop-
ping of our
Ear, we
hear a
kind of
humming
Noise.

When we stop our *Ear* with our *Finger*, we suddenly hear a buzzing kind of *Noise*.

Because it is owned by *Physicians*, that a *Steam* or *Vapour*, doth proceed out of the Hollow-winding of the *Ear*; so that when the *Ear* is stop'd, this pent up *Steam*, as well as the *Air*, seeking to get out, do beat and distend the *Drum* of the *Ear*; from which Motion, an Affection is produced like to a great *Buzzing*. Yea, it is frequently found, that the *Ears*, tho' not stop'd by our *Finger*, are fill'd with this *Buzzing Noise*, produced by the blast of a most thin *Steam* or *Vapour* breaking forth from some little *Artery* or *Vein*, which striking against the *Drum* of the *Ear*, affects it much in the same manner, as it would be by the sound of a *Bell*.

XV.
Sound
more easily
passeth
through a
Beam of
Wood, than
through
the Air.

A *Sound* is more easily diffused through the length of a *Beam*, struck at one end, than through the *Air* only. For as soon as one end of the *Beam* is moved, in the same instant the motion is communicated to the other.

The Reason is, because there is a greater Continuity of Parts in the *Beam*, than in the *Air*. For, when you move one end of the *Beam* A, at the same time the other B is moved also; but if you push the *Air* at C, it must at least move as far as D, before it can move E, because all its parts give way like a *Sponge*; and because it takes up some time in passing from C to D, it loseth also part of its Force. Whence it comes to pass, that the *Sound*, which is nothing else but a motion of the *Air*, is both sooner and more strongly heard at the Point D, than at the Point E.

XIX

XVI.
Why
Sounds are
more clearly
and
distinctly
heard near
the Banks
of Rivers.

Which is the Reason why the sounds of Great *Guns* and *Bells*, are more distinctly perceived along the *Banks* of *Rivers*, than when we are at a distance from them; and it is universally true, that all and every sound is both sooner, and at a greater distance, communicated by *water*; for the parts of the *water* being more close and stiff than those of the *Air*, when once put in motion, do communicate their Force to others. To this moreover may be added, the smooth surface of the *water*, which doth not in the least break or turn aside the sound. Thus by laying our *Ear* to the ground, we can perceive the trampling of *Horses* at a great distance; and if a *Drum* be set upon the *Ground*, and the *Ear* laid to the upper Skin of it,

the Noise of the marching of *Horses* can be perceived at some Miles distance.

The Voice of a *Preacher* in a *Church*, or *After* upon a *Stage*, reacheth the *Ears* of some Thousands of his *Hearers*.

This is not, because the whole Voice of one man comes to the *Ears* of all that hear him; for the Voice, as soon as it comes forth out of the Mouth, is broken into many parcels all like the whole; much in like manner as when *Fulders* spout out *water* out of their *Mouths*; for then the *water* is dispersed into innumerable drops, and fills a very large space. From the Mouth of the *Speaker* an entire Voice doth indeed proceed; but is afterwards divided into innumerable Voices: And therefore sure it is, that no two *Auditors* receive the same Voice, tho' they be said to hear the same, because of the likeness of these divided partial Voices, with the entire or total Voice. In the same sense, as they are said to drink the same *Liquor*, who drink out of the same *Fountain*.

Tho' Experience shews, that the whole *Atmosphere* of the *sonorous Body*, is moved to such a proportionate Circumference; yet is not the said fluctuation of the *Air* equally diffused through all parts of the *Air*, but the sound seems rather to be carried along some certain Tracts or Currents. And therefore it is that the Words of a *Preacher* or *Orator*, tho' they move the whole *Atmosphere* of the *Auditory*; yet it agitates that Tract most which his *Mouth* more directly answers to, where the *Auditors* do also more distinctly hear his Voice, than those who are more remote from that Tract. Thus it is well known, that those only hear the hissing Noise of a *Bullet*, discharg'd from a *Musquet*, who are near to the Line described by the *Bullet*, whilst those who are at some distance perceive nothing of it.

Sounds that are excited in any one place, be they Loud or Low, are in equal time conveyed to the place, where they are heard.

The Reason is, because the *Air* being a *Continuous Body*, when struck, is formed into *Orbs* or *Circles*: As we see that *Still-water*, when a *Stone* is cast into it, becomes waved into *Circles*; and as the said *Circles*, at an Equal distance, spread themselves to the *Banks*, whether they be caused by a little or great *Stone*; so likewise doth the sound, at an equal distance of Time, come to the *Ear*, whether it proceed from a great *Gun*, or a *Musquet*, or any other thing.

It sometimes happens, that 2 Sounds are heard, when one only string is struck.

This proceeds from some defect in the string, which when they are false and uneven do admit 2 several kind of shakings at one and the same time, whereof the one, and which gives the deeper sound, proceeds from the whole string; the other, which affords a more shrill sound, depends on the unevenness of the string. Suppose, for Example, that when the string A B is struck, as often as it passeth and repasseth from 1 to 6, to produce its Natural sound, at the same time the Unevenness of its parts produce another shaking in it, by means whereof, when it hath moved from 1 to 2, it runs back to 3, and from thence towards 4, and from 4 to 5, and lastly to 6, which produceth a sound that is by a Twelfth more shrill than the former:

former: In like manner, if the *second* shaking be only double to the former, it will yield an *Eighth*; if *Quadruple*, a *Fifth*; and if *Quintuple*, a *Seventeenth* more than before.

XXI. *Why we see the Lightning before we hear the Thunder.* A *Sound* takes more time to arrive at our *Ears*, than the *Light* to come to our *Eyes*; which is the Reason why we perceive the *Lightning* before we hear the *Thunder*; and we see the *Ax* of one that hews *Timber*, when we are at some considerable distance, lifted up to make a second stroke, before we hear the first.

The Cause whereof is the *Air*, which altho' it consist of *subtil parts*, and divided from each other; yet being withal *Branchy* and *flexible*, when one of them is moved, the other parts are not presently moved at the same instance, but by degrees; so as that one part being agitated, passeth on the next, and so on; like the *Circles in the Water*, which do not in an instant spread themselves over the whole *surface* of it, but proceed in a continual order till they come to the *Banks* of the *River*, or that they cease upon the failing of the force, which caused them at first. But *Light* is much more swiftly conveyed to our *Eyes*, as being caused by inflexible and solid *Globuli*. For it is the Nature of *solid Bodies*, that when one end of them is prest upon, the said precession is felt at the same moment of time, at the other end of it. Whence it is that, as was said before, a *Sound* is sooner conveyed through a whole *Beam*, than through the *Air*; because the *parts* of the *Beam* are more closely joyned together, than the *parts* of the *Air*, which are flexible, and easily give way to other *Bodies*.

XXII. *Strings of an unequal length, yield a different sound.* Let there be 2 *Strings* of the same thickness, and wound-up at the same height, whereof the one is longer than the other; that which is the shorter of the two will yield the shrillest, or most treble sound; and the longer, the deeper sound and less perceptible.

This difference of the *Sound* proceeds from the more frequent, or fewer *Vibrations* of the said *strings*: For seeing that a *shorter String* makes more wavings, and beats the *Air* with more reiterated strokes, by so much shriller is its *sound*, and the sooner it conveys the *sound* to the *Ear*. Because the difference of a deep and shrill sound, doth not proceed from the more swift or slow motion of a *string*, as *ARISTOTLE* was of Opinion, but from the variety of the *Vibrations*, which, if they be frequent, produce a treble or shrill sound; but if fewer, are the cause of a deep or bass sound.

In like manner we may give an account, why the lesser of 2 *strings* that are wound-up alike, but of different length, makes its *Vibrations* more swiftly. The Reason is, because tho' both the *strings* make their Excursions with an Equal motion, with respect to Space and Time; yet because the lesser, by its motion of Contraction, runs through a less space than the longer; and that a less Space is sooner run through with an Equal motion than a Greater, it must needs be that the motion of the Lesser Cord be swifter.

XXIII. *Why the Sound ceaseth upon touching the Strings* Whence it is evident, that if you lay your Finger upon a *String* presently after you have struck it, before it have made many of its *Vibrations*, you will indeed hear some kind of Noise, but without being able to distinguish whether it be

shrill or deep, because your *Finger* hinders the *Vibrations*, and doth not suffer the *string* by its precession to dilate the *Air*, and to drive it away by a successive beating of it. Hence it is that a slow and soft blast, blown into a *Pipe*, produceth no sound, nor that which from the *Lungs* is breathed out by the *Mouth*; because there is no rebounding of the *Air*, between the sides of a *Pipe*, nor in the *Wind-pipe* or *Mouth* of an *Animal*, which bounding this way and that way, is the cause of a sound; and according as their Repetitions are more swift or slow, so they produce either a shrill or deep sound.

XXIV. *Why the Echo repeats the same Voice several times.* An *Eccho* doth frequently repeat the same *Voice*, and renders the same sound at distinct Intervals. So *CLAUDIAN* makes mention of one that rendered the *Voice* no less than 7 times: And *GASSENDUS* tells us, that he had Experienced, that in the *Chapel of Charenton*, which is about 3 or 4 Miles distant from *Paris*, one *Syllable* pronounced at either end of it, was repeated 17 times, and that the same word spoken in the midst of it, was as many times repeated from both Sides.

The Cause of this is, the Reflection of the *Sound* from some interposed let or hindrance: For as innumerable Rays are conveyed from the visible Object, not only to the *Eye*, but every way round; so besides the *Voice* which is carried to the *Ear*, innumerable other sounds are dispersed in the *Air*, which meeting with hard and concave *Bodies*, are dispersed through the *Air*, which makes the same *Voice* to rebound several times. For *Sound* is not conveyed like the *Light*, in one moment; but stands in need of time, to propagate it self: And therefore when the former sound becomes extinct, or vanisheth in the neighbouring *Air*, another is generated in that which is farther off; which being reflected from solid and tolerably smooth *Bodies*, doth frequently beat the *Air* that is nearer the *Ear*. A *Sound* therefore is oftentimes repeated by the *Eccho* in the *Chapel at Charenton*; because the place there is so disposed, that the nearer places do first repeat the *Voices*, and the more distant afterwards. It conduceth also to the forming of an *Eccho*, that the *Bodies* which reflect the *Sound* be opposite to each other, and send back the same by turns; as it was in the *Chapel at Charenton*, before that the *Monastery* of the *Carmelites* was built there: For at that time there was a double Row of *Pillars*, between which the uttered *Voice* was rebounded; much like a *Ball*, which lighting against one *Wall*, rebounds thence to the other.

XXV. *Why the Eccho is heard only in one part.* Tho' the *Eccho* be a *Sound* which is every way circularly extended, yet can it only be heard in one part of the *Circle*; because it can only be received from the Reflexion of that part of the *Circles*, which is the farthest extended, and in that part where the said Reflexion is made. As we observe, that when a *Stone* is cast into a *River*, the *Circles* which are there formed; are further extended towards that part, where the *Stone* was cast in, than towards the opposite.

XXVI. *A reflected Sound is of longer continuance, than one that is not made, reflected.* A *Sound* that hath been frequently rebounded, is preserved or continued a longer time, than that which without repercussion is propagated in a Right line.

The Reason is, because by the several *Bodies* and Cavities against which the *Repercussion* is made, reflected.

made, the *sound* is strengthened and increased, and therefore is longer a vanishing, than if it were only extended in a Strait line, without repercussion. Moreover, it is evident from the Observations of many, that in the *Village of Simonetta*, about a mile distant from *Milan*, the *Voice* is often repeated 30 times, and in every one of its passings and repassings, it runs through 156 Paces and upwards; whence it follows, that the same *Voice* being separated 32 times, before it be altogether extinguished, must run through 5002 Paces and upward. From whence it may be easily gathered, that the *sound* must needs be greatly increased in the said Concavations, by means whereof it is enabled to continue so long, seeing it doth not seem possible, that by continual direct Motion, a *sound* should be able to reach 5 Miles, in which motion of the *sound* 25 *Hourly minutes* must be spent.

XXVII. When a Man speaks to another, a thick *Glass Window* being between them, his *Voice* will scarcely be heard; but if there be only a *Paper Window* between them, the *Voice* may be well enough discerned.

The Reason is, because the *sound* is an effect of the motion of the *Air*, and therefore because little or no *Air* can pass through the pores of the *Glass*, the *Organ of Hearing* cannot be affected thereby. Forasmuch as the intervening *Glass* is supposed to be so firm, that it is not capable of being shaken by the *sound*; whereas the *Air* easily passeth through the pores of *Paper*, especially if the same be stretched, because by this means it is the more easily shaken, and its pores are made more lax and open.

XXVIII. A *Bell* yields a more shrill *sound* when struck on the upper part of it, than when it is hit Lower.

The Reason is, because the hollowness conduceth to the *Deepness* of a *sound*; and because the further that the *sound* is propagated the more Bass or deep it is. Thus the lower Holes of a *Recorder* afford a deeper *sound*; for the slower the beating of the *Air* is, the deeper is the *sound*. As we find that the more *water* there is in a *Glass*, when we press our *Finger* round the Edge of it, the more shrill the *sound* is, for then the Vibration of the *Air* is the swifter, as when less *water* is in the *Glass*, so much the more deep the *sound* is.

XXIX. It is observed, that a *Drinking Glass* may be broken by a man's *Voice* only, and that by reason of the repeated Vibrations of the parts of a more solid *Body*. For the effecting whereof, first, we must try by a stroak with our *Finger*, what Tone the parts of the *Glass* do yield; and then must set our *Voice* as near as we can to the same Tone, and increase the same by degrees, till we come beyond a *Diapazon* or *Eight*: Whereupon the insensible parts of the *Glass* being struck with iterated stroaks, become agitated by a tremulous motion, which increaseth as they are struck in fit places, so that at last, by the augmentation of the force of the *sound*, the parts of the *Glass* leap asunder. But for this Experiment, a smooth and even *Glass* must be made choice of, and such as when flipp'd with the *Finger* doth not *scend* so shrill, but that the *Voice* of him that sings, may equal it, or go beyond it.

Sir KENELM DIGBY relates in his *Treatise of Bodies*, that he had seen the Walls of a large and round *Tower* (tho' I rather suppose it to have been of an *Elliptical figure*) which were so Artificially built, that 2 men standing at the opposite points of the *Diameter*, might easily and distinctly talk together, whilst those that stood in the midst, could not perceive the least of any thing that was spoken.

The Reason of this must be fetched from the Coition or meeting of all the *sounds*, which are dispersed through the whole Room: For seeing that all the *Air* in the Room is shaken by the uttered *Voice*, the motions thereof being diffused through that large Space, are reflected from the Wall of an *Elliptical figure*, and so by *Reflexion* become united in the uttermost part of the *Chamber*; and therefore he that lays his *Ear*, must needs hear the *Voice* of him that speaks at the other end, tho' with a very Low *Voice*.

Upon the same account it is, that by means of a *Pipe*, contracted in manner of a *Cone*, *sounds* may be increased, and made to be heard further off, better than nearer hand; and this, because the *sound* is increased proportionably, as the *Tube* is contracted; for by this means the *sound* must needs be increased in its passage through the *Pipe*. And accordingly they who are *Deaf*, make use of a *Horn*, whereof the one end is wider than the other, which they apply to their *Ear*, by it to receive the *Voice* of him that speaks to them. And by this means, a *Prince* might easily hear the *Voices* of those that walk in his *Garden*, by having *Pipes* conveyed from thence to his *Closet*, the widest Mouths of them being set outward, and the narrowest inward.

The *Stenterophonick Tube*, sometime since Invented by Sir SAMUEL MORELAND, which carries the *Voice* to the distance of a Mile or two; and that other *Trumpet*, which ALEXANDER the Great made use of, in giving Orders to his *Army*; whereof the Figure is to be seen in an Ancient *Manuscript* of the *Vatican Library*, are made after another manner; for they are streight or narrow at the *Mouth*, to the end that the particles, which are to make the *Reflexion*, being close together, may be the more easily beaten, and from thence the *Trumpet* grows wider and wider to the very end of it, in order to augment the agitation of the *Air*, by the multiplication of all the *Reflexions* which are made throughout the whole length thereof; yet with this Circumstance, that the Bore of the *Pipe* might be so great, and the *Trumpet* so long, that the *sound* would be no longer increased, because the *Reflexions* would become so weak, as not to be longer in a condition to move the particles of the *Trumpet*, and consequently cause a new *Reflexion*.

Swarming Bees are recalled by beating upon *Frying-pans* and *Sirbes*.

Some suppose the cause hereof to be, because Bees are delighted with these *Noises*, and being thereby allured, do all unite themselves in one great hanging Bunch or Cluster. But this is not at all probable, because when the Bees are got up into any height of the *Air*, how much soever the said Instruments may be beaten, this will not bring them down, or hinder them from flying away.

Where-

XXX. Why a *Sound* can sometimes be better heard by one that is at a distance, than by him that is nearer.

XXXI. How a *Sound* becomes increased by the means of a *Pipe*.

XXXII. How a *Sound* comes to be propagated at that great distance by the Stenterophonick Tube.

XXXIII. Why Bees, when they swarm, are recalled by making of a Noise.

Wherefore the true Cause hereof seems to be, because the *Air* being much shaken, and agitated with the *Sound*, the *Bees* not being able to bear the same, are forced to unite themselves and settle in a heap. For *Bees* have very thin *Wings*, not feathered ones like *Birds*, but consisting of a thin *Skin*; by means whereof they cannot endure this concussion of the *Air*: Which probably also is the reason, why they never leave their *Hives* when there is a great *Wind*, or at *Midnight*, but only in calm and hot weather.

CHAP. VIII.

Of Light.

I. UPON the rubbing of our *Eye*, tho' it be shut, there appears a round spot of *Light*, and the same will be by so much clearer, the nearer the rubbed part of the *Eye*, is to the bottom of it.

This is an *Argument* that *Light* doth not exist without the *Eye*, but is only in the *Eye* of him that sees; and consequently that the *Bodies*, which are commonly called *Luminous*, are only said to be such Potentially; that is, in case they strike the *Eye* of the *Seer*: So that if there were no living *Creatures* in the *World*, which could see the *Light*, neither could any *Light* properly be said to be in it. And therefore we must conclude, that *Light* is not in the *things* which are called *Bright* or *Luminous*, but in him that perceives it; in like manner, as *Pain* is not in the *Sword*, but in him that feels it.

II. The *Light* passing through a small hole into a *Dark Room*, enters the same cross-wise.

The Reason is, because the *Rays* flow from each point of the *Lucid Body*, in *Right Lines*: Wherefore because the *Object*, without the hole, is bigger than it, it is impossible the *Rays* should pass through it, without crossing each other; and by this means it comes to pass, that the situation of the whole *Lucid Body* is represented upside-down, on an *Opake Body*.

III. Let a hole be made in one of the *Walls* of a *Room* of that bigness as may admit the flame of a *Torch* or *Candle*; and just over-against the said hole, let another more large be made in the opposite *Wall*; then in the *Night* let the *Flame* of a *Candle* be held on the outside of the less hole, so as that the *Rays* that pass through it, may be admitted by the opposite hole, and pass through it also; by which means the whole *Chamber* will continue dark, as if no *Rays* at all were transmitted through it.

The Reason of this *Experiment* is, because none of the *Rays* that pass through the *Chamber*, do reach the *Eye*, nor affect it; and yet must, before any *vision* can follow. And for the same Reason it is, that those who in a clear *Night* lift up their *Eyes* on high, perceive all spaces above the *Horizon* to be equally covered with *Darkness*; when as yet those immense *Spaces*, except only that part of them which is vail'd by the *Cone* of the *Earth's Shadow*, are no less guilded by the *Sun*, than they were at *Noon-day*. And this because the *Rays* which are diffused through those immense *Spaces*, cannot reach our *Organs*, nor produce any motion in them.

From which *Experiment* it is evident, that the *Light* depends on the *Eye*; so that if there were no *Eye*, or no *Eye* open, neither could there be any *Light*, or *Brightness*, such as we perceive when we lift up our *Eyes* to *Heaven*, and behold this most beautiful appearance of *things*.

A *Spark* of *Fire* sheds its *Light* through a very large space. For a *Spark* of *Fire*, without any *Prospective Glass*, may be perceived in the *Night*, at the distance of 500 paces; and with a *Prospective Glass* may be discerned at the distance of 50 Leagues, and probably much farther.

It seems strange to some, that such a small *Lucid Body* should be of so great a force, as to push the intervening matter of the *Second Element* in a *Right Line*. But this their wonder will cease, if they consider that this subtil matter, which is diffused through the *Pores* of *Diaphanous Bodies*, is like a most *Fluid Liquor*, whereof one part cannot be prest upon, but that all the part must be moved by it. As for Example, let there be a double *Tube* or *Pipe*, *ABC*, filled with *water*, and of a length as great as you please; if whilst the *water* is at rest, and destitute of all motion, you put a drop of *water* into one of the ends, viz. *A*, no *Body* will deny but that the weight of that one drop will be sufficient to raise the *water* towards the other end *C*, and consequently to put the whole mass of *water* contained in the said *Pipe*, *ABC* into motion.

And for the same Reason, who will not acknowledge that a *Spark* of *Fire* may be sufficient to agitate the *Heavenly Matter*, diffused through a large space of *Air*? Forasmuch as the action of *Fire* doth far surpass the force of *Gravity*; as also because the subtil matter which is contained within the pores of the *Air*, and of the *Water* too, is more fluid than either of them. Wherefore it is evident, that the flame of a *Candle*, must needs move the subtil matter that is contain'd in the round of 50 leagues *Diameter*; forasmuch as by the force of its motion it pusheth the circumambient *Air*, much in the same manner, as a *Stone* that is whirl'd round in a *Sling*, presseth down the bottom of it; and by the virtue of its *Circular motion*, doth extend the String of it in a straight Line. For the subtil matter, which on every side surrounds the *Spark*, is also turned round, and strives to withdraw from that place.

But from this Explication of *Light*, no small Difficulty seems to arise, viz. how it comes to pass, that the *Spark* which pusheth the subtil matter contained in the *Pores* of the *Air* to *Right Lines*, can be perceived, when another of the same force and virtue is opposed to it. For let us suppose some one *Globule* of the *Air* *ABCD*, whose Center is *E*; and at *A* and *B*, 2 *Lucid Bodies* of the same force, it will follow, that either the said *Lucid Bodies* will not be perceived from the opposite places *C* and *D*, which is contrary to *Experience*; or that the subtil matter in the Center *E*, will be in many places at once, which is repugnant to the nature of *Bodies*. Which may be thus proved; *A* cannot be perceived at *C*, but that the subtil central matter *E*, must be push'd towards *C*, in a straight Line: And by the same reason *B* cannot be seen at *D*; but that the same matter *E*, must be driven towards *D*; and the same

IV. There can be no Light without the Eye.

V. A Spark of Fire, by means of a Prospective Glass, may be perceived at 50 Leagues distance.

Figure 11.

VI.

How it comes to pass, that the Rays of Light do not hinder one another.

Figure 12.

same may be said of infinite *Lucid Bodies*, placed on the surface of that *Globe*.

This *Difficulty* only ariseth from hence, because it is hard for us to apprehend how the parts of *Liquid Bodies* can receive various actions at one and the same time; because we have observed, that a *hard Body* cannot at the same time be moved divers ways at the same time. When yet in *liquid things* we know it is so; as may be seen by Experience in 2 or 3 *Tubes*, by Example A C, B D, F G, whose *Diameter* I suppose to be equal, and which are so placed crossing one another, as that the space in the middle E, be common to them all 3, and yet no greater than if it served only for one of them. For let us suppose that 3 *Men* do blow into the ends of all 3 of them A B F, the *Air* which is in the midst of these 3 *Pipes*; E will at the same time be driven towards C, D, and G. Not as if therefore it were possible, for every one of the said parts to remove at the same time to these 3 several points; but it is sufficient if some one of them be moved towards C, others towards D, and others again towards G, and that 3 times swifter, than those that fill the other parts of these *Pipes*; which is credible enough, forasmuch as they are with triple stronger force push'd forwards. Now to apply this to the subtil matter, it will by this instance be easily conceiv'd, how the same transmits the different Actions of various *Lucid Bodies*, to different parts at one and the same time.

VII. When a *Man* in the *Night* hath a lighted *Torch* in his *Hand*, and shakes it towards a *Looking-Glass*, at a quarter of a miles distance, he will no sooner perceive the shaking in his own *Hand*, but that at the same time he will perceive it in the opposit *Looking-Glass*.

The Reason is, because *Light* is rather an endeavour or tendency toward motion, than motion it self. For tho' motion cannot be performed in an instant; yet is it not repugnant, for the action of *Light* to be transmitted in a moment at any distance whatsoever. For it is one thing to say, that motion is performed in an instant, and another, that *Light* is transmitted in an instant. The *Light* is transmitted after the manner of the Action of a *Stick*, every part whereof may be perceived or felt, at either end of the *Stick*, at the very same instant wherein it is produced. And consequently nothing hinders but that a lighted *Torch*, being shaken, may be perceived in a *Looking-Glass* at a distance, at the same instant that the shaking is felt in the *Hand*; because the propagation of *Light* is momentaneous, and needs no time for its passage.

VIII. Some *Stones* shine in the *Night*, especially the *Diamond*. There is a *Stone* very common in the Country about *Bononia*, which if it be gently calcin'd, and afterwards exposed to the *Sun*, doth take in so much *Light*, that when put into a dark Room, it is observed to retain some part of it, much like a glowing *Coal* that is covered with a little *Ashes*, the *Light* whereof decreaseth by degrees, and is at last quite put out.

We must not imagin, with some, as if the *Light* of the *Sun* were preserved in the foresaid *Stone*; forasmuch as that *Light*, upon the withdrawing of the *Sun*, doth altogether vanish, as not being able to subsist a moment without its

presence; but rather conclude, that within the *Pores*, made by the *Fire* in the said *Stone*, there be some *Fibres*, so very moveable, as that upon the presence of the *Light* they are put into a great agitation, and upon the withdrawing thereof do still continue the motion impress'd upon them; and consequently move the surrounding *Globuli* of the *Second Element*. And therefore, when either in process of Time, or by the strength of *Fire*, such *Fibres* are taken away, that *Luminous Virtue* immediately vanisheth. The *Light* of this *Stone*, as was said, can only be perceived in a *Dark Room*, because it is very weak, and therefore easily overcome of a stronger *Light*. As is evident in *Rotten-wood*, *Crickets*, and other things that shine in the *Night*, which by Day give no *Light* at all.

The Reason why a *Diamond* shines in the *Dark*, seems to be this, because in the *Pores* thereof the particles of the 3d Element are so compressed, that those of the 2d Element being push'd out, some of them are surrounded only with the 1st Element, by which they are carried away, and the *Globuli* are driven or push'd forwards.

When we receive a knock on the *Head*, or a blow on the *Eye*, we seem to perceive many Sparks of *Light*.

The Reason is, because the motion of the *Globuli* is very much accelerated by the striking *Fist*, which makes them break forth from the *Eye* with great force, and so cause the appearance of those Sparks, which we see at that time. For by means of such a stroke, the *Humours* are put into a great Commotion, and more especially the *Arterial Blood*, which driving with a great force against the *Optick Nerve*, seems to exhibit the appearance of many Sparks of *Light*. For the Sense of Seeing is nothing else but a local Motion, or rather Pression, whereby the fine filaments of the *Net-like Coat* of the *Eye* are struck.

The Affection which the *Light* impresseth upon the *Eye*, doth continue for some time. For when we shut our *Eyes*, after we have beheld the *Sun*, we think we see an appearance of several Colours.

The Reason whereof is, because the fine *Fibres* of the *Optick Nerve*, do still continue agitated by an unusual motion. But forasmuch as the said Commotion wherewith they are shaken, even after that the *Eyes* are shut, is not strong enough to afford such a clear *Light*, as that is from whence it did proceed, therefore it represents only to us some weak Colours. And for the same Reason it is that some persons do perceive some kind of *Light*, for some time after that a *Light* hath been put out. Yea sometimes, tho' there be no *Lucid Body* to affect the neighbouring *Air*; yet sometimes some sharp *Humour* or *Vapor*, only moving the *Filaments* of the *Retina*, causeth an appearance of *Light* to the *Eye*.

The *Light* of a *Candle*, doth appear greater at *Night*, than in the *Day-time*, if the *Eye* be at some distance from it.

This may proceed from 2 Causes. First, It may be occasioned by something in him that sees, who when he doth not exactly know the distance of the *Candle*, may imagin that it is as far from him as a *Star*. Moreover, seeing that the Image of a *Candle*, framed in the bottom of the *Eye*, doth

IX. Why a Diamond shines in the Night.

X. Why it is that when a Man is struck on the Head, he perceives Sparks of Light.

XI. Why if we shut our Eyes after that we have, for a good while, been gazing on the Sun, we perceive an appearance of Light or Fire.

XII. The Light of a Candle doth appear more at Night, than in the Day time.

doth much exceed that of a *Star*; it may make him think that it is really greater than a *Star*. Another Cause of this mistake, may be from the *thing it self* which is seen. For when at *Night* we look upon a *Candle*, that shines at a distance, we do not only perceive the *Light*, which comes to the *Eye* in a straight Line, but that also which proceeds from the *thick Air*, and the *Opake Bodies* that surround it; for they also convey to the *Eye* the *Light* they have received, which being ascribed to the *Candle* it self, it cannot but appear much greater, than indeed it is.

XIII. *Why some Worms and Flies do shine in the Dark.* Some *Worms* and *Flies* do shine in the dark, shedding a kind of *Brightness* from their *Bodies*, through the *Air*.

It is probable that these *Insects* have a certain matter exhaling from them, that resembles the *sweat* of other *Animals*; and that the same pusheth the *Globuli* of the 2d Element. And this seems to be the more probable, because these *Animals* cease to shine as soon as they are dead.

XIV. *Some Plants do shine.* Thus we see that *Rotten Wood* appears shining and *Bright* in the *Dark*, because by the access and recess of its parts, the *Pores* thereof are so straitned, that they contain nothing else but the first Element, whereby the 2d is agitated. Thus *Sea-water*, being vehemently driven and beaten with *Oars* and *Storms*, doth appear all on a flame, because the *Sea-water* doth consist of stiff particles of *Salt*; for by these penetrating little *Bodies*, the particles of the 2d Element they meet with in their way, may be so expelled, as that some of the particles of the 3d Element, may be only surrounded with the 1st Element, and by it be carried away, and driven on to the *Eye*, by a continued Range of the *Globuli*.

XV. *How Cats and Owls see by night.* 'Tis commonly believed that some *Animals* do emit *Light* from their *Eyes*, and thereby see in the dark, as *Cats*, *Owls*, *Dogs*, and other *Creatures* that hunt their *Prey* at *Night*, avoid dangers, and search out hidden things.

But for all this is so confidently asserted, I question not but that it will be found otherwise. For if any *Light* did proceed from the *Eye*, the same might be perceived by others, or might be concentrated in a *Burning Glass*, which could never yet be proved by any *Experiment*. We are therefore to conclude, that the foresaid *Animals*, do only see by that *Action* which proceeds from the objects. For there is always more or less of *Light* in the *Night*; and therefore we see that *Snow* gives some *Light* in the dark, because it reflects the *Rays* of *Light* it hath received, better than other *Bodies*, that are less white than it self. Wherefore *Cats*, *Owls*, and other *Animals* perceive Objects in the *Night*, not because they shed *Light* from their *Eyes*, which is afterward reflected from the Object to their *Eyes* again; but because their *Retina* is more accurately framed, and more fit to receive the *Beams* of *Light*, so as that it can be affected by a very weak *Light*. For it is notorious, that the Apple of the *Eye* in *Cats* is so straitned in the *Day-light*, especially when the *Sun* shines strong, that it appears scarce so broad as a *Thread*; whereas in the *shadow* it is so enlarged, as to be almost equal to the whole *Eye*.

XVI. *The Rays of Light do more easily pass through Glass than Water, and through Water than Air.* The *Rays* of *Light* do more easily pass through *Glass* than *Water*, and through *Water* than *Air*.

The Reason is, because the *Action* of the *Subtil Matter*, wherein the Nature of *Light* doth consist, is more hindered by the *Parts* of the *Air* that are soft and not well knit together, than by those of the *Water*, which do more strongly resist it. For the more firm and solid the parts of any *Pellucid Body* are, so they be small, the more easily do they transmit the *Light*. Hence it is that *Glass* and *Crystal*, because of the firmness of their parts, do the more easily admit the *Beams* of *Light*.

And much the same Reason may be given, why *Paper* besmear'd with *Oyl*, becomes diaphanous; because the *Oyl* entering into the *Pores* of it, which before, by reason of their winding or crookedness, could not transmit the *Rays* of *Light*, it doth smooth them, and change the *Figure* and bigness of them; and by this means causeth a different disposition of the parts of the *Paper*.

Reflected *Light* is always less bright and shining, than that which is direct, or not reflected. For take the smoothest *Looking-Glass*, and the most perfectly polish'd, whether by Nature or Art, yet will it never be endued with an entire and most absolute continuity of its parts, without any inequality of the *Pores*, roughness or sign of division. Hence it is, that tho' all the *Beams* of *Light* fall upon it, yet some entering into the *Pores*, are swallowed up of them; or if they do reflect from it, because of some inconspicuous inequality of the extrem parts, yet are they insensibly dispersed; so that the entire *Light* is never so dully reflected, but that more or less it is lost, and never reaches the *Eye*.

CHAP. IX.

Of Colours.

Peacocks Tail, and the *Feathers* of a *Pigeon* do wonderfully change their *Colours*; as *Lucretius* elegantly expresseth it.

So Plumes that grow around the Pigeons Head, Sometimes look brisker with a Deeper Red; And then in different position seen, Shew a gay Skie, all intermixt with Green: And so in Peacocks Tails, all fill'd with Light, The Colour varies with the change of sight.

These *Colours* are caused when the *Peacocks Tails*, and *Necks* of *Pigeons* are turned towards the *Light*; and by reflexion or refraction do send back the said *Rays* to the *Eye*. They are commonly called *appearing Colours* only, and reckon'd amongst those *Images* that deceive us, and whose entire Essence or Nature consists in their appearance, or seeming such. But the reason why they assert this, I cannot apprehend: For if they admit *Colour* to be nothing else, than the *Light* it self, modified in the surface of *Bodies*, why may not they own those *Colours*, which they call *seeming*, to have as truly the Nature of *Colour* as any other? For can the short duration of the Cause, destroy the Truth of the Effect? Or doth not a *Son* deserve that name, because he dies almost as soon as he is born? Who will affirm, that the *Greenness* of *Grass* or *Herbs*, which for some days only doth delight our *Eyes*, is less a *Colour* than the *Greenness* of an *Emerald*, which continues so much longer?

pass through Glass, than the Water.

XVII. *Why Paper dipt in Oyl is Transparens.*

XVIII. *Why Reflected Light is less bright, than that which is not Reflected.*

I. *Whether the Colours of a Peacocks Tail, and the Necks of Doves be true Colours.*

Y y y y

longer? For by the same *Argument*, the flame of *Lightning* or *Gun-powder* will be no true *Flame*, because of its suddain vanishing and disappearance. For the lasting or continuance of *Colours* imports nothing to their Truth and Reality; and those which continue only for a moment, are no less *Colours*, than those which lastingly do affect the *Eyes*.

II.
How Colours come to be varied.

The Cause therefore of the variation of *Colours* in the *Peacocks Tail*, and the *Necks of Doves*, is the different *Reflexion* and *Refraction* of the *Rays*, made by the thin *Hairs* of their *Feathers*, because of their various admission of the *Luminous Beams*. Thus those *Pictures*, made of *Feathers*, which are brought out of the *East Indies*, according to the variety of their situation, do exhibit a *Violet Colour*, or bright *Blue*, or a curious *Emerald Green*; forasmuch as the soft *Feathers* whereof they do consist, have their *Surfaces* so ordered, as diversly to reflect the *Light*.

But this being besides my present scope, I return to prosecute my *Experiments*.

III.
Two Looking-Glasses made of different Marble, do differently reflect the Image of the Sun.

Let two *Looking-Glasses* be made, the one of *white*, the other of *black Marble*; that of *white* being exposed to the *Sun's Beams*, will represent to us a more clear and distinct Image of the *Sun*, than that of the *black*, from which only some weak *Rays* will rebound, which being not sufficiently united together, will only produce a confused Image or Similitude of the *Object*.

The Reason of this is, because the action of the *Light*, whereby the Parts of the *Subtil Matter*, push'd on by the *Lucid Body*, do tend towards the *Black Marble*, is almost quite extinguish'd or swallowed up by it, so as that very few of the *Rays* are reflected: Whereas the *White* doth altogether remit the *Action* of *Light*, and almost reflect all the *Beams* that fall upon them. For tho' *White* and *Black Marble*, consist almost of the very same parts, and no difference is discernible between them by sense; yet it is not to be questioned, but that in the *Black* some soft parts are to be found, which swallow up part of the *Beams*, and break the force of them. So that the *Black Marble* differs from the *White*, much alike as a *Pumice-stone*, whose *Pores* are filled with melted *Pitch*, differs from another *Pumice-stone*, whose *Pores* are only filled with *Air*: For as the *Grains of Sand* cast against the latter, would rebound thence, whereas those cast against the other would be deaded; in like manner, all the *Light* which falls upon the *White Marble* is reflected; whereas that which lights on the *Black*, is mostly swallowed up.

IV.
What is the Cause of the Whiteness that is in Bodies.

The same is apparent in other *Bodies*; for if *Water*, for instance, be strongly agitated and shaken together, it becomes of a *White Colour*, and after that the *Bubbles* of the *Froth* are broken, it is *Transparent*; which is a great *Argument*, that the cause of this *Whiteness* is, when the *Light* is wholly and entirely reflected from the small *Bubbles* of the *Froth*, as from so many *Looking-Glasses*. And accordingly the *Black Marble* is like *Hangings*, which upon the casting of a *Ball* against it, doth receive motion, but doth not rebound; whereas the *White* is like a hard *Wall*, which sends it back, and without any motion of its own, doth reflect it.

V.
Why White Marble is less fusible.

Hence it is, that if you take 2 *Polish'd* pieces of *Marble*, the one *White*, the other *Black*; and in hot weather expose them to the *Sun-beams* for

some time, you'll find that the *Black* will be very *prive of Heat*, whereas the *White* will, for all that, in a great measure, continue *cold*. Whereof no other reason can be given, but that the *Black*, because of its many *Cavities*, doth freely admit the *Globuli* of *Light*; whereas the *White*, because of its closeness, doth reverberate the received *Light*, retaining nothing of it. Accordingly as we daily observe in *whited Rooms*, which do reflect more *Light*, and do, in a manner, send it all back again from them. Hence it is, that when the *Light* of the *Sun* is admitted into a *Darkened Room*, through a little hole, if the *Rays* be received upon a *white Paper*, they appear very bright and shining; whereas they shew very weak and faint, when they light upon a *black Body*.

Polish'd Marble is of a blacker Colour, than that which is *Rough*.

The Reason is, because in the *Rough* there be many *Prominences*, which every way reflect the *Light*. For the *Ray* which is reflected from one part of the *Body*, goes one way, and that which is reverberated from another part, another way. But a *Polish'd Body*, forasmuch as it consists only of one continued *Superficies*, therefore it reflects fewer *Rays* to the *Eye*. Moreover, seeing there is no *Body*, in Nature, so *Black*, which doth not consist of many parts, which being separated from the rest, would constitute a *white Body*, as the difference there is between the *Polish'd* and *Rough Marble* doth abundantly testify: We may say that *Polish'd Marble* is most *black*, because its *white* parts do reflect the *Light* they receive, towards the same part; where if there be never an *Eye* to admit it, it is the same with respect to it, as if the *Light* were quite extinguish'd. But when the *Eye* is placed in that part to which the reflexion tends, it perceives this *Light* in the *Marble*, together with the *Colours* and *Figure* of the *Objects*, from whence the *Light* doth proceed; no otherwise than if it did proceed from a *Looking-Glass*.

Now that an absolutely *Polish'd Body* doth only reflect one *Ray* to the same point of the *Eye*, may be thus demonstrated: Let *B F*, be suppos'd to be a perfectly polish'd *Plain*, and let the *Light* be in the Point *A*, and the *Eye* at *H*, let the reflex *Ray* be *D H*, so as that the *Angles A D B*, and *H D F* be equal; it is evident, that no other *Ray* derived from *A*, will be reflected to *H*, supposing that the surface *B F*, be absolutely smooth and even. For let there be any other *Ray* of incidence, suppose *A C*, I say, that the *Angle A C B*, is greater than the *Angle A D B*; wherefore supposing an equal *Angle* of Reflexion *A C I*, the reflected *Ray*, *C I*, will never reach to *H*, nor will ever concur with *D H*, but rather fall wider from it, the further it is drawn. And the same must be said of all the other direct incident *Rays* between *B* and *D*. Wherefore there will only one *Ray* be reflected at *H*, viz. *D H*. I have said before, if the *Body* be perfectly smooth, for if it be not, the case will be otherwise, upon the chattering of the nature of the *Plain*.

Some *Bodies* do constantly keep the same Colour, and which way soever they are turned towards the *Light*, do always reflect it after the same manner; so *Coals* always appear *Black*, and common *Snow*, *White*.

The *Snow*, &c.

prive of Heat, than Black Marble.

VI.
Polish'd Marble appears of a blacker Colour than that which is Rough.

VII.
A perfectly Polish'd Body can only be seen on one side.

Figure 13.

VIII.
Some Bodies retain always the same constant Colour, as Coals, Snow, &c.

The cause of this constant Colour is to be ascribed to the Disposition and Situation of the Parts, which as long as it continues the same in Bodies, they admit the Light at certain Angles, and accordingly reflect it to the Sight. For Charcoal is black, because its surface is rough and uneven, by reason of innumerable furrows and chinks, which choak the Rays of Light, and break their force. Which may be evinced, not only by reason, but by our very Senses. For if a man do gently handle Charcoal, he will be sensible of a kind of Roughness, something like that we feel in a Pumice-stone; which, as I said before, is not capable of being polished. For whilst Wood is burning, much Smoak and Exhalation flies away from it, by the force of the Heat; and therefore the Fire being rarefied between the Cavities of the Wood, doth break its prison and dilate the pores; into which, when the Rays of Light enter, they are there swallowed up and entangled, so that they cannot rebound to the Eye.

IX.
In what
sense it is
that Col-
ours are
said to be
in Bodies.

But yet we must not imagine with some, that Colours do formally exist in Bodies, but effectively only, inasmuch as they produce them in the Eye, by means of a certain disposition of the Insensible parts, and the Reflexion of the Light: In the same manner as a Needle, which is destitute of all pain, yet being thrust into the Skin, doth by its motion, figure and hardness, produce Pain there.

Thus all Sulphurous matters exhibit a Red Colour: As when the Spirit of Turpentine being digested with the Calx of Lead, yields a deep Red; and the Spirit of Soot mixt with any acid Liquor, or Common water, affords a white or milky Colour. Thus the Light proceeding from 2 Lanthorns, the one of red Glass, the other of blew, being receiv'd on a Paper, will represent there a Purple Colour. All which Instances manifestly evince, that Colour is not inherent or fixed in a Body, but only a result of the Reflexion of Light.

X.
Why beaten
Glass seems
to be white.

Glass, when it is whole and extended in Panes, is transparent, that is, of no Colour, or if it have any, it is rather of a black than white Colour; but when beaten in a Mortar, it appears white.

The Reason is, because beaten Glass hath many Surfaces, which every one of them do receive the Light and reflect it again, as so many Looking-Glasses. For seeing that Glass is destitute of all Moisture, and that all its parts are of a round figure, as may be experienc'd by the help of a Microscope, one of them reflects one part of the Light, and the other, another, and so on, so that they reflect the whole Light, and that after the very same manner as they have received it. Hence it is that White Bodies are, of all others, the least opaque; because they reflect the Rays of Light from every point of them, and suffer none to be swallowed up of any of their Cavities.

XI.
What is
the Cause
of the
Whiteness
in Snow.

Neither is there any other Cause of the whiteness of Snow, which consisting of Bubbles, doth send the Rays to the Eye, according to the multitude of the Bubbles whereof it is compos'd. Nor is this contrary to what hath been said before, that from every Bubble, one Ray only is sent to the Eye: For since they are not sensible, neither do they hinder, but that abundance of continual Rays may be directed to the Eye. Hence it is that Snow, which is nothing else but Frozen-water, yet doth

appear whiter than Ice; for seeing that the surface of Ice is not so much curled, as the surface of Snow, and that there are many Devexities or Roundings in Snow, from whence the Light may be reflected, which are not to be found in Ice; it cannot be, but that Snow must appear whiter than Ice. And for the same Reason it is, that water beaten together, turns to froth, by its being divided into round and small parts: For if the Bubbles, whereof the Froth consists, be so great, they will cease to yield a white Colour. Thus likewise the Whites of Eggs, when beaten, lose their Transparency, and become white; and Crystalline Glass, heated in a strong Fire, and quenched with water, is resolved into so many flits, that it appears altogether white.

Rotten Wood, as also stinking Fish, are of a kind of whitish Colour, when exposed to the Air; but when put into the Pneumatick Engin, upon the extraction of the Air, do lose all Colour.

The Reason is, because the particles of putrefying Bodies, are agitated in such a manner as is necessary, for the causing of the Sense of Light. For the Corruption of any Body is caused by the motion of its parts, whereof some fly away and are separated from the rest; and those that remain, impart their Vibration or Motion to the inter-jacent Air, and by this means do afford a weak Light to it. But seeing that all the Air is supposed to be extracted out of the Pneumatick Engin, it needs not seem strange to us, if the Fish which shined before, doth no longer shed any Light. For the Air, by its Elastick virtue, doth assist the agitation of the Light, and where its motion is stronger, there the Light also is increased.

Thus FRACASI is of Opinion, that the Reason why the Blood appears of a darker Colour at the bottom of a Porringer, than at the top, is not because, as the common Opinion is, that part is the more Melancholy portion of the Blood; but because the lower part of the Blood is not so much exposed to the Air, and therefore appears less Ruddy and Florid, than that which is on the top.

Why the Blood that is in the Arteries and Veins is Red, appears from what hath been said in my Institution of Philosophy, viz. That the motion of the Globuli of the second Element, which are the Cause of Light, is twofold, the one whereby in a strait Line they are carried to our Eye; the other, whereby they are whirled about their own Centers. So that if they be whirld about much slower, than they move in a right Line, then the Body whence they are reflected will appear blew to us; but if they be whirld about much swifter, then it will seem red. Now no Body can be disposed to make them whirl about more swiftly, but such an one as consists of Branchy parts, and those so thin and near one another, as to have nothing about them, save only the Matter of the first Element, such as the Parts of Blood are. For the Globuli of the second Element meeting with the Matter of the first Element in the surface of the Blood; which Matter doth without ceasing obliquely pass through the same, and that with great swiftness, out of one pore into another, so as to be moved after a different manner from the Globuli; they are forced to whirl about their own Centers, by the Matter of the first Element, and

in the Ar-
teries and
Veins, is
Red.

and that more swiftly than they could be forced by any other Cause, because the *first Element* exceeds all other *Bodies* in swiftness.

XV. And the same is the Reason, why *Red-hot-Iron* and *Burning-Coals* are red; even because very many of their *pores* are fill'd only with the *first Element*. But because the said *pores* are not so narrow as those of the *Blood*, and that there is much of the *first Element* in them, to produce *Light*, hence it is that their *Redness* differs from the *Redness* of the *Blood*.

XVI. Very Famous and Credible persons give us an account of a certain *blind Organist*, who lived near *Utrecht* upon the *Maes*, who had such an exactness of *Feeling*, that by the touch of his *Hand* only, he was able to distinguish several *Colours*.

It will not be very difficult to assign the Reason of this wonderful Effect, if we consider that the interruption of parts in *Bodies*, doth very much conduce to the production of *Colours*; forasmuch as it is evident, that most *Colours* proceed from the roughness of *Bodies*, and the figure, order, situation and motion of the parts. As is evident in *red Marble*, the polish'd part whereof is very different in *Colour*, from that which is *rough*. So likewise we may perceive by a *Microscope*, that the *yellow* parts in a piece of *Silk*, are very different from the *blew*. Forasmuch therefore as there is so great a variety of Parts in *Colour'd Bodies*, which may admit a Reflexion or Refraction of *Rays*, we may conclude, that it seems probable enough that the fore-said *blind Man* might have such a quick *Touch*, as to be able to distinguish *colour'd Objects* by the roughness or unevenness of their parts.

XVII. Several *Bodies* mingled together obtain a different *Colour* from what they had before: Thus *Oil of Anniseed*, mixed with *Oil of Vitriol*, turns red; *Spirit of Turpentine* poured upon *Sugar of Lead*, or *calcin'd Lead*, produceth a red *Tincture*; and the *yellow Gall* in *Animal Bodies*, according to the Opinion of *Physicians*, is the product of the mixture of adust *Sulphur* and *Salt*.

This production of different *Colours* is caused by the inward disposition of the parts of *Bodies*. For it is certain, that from the alteration of the least parts of one *Body*, a different *Colour* must arise; as appears evidently to the *Eye* in *Herbs* that are beaten in a *Mortar*. For the temperament and ranging of the *Parts*, is, as it were, the first Rudiment of *Colours*, which upon the appearance of *Light*, and its being diversly reflected and refracted from those particles, doth super-add the last and most absolute perfection to *Colours*. Thus the *Stone Magnesia*, which for colour and hardness doth resemble a *Load-Stone*, being in a certain proportion added to *Glass*, renders it perspicuous, and quits it of its *green Colour*; but if more than is necessary be added to it, it makes it black. Thus an *Apple cut in two*, at first appears white, then turns yellow, and last of all black, according as the surface of it becomes differently disposed, by the drying of its parts.

XVIII. The transparent and clear Infusion of *Galls* being mixed with a Solution of *Vitriol*, makes *Ink*; to which if you afterwards add *Spirit of Vitriol*, or *Aqua-fortis*, the black *Ink* will become transparent again, as *Spring-water*; and if you drop

some Drops of *Oil of Tartar* into this clear *Liquor*, it will be turned again into *Ink*. The *blew Tincture of Violets*, infused into the *Oil of Vitriol*, becomes of a purple *Colour*; to which if you add a few Drops of *Spirit of Harts-horn*, the purple *Colour* will be changed to a green.

The Reason why 2 clear *Liquors* mingled together make *Ink*, is, because the particles of either of them are brought nearer together, so as to hinder the passage of the *Rays of Light*. And whereas the said *Ink* afterwards, upon the pouring another *Liquor* into it, becomes clear again, the Reason is, because the particles of the new added *Body*, do separate the Parts that before were contiguous, and consequently make an open passage for the *Light*, to pass freely, as before.

The Difference of *Colours* proceeding from the mixture of *Liquors*, is to be fetch'd from the small particles contained within the pores of each *Liquor*, which being changed in situation and position by the *Liquor* that is poured into them, do transmit the *Rays of Light*, variously refract or reflect them, and consequently produce different appearances of *Colours*. For, as was mentioned before, when the *Globuli* have more Right motion than Circular, they afford a *Violet Colour*; if they have more Circular motion than Strait, the *Liquor* appears yellow; but if the *Globuli* have much more Circular motion, than Right motion, they produce a *Red colour'd Liquor*: Again, if the *Ethereal Globuli* have more Right motion, than Circular; but yet less than the *Globuli* of those *Rays* that produce a *Violet Colour*, then they yield a *blew*. And in like manner we are to conclude concerning all other *Colours*, the variety and sudden changes whereof, in *Liquid Bodies*, is chiefly to be attributed to precipitation.

Thus we find, that sharp and acid *Salts* cause a thousand changes in the *Colours* of those *Liquors* with which they are mixed, according to the different Nature of the said *Liquors*. As for Instance, the *Oil of Vitriol* makes a black composition, with the infusion of *Galls*. Common *Brimstone* dissolved in the *Oil of Tartar*, becomes of a fair *Citron colour*. *Spirit of Nitre* turns the Juice of *Herbs* as white as *Milk*. *Spirit of Wine* turns red, when it hath been digested a while with the *Salt of Tartar*. The *Syrup of Violets* turns green, by the mixture of an *Alkali*; and red, by adding an *Acid* to it. *Acids*, or *Sowre things* destroy *blew Colours*, and *Alkali's* do restore them again. The Infusion of the *Indian Wood*, affords an amber *Colour*, when mingled with *Acids*. And the Solution of Common *Brimstone*, made by an *Alkali*, turns white, by adding an *Acid* to it. All which solely proceeds from those Dispositions which *Acid* and *Alkali Salts* produce in the pores of those *Liquors* to which they are added, which is such, that the *Light* which penetrates them, receives all the Modifications that are necessary for the several *Colours* we find produced by these mixtures.

Most *Powders* are white, if they be dry and beaten, or ground very small.

Because all those small *Bodies* into which the *Powder* is resolved, are Spherical, and like so many *Globuli*, which reflect all the *Rays of Light* to one point. And if it happen that the grains of any *Powder*

XIX. The Cause of the variety of Colours, proceeding from the mixture of Liquors.

XX. Sharp and Sowre Salts alter the Colours of Bodies.

XXI. Why Powders are generally white.

the Lowermost *Blew*, and the Middlemost *Whitish*.

pos'd to
the Sun.

The Reason is, because the *Heat* hath chas'd away the *Moisture* that was before in the *Veal*, as well as in the flesh of *Hens*, &c. for *moisture* shu up in the *pores* of *Bodies*, is a hindrance to *Whiteness*, as is evident in all dry things, which by the separation of their *moisture* become *white*; because *Moisture* doth not permit so much fraction as the *Air* doth; and yet so much is necessary to cause *Reflexion*. Hence it is, that a *Body* that is newly whited with *Quick-lime*, appears at first to be of a *dusky Colour*, and afterwards, in success of time, becomes *white*; because at first it hath much *moisture* mixed with it; which being exhal'd into the *Air*, and the *Quick-lime* dried, yields a *white Colour*.

Because many of the *particles* of *Dyed Bodies*, which compose the *Tincture* are exhaled, by the *Suns* agitation: *Secondly*, Because many little *Bodies*, that wander up and down the *Air*, do thrust themselves into the *pores* of the *Cloth*, which by covering its *Lustre*, efface its former *Colour*. Wherefore they that deal in *Cloaths*, have a care that they be not long exposed to the *Air*, but keep them shut up.

duce a *yellow*: And forasmuch as something of an *Alkalous Nature* is continually transfused from the *Gums* and other parts of the *Body*, it must follow that the *Spirit of Vitriol* being commixt with such a *Salt*, must rather make them of a *yellow Colour*, than any whit conduce to the whitening of them.

XXVI. *What is the cause of those various Colours which appear in a long* A *Glass Vessel* of a long figure, like a *Gourd* or *Cucurbit*, being fill'd with *water*, and expos'd to the *Sun-beams*, so as that they may enter obliquely through the narrow *Mouth*, at the upper part of the *Vessel*; these *Sun-beams* falling upon a *white Paper*, or piece of *Linnen*, will represent various *Colours*. For the uppermost *Colour* will be *Red*.

Z z z z z

removed

removed out of this great and strong *Light*, into a more moderate or shaded *Light*, is turned into a curious and pleasant *Green*; because from the brightness of the *Sun*, which affords abundance of *Light*, the *blue Colour*, which the *Wooden Vessel* did produce, is changed into a *green*, which is compounded of a *blue* and a *yellow*. And last of all, when the *Bottle* is brought into a more shady place, the *water* appears of a deep or dark red; because the *Redness* is weakened by the decrease of the *Light*, and is changed into a kind of *Rusty Colour*.

XXVIII.

Brazile
Wood communicates
a Red tincture to
water.

In like manner we know, that *Brazile Wood* communicates a *red Colour* to the *water* wherein it is boiled; which being put into a *Drinking-glass*, if a little distilled *Vinegar* be added to it, it immediately is turned into the colour of *Straw* or *Amber*: From which sudden change of Colours, we have good reason to conclude, that all Colours do arise from the various texture of the parts, and the different reflexion of the *Light*.

XXIX.

Nephritick
Wood yields
a Golden,
blue, and
yellow
Colour.

There is also another kind of *Wood*, which hath taken its name of *Nephritick Wood*, from the great use it is of in curing the *Gravel*, the parts whereof being infused in *water*, and put into a *Glass Vial*, do after a few hours tinge the *water* of a *Golden Colour* if the *Vial* be placed between the *Eye* and the *Window*; but if the *Eye* be placed between the *Window* and the *Vial*, it will appear of a *blue Colour*. For when the *Rays of Light* do enter into the *Liquor*, they become tinged with a *yellow Colour*; but the same represent a *blue*, when the *Rays* reflect from the *Vial*. And if you pour an *Acid Liquor* upon it, then the *blue Colour* will vanish, and the whole *Liquor* will appear of a *Gold Colour*.

The Reason of this is probably no other, than that of the foregoing: For it is evident, that this *Wood* doth consist of *Tinging particles*, which are easily resolved in the *water*, and so far seem to be much of the Nature of *Salt*; which particles entering the pores of the *Water* do so refract the *Rays*, that they appear tinged with a *Gold Colour*. And if you admit the *Light* of the *Sun* through some Hole, into a *dark Room*, and place the *Vial* full of the Infusion of this *Nephritick Wood*, partly within the *Cone of Light*, and partly without it, you will observe a vast variety of Colours, caused by the various degrees of the *Refraction* of the *Light*. Now the Reason why, after that the *blue Colour* hath been extinguished by an *Acid Liquor*, it should be restored by the Affusion of *Oil of Tartar*, or a *Sulphureous Salt*; and on the contrary why, when the *Gold Colour* is vanished, it is restored by the addition of an *Acid Liquor*, is, because *Acid Salts* do cut and slash the tinging particles into lesser divisions, or at least precipitate them, and so make the *Colour* to appear more weak and dilute.

CHAPTER X.

Of Occult Qualities.

1.
What Occult Qualities are.

Occult Qualities, are by the *Peripateticks* called *Hidden Powers*, by which *Natural things* do act or suffer any thing, and whereof no prior Reason can be assigned, as immediately proceeding from the *substantial Forms* of things. But our

Modern Philosophers are at a loss about what the *ARISTOTELEANS* means by all this *Gibberish*, who denying all *substantial Forms*, despair of ever knowing what these *Occult Qualities* are, which are the immediate products of them. Wherefore the abstruseness of some *Qualities* doth seem only to depend on the different *Hypotheses* of *Natural Principles*; so as that to those who follow the *Peripatetick Hypothesis*, the *Ebbing* and *Flowing* of the *Sea*, and the *Conjunction* of the *Iron* with the *Load-stone*, appear to be abstruse and hidden *Qualities*; whereas, according to the *Principles* of *Corpuscular Philosophy* they are most clear and evident effects.

A *Sponge* is commonly supposed to attract *water*, and to draw it upwards.

If we warily consider the thing, we shall find that a *Sponge* is very improperly said to attract *water*; whereas on the contrary, the *water* doth rather mount upwards to the *Sponge*, and intrude it self into its pores. For as soon as the *Sponge* toucheth the *water*, it somewhat presseth the same, and makes the pressed part of the *water* to mount up, and enter into the pores of the *Sponge*, as is evident in a *writing Pen*, which no sooner toucheth the *Ink*, but it mounteth up into the *Pen* by means of the *Slit* of it. For if the *Point* of a *Pen* without a *Slit* be applied to the *Ink*, no part of the *Liquor* will ascend; or if any part of it stick to the *Quill*, it immediately drops down. The mounting up therefore of the *Water* is caused by the pressure of the *Sponge*, whereby the *Air* is thrust out of its place; which *Air* afterwards pushing against the surface of the *Water*, drives it upwards, and by some Force makes it to enter the *Body* that lies upon it.

New Bread put into *Wine*, or any other *Liquor*, will draw up the same 2 or 3 Fingers breadths high, and contrary to the *Laws of Nature*, without any Pressure, operates at a distance.

The *Wine* enters into the Cavities of the *Bread*, because they are bigger than is necessary, for admitting the parts of the *Air* only; and therefore the parts of the *Air* that are shut up in them, are on every side surrounded with the *Subtil Matter*, which doth more swiftly agitate them, than they would be moved elsewhere; in case they continued entangled amongst themselves. And forasmuch as all *Bodies*, which move in places that are too narrow for them, do strive to get out of them; it accordingly happens, that whilst the parts of the *Air* do go forth from the pores of the surface of the *Liquor*, that toucheth it, the parts of the *Water*, or any other *Liquor*, do immediately follow it, and possess themselves of the relinquished place. And because also the parts of the *Liquor* do better fill the Cavities of the *Bread*, they are not so swiftly agitated in them, as the parts of the *Air*; and therefore do not endeavour to quit the same, except only in order to enter the higher pores of the *Bread*, and take up the place of the *Air*, which strives to get out of the Pores thereof.

For it cannot be questioned, but that the pores of *New Bread*, how crooked or winding soever they may be, do much assist the ascent of the *Liquor*: For they are as so many *Pipes*, through which the *water* leisurely passeth, when it is pressed by the external *Air*. Mr. BOYLE hath proved this by a like Experiment: For he

took a long *Glass Pipe*, and fill'd it with *Red Lead*, and then put the lower end of the *Pipe* into the *water*, which by degrees mounted up the height of 40 *Fingers* breadths; by means of those *pores*, which, like so many *Pipes*, do convey the *water* upwards.

V. A *Sheep* trembles at the sight of a *Wolf*; a *Chicken* at the sight of a *Kite*; and the *Pigeon*, dreads the approach of a *Hawk*.

Philosophers commonly attribute these *Aversions* to the mutual hatred that is between these *Creatures*; but without sufficient ground. For a *Wolf* doth not hate a *Sheep*, but is delighted with it, and pursues it as a convenient Good for him. And the same may be said of a *Kite*, that pursues a *Chicken*; and of a *Hawk*, that sets upon a *Dove*. A *Sheep* therefore at the sight of a *Wolf* betakes himself to flight, because it is endued with such a *Texture of Fibres*, that the *Light* reflected from the *Wolfs Body*, doth produce such an affection, upon which the motion of running follows. For there are some *Rays* or *Spirits* which are continually darted from the *Wolfs Body*, which painfully affecting the thin *Fibres* of the *Sheeps Optick Nerves*, do suitably move the *Brain* and the *Spirits* contained therein, and convey them into the *Muscles*, in such a manner, as is necessary to put them upon a flight. For these *Spirits* are of a wonderful force to affect and agitate the *Body* which they push upon, and whose most inward parts they pierce into.

VI. Some *Shades* are commonly accounted to be of a hurtful nature, and to cause either *Pain*, or some other inconvenience. Thus a *Serpent* flees the shade of an *Ash*. And those who sit down in shady places, are apt to be overtaken with sleep.

These *Effects* are not caused by the *Shade*, which being somewhat *Privative*, cannot have any positive *Vertue* or *Effect*; but from the steaming current of particles proceeding from *Bodies*, and more particularly from the neighbouring *Trees*, *Plants*, *Pools*, or any other *Bodies*. And that a person that sits, or lies down in the *Shade*, is very susceptible of these steaming particles that continually flow from *Bodies*, and very like to be affected by them, may be easily conceived, for that in *Summer-time* the *Pores* of the *Body* are more open, and stand ready to receive these outflowing little *Bodies*; and therefore no wonder if they be affected by them.

VII. Thus the *Effects* do prove that *subtil* and invisible *Steams* do continually proceed from *Quicksilver*; for which Reason those *Artificers*, who are much conversant about it, are used to keep *Gold* in their *Mouths*, with which they intercept the noxious *Steams* of the *Quicksilver*, which set themselves about the *Gold*, and cleave to it, and discolour it. Moreover, drops of *Quicksilver* have been found in the *Heads* of these *Artificers*, and in other parts of their *Bodies*. For there are certain pure and subtil *Effluvia* or out-flowings, which proceed almost from all *Bodies*, which retain the Nature and *Vertue* of the *Body* whence they proceed. Neither is it to be doubted, but that *Quicksilver* boil'd in *Water*, doth communicate a *Vertue* to it, of killing *Worms*.

VIII. It is a common assertion amongst the *Cabbalists*, that there is a great *Vertue* in *Words*; as by

which, extraordinary *Effects* may be performed. And I remember to have read somewhere in *Paracelsus*, that upon pronouncing the words *Ossy, Ossy*, *Serpents* stop their motion, and lie still as if they were dead.

But this is an ungrounded Opinion of the *Cabbalists*, forasmuch as the bare words of the most worthy *Tongue* have no efficacy at all; no more than the *Vertue* of a *Man*, or the signification of some *Holy Thing*, can communicate any *Vertue* to the *Words* pronounced by the one, or importing the other. For tho' it cannot be denied, but that *Orators* and *Poets* do excite *Passions* in the *Minds* of their *Auditors*; yet this is not by any hidden *Vertue* that is in their *Words*, but by the strength of their *Reasons*, and the aptness and *Musical cadence* of their words. Wherefore what *PLINY* tells us in the 2d Chapter of his *Natural History* of the Preservation of the *Fruits* of the *Earth* from harm, by some words pronounced over them, and of the charming of *Serpents*, ought to be lookt upon as *Fiction*. Seeing that words can operate nothing in a natural way, and have nothing of any *Sympathetical Connexion* with intelligences or the *Powers* of *Heaven*.

It is a common Story, that a *Nose* cut out of the *Flesh* of another *Man*, upon the death of him from whom it was taken, corrupts and rots as the *Body* of the dead Person doth. And the same is said of the effect of the biting of a *Mad Dog*, which continues till the *Death* of the *Dog*, and then ceaseth.

No sufficient Reason can be given to verifie these *Effects*; and therefore I suppose that these things are reported by *Authors* without sufficient faithfulness; or if any such thing ever hapned, that it was an effect of chance, and not of any *Physical Causality*.

It is also believed by many, that wounds at any distance may be healed by the *Sympathetical Powder*, by applying the *Powder* to the *Weapon* that made the *Wound*, or to a *Rag* that hath any of the *Blood* of the *Wound* upon it.

But tho' many great *Authors* maintain this for a truth, yet I am not easily persuaded to confide therein. For we do not find in calcined *Vitriol*, which is the Basis of that *Powder*, any thing conducive to the healing of *Wounds*, besides an adstringent *Vertue*, which is very proper to stop *Blood*, and to close and heal a *Wound*. And tho' the *Spirits* proceeding from the *Vitriol*, may be supposed to exert some of their efficacy at a small distance, yet is it not certain, that the *Power* thereof can be conveyed so far as is reported. Neither will the instances that are brought to prove this effect, be of any great weight with those who consider how apt the *Minds* of *Men* are to believe any stories, and how many do seem to take delight in being imposed upon, rather than to be lookt upon as incredulous. So that it seems that these *Cures* ought rather to be attributed to the cleanness of the *Wounds*; since in the *Sympathetical Cure*, charge is always given to wash them with *Urin*, which is endued with an absterfve Power, by reason of the *Salt* that is contained therein. And this is no more than the *Dogs* themselves do, who are used to cure their wounds by licking them.

IX. That a Nose cut out of another mans flesh, doth rot or perish upon the death of that man.

X. Whether Wounds at a distance are curable by the Sympathetical Powder.

XI. But if *wounds*, at any time, have been cured with this *Powder*, the same must be performed by the *Effluvia* of little *Bodies*: Which tho' not always, yet very frequently retain the nature of those *Bodies* from whence they stream forth, and transmit the same to a vast distance; and by this means the *particles* proceeding from one *Body*, entering the *pores* of others, may there produce the same effect, and move the *Senses* much in the same manner as the said *Bodies* themselves would do by *Corporal Contact*.

XII. There is a great *Sympathy* observed between *Twins*; so that if one of them chance to be sick of any *disease*, the other is frequently seized with the same.

The Reason whereof is, because they both have the same *Texture* of their *Fibres*, and the same *Temperament* of *Humours*; so that if it happen, that if by any *distemper* of the *Air*, or by any hurtful *Meat* or *Drink*, the one of them falls sick, it cannot well be otherwise, but that the same effect must happen to the other, because of the great conformity of their *Frame* and *Temper*. And therefore it is that they are subject to the same motions of *Passions*; so that what produceth loathing in one, will effect it in the other; and whatsoever is desired by one, will also be desired by the other; because a like *Texture* receives the same affection from one and the same *Object*, and consequently stirs up the same *Appetite* and *Passion*.

It is commonly said, that some *Old Women* bewitch *Infants*.

Which may be, because these *Old Women*, by the strength of their *Imagination*, intending their *Nerves* and *Muscles*, may dart forth from their *Eyes* some noxious *Spirits*, whereby the tender and easily susceptible *Body* of the *Infant* may be greatly prejudiced, especially if the *Infant* be near to the *Woman*. For bewitching, as *PLINY* tells us, proceeds from the *Spirits* of the *Witch*, entering through the *Eyes* of the *Bewitched*, into their very *Heart*. Indeed it seems probable enough, that by this darting forth of *Spirits*, much mischief may be done; since it is notorious, that a *Woman* that hath *Those* upon her, doth produce *Spots* and *Stains* in a *Looking-Glass*. And that one who *Coughs*, stirs up *Coughing* in others; and one that *Yawns*, a *Yawning* in him that sees him.

XIV. Whence we may understand the Reason, why all are not equally obnoxious to *Witchcraft* or *Fascination*, but only *Infants* and *Youth*, and others who have their *Pores* more open; and therefore are liable to suffer from the incursions of the *Spirits* and *effluvia* proceeding from others: Especially if the *Imagination* of the *Witch* be heightened by *Love* or *Hatred*; because in this case they attack the party bewitched with greater force and violence. Wherefore care ought to be taken to keep little *Children* at a distance, and out of the sight of such persons.

XV. A *Spider* or *Scorpion* that hath bit or stung a person, being bruised, and applied to the part affected, draws out the poison. The Reason is, because the substance of a *Spider* or *Scorpion* is like a *Sponge*; which, whilst the parts that are sever'd by the contusion, shrink by means of the *Nerves*, do take up the adhering

venom, and draw away that which is got in. For this is effected much in the same manner, as *Oyl* is washed out of a *Cloath* by means of *Soap*; for as the *particles* of *Oyl* which are got into the *Cloath*, do easily embrace those of the *Soap*, as being of a like nature, and are carried away with them: So the *particles* of the *Poison* sticking to the wound, do easily join themselves with those that are found in the bruised *Animal* applied to it, and by this means the wound is freed of them.

KIRCHER tells us, that in *China* there be many *Serpents*, which are called by the *Portuguese Hat-bearers*, because they have a *Skin* that starts up on their *Heads*, not much unlike a *Hat*, in which little stones are found, which being reduced to *Powder*, and mixed with *Terra Sigillata*, and applied to a *poisonous wound*, stick fast to it and draw out all the *Poison*, and then fall off from the wound of themselves, which are afterward washed clean in *Milk*, in order to be used again as before. For indeed most *poisons* are better overcome by *Alexipharmacs*, than by *Vomits* or *Purges*.

It is commonly believed, that a *Man* who is seen of a *Wolf* before he sees him, grows dumb, and is unable to utter a word, or make the least noise.

Tho' this be an old Story, yet there appears no ground at all for it: Seeing that Experience teacheth, that whether a *Wolf* see a *Man* first, or whether a *Man* see the *Wolf*, the same commotion or disturbance follows. I myself have very often lookt upon *Wolves*, yet never perceived thereby any *Hoarseness*, or the least defect in my *Voice*; but on the contrary, have many times by my shouting, made them run away. But how does it come to pass then, that some persons at the sight of a *Wolf* do contract a *Hoarseness*, and become Dumb of a sudden? Why this proceeds only from *Fear*, when the great concern they either have for their own *lives*, or for the safety of their *Company*, puts them into a sudden consternation; for then endeavouring suddenly to cry out for help, they hurt their *Lungs* by the great force put upon them, and the *Wind Pipe* by fetching in of too much breath, becomes, as it were, choaked. To which may be added, that the *Muscles* of the *Tongue* being slackned, by the great defect of *Spirits*, cannot readily be made use of, for the forming of the *voice*. So that by the failing of all these Instruments, it cannot be otherwise but that a *Hoarseness* must be caused, and the *Tongue* disabled from uttering an articulate sound.

XVIII. Some *Plants* have an *Antipathy* against each other; as the *Oak* and the *Oliver Tree*, *Cabbage* and *Rue*, *Fern* and *Reed*, which cannot endure the neighbouring of each other, nor can touch one another without some prejudice.

The Reason of this hatred is, because these *Plants* are desirous of one and the same *Alimental Juice*; and therefore the stronger of them doth draw all that juice to it self, and by this means robs the weaker of its necessary food, which must needs hinder it from growing and thriving as otherwise it would. Or else we may say that *Plants* set near one another, may hinder each others growth, in that the emanations or effluvia which

XVI. Whence it is that some Stones perform the like effect.

XVII. Whether a Wolf causeth a Hoarseness in those whom he sees first.

XVIII. What is the Reason of the Antipathy which is found amongst Plants.

which proceed from their *Roots*, may be noxious to each other. For the *Olive Tree* communicates such a bitterness to the ground round about it, that it spoils the *Cabbage* and *Lettice* that grows near it. And *Fern* hinders the growth of *Reeds* by the steams proceeding from it, which obstructs their *Pores*, and disturbs the *Texture* of their *Fibres*.

XIX.
What the Reason is of the Sun-flower turning towards the Sun.

The *Heliotrope* or *Sun-flowers*, always turns it self towards the *Sun*, and doth so follow its motion, as to face it continually. *Theophrastus* makes mention of some of these *Heliotropick* Plants, growing about the River *Euphrates*, which at the going down of the *Sun*, do so drop their *Heads* and *Flowers* into the *River*, that they cannot be reached with the *Hand*; but as soon as the *Sun* riseth, lift them up again to their former height.

This, I suppose happens, because that *Plant* abounds with much and gross moisture, which being agitated by the *Beams* of the *Sun*, and thereby rarefied, cannot be contained within the same bounds, and therefore strives to make its way through the most open *Pores*, that is, those which are over against the *Sun*: and forasmuch as the *Neck* of this *Plant* is very pliable, the agitated moisture which breaks forth from it in the finest *Threads*, turns it self that way towards which the particles of the moisture tend. The extraordinary moisture of this *Flower* may be confirmed from that *Dew* which lies upon the midst of it, when the *Sun* is at the highest and hottest; which cannot be said to be the remainders of the morning *Dew*; forasmuch as that vanisheth a few hours after the *Sun* Rising; and therefore must be that *humour*, which upon the presence of the *Sun*, doth flow from its *Stalk*, and is carried up to the *Flower*.

XX.
The Explanation of a wonderful Sundial.

In like manner a reason also may be given of that admirable *Dial*, invented by *F. Linus* at *Liege*, whereby a little *Ball*, swimming upon the *water*, did shew the *hours*, and exactly imitate the motion of *Heaven*, after the Example of *KIRCHER*, who having put some *Seeds* of the *Sun-flower* into a piece of *Cork*, found that they turned the *Cork* towards the *Sun*, and that by fixing a hand to it, they exactly pointed out the *hours* placed round the inside of the *Vessel*. For seeing that the *Sun-flower* is turned towards the *Sun*, not only *Eastward*, but *Westward* also, it must needs point to the *hours* noted on the sides of the *Vessel*.

XXI.
Whether the Bones of Animals, and Shell-fish be fuller at full Moon, than in the wane of it.

The *Bones* of *Animals* are filled with *Marrow* at the full *Moon*; and *Crabs* at the same time do more abound with *flesh*; whereas in the wane of the *Moon* both are decreased. These Effects, tho' commonly asserted to be so, yet many most exact observers of the works of Nature testifie, they could never discern in either of these any such encrease or decrease, but that the *Bones* of *Animals*, as also *Shell-fish* at any time of the *Moon* are promiscuously found either full or empty, or more or less fleshy, according as it may happen from other accidental Causes.

XXII.
Why Crabs and Lobsters are more full of fish at one time than another.

So that if at any time it happen that *Crabs*, *Lobsters* or *Oysters* be found more full of *flesh* at one time than at another; the reason is, because they have then met with more plentiful *Aliment*: For we find that of *Fishes* that are taken at the same time, and in the same place, some are much fuller of *flesh* and fatter than others; and that those *Fish* which are taken out of the *Nets*, as soon as they

are caught, are fuller of *flesh*, than those which are left in the *Net* a good while before that they be taken out.

The *Skin* of a *Stag*, if it be put by *Tanners* at the bottom of their *Fat*, and the *Hides* of other *Beasts* laid upon it, as soon as *water* is poured into it, never rests till it have got above them all, at the top of the *Tanning Pit*.

GASSENDUS imputes the cause hereof to the wider cavity of the *Stags Hairs* (for the *Microscope* assures us, that the *Hairs* of *Animals* are all of them so many hollow *Pipes*) which being filled with *Air*, endeavour to get above the *water*, as a *Bladder* full of *Air* doth. He supposeth also, that this is a great help and furtherance to the swiftness of that *Animal*, because the said *Pipes* being dilated by the heat of the motion of the *Stag*, doth much contribute to their *Lightness*: as it is also very probable, that the *Quill* part of the *Feathers* of *Birds* are a great help to their being easily supported in the *Air*.

They who are bit by the *Tarantula*, are so delighted with some certain *Tunes*, as to be thereby stirred up to strong and continual *Dancing*.

The Reason whereof is, because the *poison* of the *Tarantula* doth alter the Temperament of the *Body*, and particularly so affect the *Organ* of *Hearing*, as to comport with those *Tunes*, wherewith that *Insect* is delighted. For as there are several sorts of these *Tarantulae*, whereof some are affected with these *Tunes*, some with others; so that as the *Piper* or *Fidler* plays these, or the other *Notes*, so these, or other of their *Insects* begin to frisk, and cease as soon as ever the *Tune* is done. Accordingly it seems, that the *venom* of these *Insects*, being diffused through the *Body* of *Man*, and mingled with the *Spirits*, and afterwards excited by such *notes*, is moved after the same manner, and also impresseth the same motions on the *Spirits*, which by means of the *Nerves* and *Muscles*, produce a *Dancing*, corresponding with such *notes*. And this is the Cause of the recovery of him that is bit, because by this quick motion, the *poison* is disscut and exhaled together with the *Sweat*, provoked on this occasion.

Some *Medicaments* do purge by their *smell* only; others by being handled, or applied to the *Navel*.

The Reason is, because the *odour* only of a *Medicament* doth as strongly affect the *Nerves*, as they are affected by it, when taken inwardly; that is, when the *Fibres* or *Strings* of the *Stomach* and *Guts* are twinged and vellicated after the same manner, as they are when the *Medicin* is swallowed down into the *Stomack*. For the parts of *Medicaments* are commonly very small and sharp, hard, swiftly agitated, and very penetrative; so as that by this means they do irritate and excite the *Membranous* and *Nervous* parts of the *Body*, and provoke them to *expulsion*. Whence we may conclude, that almost all the properties and virtues of *Medicaments*, which are commonly added to the *Catalogue* of occult *Qualities*, may be explained and resolved by *mechanical Principles* and *Affections*, whether they produce these effects, by a likeness, analogy and familiarity of Nature, or whether they exert this their efficacy by way of irritation.

Why Persons bit of the Tarantula, do skip and dance.

XXV.
How Medicaments do purge.

The Third Part OF THE HISTORY OF NATURE. OF THE WORLD, AND HEAVEN.

CHAP. I.

Of the Beginning of the World.

I.
The Opin-
ion of
Aristotle
and Epi-
curus, con-
cerning
the World's
Original.

THAT we be sufficiently assured by Revelation, concerning the World's Original; yet it will not be altogether useless, to see what Reason can say in the case; and whether by her conduct we may not be able to discover the Beginning thereof. ARISTOTLE maintains the World, to have existed from Eternity, in his VIIIth Book of the *Physicks*; and in his 1st of *Heaven*; where he endeavours to prove Motion to be from Eternity, and that no temporal Principle of Motion can be admitted. To which he adds also, that it is no way agreeable to the First Cause, to be Idle; and that therefore we must of necessity own, that there must have been something moveable from all Eternity. And as for EPICURUS, he makes Matter to be Eternal, but the World, Temporary; and proceeding from the fortuitous concurrence of Atoms; whereof LUCRETIVS treats in his 4th Book of the *Nature of things*.

II.
The Opin-
ion of
Plato.

The chiefest amongst the Ancients, that attributed a Beginning to the World, was the Divine PLATO, who tho' he acknowledgeth it to have been begot from Eternity, yet asserts it to have proceeded from GOD by a kind of Emanation, as the Sun beams from the Sun. And surely he very well deserv'd his Name, forasmuch as from the Contemplation of Created Things, he discovered the Maker of them; and from the nature of Effects, rais'd himself to a view of the Efficiency of the Supreme Cause. But let us hear him, discoursing the Point in his *TIMAEUS*: The Universe, saith he, is seen, felt, and hath a Body; all which things move the Senses, and those things which move the Senses, are known or discerned

by the Senses. Now it is apparent, that such things as these are of that nature as to be generable and generated; but whatsoever is generated, we assert must be generated by some Cause. It is a thing of difficulty indeed to find out the Maker and Father of this World; and after that you have discovered him, to declare him to the Common People.

Indeed there is nothing in the Universe, which doth not preach the Creatour of it; nor doth Nature represent any thing to the Eyes of Men, which doth not speak its Author, and excite us to adore and praise him. Who is there, that by the Disposition of the Parts of the World, is not forced to own its Original, and to confess that it is not Eternal? Shall we imagine that all these things, as EPICURUS will have it, were the effect of blind Chance, and that it stumbled upon all these curious and beautiful Effects we do admire? Were the Earth, the Heavens, the Stars their own Causes, and flated in that necessary and comely Order, without the Deliberation of a Contriver? What virtue or force is there in Atoms? What power in Matter, towards the production of a World, beautified with such an infinite variety of Wonders? Or, if these Atoms were the Framers of the Sun, Earth and Planets; why did not these blind and stupid Artificers, jumble themselves as well into Cities, Houses, Churches, and Piazza's for us? Since these are Instances of a more easie and obvious Artifice, and such as human Industry can furnish.

An Engin curiously and accurately wrought, bears the stamp of the Artificer upon it, and is an incontestable Demonstration of his Ability and Skill. But what Machin is there in the least degree comparable with this ravishing frame of the Universe? In which, nothing is dull or idle; nothing produced at a venture, or in vain. Consider the Vegetables, they have all of them their peculiar

virtues.

virtues. Take a view of the *Animals*, they have all their particular *Natures*, and several propensities. Mount up to *Heaven*, and there behold the *Stars*, so exquisitely ranged, performing their *motions* with so much steadiness and equability, and always keeping within the bounds of unchangeable Vicissitudes. No man can be so senseless, saith MERCURIUS TRISMEGISTUS, to affirm, that a *Portraiture* or *Statue*, can be made without a *Painter* or *Statuary*: And will you say, that this *Great Work* had no *Maker*? O *Blindness* beyond compare!

V.
The Parts
of the
World be-
ing Cor-
ruptible,
constitute
the whole
so.

The *Whole* is of the same nature as its *Parts*, as being the result of them, and deriving its distinction from their Diversity. Now nothing is more notorious, than that the *Parts* whereof the *World* is composed, are subject to *Rise* and *Fall*, to *Generation* and *Corruption*. The *Earth* is nothing else, but a great *Theater*, where these *Changes* are continually represented, and which, according to the different Vicissitudes of *Time*, is differently drest and mark'd. The *Fire* perisheth daily, and that which seems of such insuperable Force, vanisheth in a moment. *Water* is sucked out of dry *Bodies*, and by its motion wherewith it penetrates *Bodies*, becomes turned into *Flowers* and *Grass*. Nothing in the *World* is of any long continuance; and it is a clear Demonstration, that that had a *beginning* of its being, which is continually hastening to its end.

VI.
An Obje-
ction.

Some endeavour to avoid the dint of this *Argument*, by saying that *Generation* and *Corruption* are incident indeed to the *Parts* of the *World*; but that nothing hinders, but that the *Whole* may continue for all this for ever; forasmuch as the *Total Sum* continues still the same, and is only changed as to some *Externals*, much in the same manner as *Wax*, by admitting the various impressions of *Seals*, only changeth its *figure*, still retaining its *substance* unalter'd.

VII.
Answer.

We readily grant them, that no other *Change* happens to this *World*, but what is *Accidentary*; yet can it not be concluded from thence, that the *Whole* is capable of being dissolved. For if one or the other *Part* may perish, why not 20, or 100, or 1000, nay, all of them; since we find various *Destructions* hapning in divers *places*, and that many things are oft ruin'd in one *day*, which had continued untoucht for many *Ages*? And tho', it may be, these things may not be very frequent, and have the *Intervals* of many *Years* between them; yet cannot we thence infer, that they can't happen: Seeing that many things throng in upon the *World* at one time, which have been unknown and unheard of for many *Ages*. The Instance of the *Wax* is nothing to the purpose, whose *Change* is only outward: For the *World* is capable of those *Intestine motions*, which one day or other will be the overthrow of it. Do not we daily see *New things* start up, and *Old things* sinking and perishing? We have therefore good reason to conclude, that as we see that *Changes* happen to the *Parts* of the *World*, so the *whole* is obnoxious to the same alterations and perturbations. Hence LUCAN, in his *First Book*:

One Common Fun'ral-Pile the *World* shall burn,
Mix Bones with *Stars*, and all to ruin turn.

But forasmuch as our design here is, to set down an *History* of *Nature*, we will endeavour to derive the *Original* of the *World* from the *Monuments* of the *Ancients*. We have no *History* that gives us any account of things that passed before the *Theban* and *Trojan War*. But if the *World* be *Eternal*, and consequently without all *Beginning*, how could it be that the *Historians* and *Poets* of fore-going *Ages* should not have deliver'd to us the *Deeds* of the *Heroes* of their *Times*, which they achiev'd during such immense *Spaces* of *Time*, or the *Laws* enacted by *Legislators*? Wherefore since nothing of these is any where to be found, it affords us a tacit *Argument*, that the *World* was *Created*, and had its *beginning* not long before those *Times*.

Besides, who will say, that the *World* hath been from *Eternity*, when as, besides the *Testimony* of *Historians*, the *Improvement* and *Invention* of *Things* and *Arts*, shew it to be of no over long standing? For the account which the *Ancients* give us of *Men*, is, that they liv'd after a *Barbarous manner*, not much different from that of *Beasts*; and that they did not *Feed*, as we do now-a-days, but maintain'd their *Lives* in the open *Woods* and *Fields*, with *Acorns* and *Berries*, as MACROBIUS tells us; and that it was not till long after, that they began to *Till* the *Ground*. Besides, is not this a strong *Argument* for the proof of the *Non-Eternity* of the *World*, that the *Greek History* it self doth not make mention of any *Matter* of *Fact*, beyond the *Space* of 2000 *Years*, there being nothing memorable related in *History* before NINUS, who was the *Father* of SEMIRAMIS. Now if the *World* was from *Eternity*, why were not all things highly improved, during that vast Vicissitude of innumerable *Ages*? Or, how comes it to pass, that *New things* are yet *Invented*? All these things are strong *Arguments* against the *Eternity* of the *World*, and give us great Reason to suppose, that as the *World* had its *Beginning*; so all things in successive *Years* were *Invented*, *Cultivated*, and *Improved*.

Neither are we pinch'd by that *Objection* which is commonly made by the *Platonists*, that nothing hinders, but that the *World* might have been produc'd from *Eternity*; seeing it is not repugnant for some *Effects* to be coexistent with the *Principle* of their *Emanation*. For the *Question* here is not, Whether the *World* might not have been *Eternal*, and Coexistent with its *Creator*; but whether it be really so? Since it is evident, that GOD doth not act of *Necessity*, but freely and spontaneously, after the same manner as a *Workman* is the *Cause* of his *Work*. For tho' the *Idea* of the *World* be granted to be from *Eternity* in the *Mind* of GOD; yet doth it not follow from thence, that the *Work* made by it is *Eternal* also, except we should affirm, that the thing conceived is inseparable from the perception of it; and that a *House* is built, as soon as the *Architect* hath conceiv'd the *Draught* of it in his *Mind*.

Arts also prove the *Beginning* of the *World*; seeing that most of them can be traced up to their first *Inventors*, and that not through any vast *Interval* of *Time*. For we know who first *Invented* the *Plough*; who furnish'd *Men* with the use of *Iron*, for the *destruction* of their own kind:

VIII.
History
bears wit-
ness to the
Beginning
of the
World.

IX.
The same
proved
from the
Inventors
of things.

X.
The Eter-
nity of
GOD doth
not prove
the Eter-
nity of the
World.

XI.
Arts prove
the World,
not to be
of any long
standing.

Who

who first taught the *Art of Fencing*; who, that of *Dancing*. But if the *World* never had any *Beginning*, why were not *Things* and *Arts* improved many Ages ago to the same height, and beyond what they are now? How came it to pass, that the *Art of Printing* hath been so lately known in the *World*? What was the Reason that *Vines* were no sooner planted; and that *Olive-Trees*, for the succession of innumerable Ages, were banished from the *Fields*? What can be imagin'd the Reason, why the *Mariners Compass* was not found out till near our *Days*, which is of that use to us for the *Crossing* of the *Seas*, and towards the discovery of *New-found Lands* and *Men*? All these *Instances* plainly overthrow the *Worlds Eternity*, and prove it not to be of any very long standing. Which made LUCRETIUS say,

— the *World* is new,
Nor can it many Ages of its standing shew.

XII.
What time
of the
year the
World
was made.

It is a thing controverted amongst *Authors*, about what time of the year the *World* was made; some allowing this advantage to the *Spring*, and others to the *Autumn*. Tho' indeed I can see no Reason at all, why either of these *Seasons* should be preferred before the other, seeing that both continually reign in one part or other of the *World*. Moreover, it seems absurd to determine the *Beginning* of the *World* to one *Season* of the year, forasmuch as all the 4 are found in it. But if this *Question* be meant of that part of the *World* where *GOD* at first Created *Man*, and where *Men* first inhabited, it seems probable that the *World* was Created at the time when it was *Autumn* there; seeing that it is most agreeable to Reason, that all things were Created by *GOD*, and that nothing is made by him, but what is most absolute and perfect in all degrees.

CHAP. II.

Of the Creation of Things, and of the Ranging of the several parts of the World.

I.
The Creation
of
Heaven
and Earth,
as it is
described
by Moses.

MOSES, whose *History* is owned not only by *Modern Philosophers*, but by the *Ancients* also, in the 1st Chapter of *Genesis*, describes at large the Creation of the *World*, beginning with the production of *Heaven* and *Earth*, in which two, as the *Center* and *Circumference*, he comprehended the whole *Universe*: In the *Beginning*, saith he, *GOD* created the *Heaven* and the *Earth*: But the *Earth* which was cover'd with the *water*, and involved in *Darkness*, was empty and void. For the *Spirit*, or *Subtil Matter*, did lye upon the whole *Mass* of the *Earth*, to excite and stir up its sluggish consistence; yet because it was only moved in a huddle, and without any certain determinate motion, the *Earth* all this while continued void, that is, *Invisible*, until by the Commanding word of the *Almighty*, *Light* was made, which might distinguish the *Times*, and discover the distinct appearance of all things in their several places.

II.
How *GOD*
first

For we are to suppose, that *GOD* having Created this *Immense*, *Extended Substance*, which fills the *Length*, *Breadth* and *Depth* of the

World, he divided the same into infinite *Parts*, moved the some of one figure, and others of another; some greater, others less; and that this Variety is much greater than our *Spirits* can reach. We are also to conceive, that *GOD*, in dividing the *Parts* of the *World*, hath not left any void Spaces between them; but that all the difference or division he hath made between them, consists in the diversity of their motion, which he hath given to every one of them; ordering it so, that from the very first instant of their motion, some of them began to move one way, and other another: To which if we add this, that the *Parts* of the *Matter* are impenetrable, it will appear evidently, that *GOD* could not continue to move them, without causing an infinite Variety in their motion, until at last they all agreed to move about different *Centers*, and consequently to constitute divers *Vortices* or *Whirlpools*.

And forasmuch as all *Bodies* that move *Circularly*, do continually endeavour to withdraw from the *Center* of their motion; and that the strongest always withdraw themselves further than the weaker, it follows of necessity that the *Matter* of the *Second Element*, which is more strong than that of the *First*, as being more solid, must withdraw themselves further from the said *Center* of their motion; and that in this their withdrawing, they drive downwards to the *Center* those *Particles* of the *First Element*, that are more than are necessary to fill the Spaces, which the *Particles* of the 2d *Element* leave open between them. Whence it follows, that about the *Axis* of each *Vortex*, there must of necessity be a *Body* which is only composed of the *Matter* of the *First Element*, which every way pusheth the *Second Element*, that surrounds it, and pusheth it with Force enough, to have the motion transmitted, almost in an instant, at certain Distances. And it is in this pression of this *Subtil Matter*, which is at the *Center* of each *Vortex*, and which endeavours to withdraw from it, that that *Light* doth consist which appeared the first Day of the Creation.

But forasmuch as at the *Beginning*, there was not any great store of the *Subtil Matter* in the *Centers* of the *Vortexes*, the *Action* wherewith the *Globuli* were pressed, could not reach far; and therefore those Spaces to which the Effect of that *Action* could not reach, continued obscure, and cover'd with *Darkness*.

And accordingly, by this mixture of *Light* and *Darkness*, the *World* became distinguish'd into several *Provinces*, and by the penetration of the *Subtil Matter* through all *Bodies*, the thinner and more subtil *Parts* were distinguish'd from the more thick and gross, and the *light* from the heavy. And this was the Work of the *First day*, and an Argument of the *Omnipotence* of the *First Being*. For nothing was produc'd anew the following days, but the things already made were ranged and order'd, and a proper place assigned to every *Body*.

And forasmuch as *GOD* could not move the *parts* of *Matter* with different or opposite determinations, without making them to hit directly or indirectly against one another, those which run against one another indirectly, must of necessity be reflected different ways, by *Angles* of *Reflexion* equal to those of their incidence: But they could

The First
Days work.

V.
How the
Vortexes
were form-
ed.

could not so reflect themselves, without meeting with other Parts, which turned them aside in like manner: So that meeting with a 2^d repulse, and afterward with a 3^d, 4th, and so on, they were at last forced to move about different Centers, somewhat in the same manner as the water of a River, is forced to move so, when it meets with new stops in its way; and thus made up several Vortexes, differently situated with respect to each other.

VI. On the 2^d Day, after that a Firmament was interpos'd betwixt the Waters, some of them had a place allotted above it, others under it, to water the surface of the Earth, and for the generating and feeding of Fish. For if we enquire into the Etymology of Firmament, we shall find it to signify no more than a great and diffused Extension, which we suppose to be nothing else, but the Disposition of the Vortexes, by means whereof they became so ranged, as that the Ecliptick of one Vortex, did answer to the Poles of its Neighbouring Vortexes, by which means they were so far from hindring the motion of each other, that they rather promoted the same. Whilst therefore the Heavenly Matter did continually run through these vast Bodies, the waters became divided from the waters; and those which covered the Earth, by the portion of the Firmament, were separated at a vast distance from those other waters which did lye upon solid and thick Bodies. And consequently, the waters that were under the Firmament, were divided from the waters that were above the Firmament. For it is evident, that Moses calls the Heavenly Bodies, Upper or Superior; and the Earth, Inferiour or Beneath, with respect to us.

VII. On the 3^d Day, the waters were gathered into one place, and the dry Land appeared; because when the Earth was wholly cover'd with water, so as that no part of it did appear, it seemed good to the Author of Nature, to gather the waters into some certain places, to the end that the Surface of the Earth being freed from them, might bring forth Grass, Herbs and Trees, from those several Juices, which running through the Bowels of the Earth, were joyned to divers Seeds, whose pores suited best with the figures of them. Whereupon the Earth was called the Dry Land; and the gathering together of the waters was called, Sea. But forasmuch as the Roundness of the Earth did hinder the water from running into one place, and that there was no Cavity sufficient to receive that immense Heap of waters, we are to believe that the Mountains were created on the same Day, and other Rising parts of the Earth, which leaving deep Vallies between them, made way for the Reception of the waters.

VIII. The Matter of the World being thus orderly ranged, the next work was to adorn the same: For on the 4th Day, 2 Great Lights were placed in the Firmament of Heaven, that they might be for times, days and years; that is, that by them the Diurnal and Annual Circumvolution of the Earth, and the other Planets, as likewise the Circumvolutions of the Sun, might be known and determined. At the same time there were also created many Stars, having a Light of their own, which they dart abroad every way.

For seeing that the Matter of the First Element did continually increase, by means of the motion of the particles of the Second, and that there was a greater quantity of it in the Universe than was necessary, to fill those Spaces that are left betwixt the Globuli; all the remainder of it, after that those Spaces were filled, run to the Centers of the Vortexes, where it composed some most fluid Spherical Bodies, viz. the Sun and the fixed Stars. For after that the particles of the 2^d Element were still more worn away, they took up less place than they did before, and consequently did not diffuse themselves quite to the Centers; but equally drawing from them, left their Spherical Spaces, which were filled with the Matter of the First Element, flowing thither from all parts. And therefore the collection of the Subtil Matter, in the Center of our Vortex, in which the Earth is, with respect to it, was the Greater Light, or the Sun; and the Collections in the Centers of the other Vortexes, Stars. And that Matter, which of those great Masses which approached near to the Earth, was found most fit to drive the Light of the Sun towards it, became the lesser Light, that is, the Moon.

On the 5th Day, GOD commanded the waters to bring forth Living Creatures, and the Fowl that fly above the Earth, in the Firmament of Heaven: And the Creeping things also, which without Feet crawl upon the Earth. And tho' the Scripture seems to attribute to Fishes and other Beasts, a Soul, produc'd out of the Water and Earth; yet nothing else is to be understood there by the word Soul, but only some Bodies in such a manner fitted and adapted to the Organs of Fishes, and other Animals, that they cause them to live, to feed and grow.

Lastly, After that the House was now perfected, and the Palace fully furnish'd and adorn'd for the reception of its great Guest, the Little World enter'd the Greater, being endued with Life, Sense and Reason; that he might be the Lord and Commander of the Universe, to whom the Fishes of the Sea, the Birds of the Air, and all the other Living Creatures of the Earth, might pay their Homage and Obedience. These things thus order'd, GOD made an end of the Works he had made.

This Creation of the World hath, by D A N Æ U S, been comprehended in short Verses, in his Christian Natural Philosophy; which in English speak thus:

The First Day made the Heavens, the Earth, and Light:

The Second, brought the Firmament in sight:

The Third, gave the Sea Bounds, and Grass to th' Earth:

The Fourth, to Sun and Moon, and Stars gave Birth:

The Fifth, made Fish o'th' Sea, and Birds o'th' Air:

The Sixth, gave Beasts, and Man, GOD's chiefest Care:

The Seventh, and last, appointed was for Rest.

XI.
Why the
World was
Created in
the time of
Six Days.

We need not here insist upon the Opinion of some of the *Jews*, who do not think it probable that the *World* was Created in 6 Days; and therefore do suppose, that this determination of Days, is to be taken Allegorically: To which some of the Ancient *Fathers* have been inclin'd; forasmuch as GOD, in Creating of the *World*, did not proceed in such a manner, as absolutely he might have done, but in such a manner as may be best understood and apprehended by us *Mortals*. For he ordered the Creation thus, that we weak *Men* might know, that he works nothing without the greatest exactness and order; because we are not able to conceive, how any Order could be observed in a simultaneous Creation.

CHAP. III.

Of the End or Destruction of the World.

I.
Whatsoever
hath had a
beginning,
must of
necessity
have an
End also.

From what hath been said, it is evident that the *World* was Created, and that those things that had a Beginning, are subject to Corruption and Dissolution. For why may not we attribute a Principle of Destruction to that, which we own to have had one of Production; and suppose that that which once began to be, will meet with a time wherein it must cease to be? For is not the *Matter*, whereof the whole *Universe* doth consist, the Original and Cause of Dissolution? And do not all things that we see, decay daily, and hasten to their End? For he seems to be but little acquainted with *Natural Philosophy*, who supposeth that to be *Eternal* which hath had a Beginning, as *VELLEJUS* saith, according to the Opinion of *PLATO*, as *CICERO* sets it down in his 1st Book de *Natura Deorum*. For where can we find a thing put together, that is not subject to be taken in pieces again? Or, where is that thing which hath Beginning, and shall not have an End? And accordingly *LUCRETIVS* tells us, in his First Book.

As Beasts depriv'd of Food, so things must die,
As soon as Matter fails of just supply.

II.
The Opinion of the
Ancients,
concerning
the Duration of the
World.

But you will say, that there have not been wanting some *Philosophers* who have attributed *Eternity* to the *World*, and have conceived this Great *Fabrick* so admirably contriv'd and built, as not to be capable of Dissolution. Which Opinion hath been maintain'd by *ZENO-PHONES*, *MELISSUS*, *ARISTOTLE*, and others, who accused those of Impiety, who maintain'd, that the *World* would perish. Neither were *PLATO* and *PYTHAGORAS* Enemies to this Opinion: For tho' they believed that the *World* would have an End; yet withal they supposed, that GOD only was to be the Dissolver of it; as thinking it unbecoming him, to make a *Work* that should be dissolvable by any other Hand than his own. That it is the property of *Parents*, to desire the preservation of their Offspring, and by no means to desire their Destruction.

But these are the Judgments of Blind-men, who without having a due regard to the Constitution of the *World*, thought the parts thereof to be joyned together by such strong Ties, which no Ages could be able to dissolve. But to oppose Authority to Authority, were not the *Epicureans* and *Stoicks* of another Opinion? The latter of whom supposed nothing to be *Immortal*, but *Jupiter* alone, and asserted that the *Earth*, *Sea*, *Air* and *Heaven*, were all to have an End, and to be changed into other Bodies; as the *Tragical Poet* seems to foretel, in *Hercules*. Oct.

The splendid Roof of Heaven shall fall,
A certain Ruin doth it attend;
Yea, Glorious gods themselves, and all,
In Chaos and Dark-Night shall end.

But what need have we of the Testimonies of the Ancient *Philosophers*, to assert the Corruption of the *World*; seeing that the present decays of the *World* do manifestly prove its declining, if not decrepit Age? Who doth not perceive, that all things are in a state of Decadence, and hastning on to their last end? Do not we see, that the *Seasons* of the year decline, and want much of their former force and vigour? Doth not the *Heat* of *Summer* grow less every year than other? And is not the *Winter Season* changed from what it used to be? How late, cold, and wet are our *Spring*s? And how few seasonable and fruitful *Autumns* do we enjoy? So that all things apparently fall short of their *Primaval virtue*. If we descend into the Bowels of the *Earth*, what a small quantity of *Gold* and *Silver* do we meet with there? How few *Veins* of *Metals* are now-a-days discover'd, if we compare them with those multitudes that were found of Old, and in the Times of our Forefathers?

This Failure and Decrease is also observable in other things; for who doth not find, that there are not so many *Men* in the *World* as formerly, and that the *Fields* begin to want *Husbandmen*, the *Camps*, *Souldiers*; and the *Sea*, *Seamen*? And shall not we from this General defection conclude, that Old Age hath overtaken the *World*, and that all *Creatures* are hastning to their Exit? This therefore is the unalterable Law and Decree of GOD, that all things which have had a Beginning, must decrease, grow old, and die at last.

But what needs so many words to prove, that the *World* is grown Old, since we see that *men's Lives* grow shorter every day, being now contained within a narrow compass, as *LUCRETIVS* expresseth it in his First Book:

Man's Age declin'd in Ancient Homer's days;
But now his Strength and Stature both decays.

Formerly *Men* lived 800 or 900 Years, and upward; whereas now it is look'd upon as a Prodigy, to reach 100 only; and if any by great chance reach so far, then are they encumbered and tormented with so many Ails of *Mind* and *Body*, that they long for nothing more than *Death*. And shall we, after all this, suppose that the *Eternity* of this *World* can be consistent with the

III.

and Declination of
things,
portends
the approaching
End of the
World.

V.
The shortness of the
Life of
Man is
an Argument that
the World
grows Old.

the continual crumbling away thereof; the defec-
tion of the *Seasons* of the year, and the short-
ning of *mens* lives? Or that that can be perpetual,
which is always changing and fleeting?

VI. *The Elements conspire to the destruction of the World.*
Another Argument to prove the Dissolution of
the *World*, may be fetched from those particular
changes which antedate the total destruction of the
World, and divers ways conspire to the Ruin there-
of. What vast desolations hath not the *Fire* caused
in the *World*? How many *Countries* hath not the
Sun, whom they call the *Parent of Life*, and the
Soul of the World, laid waste and barren? How
often hath *Water* been destructive to the *World*?
How many *Deluges* have spoiled it, and reduced
it to little better than its primaval *Chaos*? And
for us that are yet alive, tho' we may hope to live
still longer; yet Reason, if we will not stop our
Ears against her, doth assure us that *Death* follows
us at the *Heels*, and will ere long trip us into
our *Graves*. And tho' we never saw the Total
Ruin of the *World*, nor do not perceive any cer-
tain passages of its end, yet we have reason to
conjecture it not to be far off, since we find it
sick of the same *Diseases*, Old Age and other In-
firmities, which have led so many of her Off-spring
to death.

CHAP. IV.

Of the Generation, and Corruption of
Things.

I. *How Fire becomes generated out of Wood.*
Nothing is more common with us, than the
Generation of *Fire* out of *Wood*, by which
means a *Fluid* and *Subtil Body* is produced from
one that is *Thick* and *Hard*.

This Generation of *Fire* out of *Wood*, is not
by the Production of any *New form*, as the *Peri-
pateticks* hold, but from the alone disposition of
the *parts*; their situation and other modifications
which constitute the form of every *Body*. For no-
thing of the *substance* of the *Wood* is lost, when
it burns; and is changed into *Flame* and *Coals*,
only the connexion of the *parts* becomes changed,
and another mode of *Existence* is acquired: When
therefore, at any time, *Wood* is changed by *Fire*
into *Fire*, no new Being ariseth, that was not be-
fore; but the old Being or *Body* is so changed in
its *modes*, as that it seems to be a quite different
thing. For there is no other change made in *Ge-
neration*, save only that which is *Local*, whereby
things are so altered, as to appear as other things
to our *Senses*.

II. *The generation of a Chicken.*
This change of the Disposition of *Parts* is the
cause of the Generation of a *Chicken*; for we need
not make any difficulty to acknowledge, that the
first *Rudiment* of the *Chicken*, grows in the *Egg*
after the same manner, as the *Chickens* do that are
already hatched, viz. that all the *Fibres*, whe-
ther straight or crooked, whereof their *Organs* do
consist, become dilated by the addition of some
parts of matter, which joining themselves succes-
sively one to another, make the *Pullet* to grow by
little and little, and cause the parts of it to ap-
pear one after another.

III. *Whether Salt be generated out*
Salt is generated out of *Burnt Wood*, as *Chy-
mists* well know, who in their distillations do se-
parate *Mercury*, *Sulphur* and *Salt* from *Bodies*;

the parts of which last *Body*, mingle with the
water, and become incorporated with it.

It is improperly that the word of *Generation* is
attributed to these kind of Extractions; forasmuch
as in them, there happens no adaption of parts, as
to *Figure*, *Quantity* and *Motion*; which is neces-
sary to the true Nature of *Generation*, but only a
separation of *Parts*. For the *Particles* of *Salt* be-
ing very small and slender, are easily overwhelm-
ed by the parts of the *wood*, which do never prick
the *Tongue*, nor become savoury, except they be
separated from the grosser parts thereof by *Fire*.
It is manifest, that an ounce of *Silver* may be so
thoroughly mingled with a great mass of *Gold*, that
there shall be never a part of the *Gold*, which
hath not some *Silver* joined with it: Neither will
any sound *Philosopher* affirm, that *Silver* is gene-
rated, when it is separated from *Gold*, by the
means of *Aqua-fortis*; but only that those *parti-
cles* which before were mixed with the *Gold*, are
now separated from it, and set at liberty. *Salt*
therefore, whilst it continues mingled with the
Wood, retains its own Nature, tho' it cannot be
perceived by the *Senses*, nor exert its force; and
that because it is covered over with innumerable
particles of *Wood*, and because the points of it are
blunted and broken by its being involved in other
Bodies.

Metals are sometimes dissolved by a *vapor* on-
ly, as is common amongst the *Chymists* to dissolve
Gold and other hard *Bodies* by External *Heat*, as
in *Hot Water*, by the *Balneum Mariæ*; or by a
Balneum Roris, that is, the steam only of *Hot*
Water.

This is performed, when the steam passing
through the *Pores* of the *Vessel*, and entering the
Pores of the *Gold*, doth dissolve the weaving of its
parts. For tho' that *Heat* be slow, yet because
it is of long continuance, it hath the same effect
as a drop of *water*, which by its perpetual fall-
ing, hollows a *Stone*, and penetrates to the inmost
parts of it. Hence it is that *Chymists* having ex-
perienced the virtue of this continual heat, do by
means thereof promise us wonderful *Fermentations*,
and hope to obtain their *Elixir*, which changeth
inferiour *Metals* into *Gold* or *Silver*.

Liquid Bodies often corrupt hard *Bodies*, so
water doth corrupt *Sugar* and *Salt*; for a pound
of *Sugar*, being cast into a large *Vessel* of *water*,
doth disappear in a short time.

Forasmuch as the insensible parts of *Liquors* are
in continual agitation; it must not seem strange to
us, that the parts of the *water*, do so shake the
parts of hard *Bodies*, about which they move con-
tinually, so as to make them leave their places.
Thus we see that the *Parts* of *Sugar* and *Salt*,
do vanish in a short time; and are so scattered
and dispersed through all the parts of *water*,
that there is not one which hath not its share
of it.

Some *Bodies* are altogether exempt from Cor-
ruption, as *Glass*, which cannot be destroyed by
the utmost violence of the *Fire*.

The Reason is, because every corruption of *Bodies*
proceeds from strange particles, intruding them-
selves into their *Pores*; and by this means alter-
ing and destroying, the *Texture*, *Connexion* and
Order of their *Parts*. And therefore those *Bodies*
that have more subtil and strait pores, are for the
most

of Wood,
or any other
matter.

IV. *How Metals are dissolved by Vapor only.*

V. *How Liquid Bodies corrupt those that are Hard.*

VI. *Why Glass is not subject to Corruption.*

most part more durable, and less subject to corruption. And it is for this Reason that *Glass* is incorruptible; for tho' whilst it is red-hot in the *Fire*, many particles do insinuate themselves into the Pores of it, and do dilate them; yet do they not enter into all the Pores thereof; so as that the least particles of *Air*, or *Water*, which do more closely cleave to those of the *Earth*, can wholly be separated from them, and consequently Exhale.

VII.
Gold and
Quicksilver
are the most
Incorrupti-
ble of all
other Me-
tals.

And it is for the same Reason, that *Gold* and *Quicksilver* are the most incorruptible of all Metals, because they have the most narrow pores of any other; as may be demonstrated by their Pondrosity. Wherefore also their parts cannot without great difficulty be separated from each other, by the Art of Chymistry, so as that the Form of *Gold* and *Quicksilver* be utterly destroyed, or that the *Gold* be reduced into its first Nature. The same also may be said of *Talk*, for the reduction of which into a watry Substance or Oil, many Chymists have laboured in vain.

VIII.
A Rotten
Apple cor-
rupts many
that are
Sound.

As a Rotten Apple, if it be put to a sound one, doth corrupt it; so that frequently it happens, that many sound ones are spoiled by one rotten one. Which effect proceeds from the Steam which flows from the rotten Apple; which penetrating into the sound one, and agitated by the subtil matter that is in it, doth dispose the parts thereof in the same manner as they are disposed in the Rotten Apple. In like manner one Apple laid upon another, promotes Ripeness of each other: And therefore those that intend to make Cyder of their Apples, lay them up in heaps together, to make them ripen the sooner.

IX.
How Worms
are genera-
ted in Vi-
negar.

Worms commonly breed in Vinegar, when it begins to be weakened and putrified; which are very small and long, and like little Serpents swim upon it. Forasmuch as in every Corruption, the Connexion of the Parts is dissolved, by reason of the evaporating of the Sulphureous Parts, together with the dissolved Saline Particles, it happens that some of them breaking forth from the compound, do unite together in some near part, and there constitute these little Animals. After the same manner as Mites are bred in Cheese, and like Insects in the Grain and Fruits of the Earth; since it cannot well be questioned, but that soft Bodies are subject to perpetual intestine agitations, by which they are driven into Confusion.

X.
Animals
are produ-
ced by other
Animals.

In the mean time it seems most certain, that all Animals are the Products of certain Seeds; so as not so much as a Worm can be produced from the Tumultuary concurrence of Atoms, but from a Seed, in which is lodged a formative Virtue: And therefore we must conclude, that the very least Animals are the effect of others; tho', it may be, it is not necessary that the Eggs whence they proceed, be produced from other Animals of the same kind. Which seems probable as to those Worms which breed in Galls and other Fruits.

XI.
Spices pre-
serve Bo-
dies from
Putrefaction.

There is a Virtue found in Spices, whereby they preserve Bodies from Putrefaction: Hence proceeds the custom of Embalming Dead Bodies with Spices. The Reason is, because Spices consist of those parts, which can easily be agitated by the subtil matter; so that by exciting a new fermentation in

Bodies, they put the matter, which before was at rest, into motion also, and put a stop to many of their out-flowing particles. Thus Flowers and Fruits are preserved by means of Sugar; forasmuch as by its clamminess, it retains their thin and volatile particles from flying away; and besides affords them a pleasant Taste.

The Grains of Wheat, being ground in a Mill or otherwise, is turned into Flour, which being mingled with water is kneaded into Dough, and afterwards being baked in the Oven, becomes Bread; which after it hath been chewed in the Mouth, and let down into the Stomach, is there by means of an Acid penetrating moisture turned into Chyle, and afterwards into Blood.

The Cause of which several Mutations is only to be attributed to Motion, by means whereof almost all alterations, that happen to Bodies are effected, and all that diversity is produced, which we see in Heaven and Earth. For we are not to imagine, that any new thing is acquired in the Generation of Things, nor any thing lost in their Corruption, that was before in them, besides only a new Connexion of Parts, and a different Mode of Existence. So that when the Grains of Corn are changed into Flower, afterwards into Bread, and lastly into Chyle and Blood; there is nothing in all this progress of changes, but local motion; tho' the Species it self may seem to be changed, as Ovid appositly describes the same in the XV. Book of his Metamorph.

All alter, nothing finally decays;
Hither and thither still the Spirit strays;
There's nothing permanent, all ebb and flow;
Each Image forms, and doth wander to and fro;
What was before, is not; what was not, is;
All in a moment change from that to this.

But where there is no such change, either of the insensible or sensible parts, there no alteration can be brought about; as appears in Gold, Quicksilver, Talk, and other Subjects, whose parts are so closely joined, as that they cannot by any force be separated; or so altered, but that they may return to their former appearance again.

Nothing is more common with Philosophers, than that Water is changed into Vapours, and Vapours again condensed into Water.

I know that the Peripateticks do not hold this change to be mutual; since they suppose in every Generation a new substantial form is acquired, and that the old one perisheth; and therefore ARISTOTLE expresseth himself thus, in his 2d Book of Generation, the last Chapter: When Air is turned into Water, and Water into Air, that Air will be the same Kind, but not the same in Number. But this doth not seem probable at all, seeing that in these changes there may be restitution of the very same parts. For as an Engine or Machin, that consists of 100 or 200 parts, when it is taken to pieces, can by a Skillful Artist be put together again such as it was before: So in like manner may water return again to its former subsistence and appearance, by the coming together again of the particles, which had been dissolved into vapour. Who will say that a drop of water, which riseth up in a vapour to the head of the Alembick, and there is turned into water again,

again, is not numerically the same; seeing that all its parts may be again united, and take up the same *Figure* and *place* they had before. All the difference therefore that there is betwixt *water* and *vapour*, depends only on the *motion* and *figure* of its parts, because the parts of *vapour* are more agitated, and are at a greater distance from each other, than the parts of *water*, whose motion is less, and which takes up a lesser space.

XIV. Thus we see that *Wood*, by a multifarious transposition of its parts is changed into *Flame* and *Soot*, and lastly into *Ashes*. Thus *Vegetables*, when they are putrified, turn into *dust*, or a slimy substance. Neither can we imagine any other way whereby *Mites* are bred in *Cheeses*, but that *Flies* or other *Insects* do lay their *Eggs* in them, which afterwards become dilated, and undergo various changes as to their *figure*, *situation*, &c.

CHAP. V.

Of the Heaven, or most subtil Æther.

I. **W**HY the Heaven is a most loose or rarefied Body, and consists of many most subtil parts, may be demonstrated from the *Light* of the *Sun* and the *fixt Stars*, which through the same is transmitted with unconceivable swiftness to an incredible distance. To which may be added the perpetual action of these *Stars*, and the excitation of *Heat* in these inferiour parts, by means whereof, tho' these particles had not been most subtil before, yet must they have necessarily become such, especially those which are higher, and nearer to the *Lucid Bodies*, as being more particularly the subjects of their Activity.

II. For by the word *Heaven*, we are to understand nothing else but that immense Extension of the matter of the First and Second Element, which reacheth from the *Star* that is placed in the center of a *Vortex*, to the circumference of it. Thus the *Vortex* wherein we are, contains all that space in which the 7 *Planets* are whirl'd round; the middle part whereof is most swiftly snatched about, and all the other parts still slower, as they are at a farther distance from the Center.

III. It is evident that the *Heavenly Bodies* are no less changeable, than those that are upon the *Earth*, and that they alter their *Figures* and *Colours*; as appears from those *Phases* or *Changes* that are observed in the *Planet Venus*, which differ but little from those of the *Moon*, and are much alike represented to the *Eye*.

The Cause of these *Changes* is the motion of that *Planet*, which swimming in the fluid *Heaven*, makes its circumvolution about the *Sun*, and produceth new changes, according as it is carried above, below or sideways of the *Sun*. For seeing that the *Planets* shine with a borrowed *Light* they receive from the *Sun*; they likewise represent several Faces to us, suitable to their position, with respect to the *Sun*, as whether in *Conjunction* with it, *Opposition* to it, or any other Aspect.

IV. It is notorious, that *Venus* doth at some times appear 40 times bigger than at other times; and that when she is biggest, she appears *Crescent-wise*, and round when she is least. Which proves that *Venus*, when she appears round, is in her highest

station; and in her lowest, when she is seen like a *Crescent*. Which appearances do sufficiently evince, that *Venus*, as well as *Mercury* do not run round the *Earth*, but are whirl'd about the *Sun*; and consequently that our *Earth* is placed between *Venus* and *Mars*.

The *Comets* run through several *Regions* of *Heaven*, and are moved so swiftly, that within a few days they quite vanish from our *Eyes*. For they are found to pass through vast spaces beyond the *Sun*, and to run from one *Heaven* into another.

This Motion of the *Comets* is a strong and convincing proof of the fluidity of the *Heavens*, which we have demonstrated in our *Institution of Philosophy*, without which there could be no passage of *Bodies* through them. For how could the *Stars* or *Comets* move from one place to another, if they were surrounded with a *Solid Body*? The *Comets* therefore are swiftly moved through the *Heavenly Spaces*, because the *Heaven* is like our *Air*, tho' much more pure, which with the greatest ease yields to *Solid Bodies*, and makes way for them. But of the *Comets* more hereafter.

VI. The *Bodies* that are moved in the *Heaven*, do pass every way without stop, and move with such a force, that they run through all spaces with an equal swiftness; the contrary to which we find in our *Air*; where the *Birds* cannot fly without wearying themselves, because of the opposition it makes to their motion.

GASSENDUS, to avoid this difficulty, supposed empty spaces in the *Heavens*, to which he attributes the swift motion of the *Stars*, as supposing them void of all *Matter*, excepting only the *Beams* of the *Sun* and *Stars* which pass through them. He also supposeth that the *Stars*, how bulky soever they may be, have no ponderosity, and consequently that they do not stand in need of any *Medium* to support them; as *Birds* stand in need of the *Air*, and *Fishes* of the *Water* to bear them up. But forasmuch as we have already confuted this Opinion of *Gassendus*, and proved that there can be no *Vacuity* in the *World*; I shall only add one word, that in case a *Vacuum* be once admitted, there can no longer be any distance between those *Bodies* that are most remote from one another: Which is the same, as if one should say, that there is extended space in the *World* without extension; and that there is that which is high and deep, without *Height* and *Depth*. The Reason therefore why some *Stars* do freely wander through the *Heavens*, and meet with no stop in their Course in the *Heavens*, is not because the *Fluid Body*, through which they are carried, doth not hinder their motion; since it is a contradiction, that there should be any such *Body* in Nature; but because the parts of this *Liquid Substance*, which are variously moved, without tending one way more than another, are determined by the subtil matter; and complying with the motion thereof, are carried towards a certain Region of the *Heavens*. Not much unlike that which we observe in the other Scale of a *Ballance*; which with the least impulse from without, is either raised or depressed.

CHAP. VI.

Of the Sun.

VII. For as the *Particles* of the *Heavenly Matter* are most *subtil*, so are they most apt to admit motion, or any determination of it. Partly because most of them are of a *Spherical Figure*; and partly because the *Motion*, and the *Resistance*, which *Bodies* meet with in their *motion*, are proportionable to their *Bulk*: And therefore a weaker cause, and which is not endued with the greatest force, may easily suffice, either to push forwards these most *subtil particles*, or to determine their motion.

VIII. The *Heaven*, when it is free from *Clouds*, appears of a *Blue Colour*; which *Colour* also is seen at the *rising of the Sun*, if before *Day-break* it was full spangled with *Stars*: For then, as well in the *place* where they *shine*, as where they become extinct by the *Light* of the *Sun*, every way this *Blue Colour* doth appear.

This *Adventitious Colour*, is not so much to be attributed to the *Heavenly Body* it self, as to the *Vapours* and *Exhalations* which hang over us. For it is certain, that the *Heaven* sends forth no *Light*, and that indeed it would appear very dark to us, if there were not other intervening *Bodies*, which did reflect some *Beams* to us, or which sent back to our *Eyes* those *Globuli* of the 2^d *Element*, which the *Sun* or *Stars* have dash't against them. For since these *Vapours* are very loose, and are very much dilated, the *Heavenly Globuli* do not meet with *particles* enough, so as to be with equal swiftness moved round their own *Centers*, as in a *straight Line*; and this is the Reason why the *Heaven* appears of a *Blue Colour*, as before hath been said. And it is for the same reason also, that the *water of the Sea*, where it is most clear and deep, shews of a *Blueish*, or *Sea-green Colour*.

IX. But that the *Heaven* is not indeed ting'd with a *Blue Colour*, is evident from hence, because if it were so, all the *Stars* which we see through it, would appear to us of the same colour, as those things which are beheld through a colour'd *Glass*, seem to us of the same *Colour* as the *Glass* is.

X. Many *Stars* do appear in the *Heavens*, which were never seen there before; according to what *Astronomers* tell us of the *Star Meropus* or *Electra*; which having appeared in the *Heaven* a long time before the *Trojan War*, did afterwards vanish by degrees. *TYCHO BRAHE* also hath observed another, which shone for many years together in the *Heaven*, and afterwards disappeared.

The Cause of these and other *New Stars*, is by *Astronomers* attributed to the *Corruptibility* of the *Heavens*. For whatsoever is generated in another, doth borrow the matter whereof it consists from the same, and takes its Rise from the *Dissolution* thereof. There being no greater *Argument* of the *Corruptibility* of any thing, than that many things are generated and corrupted in it. But now more particularly, these *New Stars* do arise, or appear, when at any time the most *subtil matter*, collected in the *Center* of its *Vortex*, having dispersed its *Spots*, doth press the *Globuli* of the 2^d *Element*, as before: Or when the matter of the first *Element*, flowing in great abundance from a neighbouring *vortex* to the obscured *Star*, doth diffuse it self over the *Spots* that cover'd it, whereupon it shines forth again.

THE *Sun* is observed daily to describe a *Circle Parallel* to the *Aequator*, from *East* to *West*.

In order to the explication of which appearance, we are to suppose some things set down in our *Institution of Philosophy*.

1st. That the *Heavenly Matter* which surrounds the *Sun*, doth whirl continually round about its *Center*.

2^{dly}. That the *Vortex* of the *Sun* carries the *Elementary Matter* along with it.

3^{dly}. That the *Circle* which the *Elementary Matter* doth describe, is *Excentrick*.

4^{thly}. That the *Axis* of the said *Circle* is always *Parallel* to it self.

5^{thly}. That the said *Axis* inclines on the *Plane* of the *Excentrick Circle*, which the *Earth* describes.

6^{thly}. That the *Elementary Mass* doth turn round about its *Center*, at the same time that it whirls about the *Sun*. These things thus supposed,

It is manifest that the *Sun*, and whatever else appears in the *Heaven*, must appear to us, as daily describing a *Circle Parallel* to the *Aequator*. For seeing that the *Earth* is turned about the *Sun*, the *Sun* also must appear to take the same course, and to describe a *Circle*; which would be the same with the *Aequator*, in case the *Axis* of the *Earth* were *Parallel* to the *Plane* of the *Excentrick Circle*, which it describes about the *Sun*, but which necessarily differs from it, and which it intersects, by withdrawing from it 23 degrees and an half; because the *Axis* of the *Earth* is just so much inclined upon the *Plane* of its *Excentrick Center*. The *Earth* therefore rolling about its own *Center*, from *West* to *East*, within the space of 24 hours, the *Sun*, and whatsoever else we suppose to be immoveable in the *World*, must needs appear as if it were carried by a contrary motion from *East* to *West*.

The *Sun* appears greater to us, when in the *Southern* part of *Heaven*, than in the *Northern*.

Because then the *Earth* is in its *Perigeum*, or in that part of its *Excentrick Center* which is nearest to the *Earth*: And besides, the *Sun* must of necessity appear more days under the *Southern Signs*, than under the *Northern*; because the *Aequator* cuts the *Excentrick* of the *Earth* into 2 unequal parts; and that the *Earth* describes the greater half from the *Day* wherein the *Sun* doth appear to us under the *beginning* of the *Ram*, till the day that he enters the *Balance*; which is the reason that it makes more diurnal *Revolutions* in this half, than in the other.

The chiefest and most common effect of the *Sun*, is *Heat*; which it every way transmits to us. For wheresoever the *Sun-beams* come, they bring *Heat* along with them, and cause those effects, which we see the *Flame* daily produceth. And therefore *PARMENIDES* and *HERACLITUS*, as *Stobaeus* tells us, did believe the *Heaven* to be *Fire*, and that the *Stars* were so many flaming *Torches* placed in it; by which the *Light* is conveyed to us, and from whence, as so many *Fountains*, the vigour and life of all things here below do proceed.

They who follow ARISTOTLE, attribute this effect to the *virtue* of the *Sun*, and not to its *substance*, which they will not allow to be endued with a *Fiery Nature*, and that it is only *virtually* hot; but not to the *Touch*. Like *Ginger*, or *Spirit of Wine*, which excite a *heat* in the *Mouth* and *Stomach*; tho' it cannot be felt with the *Hand*. But how doth it appear to these *Philosophers*, that the *Sun* is only *Eminently* hot, and not *Actually*? Were they ever so near it, as to touch it with their *Hand*? Had not they much better attribute a *Natural* and *Real heat* to it, since they find it in all things to be like *Fire*? There is nothing here on *Earth* that is more moveable than *Flame*, which by its great *Activity* and *Mobility*, dissolves all *Bodies*. Have not the *Astronomers* observ'd as much, who, with the assistance of an *Helioscope*, have seen the *Sun* in appearance of *Gold* boiling in a *Furnace*; or like a *Sea of Fire*, with its *waves* rolling through and over one another? And what else is *Formal Heat*, but the *various Motion* of the *Parts of a Body*, whilst they are diversly agitated and carried against one another? Now that this happens in the *Sun* no Man will deny, but he who is ignorant of the *Nature* of it. And as to the Instance they alledge of *Ginger* and *Spirit of Wine*, that makes more for us, than for them; seeing that they are not perceived to be *hot*, till the *subtil Matter* hath excited a *motion* in their *parts*, and separated them from each other. But the *Particles* of the *Sun* are in perpetual *motion*; and tho' they do not make any *Excursions* beyond the *Bounds* wherein they are contained; yet do they vary their *situation*, and are carried divers ways.

IV.
Why the
Sun, at
his Rising
and Set-
ting, doth
commonly
appear
Red.

The *Sun* commonly appears *Red* at his rising or setting.

Because the *Light* at that time passeth through abundance of *Nitrous Vapours*, which make it subject to *Refractions*, much like those which a *Prism* is the cause of; and we shall be easily persuaded to be of this Opinion, if we will take the pains to observe, that when we distil *Saltpeter*, in order to the making of *Aqua-fortis*, the *Vapours* which arise and circulate in the *Recipient*, do make a *Candle*, held on the other side of the *Recipient*, and viewed through those *Steams*, to appear very *Red*. And by the same Reason it is, that the *Sun* appears *red* to us, when we look upon it through a *Glass*, upon which we have put some *Ink* or *Soot*.

V.
Why the
Sun is of
a Spherical
figure.

The *Sun* appears *round* to the *Eye*, especially if it be assisted with a good *Telescope*, whose *Concave-glass* is tinged with some *pale Colour*, especially a *Violet*; for then it doth not appear *Round* like a *Dish*, but *Spherical*.

The Reason of this is, because the *Matter* of the *first Element*, which constitutes the *Body* of the *Sun*, doth endeavour every way to withdraw from its *Center*, and by an equal pressure pusheth forward the surrounding *matter*. For it is a *Law of Nature*, that *Bodies* which are circularly moved, withdraw, as much as they can, from the *Center* of the *Circle* they describe, and consequently leave those *Round spaces*, which are afterwards filled with the *Subtil matter* of the *first Element*. And forasmuch also as the *Vortex*, wherein the *Sun* is formed, is on every side pressed by the encompassing *Vortexes*, and so is hindered from prosecuting

its *motion* in a *strait line*; therefore it must of necessity continue *Round*, and never attain any other *figure*. As appears in a *Glass*, which is formed of a *Round figure*, whilst the *Air* that is blown into it through a *Pipe*, doth equally press the parts of the *Glass* one way as much as another.

The *Sun* seems sometimes to be of an *Elliptical figure*, viz. about his setting.

VI.
Why the
Sun some-
times ap-
pears of
an Ellip-
tical figure.

The Reason whereof is to be fetch'd from the *Refraction* of its *Rays*: For the *Sun-beams* are refracted in a thick *Vapour* about the *Horizon*, at a greater distance to the *Right* and *Left* hand, than upwards and downwards, as those that have skill in *Dioptricks* demonstrate, which it will be sufficient to have only mention'd here. For who doth not know that a *Circle* is changed into an *Elliptical* or *Oval figure*, by *Reflexion*, as in a *Cylindrical Glass*, and by *Projection* upon a *Plain* obliquely oppos'd; and also by *Refraction*.

The *Astronomers* never observed any change in the *Sun*, but own it to consist of the same *Bulk*, and to enjoy the same force and virtue, as it had from the beginning. Which some alledge, as an Argument to prove, that it cannot be of a *fiery Nature*, because *Fire* always stands in need of *Fuel* to maintain it, upon the withdrawing whereof it becomes extinguish'd.

VII.
The Sun
always
appears of
the same
bigness, and
figure.

Tho' the *Sun* be consider'd as a *flame*, and seems obnoxious to the same defects, as a *Flame* is; yet cannot we conclude from thence, that it stands in need of *fuel*, as our *fire* doth. For, according to the *Laws of Nature*, Every *Body* always continues in the same state, till it be forced by a foreign *Body*. Whence it is evident, that *Fire*, being of a *fluid* and *moveable Nature*, is easily destroy'd and choaked by the *Matter* that doth surround it, and that consequently it stands in need of continual *Fuel* to support it, that as fast as any of its *Matter* vanisheth, other may be restored in the stead of it. But the case is not the same with the *Sun*, whose *Ruin* is not conspired by the parts of *Heaven* that are about it. But yet it doth stand in need of some *aliment* or *fuel*, which is no other than the same *Matter* of the *first Element*, which as it runs out by the *Ecliptick*, or those places which are most remote from the *Poles* of the *Sun*; so new *Matter* enters again to the *Sun*, by the *Poles*; and recruits the defect of that which is gone away. Wherefore as a *River* is said ever to continue the same, as long as it is recruited by the continual succession of new *Parts of water*: So likewise the *Sun*, by this entrance of *New matter*, doth continue the same, and keeps the same *bulk* and *figure*.

Tho' the *Sun* causeth different *Seasons* over the whole *World*, and by his presence produceth *Heat* every where: Yet we find the contrary in the *Torrid Zone*, where there is nothing else, but continual extream *Heat*, even when the *Sun* is most remote from it; whereas it grows weaker, when the *Sun* is perpendicular to it: So that they who live between the *Equinoctial* and the *Tropicks*, do begin their *Summer* about *Christmas*, and their *Winter* about the Feast of *St. John Baptist*.

VIII.
Why the
Sun is felt
more hot
in the
Torrid
Zone, than
elsewhere.

This

This difference of *Seasons* proceeds from the *Sun* it self, which hovering directly over the *Heads* of the *Inhabitants* of the *Torrid Zone*, doth raise up many *Vapours* to that height, that by their meeting with the *cold Air*, they are immediately turned into *water*, and consequently cause almost continual *Rains*, which do very much cool and refresh the *Air*: But when the *Sun* is no longer perpendicular to them, the *Rain* ceaseth, and the *Air* being deprived of its coolness, grows so hot, as scarcely is tolerable.

IX.
Why the
Sun doth
blacken
some Men,
and not
the Fire.

In some Parts of the *World* Men are colour'd black, as those who live in *Guinea* and *Ethiopia*: Which effect the *Fire* doth not produce, tho' it exert a greater force upon *Bodies*, than the *Sun*. And hence it is that those who make *Glass*, are rather of a pale, than a black Colour.

The Reason whereof is, because *Fire* exerts its Force most upon the *Blood* and the *Spirits*, causing them to exhale; which makes *Men* that labour much in the *Fire* to be of a pale and somewhat tawny Complexion: Whereas the more benign heat of the *Sun* only draws the *Blood* towards the outward parts of the *Body*, and does rather concoct it there, than cause it to evaporate. And therefore it is that the *Ethiopians* are indeed of a *Fleshy habit* of *Body*, but not so well and handsomely made, and generally have thick *Hips*, which shews that their moisture is shut up rather, than exhausted.

X.
Whence
the Twi-
light, and
the differ-
ences
thereof do
proceed.

In the *Morning* before the *Sun* riseth, and in the *Evening* after its setting, we have the *Twilights*, which in some parts of the *Earth* are perpetual, and exclude the *Nights Dominion*.

The Cause of these *Twilights* is, when the *Sun-beams* falling obliquely upon the surface of the *Air* and *Atmosphere*, become refracted towards the *Earth*, and entering the same, are reflected back again by the particles of *Air* and *Vapour* they meet with. These *Twilights* begin and end, when the *Sun* is 18 Degrees distant from the *Horizon*; for if it sink lower, it makes *Night*. Whence it is evident, that in those *Countries* where the *Sun* in *Summer* time doth not sink 18 Degrees below the *Horizon*, there they enjoy a continual *Twilight*, and have no perfect *Night*.

XI.
Why the
Sun ap-
pears some-
times, to
be in the
place where
it is not.

This Refraction of the *Sun-beams*, is the cause that the *Stars*, which are near to the *Horizon*, do seem to make a stop there, and to set, as it were, with some delay or reluctancy; and accordingly towards *Evening*, reach the *Lines* that point out the *Hours* on *Sun-Dials* more slowly, and so make the *Hours* longer. As also that sometimes the *Sun* appears together with the *Moon*, at the time of its *Eclipse*, tho' it be necessary for the producing of an *Eclipse*, that the *Moon* be interpos'd between the *Earth* and the *Sun*. And that the *Hollanders* in *Nova Zembla*, after a continual *Night* of 3 Months, see the *Sun* above their *Horizon*, and at the very *Meridian*, 15 Days sooner than according to the position of the *Sphere* they ought to find him there. The Reason whereof is, because the *Ray* which is betwixt the *Eye* and that Point of the *Atmosphere*, wherein the *Refraction* is performed, is not terminated in the *Sun*, but somewhat above it: Which is the true cause, why the *Sun* appears higher than indeed it

is. Thus the *Virgins Ear of Corn*, a very resplendent *Star*, appears to us to rise, when it is yet 32 Minutes under our *Horizon*; which we conclude from hence, because it seems to rise when the *Lions Tail* is 34 Degrees and 30 Minutes high, and in the same quarter in which that *Star* of the *Lion* then is. But the *Lions Tail*, and the *Spike of the Virgin*, are distant from each other 35 Degrees and 2 Minutes.

The *Eclipse* of the *Sun* always begins from the West, but that of the *Moon* from the East.

The Reason is, because the *Moon*, by her motion towards the *Earth*, doth with her Eastern part enter upon the Western part of the *Earth's shadow*, as well as of the *Sun*. And therefore it is that she, in her Eastern part, begins to be eclipsed by the Western part of the *Shadow*: and the *Sun* on the contrary, on its Western part, because of the Eastern shadow of the *Moon*. And forasmuch as that which last suffers the *Eclipse*, doth last recover its Light, it always happens that the *Eclipse of the Moon* ends towards the West, and that of the *Sun* to the East.

It is observed, that the *Heat* is not so great at the *Solstice*, when the *Sun* darts his *Rays* more perpendicularly down upon us; as some days after, when the *Sun* begins to decline from our *Hemisphere*:

The Reason is, because the *Sun*, in its approach to our *Horizon*, doth every day heat the *Air* with more direct and perpendicular *Rays*, and makes a longer stay above our *Horizon*, until the time of the *Solstice*. And since these direct *Rays*, together with this longer stay of the *Sun*, doth sensibly continue for some days; and that continually like degrees of *Heat* are still added to the *Heat* that is already acquired, it cannot be otherwise, but that the *Heat* by this means must be much increased. So that the *Heat* cannot decrease till the *Sun-beams* do very sensibly deflect from their former Directness, and till the stay of the *Sun* above our *Horizon*, be considerably shorter.

The *Sun*, when it is nearest to the *Horizon*, appears greater, than when it is farther from it, towards the *Meridian*; because there it is conceived to be highest.

The Reason of this Deception must be fetch'd from the Refraction of the *Rays* (according to the Opinion of almost all *Philosophers*) in the *Dewy Vapour*, which inflexion of the *Rays* doth dilate the visive Angle, and thereby increase the Bulk of the Object. For seeing that the *Vapour* is but lifted up a little way above the *Horizon*, on the Plain whereof, notwithstanding it is far and wide extended, it so happens that more of the *Solar Beams* do meet on this and that side, than upwards, and consequently make the longer Diameter of the *Sun*, which is then seen to be parallel to the Plain of the *Equator*. But the *Sun*, when it is about the *Meridian* and *Vertical* to us, doth appear higher, because the *Rays* which proceed from the *Sun*, passing through *Bodies* of different Rarity or looseness of the Parts, viz. the *Aether* and the *Air*, are refracted towards a Perpendicular, and therefore reach the *Eye* through a great Refraction. And thus it comes to pass, that the *Eye* apprehends the *Sun* to be much higher than indeed it is: For the *Eye*, or rather the *Mind* of

XII.
Why the
Eclipse of
the Sun
always
begins at
the West
side, and
that of
the Moon
on the
East.

XIII.
Why the
Heat of
the Sun is
most wake-
ment after
the Sum-
mer Sol-
stice.

XIV.
Why the
Sun at his
Rising and
Setting,
appears
greater,
than in the
Meridian.

XV.
The Sun,
about the
time of
its Rising
and Set-
ting, seems
to tremble

XVI.
Why the
Sun
seems to
tremble
at
the
Sky, at

Man, doth measure the Greatness of the Object according to the *Right Line*, which last of all reacheth his *Retina*, or Net-like-Coat of his *Eye*. it happens also that the *Ray* which is understood to be continued from the Point of the *Atmosphere*, whence the *Refraction* is made to the *Eye*, is not terminated at the *Sun*, but doth reach somewhat above him; where the *Mind* takes occasion to apprehend him higher than indeed he is.

It may also be said, that the *Sun* being near the *Horizon*, the *Eye* doth wink less, because of those *Vapours* which dull the *Sun-beams*; and therefore suffer the *Apple* of the *Eye* to be more dilated, than when the *Sun* being up on high, near the *Meridian*, there are few or no *Vapours* interposed between him and our *Sight*; by which means, when the *Apple* of our *Eye* is fixt upon him, it becomes the more contracted. Now it is evident, that the *Image* introduced through the more dilated *Apple* of the *Eye*, doth produce a larger appearance of the Object, than when it enters through a contracted *Apple* of the *Eye*. Because probably in the former case it doth strike more of those little *Nerves*, whereof the *Organ* consists. Thus we find that the *Moon* appears less in the *Day*, than at *Night*: For in the *Day-time* the *Hole* of the *Uvea* is more narrow, and therefore the *Rays* that enter through it being nearer to the *Axix*, are not so much dispersed.

XV. The *Sun*, at his *Rising* and *Setting*, seems to tremble, to whirl about its own *Axix*, and to leap, as it were, according to that of *CLAUDIAN*, in his 1st Book of the Praises of *Silico*:
Then did Bright Titan's Horses lead a dance
To th' following Stars.

And hence it is, that that Story arose amongst the Common People, of the *Sun's Dancing* on *Easter-day* in the *Morning*; as believing, that all Created things do testify their Joy on that Day, because of our *Saviour's Resurrection*, and that the *Sun* in particular testifies the same by his *Dancing* at that time.

Some there are, that attribute this effect to the *Sun's turning round*, as if in so doing the *Brim* or *Edges* of it were really shaken, and so with a kind of *Palpitation* whirl'd round about his *Axix*: But this is found to be false, because the motion of the *Sun* about its own *Center* is insensible; which Rotation therefore cannot be perceived, but after many repeated Observations. This seeming *Trembling* therefore is caused, by those *Vapours* that interpose between the *Sun* and our *Eye*, which being agitated by its heat, do represent a kind of *Trembling motion*; and therefore the *Beams* that pass through them, do shake the *Retina* in such a manner, that the *Sun* appears to the *Eye* to leap and skip. In the very same manner as the *Sun* is seen to tremble on a *Paper*, or against a *Wall*, when the *Smoke* of a *Candle* doth intercept its *Rays*; or like as a *Stone*, that rests at the bottom of the *River*, seems to tremble, because of the *Stream* or *Current* of *Water* that runs over it.

XVI. If the *Heaven* appears *Red* at *Sun-rising*, it doth preface *Wind* or *Rain*; whereas at *Sun-set*, the same *Redness* doth promise *Fair-weather*.

Redness, appearing in the *Morning*, fore-bodes the *Sun* *Wind* or *Rain*; because this is a *Sign*, that seeing there are but a few *Clouds* in the *East*, the *Sun* may elevate many *Vapours* before *Noon*, and that those *Mists* which will produce the same, are already *Rising*. Whereas on the contrary, this *Redness* appearing in the *Evening*, portends *Fair-weather*; because this shews, that there are none, or very few *Clouds* gather'd in the *West*; and consequently, that *Eastern-winds* have the predominance, and that the *Mists* will be driven downwards during the *Night-season*.

CHAP. VII.

Of the Fixed Stars.

THE *Fixed Stars*, besides their motion from East to West in 24 *Hours*, have another from West to East, within *Circles Parallel* to the *Ecliptick*; according to which *Circle* they move only 2 *Degrees* in the space of 200 *Years*, and finish the whole *Round* in 36000 *Years*.

The *Diurnal*, or *Daily Motion* of the *Stars*, is evidently deduc'd from the *Circumrotation* of the *Earth* upon its own *Axix*; and as to the other *Motion*, which they call *Periodical*, it will be sufficient to say, that the *Earth*, when it wheels every year about the *Sun*, doth not so exactly observe its *Parallelism*; but that it doth, as it were, reel a little from it, by which means it comes to pass, that its *Poles* do answer to different parts of the *Firmament*, and that consequently its *Poles*, during the space of many *Thousand years*, describes a *Circle* from East to West. This being suppos'd, forasmuch as we conceive the *Aequator* of the *Earth* to correspond to different parts of the *Heavens*, it follows, that the *Aequator* of the *Earth* is changed after the same manner, and divides the *Ecliptical* at various Points, whose sequel is from East to West. And because the *Longitude* of the *Fixed Stars*, is taken from the common Section of the *Aequator* and the *Ecliptick*, it is necessary that the *Stars*, how fixt and immoveable soever they be, must every *Hundred years* appear, to have moved somewhat from the *West* to the *East*.

Wherefore it is no wonder, if the motion of the *Stars* be irregular, and that the *Astronomers*, who followed *HIPPARCHUS*, discover'd, that their motion from *West* to *East* was so much increased, that the *Longitude* of every *Star* was augmented to 28 *Degrees*, beyond what it was observed to be at the time of our *Saviour*. Because probably this *Reeling motion* of the *Earth*, may have been more manifest in one *Age*, than in another.

The *Fixed Stars* do *twinkle*, and dart their *Beams* from them, as the *Sun* doth, who shines with a *Light* of his own.

The Reason whereof is, because the *Fixed Stars* are as so many *Suns* in their proper *Vortexes*, consisting of a most fluid *Matter*, which with the greatest swiftness is whirl'd about its own *Center*: Whence it is that they always press that *Matter*, which is continuously extended from the *Stars* to our *Eyes*, and thereby produce the Sense of *Light*. For if the *Sun* were placed amongst the *Fixed Stars*, he would not appear greater to us, than the very

least of them: And on the other hand, if the *Little Dog-Star*, by Example, which is accounted the least of all the *Fixt Stars*, should be in the place of the *Sun*, there is no question to be made, but that he would be equal to the *Sun*, both in *Bigness* and *Light*. From whence we may gather, that the *Sun* hath not strength or force enough to lend his *Light* to the *Stars*, and that therefore we must conclude, that they must shine with their own proper *Light*, without borrowing it from any other *Body*: Tho' *PLINY* and *METRODORUS* were so much taken with the admiration of the *Sun*, that they thought him sufficient to illustrate the whole *World*.

IV.
Why the
fixt Stars
are con-
spicuous to
us, and not
the Co-
mets, when
they are
out of our
Heaven.

Hence it is, that the *Light* of the *Fixt Stars* reacheth our *Eyes*, and not that of *Comets*, except only when they are within our *Heaven*; because the *fixt Stars* having a *Light* of their own, do dart the same much more strongly, than the *Comets* can, who only reflect the *Light* to us, which they have borrowed from the *Sun*. And therefore cannot be seen by us, when they are too remote from our *Heaven*: For it is well known, that the greater the distance of any *Body* is, so much the less is the *Angle* under which it is seen by us.

V.
Why Stars
are seen by
us in those
places
where
they are
not.

There are many *Stars* which are not seen by us in their *Right places*; yea, sometimes it happens, that one and the same *Star* appears in different places.

This proceeds from the *Vortexes* of those *Stars* that surround our *Heaven*: For their surfaces having several *Corners*, cannot be so aptly joyned, but that the *Beams* which proceed from them, must suffer divers *Refractions*. Whence it is, that when they are viewed from the *Earth*, they do not appear in those places, where indeed they are; but as if they were in those places of the surface of our *Vortex*, through which those *Beams* pass, which come from them to the *Earth*. And seeing that those *Places*, since the time that they were first observed by *Astronomers*, are not found to have been changed, therefore the *fixt Stars* are said to keep the same situation or distance from each other, and to continue in the same station. Which gave occasion to *MACROBIUS* to say; Behold the 7 *Stars*, which never scatter themselves from each other, no more than their Neighbours the *Hyades*, nor quit the station they have near to the Constellation of *Orion*. Neither do the *Great* and *Less Bear* desert their places; nor the *Serpent*, that glides between them, ever change the *Ring* wherewith he winds himself round about them.

VI.
Why the
Stars are
only seen
by Night.

The *fixt Stars* are not perceived by us, save in the *Night*; and in the *Day* time are inconspicuous to us.

The *Light* of the *fixt Stars* cannot be seen in the *Day* time, because the *Rays* of the *Sun* are of greater force, than the *Rays* of the *fixt Stars*, so as to disable them from affecting our *Eyes*. And therefore it is that by how much the nearer the *Eye* is to the *Sun*, the less can it perceive the *Light* of the *fixt Stars*: Because their Force becomes altogether weakened by the far more vigorous heat of the *Sun*; according to that Rule which always takes place in the meeting of *Bodies*, viz. That those things, whose Force exceeds that of others, they obtain their effect. Tho'

sometimes it may so happen, that *Stars* may in the *Day* time be seen by us, as, according to what *Historians* tell us, it hapned under the Empire of *COMMODUS*, when the *Stars* appeared for a whole *Day*, as if they had been fixed in the *Air*. The cause whereof I suppose to have been, because the *Sun*, at that time, being cover'd with *Darkness*, did give forth weak or almost no *Rays* at all, which being not sufficient to resist the Action of the *Light* of the *fixt Stars*, they consequently appear'd visibly to men. As we see that Persons let down into a dark and deep *Pit*, or *Well*, can thence see the *Stars* in the *Day* time.

The *fixt Stars* do always appear the same to us, and never increase or diminish their *Bigness*. Whence it is, that the *Stars* which pass over our *Vertical Point* in the *Crab*, are seen the same in *Capricorn*.

The Reason is, because the *Axis*, about which the *Earth* whirls round every *Day*, doth always continue unchanged. Whence it is, that that *Point* which is *Vertical* to us, when the *Earth* is in the *Crab*, is as far from that which is over our *Heads*, when it is in *Capricorn*, as the one *Tropick* is from the other in the *Great Orb*. But forasmuch as all this distance, and the whole *Great Orb*, is but as a *Point* with regard to the *Heavens*, therefore also the *Interval*, that comes between the 2 *Vertical Points*, is also to be esteemed no other than a *Point*.

New Stars do now and then arise in the *Heavens*, which some time after do vanish again: As that which appeared in the *Swan*, in 1600, much about the *Bigness* of one of the *third Magnitude*; and that other which appeared in *Serpentarius*, in 1604, which was almost of the same bigness with *Venus*; whereof the one continued for many years; but the other disappeared, after having continued its station for one *Year* only.

The Cause of the Rise of *New Stars* is, as was said before, the dissolution of *Spots*, where-with sometimes the *Body* of a *Star* becomes so cover'd, that by their thickness, or hardness, they hinder it from shedding any of its *Rays*. When therefore it so happens that a *Star* becomes freed from those spots, by one means or other, then immediately a *New Star* appears to our *Eyes*, which it may be had not been seen for some hundred years before. Now the dissolution of those spots happens, when the *Vortex* that encompasseth the spots, doth with greater force press upon its Neighbouring *Vortexes*, than they push upon it: For then the said *Vortex* enlarging its own Borders, causeth the Matter of the first *Element*, which flows forth from the *Eclipticks* of other *Vortexes*, to run in greater abundance towards the obscure *Star*, where spreading it self over the spot that covers it, and making an impression on the *Heavenly Globuli*, it doth by this means convey the Action of the *Light* to our *Eyes*.

And on the other hand we find, that sometimes *Stars* which have appeared many years, afterwards disappear. Thus formerly the *Astronomers* counted 7 *Pleiades*, whereas now 6 only of them are to be seen.

countess Maidston,
of Eastwell &c.

This Plate is humbly

Dedicated by Ric: Blome.

The Reason whereof is, because the *spots* about these *Stars* grow so thick and close, that they can no longer be dissipated or dispelled by the said *Star*, nor the *Heavenly Globuli* be push'd forwards. Because nothing doth more conduce to the preservation of a *Vortex*, and keeping it from being destroyed, than when the *Star* that is in the *Center* of it, is in a vigorous condition to push forwards the *Globuli* of the 2^d *Element*, and by that means hinders the neighbouring *Vortexes* from encroaching upon his *Territories*, and hurrying away of his *Globuli*. Thus the *Star* in *Cassiopeia* appeared in 1572, and the other in the *Breast* of the *Swan*; which being first discovered by *KEPLER* in 1602, vanished in 1625; and after this was seen again by the Famous *HEVELIUS* in 1656, of the same magnitude as it had before been observed by *Kepler*. About the beginning of the year 1660, it appeared less than formerly; and in 1661, it disappeared again till the year 1666. Thus at the beginning of this *Century*, there was a *Star* observed in the *Neck* of the *Whale*, which presently after becoming extinct, appeared again in the year 1648, till the Learned *BULLIALDUS*, had calculated the motion of it. For after a *Circle* of 333 days it appeared again. The same Reason must be given of that *misty Star*, which at sometimes is conspicuous in the *Girdle* of *Andromeda*.

X. *Stars* are seen in the *Day-time*, either when the *Sun* suffers a total *Eclipse*, or when the *Spectator* beholds them from the bottom of a deep *Well*. For seeing that in these cases there is no reflexion of the *Sun-beams*, and that the *Spectator* is placed in nocturnal darkness; the *Apple* of the *Eye* being by this means dilated, and the *Optick Nerve* free from the dazzling splendor of the *Sun*, or at least being not compressed by it, the smallest *Beams* of the *Stars* are capable of affecting it, so as to make the *Stars* become sensible.

XI. The *Stars* are sometimes changed into *Comets* and *Planets*, and losing their own *Light*, only reflect that which they borrow from others. The Reason of this is deduced from what was said before. For when a *Star* is altogether covered with *Spots*, and hath lost all its force of pushing forwards the matter of the 2^d *Element*, it may easily be so prest upon by the neighbouring *Vortexes*, as to be swallowed up by one of his strong and vigorous *Neighbours*. And when the *Vortex* of the *Star* is thus swallowed, and the *Star* being wholly covered with *Spots*, and carried into another *Vortex*, it then either passeth farther, and is driven again from that *Vortex*, which first swallowed it, into another *Vortex*, and so becomes a *Comet*; or because of its being less solid, doth descend lower, keeping a certain distance from the *Star* which possesseth the *Center* of that *Vortex*, and thus becomes a *Planet*; and continually wheeling about the said *Star*, doth reflect its *Light*; and thus the *Body* which was *Lucid* and *Fluid* before, by the access of these *Spots* becomes hard and solid.

CHAP. VIII.

Of the Moon.

THE *Moon* hath always one and the same Face turned toward the *Earth*; neither could ever any *Telescope* inform us, that its *Body* hath changed its former situation.

The Reason is, because that part of the *Moon* which is furthest from the *Earth* is more solid, that is, contains more of the matter of the 3^d *Element*, and hath fewer pores that are filled with the matter of the 1st and 2^d *Element*. For it is apparent, that solid *Bodies* do withdraw themselves further from the *Center* of the *Vortex*, in which they are, than those which are less close, and abound with more Pores. Because they have a greater force to continue their motion, and to abide in the state wherein they were put at first. As it is evident in *Gold*, *Lead*, and other metals, which do longer retain the impulse impress upon them, than *Wood* or *Stones* of the same bulk and Figure. The Reason therefore why the same Face of the *Moon* is always turned towards us is, because that part of her which reflects *Light* from the *Earth*, is less solid, and doth contain less matter of the 3^d *Element*, and therefore requires a less space to move in. Now that that part of the *Moon* which faceth the *Earth*, is less solid than the other part, may be gathered from those *Spots* and *Shades* which appear up and down in it; and which by letting in, and swallowing up the *Sun-beams*, produce darkness, and make an *Opake Body*.

But there are some *Philosophers* that pretend, that the *Moon* is whirled about her own *Axis*, all the while that she is turning round about the *Earth*, within the time of about 29 days and an half; because, say they, the *Sun* in a months time, enlightens all the parts of the *Moon* one after another. But it is an easie matter to make it appear, that the *Moon* will be enlightened in a months time in all its parts, tho' we should suppose it not to move at all about its own *Axis*, but only to be moved about the *Earth*.

For Example, let *T* be the *Body* of the *Earth*, *S* the *Sun*, *B C D E* the *Circle*, which the *Moon* describes about the *Earth* in 29 days and an half; Figure and let the *Moon* be so placed in this *Circle*, as to be in *Conjunction* with the *Sun* at the point *B*, opposite to the point *D*, in her first quarter at the point *C*, and in the last quarter at the point *E*. This supposed, it is evident, that the *Moon* being at *B*, shall have her upper half 1, 2, 3, enlightened; and that being in her opposition to the *Sun* at *D*, her lower half 3, 4, 1, will be so. That when she is at her first quarter at *C*, the half of her 2, 3, 4, will be illuminated. And lastly, that when the *Moon* is in her last quarter at *E*, the half of her marked 4, 1, 2, will receive the *Ray* of the *Sun*. Which makes it evident, that the *Moon*, in order to her being illuminated in all her parts, hath no need to turn round about her own *Center*, seeing that her running through the *Circle* where-with she encompasseth the *Earth*, is alone sufficient for that purpose.

III. The *Moon* diffuseth her *light* every way, and doth so reflect the same, as that the *Rays* do not unite in one point only, but are dispersedly reflected, and scattered every way.

This

I. Why the Moon hath always the same side turned towards the Earth.

II. An Objection on Answered.

III. The Moon from all parts reflects Beams to the Earth.

This proceeds from the *Rugged Surface* of the *Sun*, which dilates the *Light* it receives, and shews its *Brightness* to all that behold it. For *Rough Bodies* do consist of many *Surfaces*; which are so disposed, as that some of them reflect their *Beams* this way, and others that way. But if the *Moon*, whom all *Philosophers* grant to be *Spherical*, were smooth and like a *Convex Looking-Glass*, not in all its parts thus *polish'd*, but in one part only; it would convey its *Light* to the *Spectators Eye* in one point only, as hath been before demonstrated. For certain it is, that an *Opake Globe*, having a *polish'd surface*, doth not reflect its *Light*, but as it were, from one point, as is manifest in *Brass Globes*, exactly *polish'd*, when they are exposed to the *Sun*. For tho' the whole *Hemisphere* were exposed to the *Light* of the *Sun*, yet would only the least part of the *Moon*, transmit the *Light* thereof to the *Eye* of a *Spectator*; which because of the smallness of it, and its vast distance from that *Star*, must needs be extinguish'd, before it could arrive to his *Eyes*.

IV. When the *Sun* shines, the *Moon* appears less than in the *Night*: which G A S S E N D U S assures us he had experienced by the help of a *Telescope*; and found the *Compass* of the *Moon*, at full in the *Night-times*, to be 5 minutes bigger than her true *Diameter*. Which may also be confirmed by a more familiar Experiment, viz. by beholding the *Moon* when it begins first to appear at eventide, whilst the *Sun* is yet above the *Horizon*: for then its *Crescent* will appear so very slender, that it appears but like a *Thred*; whereas when the *Sun* is wholly gone down, it grows broader and broader, as the darkness encreaseth. This encrease of the *Light* must not be ascribed to the *Body* of the *Moon*, as if it had Power of sending forth *Beams* from it self, and of dilating them in the *Night-time*; but only because the *Aether*, or that *Matter* which is analogous to our *Air*, and encompasseth the *Moon*, is enlightned by the *Sun-beams*, which she reflects, and seems the same as the *Body* of the *Moon*: For being most intimately joined to the same, it is supposed to belong to the same *Circle*. But by making use of a *Telescope*, this false *Light* is easily discerned, for then that space, which is supposed to be illuminated, doth appear dark, and not at all touch'd by the *Arc* of the enlightned part.

V. The *Moon*, when in *Conjunction* with the *Sun*, doth not shed any *Light*, neither can she be seen till she be 2 degrees distant from the *Sun*. And afterwards changeth her *Faces*, according to her different *aspects* to the *Sun*.

This diversity of appearances is caused, for that the *Moon* doth borrow her *Light* from the *Sun*, and shines no otherwise than a *Looking-Glass* doth, which sends back the *Beams* that light upon it. Wherefore it is no wonder, if at the *Conjunction*, nothing of the illuminated part of the *Moon* be discerned by us, because then her whole enlightned half faceth the *Sun*, the other part being turned towards us. But during the following days, whilst she turns sideways, and hath a *Sextile Aspect* to the *Sun*, some part of her is perceived in the form of a thin *Sickle* or *Crescent*: But in the 7th or 8th day in her *Quadrant Aspect*, when she is one *Quarter* of the *Zodiack* distant from the *Sun*, the one half of her appears in light. But whilst she is in the

3d part of the *Zodiack* distant from the *Sun*, above one half of her *Rim* doth appear; and on the 14th or 15th day, when the *Moon* is directly opposite to the *Sun*, her whole *Face* is turned to us.

The *Moons motion* changeth every day, hour and moment: for she moves most swiftly at the Full and New; and thence her *swiftness* decreaseth from the Full to the First *Quarter*, where she moves more slowly, and then her *Motion* encreaseth again till the New.

The Reason of this perpetual variety is, because the concave or hollow surface of her *Sphere* is not round but oval: So that the *Vortex* of the *Earth* must of necessity move with unequal degrees of swiftness in its circumference: For every *Fluid Body*, passing through a narrower space, doth accelerate its motion, as we see in a *River*, when it runs through the *Arches* of a *Bridge*, whereby it becomes straitned in its Current, and therefore is hastned in its motion, by the following water pressing upon it. Forasmuch therefore as an oval Figure hath one *Diameter* longer, and the other shorter, the *Fluid Aether* passing through the latter, where it is more straitned for Room, doth of necessity move more swiftly, than when it passeth through the longer *Diameter*, where it hath more Room; and because in every part of an Oval Figure, there is a different wideness or capacity, there must needs follow a variety in the swiftness of motion through those spaces of different wideness; and accordingly there must be a longer Oval *Diameter* betwixt the *Quarters*, and a shorter between the Full and New *Moon*, or thereabouts.

From what hath been said, we may easily be satisfied about the Reason of the variety of the *Distance*, *Bulk* and *Brightness* of the *Moon*; because when the *Moon* is in her *Quarters*, near the longer Oval *Diameters*, she is at a greater distance from the *Earth*, than in the New or Full *Moon*, when she is near, or at her shorter *Diameters*; and forasmuch as the magnitude and the light do grow or decrease equally with the distance, therefore the *Swiftness*, *Distance*, *Bulk* or *Splendor* must appear greater or less, not only about the four extrem oval *Points*, but at all the other points of the Planetary *Circle*, according as the Capacity or Room betwixt the oval sides of the said *Circle* is greater or less.

The *Moon*, whilst she is in an *Eclipse*, doth present an obscure light to our *Eyes*.

It seems probable, that this *Secondary Light* proceeds from the *Sun-beams*, reflected from the *Earth*: If we speak of that *Light* which is seen in the New or Old *Moon*; but that *Light* which appears in her, whilst she is *Eclipsed*, must be attributed to the Refraction of the said *Beams*, from the *Air* that surrounds the *Earth*. For seeing that the *Sun* doth continually dart his *Beams* against the *Earth*, they cannot be so admitted by it, but that they must rebound again from the *Earth* towards the *Sun*; and because the *Sun*, when New and Old, is in that *Region*, she must needs receive the more *Beams*, as she is nearer to the *Sun*. And accordingly it is necessary that the *Moon* be enlightned with the said reflected *Light*, especially in that part of her, which is not directly illuminated by the *Sun*; altogether in a like manner, as the *Earth* is enlightned by a light reflected from the

VI. Whence the perpetual variety of the Motion of the Moon doth proceed.

VII. Why the distance of the Moon, from the Earth, is sometimes more, and at other times less.

VIII. Whence the Secondary Light of the Moon doth proceed.

X. Why the Moon appears greater at her Rising and Setting, than when she is elevated above the Horizon.

XI. The Moon moves faster at the New and Full, than in other parts of her Circle.

Body of the Moon, in that part of her which is turned from the Sun. Now that this Secondary Light doth proceed also from the Refraction of the Air that surrounds the Earth, doth appear from hence, because the Globe of the Earth encompassed with its Atmosphere, doth project a Conical Shadow, whose length consists of about 250 Semidiameters of the Earth. And because the Sun-beams, horizontally falling upon the Atmosphere, are according to TYCHO's observation refracted at an Angle of 34 minutes; and that they double this Angle in their passage from it, therefore consequently they are united in the Axis of the Shadow, and there are decussated or cross one another, and so pass away, and produce the Cone of a Shadow, whose top, or extremity is not above 43 Semidiameters of the Earth high, on this side the Decussation, or before they come to cross each other; and beyond their Decussation an inverted Cone, which afterwards is confounded with the residue of the greater Cone.

IX.
Why the Moon is moved more swiftly than the Earth.

Figure 29.
in the Institutions.

The Moon γ which moves round in a peculiar Vortex A B C D, that compasseth the Earth T, is whirl'd as swiftly again about the Earth, as the Earth whirls round its own Axis. For the Moon runs round her own Circle A B C D, which 60 times exceeds the Circumference of the Earth T, in the time that the Earth only 30 times runs round its own Axis, by its Diurnal Motion.

Tho' some boast themselves to have cleared this Phenomenon, yet there seems no other reason assignable of it, but only the littleness of the Moon. For seeing that the Earth, as well as the Moon itself, is moved by the same Celestial Matter, no other cause can be imagined of this greater degree of swiftness in the Moon, than that she is less than the Earth. For this is the Rule of all moving Bodies, that whilst one is moved as swiftly again as another that is twice as big, there will be but just as much motion found in the less Body as in the greater. Now so far as the swiftness of the motion of the Body of the Moon γ , and of the Earth T, is from the Celestial Matter, which is much the same about the Earth as about the Moon; the Earth ought to whirl about as swift again, as it doth, in order to the running over its Circle 60 times in the same time that the Moon once runs through hers, A B C D, 60 times greater, but that its Bulk doth hinder it.

X.
Why the Moon appears greater at her Rising and Setting, than when she is elevated above the Horizon.

XI.
The Moon moves swifter at the New and Full, than in other parts of her Circle.

When the Moon Riseth or Sets, she appears to us much greater, than when she is high raised above our Horizon. The Reason is, because when she is very high above our Horizon, there are no objects that interpose between her and our Eyes, whose magnitude is known by us; that by comparing her with them, we might be able to judge of her Bulk: But when she is newly got above our Horizon, or is near Setting, we see betwixt her and our selves many Fields, the largeness whereof is in some part known to us, by which we know her to be farther from us, and consequently judge her to be greater.

The Moon doth not observe an equal tenor in running through her Circle: For when she is in Conjunction with, or in Opposition to the Sun, that is, at New and Full, she is more swiftly moved than in any other of her Aspects.

The Cause of this Inequality of her Motion, is her particular Heaven A B C D, the Circumference

whereof is not absolutely Spherical, but is somewhat Elliptical. For when the Globuli of the 2d Element, which are comprehended within the Circumference A B C D, differ in motion and magnitude as well as solidity; it must needs follow, that the more solid ones must more freely diffuse themselves towards A and C, than towards B and D, and so constitute an Oval or Elliptical Figure. And therefore it is that the Heavenly Matter is more slowly moved betwixt C and A, which is the larger part of that particular Heaven, than that which is betwixt B and D, which is the more narrow part. For it is consonant to Reason, that the Matter which carries the Planet, should flow more slowly in a broader space, and more swiftly in a narrower. As is evident in Rivers, whose Course is so much the swifter as their Channel becomes more narrow, and more slow where it widens.

This Oval Figure of the Moons Circle also, is the Cause why the Moon at her Conjunction and Opposition is less distant from the Earth, than at her Quarters; and consequently is seen under a greater Diameter at the time of her New and Full.

There is one difficulty still remaining, which is this: If the Moon, because of its littleness, be capable of a swifter motion; how is it, that when she is carried about by the Heavenly matter that surrounds her, she doth not sink down towards the Earth; and why, leaving her Circular motion when she is at C, she does not decline towards Z, rather than go to D, and then turn upwards again.

We shall extricate our selves from this Difficulty, by considering that the Moon doth altogether follow the motion of the Celestial matter, tho' it have not all the degrees of swiftness which the said matter hath. For seeing that the Earth, and all the Celestial matter contained in the Vortex A B C D, is turned round about the Center T; it follows, that the Moon which is whirl'd about the Celestial matter, must continue its motion towards the Center of the Earth T; and that after it hath reached the point C, it does not proceed towards Z, but goes towards D; and that because the Heavenly matter drives it that way, and carries it along with it.

It is a common received opinion, that the Moon, as she appears under several Colours, presages changes of Weather: Which gave occasion to these Verses.

The Pale Fae'd Moon, gives Rain,
When Red, 'twill blow again:
But when she's Fair and Clear,
Like Weather will appear.

But we must not imagine that this variety of Colour is in the Body of the Moon; but in that exhalation or steam which is between the Eye and it. Hence it is, that when Rainy Clouds are interpos'd between our sight and the Moon, she appears of a Pale and Dusky Colour; and again Red, when she is surrounded with many windy exhalations, and a moderate quantity of Vapour. It being a thing notorious that Colours are changed, according to the diversity of the medium through which they are transmitted. And accordingly when the Air is free from all manner of Exhalations, then the Moon appears fair and Clear.

XII.
Why the Moon is beheld under a greater Diameter at her Conjunction and Opposition.

XIII.
How it comes to pass, that the Moon doth not fall down to the Earth.

XIV.
Whether the Colours of the Moon be any certain Signs of the Weather.

XV. *Why Eclipses of the Moon do appear alike, to those that live in the same hemisphere, but not those of the Sun.*

An Eclipse of the Moon appears alike in Quantity, to all those who live in the same Hemisphere of the Earth, and have the Moon above their Horizon. Whereas a Solar Eclipse appears to some Inhabitants of the same Hemisphere, Partial; to others, Total; and to some again none at all.

The Reason hereof is evident from what hath been delivered in my Institutions of Philosophy. For seeing that the Moon is destitute of any Light of her own, she must of necessity appear as much to some, as she is perceived of others deprived of Light. Whereas the Sun having an inborn Light of his own, and being only hidden by the Body of the Moon, which is interposed between the Sun and the Earth, and is less than either of them; it may so happen, that some part of the Earth appearing equal to the Sun, or bigger, may hide the whole Sun; another the half of him; another a greater or less part; and another again no part at all. Thus that Eclipse which THALES is recorded to have observed about the Hellespont, was Total; whereas at Alexandria in Egypt, it was only of 9 digits, with 3 fifths. Or as CLEOMEDES reports it, of 4 fifths of a Diameter.

CHAP. IX.

Of the Planets, Mercury, Venus, Jupiter, and Saturn.

I. *The Planets, Mercury and Venus, seem to move variously.*

Mercury and Venus appear sometimes to move from East to West; and at other times the contrary way, from West to East.

Forasmuch as the Earth is turn'd round about its Center from West to East, within the space of 24 hours, it follows that the Planets, Mercury and Venus must seem to move from East to West, and every day to describe a Circle Parallel to the Equator. In like manner they must also trace a Circle about the Sun from West to East; forasmuch as they are comprehended in the Heavenly matter, which carries the Earth that way.

II. *Why the foresaid Planets are more swiftly carried about the Sun, than the Earth.*

These 2 Planets are also more swiftly rolled about the Sun, than the Earth, which doth not finish its Circumvolution in less than a Year.

The Reason is, because the Circles which Mercury and Venus run through, about the Sun, are lesser than that in which the Earth is carried; and therefore it is necessary, that the true Circumvolutions of these 2 Planets be absolved in less than a years time.

III. *Why Mercury and Venus seem to move more slowly, than indeed they do.*

These 2 Planets seem to take up more time in their Circumvolution, than indeed they do.

The Reason is, because if we fix the beginning of one of their Revolutions, when these Planets are placed betwixt the Sun and the Moon, this Period cannot be said to be finished, till they be come back to the same place again. Now forasmuch as the Earth it self hath changed its place, whilst those Planets run through their Circles, and at the end of their circumvolution is no more at the same place where it was at the beginning of it; it follows that the appearing Period of every Planet, must of necessity comprehend, not only the whole Circumvolution it hath absolved; but besides all that space to which the Earth hath past through during the time of the Planets Circumvolution.

CASSINIUS observes concerning the Planet Mercury, that the same is scarcely visible, because of his great nearness to the Sun, so as that it but very seldom gets free of his Rays. For he is not above 27 or 28 degrees distant from the Sun, and often turns back to the Sun again, by that time he is got 18 degrees from him, so that his greatest elongations, from the Sun, do not differ above 9 degrees from each other.

The Circle of Mercuries Motion divides the Ecliptick; and with it makes an Angle of 6 degrees; so as that the line of Section, is not far from the Center of the Sun. The Northern Intersection, which some call the Node, is reduced to the 13th degree of Scorpio: and these Nodes proceed one degree within the space of 40 years.

Forasmuch therefore as Mercury doth not appear to us, but in his withdrawing from the Sun, he can scarcely be perceived with the help of a Telescope, in the form of a Globe or Round Body, but sometimes as if he were cut in 2, as the Moon appears at her Quarters; and sometimes more swell'd, and at others more deprest. And when at any time he is near the Horizon, or darkned with vapours, then nothing but his Bulk or Figure can be detected. However it is apparent that he receives his Light from the Sun, and is carried round him.

Concerning the Planet Venus, the foresaid Cassinus hath observed; first that this Planet is sometimes 40 degrees and an half distant from the Sun, that is, as far as the Moon at 4 days old is distant from him. Tho' sometimes it happens that she returns to the Sun, after a recess from him to 45 degrees; so as that the furthest elongations of this Planet do not differ above 2 degrees.

The Aphelium, or farthest distance of Venus from the Sun, is in the 2d degree of Aquarius; her Perihelium, or nearest approximation in the 2d of Taurus: and these Points do continually move onwards towards the East, so as that within the space of 46 years, they proceed one degree.

The foresaid famous man found that these 2 Planets moved about their own Centers. For when in the year 1666, he had observed one part of Venus to be brighter than all the other parts of her Circumference, on the 14th of October, 5 hours and 15 minutes after Noon; and the year following on the 24th day of April, about a quarter of an hour before Sun-set, had found the same bright part, near to the Line which separates the Lucid part of Venus from the Opake, and distant from her Southern Horn, above a quarter of the Diameter of Venus: and when after Sun-rising he had observed that the said Bright Part was further removed from the Southern Horn, from which it was distant the 3d part of her Diameter; he immediately concluded, that some kind of motion, at least, must be assigned to the Globe of Venus, tho' he dares not determine whether the same be a motion of Rotation, or of Libration only. Because Venus doth not present her self to her view but for a short time. But supposing that bright part, which he had so often seen, to have been always the same, he is not afraid to affirm that the said motion is finisht in about 23 hours; after which the said bright part of Venus returns again to the same place.

Mars,

Priory in Brecknock
Citty of London
his Wife.
Dedicated by Richard Blome.

VI. *Why Mars, like other Planets, within the space of 24 Hours, from East to West about the Earth; but not equally within the same term of Time.*

The Reason is, because the *Circles* they describe do include the *Circle* of the *Earth*, and because they, as well as the *Earth*, do swim in the *Celestial matter*; and consequently must appear, as the other *Planets*, to turn from *East* to *West*, within the space of 24 *Hours*. And forasmuch as, according to the *Law of Mechanicks*, the *Circles* which *Mars*, *Jupiter*, and *Saturn* do describe, must be found under the *Zodiack*, and are greater than that which the *Earth* moves in, we shall easily apprehend, that they cannot finish their *Circuit* in so short a time as it doth. Accordingly we know, that *Mars* takes up 2 years in performing his *Circumvolution*, *Jupiter* 12, and *Saturn* 30; for they being at a farther distance from the *Sun*, than the *Earth*, the *Heavenly matter* which carries them about, must take up the same time in absolving of its *Course*.

VII. *CASSINUS* also gathers from those spots, that obscure the *Aspect* of *Mars*, that this *Planet* moves about his own *Center*, in the space of 24 *Hours* and 40 *Minutes*, because these spots return to the same place, at the same distance of time. He observed in *Mars* one part more bright than all the rest, and always in the same situation; tho' the other spots had their different places.

Jupiter, when he is in *Conjunction* with the *Sun*, appears at a greater distance to us, than when he is in *opposition* to him; insomuch that we see him almost bigger by one half, when he is oppos'd to the *Sun*, than when conjoyn'd with him. And *Mars* appears five-fold greater, when he is nearest to the *Earth*, than when he is at his furthest *Elongation* from it.

VIII. *GALILEUS*, in the year 1610, the 7th of *January*, at the first Hour of the *Night*, discovered 4 less *Planets* about *Jupiter*, which like so many little *Moons* are whirl'd round him. Those of them which are nearest to *Jupiter*, move more swiftly, than those which are more remote. The *Revolutions* of which *secondary Planets* are thus calculated by *SIMON MARIUS*:

The first and inmost of them takes up,

D. H. M. S. D. H. M. S.

1 18 28 30 03 13 18 0

The Third The Fourth.

D. H. M. S. D. H. M. S.

7 03 56 34 16 18 09 15

These *Attendants* of *Jupiter*, whenever they enter the *Verge* of his *shadow*, do suffer an *Eclipse* after the same manner, as the *Moon* doth when she dips in the *shadow* of the *Earth*, and are totally depriv'd of *Light*; as being *Opake Bodies*, which borrow their *Light* from the *Sun*. The 3 first of these in every *Revolution*, produce 4 *Eclipses*; the 1st, when the *Satelles* enters into the *Rim* of *Jupiter*; the 2d, when the *shadow* of the *Satelles* doth darken the *Rim* of the said *Planet*; the 3d, when the upper part of *Jupiter*,

at his *Elongation* from us, doth hide the *Satelles*; and the 4th, when the *Satelles* dips in the *shadow* of *Jupiter*. So as that the first *Satelles*, within the space of 7 *Days*, doth effect 16 *Eclipses*; the second, 8; the third, 4; so as that all of them together produce 28 *Eclipses*. The fourth, after that he hath reached the *Nodes*, doth make 4 *Eclipses* in 17 *days*; but when near his bounds, he never suffers a defect of his *Light*, because his *Latitude* is so large, that he never touches the *Rim* of *Jupiter*, or reacheth his *shadow*. These *Eclipses* are of great use, in order to the determining of the *Longitudes* of *Places*.

Saturn hath also been found guarded by 3 *Satellites*. The first of these was discovered by *CASSINUS*, at *Paris*, in the *Royal Observatory*, in the Year 1672; and the same is removed from the *Center* of *Saturn*, 1 *Diameter* of the *Ring*, (mention'd by the *Author*, Chap. 16.) and 2 *Thirds*, and absolves his motion about the *Planet* in 12 *Days*, 4 *Hours*, and 27 *Minutes*. The second was long before detected by *HUGENIUS*, and is much mote bright than the former; and is distant from the *Center* of *Saturn*, 4 *Diameters* of the said *Ring*, and turns round him within the space of 16 *Days* and 23 *Hours*. The third was first observed by *CASSINUS*, in the year 1671, towards the End of *October*, at his furthest digression from *Saturn*. But soon after he vanish'd out of *light*, and did not appear again till the 15th of *December*; and presently after disappeared, until about the beginning of *February* 1673, when he continued in sight for 13 *Days* together.

No other Reason seems assignable for this great variation of *Light* in this last *Satelles*, than that some part of his *Body* doth strongly reflect the *Light*, whereas the other cannot do so. According as we see it happens in the *Globe* of *Earth*, where that part which is cover'd with *water*, is not fit to reflect the *Sun-beams*; whereas the other parts of it send them back every way. This *Satelles* therefore either is rolled about his own *Center*, or else is carried about *Saturn*, as the *Moon* is carried about the *Earth*. And therefore when that part of him, which is like the *Continent* of our *Earth* is turned towards us, then we see him, and he vanisheth again from our sight, when that part which is of the *Nature* of *Sea*, faceth the *Earth*.

They who first observed *Saturn* with a short and imperfect *Telescope*, were astonish'd when they perceived him sometimes of an *Oval figure*, sometimes as having 3 *Bodies*, that is, with 2 other added to the middlemost; sometimes solitary and perfectly round. But when these unlook'd for *Appearances* had stir'd up others to the viewing of this *Planet*, some making use of more exquisite *Instruments*, found, that those which before were taken to be the *Lateral Globes*, were in the figure of *Handles* or *Arms*, that is, hollowed out and bent, so that joyned to the middle *Globe*, they constituted a figure not unlike a *Weavers-shuttle*. But at last, by the use of the most absolute *Telescopes*, it was found that this *Planet* hath a round *Body*, as all the rest; but hath this peculiar, that it is encompass'd, as it were, with a broad *Ring*, not much unlike the *Brim* of a *Hat*, when the *Head* is out of it; or that of a *Dish*,

IX. The *Satellites* of *Saturn*, discover'd by *Cassinus* and *Hugenius*.

X. What is the Cause of the variation of *Light*, which is observed in the last *Satelles* of *Saturn*.

XI. Why *Saturn* appears under different figures.

Dish, when the bottom or hollow is taken away. And therefore this *ambient Body*, which before was called the *Handle* or *Arms* of *Saturn*, was since called the *Ring*.

In order to the explaining of this *Appearance*, we must represent to our selves this *Planet*, as a great *Globe*, resembling that of the *Earth*, and in which we conceive 2 *Poles*, an *Equator*, and a *Torrid Zone*; and that round about the said *Torrid Zone* there is elevated an *opaque Matter*, which fills the space of a considerable breadth, and is disposed in the figure of a *Ring*, resembling that broad *Circle* we call the *Horizon*. This being thus supposed, it is certain that we must of necessity see *Saturn*, according as he appears at A, when we view him from a place that is much higher than the *Level* of the *Ring*; afterwards he must appear to us, as at B, or at C, when we behold him from a place where we are not so high as the said *Level*. And last of all he must appear altogether round to us, as at D, when we are so placed with respect to his *Body*, that if his *Ring* were continued, it would pass through our *Eye*; for then the inconsiderableness of the *Thickness* it hath, by reason of its great distance, makes it altogether invisible. To which may be added, that probably we fail of seeing this *Ring* of *Saturn*, because this *Planet* passing over against some *fixt Star*, and having deprived us of the view of it by one of the *Tops* of the *Oval G*, in the *Figure A*, the said *Star* will afterwards be seen at the place E, where we see a kind of *Blackness*, which is nothing else but the defect of the *Circle*, and a part of the *Heaven*, which offers it self to our view, by that space which remains betwixt the said *Ring* and *Body* of *Saturn*.

CHAP. X.

Of the Spots about the Sun, and the fixt Stars.

THE *Sun*, to an unassisted *Eye*, appears bright, and to have an uniform *Aspect*; yet when we make use of a *Telescope*, with 2 *Convex-Glasses* in the figure of *Lentils*, it doth represent such a vast variety of bright and shaded *Bodies*, as if it were nothing but a continued *Checker-work*.

This various mixture in the *Body* of the *Sun*, is not caused by the foresaid *Glasses*, as some have feigned, supposing that they, by reason of their *Impurity*, might represent *shadows* to our *Eyes*: Because when those *Glasses* are turn'd round, the *Solar spots* are not turned round with them, but keep their former situation: And moreover those of these *spots* which one day are seen towards the *East*, in the following days move forwards and are seen towards the *West*. These *spots* therefore of the *Sun*, are generated from those *Striate Particles*, which entering through its *Poles* do run towards the *Center*; from whence, because of their irregular figures, which they have got by passing the *Triangular spaces*, they are expell'd, as not being able to comply with the motion of the *subtil Matter*, which whirls round in the *Sun's Center*, and are cast off like *Scum* from a *boiling Liquor*; so that being endued with rugged and many *Corner'd figures*, and running round more slowly

than those which wheel about with the *Sun*, they become easily entangled and grow to a great bulk, which being contiguous to the *Sun*, and lying upon the face of it, do cover and involve it with *Darkness*.

It seems very probable, that as *Steams* do proceed from the *Body* of the *Earth*; so likewise *Fumes* and *Vapours* do exhale from the *Sun*, and are dissipated again, like those that sublime from the *Earth*. For tho' the whole *Sun*, at some time may be altogether free from any *spots*; yet is he frequently so beset with them, that GASENDUS hath observed no less than 40 of them; yea, they sometimes increase to that bulk, as to be visible without a *Telescope*; which hapned not only at the time of CHARLEMAIN, but also of late years, when KEPLER took one of those *spots* to be the *Planet* of *Mercury*.

The *Out-parts* of the *Spots* are sometimes bright, and represent several *Colours*; when in the mean time their *Middle parts* continue still *opaque*.

This proceeds from the *Matter* of the *Sun* that surrounds these *spots*; for tho' probably all of them may at the beginning be of the same thickness, and equally resist the *Light*; yet it may so happen, that afterwards they may be more extended in the *Circumference*, than in the *midst*; and by this means the *Sun-beams* being refracted through these thin brims of the *spots*, do exhibit several *Colours*; whilst all this while, the middle of them continues *opaque* and impervious to the *Solar Rays*. Because the most *subtil Matter*, which is predominant in the *Sun*, and in every *fixt Star*, hath not force enough to transmit its own *Action*, because its strength is broken by meeting with the *soft parts* of *Matter*: Or, if by chance the *Heavenly Globuli*, being whirld about by the force of the *Matter* of the *fixt Element*, endeavour to withdraw from the *Center*, and to communicate the *Action* of *Light* to our *Eyes*; yet is not that impulse strong enough to affect the *Sense*, except it be accompanied with a continual pressure of the *Sun* and *fixt Stars*, such as may be sufficient to overcome this Reluctancy, and dispose it for the reception of the *Action* of *Light*.

These *Solar spots* are more commonly discerned about the *Ecliptick*, than towards the *Poles*; according to the unanimous Assertion of most *Astronomers*; some whereof have been so accurate, in the description they have given of their progress, as to declare that these *spots* move about the *Rim* of the *Sun*, not in perfect parallel Lines to the *Ecliptick*, but with an inclination towards 3 Degrees and an half.

The Cause of this *Appearance* is, that tho' the *Particles*, whereof these *spots* be composed, have *Action* enough, when they proceed from the *Eclipticks* of other *Vortexes*, to pass through the *Poles* of the *Sun*, and to be carried towards its *Ecliptick*; yet when they are once mingled with the most *subtil Matter* of the *Sun*, not being able to comply with the most swift agitation thereof, are flung off towards the *Heaven*, where the motion is not so swift; as before hath been said concerning the *Scum*. Now the Reason why they are rather expell'd towards the *Ecliptick*, than towards the *Poles*, is this; because the new *Matter*, which

which continually enters through the Poles of the Sun, thrusts out the striate Particles, and all others that are easily entangled together, and drives them upwards. For the better clearing of this, let us suppose 2 Rivers flowing from opposite Points, the one from A to S, and the other from B towards the same S; and that their Streams meeting at S, and driving each other forward, make a deep Hole or Whirl-pool, *d e f g*; where, after having performed several Circulations, they continue their Course towards M and Y. Besides, let us suppose that by this forceable meeting of these Streams, much Froth is produced, which swims on the top of the Vortex S, and follows the motion of the Water. We shall easily apprehend, that this Froth cannot tend to A or B, that is, towards the Poles; but after having taken some compasses in the said Whirlpool, will take its Course towards M and Y, that is, towards the Ecliptick.

V.
The Spots of the Sun are sometimes changed into Torches, and Torches sometimes into Solar Spots.

The Spots of the Sun are sometimes changed into Torches; and those Parts which before were dark and misty, appear bright and shining: And, on the contrary, these Torches are sometimes turned into Spots.

The cause of this Change is the Ebullition of the Sun, whereby it continually casts out some of its parts, and soon after swallows, or takes them in again. For Spots are turned into Torches, when the Solar matter, which flows about them, is raised above their Rims, and by exerting its force upon them, does produce that Action, which reaching our Eyes, produceth that which we call Light. For seeing that the Matter of the Sun is intercepted between the spots themselves, and the surface of the Neighbouring Heaven, the swiftness of the motion is increased, because of the narrowness of the Space; which therefore must render the Light of the Sun more intense. As we find by Experience in Rivers, whose swiftness is increased, and becomes more strong, the narrower the Channel is, or when straitened by great Stones. But Torches are changed into Spots, and those which before were the more bright parts of the Sun become darkened, when that more subtil Matter, which lay upon their surfaces, is swallowed up by the Sun, into the room whereof, when abundance of New matter comes, whose particles cling together, they produce a close and dark Body.

VI.
What the Reason is, why the Sun hath for some days been without Light.

Histories assure us, that the Light of the Sun hath been frequently intercepted to that degree, that his Light did not much exceed that of the Moon. Yea, what is more, Histories tell us, that in PLINY's time, the Sun for 12 Days together was not to be found; and that when CONSTANTINE had his Eyes put out, it did not shine for 17 Days together, and that Darkness cover'd the Earth all that while.

I suppose, that no more proper Cause can be assign'd for this Obnubilation, than the Spots which at these several times did beset the surface of the Sun, and hinder the diffusion of his Light. For tho' these spots, at their first Gathering, be very soft and loose Bodies, which are able to break the force of the most subtil matter; yet the Matter of the Sun's Substance, continually beating against them, makes them smooth and hard, whilst the other part of them, which is turned towards the Heaven, still continues soft and loose,

as before. And therefore they cannot without difficulty be dissolved, because the Matter of the Sun doth continually rush against the inside surface of them; but rather increase continually, as long as these their Edges, which are raised above the surface of the Sun, are not made hard by the constant pushing of the said Matter. And therefore whenever this happens, it cannot seem strange, that one and the same spot should so spread it self over the surface of the Sun, as to intercept the Light of it, not only for many Days, but also for some Months.

These Spots sometimes appear of an Oval, and sometimes of some other figure, when they move in the utmost Circumference of the Sun's Body.

VII.
How these Spots come to appear of diverse figures.

The Reason is, because there they must needs appear less, when their Illuminated part is invisible to us, and the lesser dark part is only perceived by us; but the more they approach towards the middle of the Sun's Round, and in a right Line to our Eye, so much the greater and rounder do they appear to us. Another Reason also of their different Appearance, may be the various Configuration and Disposition they have amongst themselves, as when some of them happen to meet in the same Line of our Sight, and by this means do in part hide one another, for then they appear of a kind of Oval figure. And forasmuch as many of them do frequently thus meet together, and are afterwards separated again; it so happens, that some of them seem to us to be generated, and others again to be destroy'd or vanish; which then comes to pass, when spots of different Magnitudes and Distance (some of them moving more swiftly, and others more slowly) do hide one another; and when some of the lesser of them, and that are nearer to the Sun, are by degrees Eclipsed, and afterwards again uncover'd, and so appear, as before.

CHAP. XI.

Of Spots that appear in the Orb of the Moon.

There be 2 sorts of Spots perceiv'd in the Moon, some are perpetual, and which from the beginning have appeared in it, as proceeding from the make and disposition of her Parts: And others Temporary, which only are about the surface of her Body, and after a short time vanish and disappear again. The Perpetual spots, do always appear of the same dark and dusky Colour; and which way soever they be posited, with respect to the Sun, do always retain the same degree of Obscurity, and are much darker than those spots that are temporary.

I.
Of the Perpetual and Temporary Spots in the Moon.

This Phenomenon proves, that there is a great affinity betwixt our Earth and the Lunar Globe, and that like Bodies are found in them both. For we cannot imagine these constant or perpetual spots to be any thing else, but Seas which are diffused over the Body of it. For it is evident, that the Light reflected from Water, is much weaker than that which is reflected from the Earth, or any other solid matter; as we may see in our Sea, which doth not appear of a white, but of blewish, or Sea green Colour. We observe also,

that white things, when moistned, do become more obscure, and draw towards a black Colour. Let but some Water be spilt upon a Floor (to make use of GALILEUS his Example) and presently the moistned Bricks will appear of a darker Colour than the rest, because the water filling their pores, makes their surfaces plain and even; which consequently do unite the Rays, and direct them to one Point only. And seeing that fewer Rays are reflected from a Convex surface, than from one that is plain, the Light which from the Moon can be reflected to our Eyes, must be so inconsiderable in quantity and strength, as not to be so much as one 14000th part of her Diameter.

II. The Moon has some parts which are much brighter than the rest, and which do so strongly affect our Sight, as that they seem to be very distant from one another. Whence G A S S E N D U S tells us, that about the 3d or 4th day after the New Moon, we may for the most part observe, beyond the lower point of her Body, at the distance of about a 27th part of her Circumference, a certain bright Point, and sometimes also a 2d and a 3d, at a greater distance, whilst the Intervals betwixt them continue still in obscurity.

These Appearances give us good ground to conclude, that there be Mountains in the Moon, seeing that with the assistance of a Telescope, the Ridges of several of them are perceived very bright, which cast a most thick shadow, and that greater or less, according as those Eminencies are more or less distant from the Confines, which separate the enlightned part of the Moon from the dark. For it is observed, that these shadows decrease, according as the Illumination is increased, until that they do altogether vanish away upon the diffusion of the Light over the whole Hemisphere. And after that the Lunar Beams are come to the other Hemisphere, the same Ridges or Tops of Mountains do appear again, and cast their shadows, but towards an opposite Point. Which Appearances afford us an incontestable Proof, that the Moon hath her Mountains, as well as our Earth, whose Tops are illustrated by the Sun, and shed a great Light, whilst in the mean time her lower and more depressed parts, continue obscure and dusky.

III. About the 6th day of the Moon, towards the Western part of it, there appears the Face of a Man, with a broad Fore-head, a crooked Nose, a wide Mouth, and Eyes deep sunk.

This Appearance is caused by several Spots, that are depressed between the foresaid Prominences. For seeing that the Mountains in the Moon, do far exceed ours in height, they accordingly project great shadows, which renders their Intervals dark and obscure, and makes them look like spots residing in those places. This we find by Experience in the Mountainous parts of the Earth, which are thick set with Trees, and therefore appear more dark than bare and open Fields; because the Trees make a great shade, and hinder the Rays from proceeding further. Thus foras much as not only Rocks and Banks are discover'd in the Moon, but also very high Mountains; the shadows which they cast, may be so ranged as to represent the Fore-head, Nose, Mouth, Eyes, and Lips of a Man, but very deformed: Seeing that

it cannot be question'd, but that the even or plain parts of the Moon, which lye between the Mountains, are dark and reflect no Light at all towards us; and that therefore the spots, which represent to us the parts of some deformed Countenance, do not proceed from the Tops of the Mountains, but must rather be attributed to their Intervals, between which the shadows are projected.

But if any one enquire further, how it comes to pass that when we behold the Moon, we seem to see the Face of a Man, with Eyes, Nose, Mouth, &c. when indeed there is no such thing there.

To this I answer, that no other Reason can be assign'd for this Appearance, save only that the Footsteps or Traces of a human Countenance, are so deeply impress'd in our Brain, from our frequent, and almost continual beholding of the Faces of Men; that the Animal spirits, which have their Rendezvous in the Brain, not being able to penetrate the other parts of it, because of their Resistance, are easily turned aside, by the direct Light of the Moon impress'd upon them; and made to betake themselves to those Traces, to which the Ideas of a human Face are linked by Nature. And tho' others seem to behold in the Moon, a Man standing, or any other Appearance, this is only to be attributed to their Imagination, which having been strongly impress'd by such like Objects, have some Traces left in it, which are easily open'd again, by any thing that hath the least resemblance with them.

The Moon increasing, and being look'd upon through a Telescope, doth appear rugged and, as it were, with Teeth like a Saw; as if in the very confines of the Luminous part of it, there were some rugged and uneven Bodies, that did terminate that part of its surface.

The Reason is, because the Sun being then newly risen, and only darting his Rays side-ways, doth cast shadows towards the opposite part. And because this Section of the shadow is very unequal, because of the great variety and multiplicity of the Mountains against which the Solar Rays are reflected, the Face of the Moon must needs appear uneven and jagged.

No spots or shadows are discerned in the Moon, when she is at the Full; yea, those very parts which appear'd very black at the time of her Conjunction, do at the Full Moon appear most bright and refulgent.

The Reason is, because all the parts the Moon, then discovers to us, are illuminated by the Sun, who being directly opposite to her, doth enlighten all her most abstruse parts. Or, if any of her parts, by reason of their bending downwards, continue unenlightned, the same are cover'd by some nearer Parts, which turned towards us and them, and so do not appear to us at that time. To which may be added, that those Intervals which before were shaded, do not only at the Full Moon receive the direct Rays of the Sun; but also the Beams, which are reflected from the sides of the Mountains, by which reflexion all the parts of the Moon cannot but appear white and refulgent to our Eyes.

IV. Why the Face of a Man, rather than any other figure, is perceived in the Moon.

V. Why the Moon increasing, appears with Teeth like a Saw.

VI. Why the Moon at the Full, doth appear bright all over.

I. Comets through several Regions of the Hemisphere.

II. Why the Comets move from West to East, others from East to West.

III. Why the Comets consist of light.

IV. The Time of the Continuance of Comets is uncertain.

renewed or renewed.

I. **C**omets observe no certain Tract in the Heavens, but perform their Courses sometimes through this, and sometimes through another part of them. For some do first appear at the Sun's rising, others at his setting. The Comet which appeared in the Year 1585, was almost directly opposite to the Sun, and wanted but little of receiving his Rays directly: Whereas another that appeared in 1607, was first seen about the Bear, when the Sun was near the Winter Tropic.

The Cause of these Appearances will be evident to us, if we consider that Comets, are Stars cover'd with Spots, and swallowed up of other Vortexes. Now, forasmuch as they may happen to fall into any Quarter of the Heavens, accordingly they may sometimes pass through one, and at other times through another part of the Heaven; neither is there any part through which they may not take their course at some time or other. The place therefore of the appearance of Comets, is very uncertain, seeing that they promiscuously may pass by the Stars of any Asterism. So that Comet which appeared in 1618, did seem to come forth from the Rays of the Rising-Sun; when as others have been seen to appear from under the Beams of the Setting-Sun.

II. **C**omets seem to move every day, from East to West about the Earth; because the Earth moves the quite contrary way. But yet forasmuch as their own proper motion is indeterminate, those which come from a Vortex, which is towards the East, supposing they can continue their motion, will move towards the West; and those which proceed from a Vortex towards the West, must consequently move towards the East; yet with this Circumstance, that when they have once taken their determination towards the East, or towards the West, their Course is every whit as exact as that of the Planets; for after having 2. or 3. times calculated their Diurnal motion, it is easie to compose an Ephemerides of their whole Course, and to know as perfectly the degrees of their swiftness and slowness, as we know all the degrees of Heaven, through which they are to take their progress, and their various Configurations with the Stars.

III. From what hath been said, may be gather'd the Reason why a Comet at first appears greater, and afterwards continually decreaseth, until its total disappearance: For seeing that Comets receive their Light from the Sun, after that they are past out of our Vortex, they can no longer appear to our Eyes.

IV. **C**omets have no time prefix to their motion: For sometimes many years pass without the appearance of any of them; and at other times many are seen in one and the same year: As Historians tell us, that in the year 1618, there appeared no less than 3. or 4.

Forasmuch as Comets proceed from several Vortexes into ours, it is very difficult to determine, whether their Appearance be fortuitous and casual, or regulated and necessary: But howsoever it be, we are to consider it as fortuitous, because all the

Observations that have been made hitherto about this Matter, are not over exact. And if so be that Comets do never begin to appear in the Zodiac, it is without doubt, because the motion of our Vortex, which is very rapid in that part of it, makes their entrance that way more difficult, or, it may be, altogether impossible.

Comets do generally appear under the same Magnitude, inasmuch as that being beheld through a Telescope (if we will believe the Assertions of some) they do not appear greater, than when beheld without it.

The Reason is, because they are so far from us, that one and the same Comet may be perceived at the same time by several Spectators, tho' at a vast distance from one another, and that without any Parallax. So that they are probably concluded to be in that vast Space which is supposed to be betwixt Saturn and the fixt Stars. For the Comets are such vast Bodies, and are moved with such extraordinary swiftness, that they stand in need of that immense Space for the performing of their Courses; neither can any other places be assigned, wherein they can conveniently absolve them.

But how can it be, may some say, That Comets being beheld by Spectators with a vast Tract of the Earth between them, should exhibit no Parallax or variation of Aspect? This difficulty will be fully cleared by the Figure. For suppose we that some Luminous Body A, or F, placed in the lower part of Heaven, should be beheld by 2. Persons at a distance, D and B, at the same time; then will the Luminous Body A, which is seen by the Spectator D, appear over against the Luminous Body E; and the Luminous Body F, seen by the other, will appear over against the Luminous Body H. But the same Luminous Body A, when perceived by another Person at a distance B, will appear to him about the Luminous Body C. And the Luminous Body E, seen at the same time by the Person B, will be discover'd by him over against the Body G. And thus the Aspects of these 2 Bodies, A and F, according to their different situation, will produce a greater or less Parallax, as is C and E, or G and H. But if the Luminous Body be placed in the upper part of Heaven, about I; it will appear to both Persons, at a distance from each other, in the same place, that is, over against the Luminous Body K.

Comets, after a few Months or Days, do disappear and vanish. And therefore PLINY determines their longest appearance to 185 Days: Seeing that which was seen in Nero's time, and was lookt to be of the longest continuance of any other, was conspicuous only the time of 6 Months, tho' in all that time it scarce run through the one half of Heaven.

The Reason whereof is, because Comets, by passing from one Vortex to another, are driven towards the Circumference of them, because of their solidity: And tho' they every where retain the same degree of Celerity; yet because they have more Agitation, than to be stop't by the Matter of the Vortex, through which they pass, they slip into a Neighbouring Vortex, much like a Ship, which being carried contrary to the Stream of a River, doth in some degree comply with the motion of the River, but is at last driven to the Shoar.

Thus

Thus a *Comet* Courſing it ſometimes through this, and ſometimes through another part of *Heaven*, doth continually keep it ſelf at a diſtance from the *Center* of the *Heaven*, wandering only in the *Circumference* of it; and ſo by this means it comes to leave our *Heaven* within a few Days or Months, and paſs into others which are inviſible to us. Wherefore, if we meaſure the Space which the *Comets* run through, we ſhall ſeldom perceive it to reach the half of a *Circle*, and that moſt frequently it doth not exceed the quarter of one. And if at any time it happens, that their Appearance is continued 4 Months, or longer, this is becauſe they enter into our *Vortex*, near the *Poles* of it, where they find the Matter leſs agitated.

VIII. *Comets* about the beginning of their Appearance are moſt ſwiftly moved, and but ſlowly towards the end of it; according to the account which *Aſtronomers* give us of that which appeared in 1572; which at the beginning of its motion, proceeded 5 Degrees every day, and towards the End thereof ſcarcely Half a Degree.

The Reason hereof muſt be fetched from the diſtance of the *Comets*; for tho' *Comets* by paſſing through the Extremities or utmoſt parts of the *Vortexes*, do always keep the ſame degree of ſwiftneſs; yet becauſe at firſt they have run a good way of their Courſe before we ſee them, by reaſon of the Matter they bring along with them, which too much refracts the *Rays* of *Light*; and then do by little and little move towards other *Vortexes*, and withdraw from our ſight, therefore their Courſes appear more ſlow towards the end of them. After the ſame manner as when we ſee a *Traveller*, paſſing on his way with the ſame pace, as long as he is not at any conſiderable diſtance from us, we perceive no difference in his gate, until he be come to a greater diſtance, when he appears to us to move more ſlowly; not becauſe of his moving ſo indeed, but becauſe of his greater diſtance from us.

IX. Tho' *Comets* move more ſwiftly, when they firſt enter into any *Vortex*, than after that they have been there for ſome time; yet is the miſt of their Courſe ſwifter than any other parts of it; becauſe being then in their *Perigæum*, or place neareſt to the *Earth*, they are alſo in thoſe parts of the *Line* they deſcribe, which are neareſt to the *Earth*. Whereas, when they are at the beginning or end of their *Courſe*, they are about thoſe parts of the ſame *Line*, which are the moſt remote from us. To this we muſt add, that when a *Comet* at the ſame time is in his *Perigæum*, and his oppoſition with the *Sun*, his motion muſt appear much more ſwift, becauſe he is then nearer to us by the whole quantity of the *Excentrick* of the *Earth*.

X. *Comets* commonly ſhed *Hairs* from them, eſpecially on that ſide which is oppoſite to the *Sun*: But after a various manner; for ſome drag a *Tail* after them, others have a long *Beard*, others repreſent a *Rose*, by having theſe *Hairs* ſcatter'd round them.

This variety proceeds from the different *Heavenly Globuli*, that are found in our *Heaven*. For we ſuppoſe thoſe that are near to the *Center* of our *Vortex* to be leſs, but that they increaſe by

degrees, as they draw nearer to the Orb of *Saturn*; which after they have once paſt, they are all of them equal, and whirl'd about with the ſame degree of ſwiftneſs. Forasmuch therefore as *Comets* are carried in the utmoſt parts of the *Vortex*, and borrow all the *Light* they reflect to us from the *Sun*, it follows, that thoſe *Beams* of *Light*, which are communicated by the greater of thoſe *Globuli*, by that time they come to the leſſer, do not only paſs according to *Right Lines*, by which, as being the chiefteſt, the *Head* of the *Comet* is ſeen by us, but are alſo refracted and diſperſed ſide-ways. As if a *Veſſel* ſhould be ſo fill'd with *Bullets*, as that the great ones did lye upon the leſſer, we ſhall find, that upon boring a Hole at the bottom of the *Veſſel*, the greater *Bullets* lying at the top, muſt in their deſcent preſs upon more of the leſſer, and drive them down to *Right Lines*. And the ſame thing is obſerved in *Comets*: For ſeeing that the *Sun* is much about in the miſt between the *Comet* and the *Earth*, his *Rays* beating againſt the *Comet*, and ſcatter'd on every ſide of it, do produce the *Hair* of it: But when the *Earth* withdraws from the *Right Line*, which joyns the *Centers* of the *Sun* and a *Comet*, then the *Beams* of the *Sun* which are reflected towards us, do repreſent the *Body* or *Head* of the *Comet*; and thoſe which are diſſeſed towards the *Edges* of it, do repreſent its *Beard* or *Tail*. Which are called by either of their Names, as they either go before, or follow the *Body* of it.

The Figure will fully clear this Point. Let the *Sun* be S, the *Circle* through which the *Earth* runs in a *Years* time, 2, 3, 4, 5, according to the order of the ſaid *Ciphers*. The term or limit from whence the *Globuli* begin to grow leſs and leſs, D E F G, and the *Comet* in our *Heaven* C. It is apparent that the *Rays* of the *Sun* darted againſt this *Comet*, towards all the parts of the *Circle* D E F G H, are in ſuch a manner reflected thence, that thoſe that fall perpendicularly upon F, do moſt of them tend towards 3; but ſome of them are ſcatter'd this way and that way; and thoſe which fall obliquely upon G, do not only tend directly towards 4; but are in part refracted towards 3: And laſtly, that thoſe which fall upon H, do not reach directly to the *Circle* of the *Earth* 2 3 4 5, but being reflected, tend towards 4 and 5. Whence it is evident, that when the *Earth* is in the part 3 of her Orb, the *Comet* C will appear to thoſe that view it from thence, with *Hair* ſcatter'd on all ſides of it, which ſort of *Comets* are commonly called *Roses*: For the *Rays* that come directly from the *Comet* C, to 3, do repreſent the *Head* of it; and the weaker, which proceed from E and G, towards 3, do afford the appearance of its *Hair*. But if the *Earth* be at 4, then the ſame *Comet* will be perceived by the ſtrait *Rays* C G 4, and its *Tail* will appear directed only to one part, by the *Rays* that are reflected from H, and other places between G and H, towards 4. And in like manner, when the *Earth* is at 2, the *Comet* will be perceived by means of the direct *Rays* C E 2, and the *Hair* of it by the oblique *Rays*, which are plac'd between C E 2, and C D 2. Neither will there be any difference, ſave that when the *Spectator* is placed at 2, the *Comet* will appear in the Morning, with

XI. How *Comets* come to appear with *Tails*, *Hair*, or *Beams* like *Roses*. Figure 27. in the Inſtitutions.

with its *Hair* going before it, but to the *Spectator* placed at 4, the *Comet* will appear in the Evening, with a *Tail* trailing after it.

XII. Why none of these appearances are ever perceived in the Planets. The Reason why the *Planets* never appear with *Tails*, *Beards*, or *Hair* scattered round them like *Comets*, is because the *particles* of the 2d Element, which encompasseth them, are not big enough to make *Beams* that enlarge and divide themselves into many others; whereas those that are about the *Comets*, are always big enough for that purpose.

XIII. Whether Comets preface future events. *Comets* are commonly look'd upon as the fore-runners of great *Calamities*, and are supposed to preface *Storms* and *Tempestuous Weather*, *Destructions*, *Famine*, *Wars*, *Death of Princes*, *Plague*.

Thus the *Comet* that appeared in *VESPASIAN* time, is said to have prefigured his *Death*; others the taking of *Rome* by *ALARICUS*; the Murder of the Emperour *MAURICE*, and destruction of *MAHOMET*; the Death of *CHARLEMAIN*; the irruption of the *TARTARS* into *Silesia*, and the cutting off of the *Inhabitants Ears*.

Such Stories as these are common amongst the vulgar, and believed also by many who think themselves much wiser than their Neighbours. But if we examine the matter, we shall find that the appearance of these *Stars* had no connexion at all with the things that hapned soon after their appearance. For if *Comets* be the signs of *Wars*, the death of *Princes*, &c. Why do these ever happen without the foregoing prefiges? Why do *Kings* die, *Famine* and *Plague* prevail, when no *Comets* at all have discovered themselves to give warning of these accidents to the *World*? True it is, that these events are sometimes ushered in by *Comets*, but more frequently happen without them.

Moreover, seeing that *Comets* pass about the *Earth*, how is it that they foretell *Overthrow* and *Destruction* to some, *Success* and *Victory* to others? Probably indeed we might be induced to own this power in *Comets*, if *Kings* only died when they appeared; if they could distinguish between persons, or if they only aspect *Great-Men*. But since we always find the *Funerals* of *Princes* and *Great-Men*, accompanied with so many thousand of vulgar *Exequies*, have we not great reason to conclude, that they have no greater force or influence upon the former, than upon these latter?

XIV. The Affairs of Men are covered with great darkness. But some Body will say; it is certain that these kind of *Stars* are sometimes sent by God to denounce some calamity or other to the *World*. Be it so, for I will not deny it; but by what Argument can it be proved, that the appearance of a *Comet* is to denounce this or the other particular event, rather than another? Has GOD ever by Revelation made known to us, that when a *Comet* moves towards the *West*, it denotes danger from things Foreign and without; and when to the *East*, danger from within? It is sure enough, that the *Comets* have no Power over us, and that it is only our Folly or Ignorance that makes us afraid of them.

CHAP. XIII.

Of the Productions of the Stars.

IT hath hitherto been the common belief of most Men, that the *Stars* govern these inferior things; and by an universally diffused *Virtue*, preside over *Human Affairs*. Hence it is that they have attributed Heat to *Mars*, Cold to *Mercury*, Moisture to the *Moon*, as supposing their Dominion chiefly to consist in these qualities, and that they impart these to all their inferior Subjects. Therefore it is that they call the *Sun*, the Parent of the *Universe*, and the Great Artificer of all *Natural Works*; because they find that his presence imparts Life and Vigour to all *Natural Things*, as his absence, on the contrary, is the cause of their failing, wasting and Death.

Some Fancy Influences in the *Sun*, by which he concurs to the production of all *sublunary things*. But would they diligently give heed to the *Sun's Action*, they would find him to have no other but that of *Illumination*; or if they meet with any other, that they are reducible to it, as to their original. For that the *Sun* doth heat, dry and burn Bodies, proceeds from this Act of *Illumination*, which produceth these various effects according to the different disposition of the Subjects.

If any one say that Cold and Moisture, where with Bodies are affected, cannot be derived from the *Sun*.

I Answer, That these also by accident do proceed from the *Sun*; forasmuch as during his absence, the moisture is no more disscut and extenuated, and therefore the *Vapours*, either by their abundance, or by supervening Cold, become condensed, and moisten.

The *Sun* is the Cause of the *Tempestuous* and *Fair Weather*; and therefore when he is about the midst of *Sagittary*, upon the dissolution of those humours which before were bound up, and the *Earth* being watered with them, he produceth fruitful *Western Winds*: He stirs up the forces of the *Pleiades* and *Hyades* in *Taurus*; those of the *Kids* towards the *North*; those of his Neighbour *Orion* towards the *South*; and of *Arcturus* over against him, which stir up *Southern* blasts, and for some days together, do moisten with *Rains* the sown *Seeds*.

These and the like effects do not proceed from the *Sun*, as from a *special Cause*, but only as from a *General*, who diffusing his *Rays* every where, and promiscuously illuminating all *Bodies*, is not determined more to this effect, than to another. But if the *Sun* produce *stormy Weather* in one part of the *Earth*, and *Fair* in another, this is not so much to be attributed to him, as to the *situation* and *disposition* of the several parts of the *Earth*, which receiving his *Beams* after a different manner, are differently affected by them. For that we, for instance, have a pleasant *Summer*, and that our *Antipodes*, at the same time, suffer an unpleasant and sluggish *Winter Season*, doth depend on the *Sun*, who with a constant and even Course runs through the *Zodiack*, and uniformly diffuseth his heat. Who will say that the *Sun* is the Cause of *Tempests* and *Fair Weather*; when at the same time, he is the same on this side, or beyond the *Equator*? The reason therefore why

the Sun doth more copiously impart his *Light* and *Heat*, when it is *Summer* with us, is to be imputed to the *situation* of the *Earth*, that we tread upon, and which makes the difference between us and the *Antipodes*, with whom it is *Winter*; but not all to the *Sun*, to whom it is merely accidentary, that they are cold, whilst we have *heat*, or who darts his *Beams* obliquely upon them, whilst he is perpendicular to us.

IV.
In what
sense the
Stars are
said to be
for Signs
and Seasons

Neither doth it contradict any thing that we have said, what the *Scripture* declares concerning the *Sun*, *Moon* and *Stars*, that they were to be for *Signs* and *Seasons*, and for *Days* and *Years*. Because these things are no otherwise signified by the *Stars*, than by the *Swallows*, who by their coming and going, do preface the *Spring* and *Winter*; or as *Rainbows*, *Lightning*, *Darkness* and other changes of the *Air*, do indicate *Showers*, *Thunder* or *Fair Weather*. For as *Swallows* are not the Cause of the *Spring*, nor the *Rainbow* of *Fair Weather*, but only signs of either of them: So neither is the *Dog-Star* a cause of the great *Heats* we have at the latter end of *Summer*, but only a sign of the time wherein they happen. As shall be declared hereafter.

V.
Whether
the Moon
hath any
Dominion
over Sublu-
nary things.

The *Moon* contributes very much to the changes we have here below, for she not only raiseth violent *Winds*, excites *Storms*, and reduceth condensed *Vapours* into *Rain*: but moreover doth make *Seeds* to grow, and ripens the *Fruits* of the *Earth*, and encreaseth or lesseneth moisture, according as she encreaseth, or is in the wane.

Tho' all these things pass with the most of People for *indubitable*, yet we have good reason to affirm, that they are taken up without sufficient ground or reason; because *Storms* are raised, *Showers* moisten the *Earth*, and *Plants* encrease and ripen, as well when she is opposite to the *Sun*, as when she is in her first, or last Quarter; except we should say that she hath the power by the weak light she draws from the *Sun*, of moving or stirring those *humours*, which she is not able to discuss, and therefore is said to foment and encrease them. But let that *virtue* be what it will, sure it is that it cannot with any reason be ascribed to her, seeing that it belongs only to the *Sun* as a General Cause; who by his *Beams* produceth all the vicissitudes of *times* and *things*, which we see here on *Earth*. Hence are those Rules of *Astrologers*, that *Millet* should be sown in *April*, whilst the *Sun* is in *Taurus*; and *Wheat* in *October*, when the *Sun* riseth together with *Scorpius*, and when the *Pleiades* sink out of sight, as the same is elegantly described by *Virgil*, in the first Book of his *Georgicks*.

And Millet then your Annual care awakes,
When Taurus Golden-horns open the Year;
And Sirius leaves to other Stars the Sphear.
But if for Wheat and stronger Corn, thy ground
Thou exercise, and but a Crop propound;
First let the Eastern Pleiades go down,
And the bright Star of Ariadnes Crown:
Commit due Seed to Furrows then, and here
Trust Earth with hope of the ensuing year.

Hence it is, that the Poets call *Orion*, *Stormy* or *Tempestuous*; the *Vergilæ* or *Pleiades*, *Showery* or *Cloudy*; because upon their appearance the *Seas* are troubled with *Storms*, and the *Earth* with

Rainy and Cloudy Weather. I do not deny but that the *Stars* may be said to be the Signs of changes of *weather* and *seasons*; but by no means the *Causes* of them, as if by their Influence and Activity *Plants* did grow, and attain their Maturity; but only point out those times, wherein the *Sun* is more favourable to the growth of *Corn*, or when the *Sea* is most subject to *Storms*.

The *Dog-star* excites extream heats, and is sometimes so malignant, as to produce dangerous and Epidemical Diseases.

But this event is to be resolved as the former; for this intense *Heat* doth not proceed from the *Dog-star*, as if there were any virtue in him, to cause, and excite some extream hot *Spirits*, proper to inflame and destroy the healthful temper of mens *Bodies*: But because this *Star* doth arise at that time, when the *Sun* by his nearness to the *Earth*, doth very much dry up its moisture, and draw forth those exhalations, which infecting the *Air* first of all, do afterwards communicate the same corruption to *Bodies*. Hence it is, that the *Air* at *Rome* is at that time counted very unwholesome, because the Country thereabouts abounds with many *Caves* and *Holes*, whence the *Sun* raiseth many *exhalations* that are very prejudicial to health. But it is evident, that these effects cannot be attributed to the *Dog-star*, because that *Constellation*, when the *Heat* is at the height, is not advancing towards our vertical point, but withdrawing towards that of our *Antipodes*, and therefore ought rather to affect them, than us. For this is common to all *Stars* and *Constellations*, that they affect most those parts of the *Earth*, on which they dart their more direct *Rays*. Which since it doth not happen in the *Dog-star*, and that our *Antipodes*, at that time, are oppressed with Cold, when our Climate is scorcht with Heat; we may safely conclude, that the *Heats* we are sensible of, at that time, do not proceed from the *Dog-star*, but that there is a quite different Principle to be assigned for our heat.

How absurd it is to attribute Acute Diseases to the *Dog-star*, is evident from hence, because whereas that *Constellation* about 2000 years since, did arise about 23 or 24 days after the *Solstice*, that is, about the 7th of *July*, of our Style; it is still supposed to rise at the same time; whereas indeed the *Dog-star* doth not rise now till a month after, by reason of the motion of the *Fixt Stars* towards the *East*, according to the order of the *Signs*. And notwithstanding *Acute Diseases*, *Fevers*, &c. are commonly attributed to the former term, beginning at the 17th day of *July*. But who can believe that those extream Heats, we are sensible of in *July*, will ever be translated to *January*? When yet it is most certain, that after 10000 Years, if the *World* continue so long, the *Dog-star* will arise about that time.

The Virtue and Efficacy of the Planets are proved by certain Experiments; as that some of them influence Cold, others Heat; some under such an Aspect communicate Moisture, and under another Drought. Whence is that of *PLINY*, When the Grass and Herbs are grown, and that they stand in need of more Moisture, whereby they may arrive to their full growth and perfection; the *Sun* by entering the *Constellation* of *Cancer*, doth furnish and supply the same.

VI.
The Dog-
star hath
no virtue
for the pro-
ducing of
Heat or
Diseases.

VII.
It is absurd
to ascribe
acute Dis-
eases to the
Dog-star.

VIII.
The Planets
do not con-
tribute to
the Moi-
sture or
Drought of
Sublunary
Bodies.

This

This also, in a good Sense, may be said to be false and erroneous; for seeing that all the *Planets*, act only by the light which they borrow from the *Sun*, and that they reflect nothing but it, there can no diversity of *Effects* be infer'd from the variation of it. For all that can be gathered from their Conjunction with the *Sun*, is only this, that the *Air* is Hot in *Summer*, and Cold in *Winter*. But as to what Weather it will be the next Year, when the *Sun* shall enter this or the other *House*; when the *Dog-star* shall arise; or when *Arcturus* shall set; whether the *Winds* will be boisterous; whether we shall have a hot *Summer*, cannot with any certainty be known from any presage that can be taken from the *Stars*; since it frequently happens that the very Seasons of the Year are confounded, so as that we have cold *Summers*, clear and mild *Winters*, a hot *Spring*, and *Winter-like Autumns*. For the *World* is not governed in such an exact and settled order, but that great alterations happen in the Seasons of it, and make it look as if it were governed by hap and chance.

IX. Conclude we therefore, that no *Stars*, besides the *Sun*, who acts only by his *Light* and *Heat*, have any influence on things here below: And that therefore it is a vain thing for *Astrologers* to predict *Wind* or *Rain* from the Position or Aspects of the *Moon*, or from the same indication to prescribe the taking of a *Potion*, or *Blood-letting*, or to determine that it will be good or bad *Sailing* *Weather*; that *Trees* are to be planted, *Flowers* and *Herbs* watered in the increase of the *Moon*. From all which notions, I question not but men will be delivered, by considering their vanity, and that they are only grounded on such suppositions, the truth whereof can never be proved.

C H A P. XIV.

Of the Predictions of Astrologers.

I. IT is a thing notorious, that *THALES* the *Philosopher*, was skilful in *Astronomy* and *Astrology*; and that from this Knowledge of his, he was assured of a Dearth of *Oyl*, which came to pass accordingly.

Tho' this be a Story, commonly avouched by *Astrologers*, to maintain the *Glory* of their *Science*, yet it may easily be made out, that he did not conjecture this from any Rules or Precepts of *Astrology*, but from his continual Study of Nature. For being a great *Natural Philosopher*, and being well acquainted with the virtue and efficacy of *Water* (which he maintained to be the Principle of all things) he could not be ignorant what *Fruits* stood in most need of moisture, and how much they were beholden to *Rain* for their growth and increase; and in what season of the Year they thrive best. All these things he might easily know without the Precepts of *Astrology*, they being such, as no man, skill'd in *Natural Philosophy*, can be ignorant of. But if they will needs have it, that *Thales* foreknew this by his Skill in *Astrology*, why do not they do as much, who pretend to be so well vers'd in the said *Art*? How comes it to pass that they are always poor, if they, by their Skill, have the same opportunities of enriching themselves which *Thales* had? But the case is plain, that they themselves cannot trust the Truth of

their own Principles, and are afraid of spoiling their Credit, by a too peremptory assertion of any thing that is built on them.

And not without good Reason: For 1st, They are not certain of the Nature and Virtue, even of those *Stars* that are most known. 2^{dly}, Because the Nature and Virtues of most of the *Stars* are utterly unknown to them; which unknown Virtues may variously change and alter the operations and effects of those *Stars* that are known. 3^{dly}, Because they can give no Reason, why a Figure erected for a Childs *Nativity*, to guess at his Fate, *Manners*, &c. must be taken from the time of his Birth, rather than from that of his Conception. 4^{thly}, Forasmuch as the Aspects of the *Stars* are greatly changed in a small moment of time, by reason of the incredible swiftness of their motion; how will any Mother or Midwife be able so exactly to determine the very just moment of the Childs Birth, so as to make the *Astrologers Judgment* true and certain, which cannot be pretended, except the exact point of time be given him. Besides, 5^{thly}, We find that those persons, who were born and conceived at the same moment of time, are found to have different Natures, Manners and Destinies: And that persons of both Sexes, of all Ages, and born under several Aspects of the *Planets*, and in different Countries, do perish at the same moment of time by *Earthquakes*, falling of *Houses*, taking of *Cities* or *Shipwracks*. 6^{thly}, I would demand of these Men that are for Influences, whether *Discipline*, *Learning* and *Good Education*, or *Divine Providence* it self have no influence upon the Manners of men, to oppose and countermines this force and efficacy of the *Stars*? Probably it was for these, or the like reasons, that *Astrologers*, *Magicians* and *Diviners*, were by a most severe Edict of the Emperor *Tiberius*, banished out of *Rome*, and all *Italy*, according to the account *Dion* gives us, *Lib. 57*.

Neither is it of any consideration in this case, that the *Ancient Poets* have put the names of *Bears*, *Lions*, *Perseus*, *Hercules*, &c. upon the *Constellations*; forasmuch as this was not done by them, because they supposed them to have any particular influence upon *Bears*, *Lions*, &c. but only in commemoration of some strange and wonderful accidents, or to celebrate the memory of some of their *Ancient Heroes*, and their Achievements: In the same manner as *GALILEUS* not long since, gave the name of the *Medicean Stars*, to the secondary *Planets* by him discovered about *Jupiter*; not because of any *Medicinal Virtue* he supposed to be in them, but in honour to the *Great Duke of Tuscany*, whose Name is *de Medicis*.

Many have had the time of their death foretold to them: Thus *SENECA* makes mention of a certain person, who being told by an *Astrologer*, that his Death was at hand, went home, and 2 days after died.

To which I answer, that this effect doth not prove the Truth of the Prediction; for tho' a *Prognostication* be never so vain and ungrounded, yet it may strike such a fear into the person to whom it is declared, as may cause his Death to follow thereupon. For a person in this Case, finding himself altered and discomposed with the fright, he presently imagines, that this Illness is the sure fore-

II. Reasons that prove Judicial Astrology to be vain and false.

III. Whence the Stars took their Names.

IV. Many have had their Death foretold them by Astrologers, but without any certainty.

runner of his *Death*, and so kills himself by the strength of his Imagination. How many have by this means hastned their own ends, and have died for fear of *Death*? For it is not always the greatness of the Evil we suffer that troubles or torments us, but the conceit we have taken of it. Who doth not deride A R C H E L A U S, who, according to what *Seneca* tells us of him, at the time when the *Sun* suffered an *Eclipse*, commanded his Palace to be shut up, and had his *Sons Hair* cut off; which was never done but in sign and token of the extreamest Grief and Calamity? Or who would not deride the superstition of the *Thebans*, who shouted, beat upon *Bra's Instruments*, and rang *Bells*, to rescue the *Moon*, whom they supposed that some *Witches* were, by their *Charms*, about to pull down from her station in *Heaven*? For people commonly are not so much troubled with things, as with the *Opinions* and *Imaginations* they have taken up concerning them.

V.
Various things seem to have been truly foretold by some Astrologers.

But some will say, that at least it cannot be denied, but that *P. Nigidius*, the *Astrologer*, foretold to *Augustus*, that he should be Lord of the *Earth*, and the Successor of *Julius Caesar*. *Scribonius* declared concerning *Tiberius*, when he was yet an *Infant*, lying in his *Cradle*, that he should come to the *Empire*; and after having overcome manifold difficulties, should be the Sovereign of the *World*. *Largius Proculus* determined the day of *Domitians* Death; and *Asclepius* fixt the manner of it; who being thereupon demanded by the *Emperour*, whether he knew what kind of death he should die himself, answered that he should be torn to pieces by *Dogs*: Whereupon the *Emperor* to prove him a *Liar*, and to expose the vanity and groundlessness of his Predictions, commanded him presently to be burnt; which being put in Execution, as he was burning, a suddain storm of *Rain* falling, extinguish'd the *Fire*, whereupon the *Dogs*, falling upon the half-burnt Body pulled it to pieces and devoured it.

To all which I Answer, 1st. That we have ground to question the Truth of many of these Relations; not that I would make the veracity of all *Historians* doubtful, or suppose them to have inserted Lies, on set purpose into their Relations; but because I conceive them to have been too apt to give credit to the Report and Talk of the Common People, especially about those Rumours that were spread abroad concerning the *Birth* or *Death* of their *Kings* and *Emperors*. 2^{dly}. It is a thing notorious beyond dispute, that many of them did by all means endeavour to please and flatter their *Princes*; which they had no better way to do, than by inventing some things they knew would be grateful and acceptable to them; as by shewing that they had been by *G O D* elected and appointed to the *Government*; that they should be prosperous in their *Reign*, and enjoy long *Life*, and lasting felicity.

But that I may not seem to be too injurious to *Historians*, let *SENECA* speak instead of me; who living at the same time with them, was fully acquainted with their Manners and Temper. Neither, saith he, need we take much pains to invalidate the Authority of *Ephorus*: For, to say no more, he is an *Historian*: And how many are there of these, who hunt for praise, by relating of things

strange and incredible; and stir up their Readers Appetite (who should they relate common and ordinary things only, would never think them worth the reading) with some prodigy or miracle? Some of them are credulous, others are negligent; some of them are overtaken with Lies, others are pleased and delighted with them. Some do not take the care they ought, to avoid all falsities, and others desire them; and this may be said in common of them all, who think their Work will never be approved of, or become Popular, except it have a sprinkling of Lies. And as for *Ephorus*, it is well enough known, that he is not a Writer of the most Religious Veracity, but that he is often deceived himself, and as oft deceives others.

Indeed it may easily be proved, that many *Historians*, besides *EPHORUS*, have both deceived others, and been deceived themselves, in their Relations concerning *Augustus*. For seeing that *Augustus* could not be posselt of the *Empire*, till after the *Death* of *Cæsar* and *Pompey*, of whom the *Chaldeans* had foretold, that they should die, not by violent Deaths, the one in the *Senate*, the other in *Egypt*, but in their own Houses, and full of Years and Glory; how can we give credit to them, seeing they pronounce things contrary? And whilst they stumble upon one Truth, pronounce many Lies, and are deceived in all the rest?

But they will further urge the instance of *Asclepius*, who precisely told the manner of *Domitians* Death, and his own too; Whence had he this, but from the Stars?

I will not here alledge the Opinion of several Authors, who have look'd upon this whole story of *Asclepius*, as one of those Fables that run amongst the Vulgar. But shall only hint this one thing, that *Asclepius* might foreknow the Death of *Domitian*, without any assistance from his skill in *Astrology*, and that by very certain and unerring signs. First. For that *Tyrants* are hated by all men, and that few of them die in their Beds. 2^{dly}. He knew that many did lie in wait for *Domitian* to kill him, and that he was every way surrounded with Enemies. But as to what he foretold of himself, that he should be torn to pieces by *Dogs*, this he could not foreknow, but by near guessing at a venture; and therefore it seems most probable, that this was only a fiction, superadded by the Common People, to make the Story look more strange and wonderful; seeing that the most skillfull *Astrologers* do not extend their Predictions beyond Death; and therefore it is probable that *Asclepius* supposed not that his dead Carcass should be devoured by *Dogs*, but that *Domitian* would have exposed it to be torn to pieces alive by *Dogs*, for a punishment of this Boldness, in foretelling his *Death*. And if so, it is apparent he was mistaken, and that the Predictions of *Astrologers* are vain and uncertain; or if any thing they prognosticate comes to pass, it is only by chance and conjecture. Such were the foolish Prognostications of a certain *Astrologer*, who from the condition of the weather on *New-years-day*, would determine the Fate and State of the whole following Year. But who is so senseless as to believe such stuff as this, or to amuse himself with groundless Conceits and Imaginations?

VI.
How Asclepius might foreknow Domitians Death.

I.
Why the
Earth, as
containing
the Water,
is called a
Terrene
or Globe.

II.
The Earth
is but a
Point, com-
pared with
the vast
extent of
Heaven.

The Fourth Part OF THE HISTORY OF NATURE. OF EARTH, WATER, FIRE and AIR.

CHAP. I.

Of the Globe of Earth.

I.
Why the
Earth, as
containing
the Water,
is called a
Terraque-
ous Globe.

THE Earth, forasmuch as it contains in its Cavities the Waters, and together with them constitutes one Globe, is called the Terraqueous Globe.

For when we take a Voyage by Sea, sailing in the Atlantick Ocean, and passing through the Magellan Straits, towards the South Sea, and so on to the East and Ethiopick Seas, we find that all these Seas are encompassed with Shores. And in like manner, when we travel by Land, we shall find the Land bounded, on one side with the Atlantick and Ethiopick Seas, and on the other with the South Seas; and again, this way with the Eastern and Arabian; and that way with the Tartarian, Atlantick and Ethiopick Seas.

II.
The Earth
is but a
Point, com-
pared with
the vast
extent of
Heaven.

Tho' the Earth be of that vast extent, that its compass is of about 7000 French Leagues; or according to the later investigation of WILLOBRORDUS SNELLIUS, of 24624 Miles: Yet if we will believe Astronomers, it is no more than a Point, compared with the vast Circumference of Heaven.

Neither is this Assertion of theirs without ground: For so great is the distance betwixt the Earth and the fixt Stars, that it cannot be certainly determined, as exceeding all Calculation; and can scarcely be apprehended by our Imagination. The distance of the Planets may be discerned by their Parallax, or that variation of Aspect they afford to several Spectators in distant places; but the Fixt Stars are at so prodigious a distance, that no Parallax is to be found in the beholding of them, and the Semidiameter of the Earth, with relation to them, is as nothing. So that if some one of us should be supposed to continue in the

place of the Earth, whilst it was carried up towards Heaven; there is no question, but at its first rising, it would shew like a vast Globe; but as it mounted higher, would still decrease to our sight; till being got up as high as Jupiter, it would appear no bigger than one of the lesser Stars; and rising higher towards the Fixt Stars, would become invisible to us. And therefore the Earth which contains so many Seas, so many Kingdoms, so many Islands, yet is no more than a point, with respect to the Heavens. Yea, when compared to our Vortex, which hath the Sun in its Center, we shall find it so inconsiderable, that they who make Sundials, suppose the top of the Pins of them to be placed in the center of the Earth, whence they cast their shadows upon the surface of it; as if the difference were so small, that it comes to the same thing, whether they cast their shadows from the Center, or the surface of it, the distance being so very inconsiderable in comparison to the Sun's distance.

This may give us an estimate of the folly of Men, who for one point of Earth, wage so many Bloody Wars, yea, for the 1000th or 100000th part of it. This forsooth, as PLINY saith, is the matter of our Glory. Here we enjoy our Honour; here we exercise our Dominion; here we have our Riches and Possessions; here mankind continually Bustles, Toyls and Turmoyle it self; here we wage Wars, and soak the Earth with one anothers Blood; and our Swords destroy our own kind. But not to speak now of the publick feuds, and fury of whole Nations against each other: Here it is that we endeavour to lay one clod of Earth to another; and after having purchased all the poor pittances of our Neighbours about us, what a brave purchase have we made after all? And what great Reason have we to boast in being Possessors of not so much as the thousand thousandth part of a point? But this is to sing a Song to a Deaf-man; return we therefore to our Earth.

III.
How vain
Men are,
that make
such potter-
ing about a
filly point
of Earth.

IV.
How the
Earth
hangs
pois'd in
the Air,
without
any thing
to support
it.

The *Earth* hangs in the midst of *Heaven*, without any *Pillars* to uphold it; and, as if it were immovable, doth ever keep the same distance from the *Heavenly Orbs*.

This happens to the *Earth*, not because it is the *Center* of the *Universe*, as it is commonly supposed, and that all the *Celestial Orbs*, are rolled about its *Circumference*: For should we grant this to be, yet would the difficulty still remain, why the *Earth* does not reel from its place; why it doth not either mount upwards, or fall down. For if it be *Heavy* by Nature, how comes it to pass that it doth not rush downwards? If it be *Light*, why does it not fly upwards? Conclude we therefore, that the *Earth* doth hang pois'd in the midst of the *Air*, by means of the subtil matter, which continually whirls round it, and pierceth all the pores of it. For seeing that the *Heavenly matter*, which on all sides surrounds the *Earth*, is whirl'd about it with one and the same degree of *Swiftness*, which far exceeds that wherewith the *Earth* is moved, it cannot but hinder it from falling, or mounting higher. For as *Birds* are upheld by the *Air* from falling; so the *Earth* and the *Moon*, which circulate in the same *Vortex*, are supported by the same Matter that carries them along, and hindred from Reeling any way from their *Centers*.

V.
Why the
Earth, by
its weight,
doth not
come nearer
to the Sun.

The *Earth*, notwithstanding its weight, yet is not driven to the *Circumference* of the *Sun's Vortex*; but being kept within its bounds by the *Heavenly Globuli* that surround it, continues at a certain distance, viz. in the midst, between *Mars* and *Mercury*, without passing any further.

The Reason is, because the *Planets*, amongst which the *Earth* is, by reason of their different degrees of *Solidity*, are more or less removed from the *Center* of their *Vortex*: So that *Saturn*, who is at the greatest distance from the *Sun*, is more solid than all the rest. And the *Earth*, tho' it seem to be a close and compact *Body*, yet is not of that *Solidity*, as to sway it more towards the *Circumference* of its *Vortex*; forasmuch as *Mars*, who is much less than the *Earth*, yet is also more solid, by reason of the closer entanglement of its parts. Fortho' the *Earth*, as to its surface, be very compact and solid, yet with respect to its bulk, it may well be accounted light; because the surface of it is not above 2 or 3 Mile in thickness, which is very inconsiderable, if compared to those vast *Cavities* it hides within its Bowels. And therefore as little *Ships*, such as have no great force, are easily kept in the *River*, and carried by its motion: So likewise the *Earth*, being fallen into the *Vortex* of the *Sun*, always keeps the same place, in which, by reason of its *Solidity* it is ranged, and cannot be pushed any further towards the *Circumference* of the *Sun's Vortex*.

VI.
The Mag-
netical
virtue of
the Earth,
doth but
weakly
affect Iron.

The *Earth* communicates a *Magnetick* force to *Iron*; but the same is so weak, that it easily loseth it, and admits the contrary. Thus when we turn the End of a *Bar of Iron*, as yet not endued with any *Magnetick* virtue towards the *Earth*, immediately in that End which is inclin'd towards the *Ground*, it will obtain the force of the *Southern Pole* in these Northern parts, which in a moment it will lose again, and obtain the contrary; if that End which was towards the *Earth*

be turned upwards, and the other End inclined downwards.

The Reason whereof is the weakness of the *Magnetick* force that is in the *Earth*: For seeing that the *striate Particles*, which proceed from out of the *Earth*, do return thither again through the inner *Crust* of its upper *Region*, whence the *Metals* are dug up, it so happens that very few, or none of them return through our *Air*; those only excepted, who do not find a Passage in the said inner *Crust* open for them. Hence it is that *Load-stones*, that have fit pores for the reception of the said particles, have also a greater force to attract *Iron*; because the *striate Particles* meet with pores in the *Load-stone*, which are ranged in like manner, as are those of the inner *Crust* of the *Earth*. Whereas, when they pass through the *Air*, or through other *Bodies* of the outward *Crust* of the *Earth*, where they find no such pores, they move with more difficulty, and consequently also fewer of them come to us.

Persons that Travel from North to South, find that the Northern parts of *Heaven* sink lower and lower, and by degrees withdraw from their sight; but they who pass from South to North, do find the Northern parts of *Heaven* to be raised higher; so that after having Travelled 73 Italian miles in length, or 24 common French Leagues, the Northern Pole will be raised a Degree higher.

This Experiment proves the *Earth* to be Round; for if the *Earth* were plain, no such Change could be perceived. For tho' we should suppose a Man to be plac'd directly under the Pole, yet would there be no change in the elevation or height of the Pole; for if he should withdraw from it in a *Right Line*, the depression will not be equal, nor after he hath Travelled onwards 73 Miles, would he find one Degree left behind, but the withdrawing will become still less and less, because of the continual decreasing of the Angle: So as that at last 73 Miles would scarcely make a depression of 1 minute of a Degree: Which is contrary to daily Experience.

The Roundness of the *Earth* is not hindred by those high Mountains that are found on the surface of it, many of which rise much higher than the Clouds, as *Olympus*, *Athos*, and the Peak of *Teneriff*. Because the Roundness that is attributed to the *Earth* is not *Mathematical*, as if the Lines drawn from the *Center* to its *Circumference* were all perfectly Equal; but only *Physical*, that is, such a Roundness, as is suitable and convenient for the *Universe*; forasmuch as these *Inequalities* are of so great moment, that they do not come into any consideration, when compar'd with the vast amplitude of the *Body*. For seeing that the *Semidiameter* of the *Earth* is of 860 miles, the proportion of the greatest height of the Mountains, to the *Semidiameter* of the *Earth*, will be as one 1 to 860. And forasmuch as there be but very few Mountains that are perpendicularly so high, and that the most of them are scarcely one Quarter of a Mile in Height, it is evident that they can no more spoil the Roundness of the *Earth*, than some small Unevennesses in the Round Balls made by Artificers, do hinder their being Round. For indeed, there is not a *Body* to be found in the whole *Universe* that is perfectly and absolutely Round, that is, which hath an exact *Geometrical Roundness*.

VII.
They who
Travel
from North
to South,
find the
Northern
parts to be
withdrawn
from their
sights.

VIII.
The Moun-
tains do
not hinder
the Round-
ness of the
Earth.

This

IX.
The Variation of the Altitude of the Pole, proves the Roundness of the Earth.

This *Physical Roundness* of the *Earth* may be demonstrated by the following Experiment: When a Man travels North or South, he will find the Altitude or Elevation of the Pole to vary continually, whether he go a Plain-way, or Up-hill and Down-hill: So that if being at the Foot of a Mountain, and having observed the Elevation of the Pole, he Travel the whole day towards the South, he will not perceive the Elevation of the Pole to be increased, but rather decreased, by that time he comes to the top of the said Mountain. Neither will he in like manner find the same Altitude decreased, but diminished, if having taken the Elevation of the Pole at the top of the Mountain, he goes down again to the bottom of it. Which is an evident Proof, that the *Deconvexity* or bending downwards of the *Earth*, is every where perceptible, and that a perpendicular falling upon any different Points, whether of *Acclivity* or *Declivity*, do all tend downwards by different Lines, that will meet at last in the Center.

CHAP. II.

Of Water.

I.
Water is more hard to be congealed, than Oil.

WE daily Experience, that *Water* is more difficultly congealed than *Oil*, and that it never is frozen without there be a vehement Cold in the *Air*: Whereas *Oil* is apt to congeal in any place, where the *Air* is only inclining to Cold. And, on the other hand, *Water* is sooner turned to *Vapours* than *Oil*, if they be both exposed to the *Sun*, or set over a *Fire* of the same heat.

The Reason why *Water* is fluid, and doth not so easily congeal as *Oil*, is, because it hath smooth and slippery parts, like *Eels*; which tho' they lye close, and be entangled together; yet they never stick so close, but that they may be easily separated again. Whereas *Oil* consists of Parts which are easily entangled, and stick fast and close together: Which is the Reason why *Oil* is not so easily resolved into *Vapours*, as *Water*, the parts whereof, by the agitation of the subtil matter, are easily separable and hang but loose together.

II.
Why Water will not easily mix with Oil.

From hence it appears also, why *Oil*, or *Air*, cannot, without great difficulty, be mingled with *Water*; because their parts do more easily joyn together, than with the parts of this: For if you beat *Water* and *Oil* so long together in a *Vessel*, till they appear as one and the same *Liquor*; yet cannot they continue so long, but that the parts of *Oil* meeting again with one another, will cling together, and form several Drops, which being carried to the top of the *Water* by their Lightness, will there continue, whilst the parts of the *Water*, at the same time, do likewise run together into Drops, and so by their weight fall down to the bottom of the *Vessel*.

III.
That Water is not Cold, as Aristotle would have it.

From what hath been said, may likewise be gathered, that *Water* is not cold of its own Nature, according to *ARISTOTLE's* Opinion, seeing that it admits heat, and doth not let it go, but by imparting it to the *Air*, which is colder than it. We find also, that when a River freezeeth, the Ice begins at the Top, that is, in that part which is touch'd by the cold *Air*: Which would not happen so, if the *Water* were cold of its own Nature; for then it would begin to freeze either in the midst,

or at the bottom; or at least would freeze as soon in the midst, as at the top; which yet is contrary to Experience.

And for the same Reason it is, that *Wine* is not so easily congealed as *Water*; because in the *Wine* there be many subtil particles, easily moveable, and which are swiftly and readily agitated by the *Celestial matter*, which because of their subtilty are called *Spirits*. And therefore it is, that by how much stronger the *Wine* is, so much the harder it is to be frozen; and that the Spirit of *Wine*, when freed from its *Pblegm*, doth elude all the extreamest force of Cold. And accordingly it hath been found by Experience, that if a *Vessel* of some Rich *Wine* be exposed to the *Air*, in extream Cold weather the watry part of the *Wine* will be frozen, and the *Spirits* will continue liquid and fluid in the Center of it.

The weight of *Water* is not felt at the bottom of a *River*: Which is a thing experienced by *Divers*, who are not prest down by the water that lies upon their Heads; but are as much at liberty for all that, as if they were in the free and open *Air*.

The Reason whereof is, because no more of the water doth exert is gravity upon the Body, than would descend, in case the Body did remove out of its place. For suppose we a Man placed at the bottom of the *Vessel* B, and lying in such a manner with his Body on the Hole A, as to hinder the water from running out of the *Vessel*, he will find that the whole weight of the Cylinder of water A B C doth lye upon him, the Basis whereof I suppose to be of the same bigness with the Hole A; who, if he himself should pass down through the Hole, the whole Cylinder of water would descend likewise; but if we should suppose the man placed somewhat higher at B, so as not to hinder the Egress of the water at A, then would he no longer perceive any weight of the water which lies upon him between B and C; because if he should sink down towards A, yet the water would not fall down with him; but on the contrary, that part of the water which lies under him towards A, to the same bulk as his Body is, would come up into his place: Whence it appears, that the water rather carries him upwards, than bears him down, as may be proved by the Example and Experience of *Divers*. For which Reason also it is, that they cannot reach the bottom of the *Sea*, without some weight hung at their Feet.

For the same Reason it is, that Bodies which being weighed in the *Air*, are found to be of Equal weight, do lose the same equality when they are weighed in the water. Thus when *Lead* and *Copper* being weighed in the *Air*, are found of equal weight, if they be weighed under water, they lose the same: Because the *Lead* takes up less place in the water, than *Copper* of the same weight does; and therefore in water it must needs preponderate, tho' in the *Air* it was of equal poise with the *Copper*.

Water, if it stands still without motion for a while, or if it be kept close in a *Vessel*, doth putrefie and stink.

The Reason is, because tho' some small quantity of *Salt* and *Sulphur* be found in water; yet, because upon its standing still, they become loosed from

IV.
Why Wine is frozen sooner than Water.

V.
A Man under Water, doth not feel the weight of it.

Figure 18.

VI.
Things weighed, that are found to be of equal poise in the Air, do lose the same when weighed in the Water.

VII.
How water comes to putrefie or corrupt.

front the union they had with the parts of the water, and run together; they consequently do easily evaporate, and thereby cause Putrefaction. Whereas, as long as the Water continues in motion, the particles of the Salt and Sulphur, are mixed with those of the water, and by this means become entangled, and are hindered from flying away, and leaving the water destitute of that which doth preserve it from Putrefaction.

VIII.
Why the
Water
sinks, or
rises
higher in
a Vessel.

Water contain'd in a Glass-Vessel or Tube, without filling it to the top, appears lower in the midst, than at the Sides or Edges. Whereas, on the contrary, if the said Vessel be fill'd to the very top, it will appear swell'd and higher at the top, and inclining to a Spherical figure.

The Reason is, because the Air presseth down the middle part of the water on every side, in a Vessel that is not quite full; whereas it only presseth the out-sides of it more obliquely. But when the Vessel is full of water, besides that the water is more firmly closed in the Vessel, its middle parts are only drawn together by the Air that lies above them; whereas the Extream parts are compressed, as well by the Air that is above them, as by that which is on the Edge or Brim of it.

IX.
What is
the Cause
of the
Roundness
we find in
the Drops
of Water.

The Drops or Bubbles that are seen in water, are Round; but as soon as they touch others, they unite, and are confounded with them.

The Reason of their Roundness, is the equal pressure of the ambient or enclosed Air. For a Drop of water, being, as it were, pois'd on its point of Contact, is equally prest on all sides by the Circum-ambient Air. And as soon as it toucheth another Drop, because the pressure in the place of Contact is thereby weakned, it presently becomes joyned with it. And therefore it is, that those hanging Drops, which are, as it were, supported every where, and surrounded by the Air that doth encompass them, are driven that way, where there is no Compression; that is, towards that part where they rest upon solid Bodies. And if you touch a hanging Drop, at the lower part of it, it immediately follows; because the Air doth not press at the point where it touches a solid Body.

X.
Whether
the same
Roundness
is not
observed
in the
Drops of
Spirit of
Wine.

But the Drops of Spirit of Wine are never Round; for seeing that this Spirit is very light, it consequently abounds with so many Pores, and its surface is so much interrupted, that but few parts of the Air can apply themselves to it, in order to their compressing of it into a Round figure, seeing that the most of them run through it, endeavouring the destruction of it. And therefore if this Liquor be poured down from on high, it doth not fall down in Drops like water, especially if it be highly rectified, but is immediately dissipated in the Air, that no sensible part of it comes to the Ground: Or, if it be pour'd on a Table, cover'd with Dust, it doth not turn into round Drops, but spreads it self every way, and mingles it self with all the Bodies it meets with.

XI.
Whether
Water
may be
made of
Air.

Air is sometimes condensed into water: Which we see in the production of Fountains, the Cause whereof the Ancients very probably assign'd to be, the changing of the Air into Water; which change is facilitated by the rest or stagnation of the Air in those parts, and by the coldness of the Rocks. For it is found by Experience, that Foun-

tains are most commonly generated in such places as these.

The Maintainers of this Opinion do very well to add the word, *Probably*, seeing there be several that utterly deny this, and prove the contrary by Experiment. A Modern Person, and great searacher into the Nature of things, took a Glass-Vessel with a long Neck, containing a Quart, and sealed it Hermetically; which Vessel, wherein was contained nothing but Air, he plac'd in a Barrel full of water, and left it there the space of 3 years, and never removed it thence all that time, save only to observe, whether any change had hapned to the Air; but he never could perceive the least alteration, or that any part of the Air was changed into Water; which according to the former Supposition ought to have hapned, because of the moist and cold water, wherewith the Air was surrounded on every side. Which proves them to have been mistaken, who supposed that that which was sufficient to turn Water into Ice, would also turn Air into Water: Since this change could not be brought about, by means of cold and moisture, in the time of 3 years. And the Reason of it is plainly this, because the particles of the Air being very subtil, are so continually agitated by the motion of the subtil matter, that they always are tost through one another, and therefore can never be turned into Water, no not by means of the most intense Cold.

A Rope, or Cord, if it be sprinkled with water, so that it sink through it, becomes contracted, and is not so long as it was before.

The Reason is, because the several Threads, whereof the Rope is composed, are as it were so many Pipes, which are blown up by the letting in of water into them, and so become shorter. Hence it is that the Strings of a Lute break in moist and wet weather, if they be wound up too high: For that the Threads of them, turning round like a Screw about other greater Cylinders, do by this means become contracted, and lose something of their length.

All Water, but more especially Rain-water, is insipid, and hath either no taste at all, or such as is hardly perceptible.

Tho', to speak exactly, there be no Bodies in this Universe that are altogether insipid; yet are some so called, because they are not endued with any eminent or very perceptible Taste; such as are some cold and waterish Herbs, the Raw white of an Egg, and Common water; because their particles have smooth surfaces, which do not enter the pores of the Tongue, nor can vellicate or twitch, but only glide over it. Thus Air is look'd upon to be insipid, because it swims upon our Spittle, and not mingling with it, makes no impression at all upon the Nerves. And for the same Reason it is, that fat Liquors do relish less than others.

Filtration cannot be performed, but with a piece of Cloth, that is thoroughly made wet with water: Or, if you will, Water will not ascend by a Label of Linnen or Woollen cloth, nor run down by that part which reaches down on the outside of the Vessel, except this part be first thoroughly made wet: For if the propendent part continues dry, the filtration can never proceed.

XII.
Why a
Rope being
sprinkled
with wa-
ter becomes
shorter.

XIII.
In what
sense Water
is said to
be insipid.

XIV.
In Order
to the
filtering of
any Liquor
by a slip
of Cloth,
the Cloth
must first
be moist-
ned.

The Reason is, because in *filtration*, the outward parts of the *water*, wherewith the cloath is wetted, do so insinuate themselves into the *Threads* of it, that they produce there a kind of *thin skin*, through which the inner parts of the *water*, which are in continual agitation, run downwards, and are carried towards that part of the *Cloth* which hangs down without the *Vessel*. Whereas, when any part of the *Cloth* continues dry, and unextended by any *Liquor*, so long this *Pipe* cannot be compleated, which is necessary for the conveying of the *water*; and therefore it is necessary that the whole *Cloth* be moistned. For we must not imagine, that the part of *Cloth* which hangs down without, becomes moistned, because the *water* that is contained in the *Vessel* is driven upwards, for this would be contrary to Nature; but the reason of it is this, because that part of the *filter* being dipt in the *water*, its *Pores* are thereby widened, and so prepared to admit more *water*, which by degrees entring more copiously into the same, doth still more widen the parts, and so continually makes way for the following *Liquor* to ascend.

XV. After the same manner as *Liquors* mount up by *filters*, so likewise doth *water* ascend in a *Pipe* full of *Sand*, placed perpendicularly in a *Vessel* full of *water*, and whose bottom or lower end, is stoppt with such a *Body* through which the *water* can penetrate. For if we leave this *Pipe* thus, the time of 24 hours, we shall find the *water* to be mounted up in the *Pipe* through the *Sand*, about 18 inches high above the *Level* of the *water*, that is in the *Vessel*.

XVI. Those that *Swim* take notice, that the *water* of *Rivers* doth not every where flow alike, and that the stream of the *River* runs more slowly at the bottom, than at the top. It is not so in all *Rivers*, but only in such whose bottom or channel is uneven, and hath deep holes in it; for where all the parts of a *Channel* are level, there is no reason why the course of the *River* should be more slow at the bottom than at the top. Conclude we therefore, that this happens in such *Rivers* only when the bottom is interrupted with deep holes, where the *water* is detained longer, than it would be on a *level*, and consequently doth not move so swiftly as the *Surface*.

XVII. Hence it is evident that *water* always takes its course that way, where it finds a *down-hill*; for seeing that the upper parts of the *water*, do by their *weight* press those that are under them; and that they by reason of their fluidity, except they be kept in on the sides, do spread and slip away; it must needs be that when the *water* is upon a hanging ground, and its lower parts press by the upper, it must give way and run downwards, to avoid that pressure. For a *down-hill ground*, is more open than a plain or level, for seeing it is nothing else, but a range of perpendiculars the one shorter than the other it, cannot be otherwise, but that the *water* that lies upon a *shelving ground*, upon its being pressd must slide down, towards the shorter perpendicular. So that it is manifest that no *water* flows upon the *Earth*, but what moves *down-hill*, by reason of the shorter perpendicular.

Let a *Glass Vessel* be made, with a narrow *Arm*, and fill'd with *water*: The *water* which is in the *Vessel*, will not be able to thrust the small quantity of *water*, which is in the *Arm* out of its place, nor lift it up higher, tho' it be in much greater quantity, and exceed it in weight.

This effect is to be attributed to the *Heavenly matter*, which is most swiftly carried round the *Earth*, and drives all *Earthly Bodies* towards the *Center* of their motion. For seeing that the *water*, which is in the *Vessel*, and that in the *Arm* of it have an equal *Surface*, they are consequently alike pressed downwards by the *Heavenly matter*; and therefore that great quantity of *water* which is in that large *Vessel*, hath no power to push the little *water* that is in the *Arm* out of its place, or to raise it higher.

The *Surface* of the *water* is more difficultly divided, than the more inward parts of it: For little *Steel needles*, being laid crossways on the *Surface* of the *water* swim upon it, but as soon as they have divided the top of it, do without stop sink to the bottom.

The Reason is, because tho' the parts of the *water* be uniformly moved, and constitute a smooth and even *Surface*; yet the parts of the *Air*, that surround the *water*, are agitated after a different manner, without any such uniformity in their Motion; by which means it comes to pass, that the *Surfaces* of *Air* and *Water* become smooth and polished; as we see that rough *Bodies* are polished by rubbing against each other. Now it is apparent that *smooth Bodies* are more apt to resist, and exert a greater force in putting by other *Bodies*. And therefore it cannot seem strange, seeing that the *Surface* of *water* is more difficultly divided, than its under parts, that it should support *Steel needles* laid upon it. Yet to this end, the *Needle* must be very slender, and must be laid a thwart upon the *water*, for otherwise the effect would not follow.

From what hath been said may be gathered, why a *Ship* with a sharp *Keel*, doth draw more *water*, and better cuts the *waves*, than that which hath a broader. For a *Ship* pusheth and takes up so much *water*, as its weight is, and all it contains, that so the *water* may be prest equally on all sides. Now the sharper the *Keel* is, with so much the lesser compass it doth beat back and push against the *water*, and doth more easily divide it, than when it is broader; for then it draws but little *water*, and pusheth away a greater quantity of it. And therefore it is, that the Foundations of the *Arches* of a *Bridge* are made sharp pointed towards the *water*, that it may slantingly slide by without exerting its force upon them.

CHAP. III.

Of the wonderful Properties of some sorts of Waters.

Some *Waters* are *hot* when they break out of the *Ground*; yea there are some *Springs* that are so *hot*, as to boil an *Egg* hard that is put into them.

Some derive this *heat* that is found in *hot Baths* from *Subterraneous Fires*, which lye hid

XVIII. *Water* contained in a *Vessel* of unequal thickness is not driven forwards by a greater bulk of *water*.

XIX. Why a *Needle* swims on the top of the *water*.

XX. The sharper the *Keel* of any *Ship* is the more *water* it draws.

I. Of the cause of *hot Waters* or *Baths*.

in the *Bowels* of the *Earth*, and are diffused up and down through it by certain *Channels*, which as the *water* passeth through, it becomes heated. But this doth not seem agreeable to Reason; for whence are these *Subterraneous Fires* fed and maintained, where is their *Fuel*, or how can the same be kindled into a flame under ground? Or how comes it to pass that these *Fires* are not choaked by the smoak that proceeds from them? Or why do not they dilate themselves, and breaking out at the *Surface* devour all before them? It seems therefore more probable, that this heat of some *waters* is the effect of a mixture of *Liquors*, proper to produce that quality; as we find that *water* poured upon quick *Lime* grows hot; and the same effect ariseth from the mixture of *Oyl of Tartar*, with *Oyl of Vitriol*; and *Butter of Antimony*, with *Spirit of Niter*: Which though singly they be cold *Liquors*, yet when put together, produce a very intense heat; for if *Oyl of Tartar* be poured into *Aqua fortis* wherein *Iron* is dissolved, it will not only work and boil, but break forth into a *Flame*.

Conclude we therefore, that the heat of *Baths* proceeds from a mixture of *Fews Lime* and *Brimstone*, which being united together produce heat by effervescence.

II.
The heat
of Baths,
doth not
proceed
from subter-
raneous
Fires.

That this is so, may be evidently proved from hence, that the *water* of hot *Baths* being set upon the *Fire*, is as long a boiling as any other cold *water*: Neither doth it scorch and burn the *Tongue* as common *water* doth, which hath acquired a like degree of heat from our *Culinary Fire*; which shews that the Subject of this heat is a thin *Vapour*, which doth not so much penetrate the parts of the *Tongue* and *Mouth*. It is found likewise that this *water*, doth not boil and make tender, soft and juicy *Herbs* that are put into it, such as *Sorrel*, &c. as soon as common *water*, that hath the same degree of heat. The reason whereof seems to be, because the *Volatile Sulphurs*, that produce the heat in these *waters*, do so insinuate themselves into the *Pores* of the *Mouth*, or of the *Leaves* of *Sorrel*, that they hinder the *water* from entering into them; or because the heat of these *waters* doth wholly consist in these *Sulphurs*, the parts whereof are so *Subtile*, that they cannot exert their force, neither upon the *Mouth*, nor upon the *Leaves* of *Sorrel*; for the very same reason that the flame of *Spirit of Wine*, will not burn a *Handkerchief* that hath been dipt in it.

III.
Corrosive
Spirits do
dissolve
Metals, and
rather act
upon hard
than soft
Bodies.

Corrosive Spirits, or *Stygian waters*, as the *Chymists* call them, do penetrate the hardest of *Metals*, and in a short time do dissolve them; but act little or nothing at all upon *Wax* which is soft, but leave it in a manner untouched. The said *waters* do also more easily dissolve *Iron* and *Steel*, than *Lead*, which is softer than they, and more easily divisible.

The reason is, because these *Corrosive Spirits* do not meddle with those *Bodies* that give way to them, but crumble them to pieces that oppose and resist their entrance. Which will be easily apprehended by those who know that all *Bodies*, do not consist of the same parts, nor have their parts joyned in one and the same manner, but suitable to the variety of their *Bulk* and *Figures*. For as a heap of *Earthen Vessels*, may with a

Stick be broken into a Thousand pieces, whereas *Wool* being struck with the same Stick and force, doth admit no change at all; and as *Wool* may be easily cut with the edge of *Knives* and *Scissars*, whereas *Earthen Vessels* cannot; so we may easily understand, how some *Bodies* are easily dissolved by *Corrosive Spirits*, whereas others are scarcely toucht by them.

Historians tell us of a *River* in *Epirus*, producing contrary effects. In *DODONA*, saith *PLINY*, is a *Fountain* dedicated to *Jupiter*, which tho' it be cold and doth extinguish the lighted *Torches* that are put into it, yet doth it kindle those which are extinguishd when approacht to it.

This seems at first sight impossible, that inflammation should proceed from a cold *Body* as the *water* is: Yet for the clearing of this difficulty we may say, that the *water* of this *Fountain* being cold, does extinguish a flaming *Torch* that is dipt into it, this being the property of *water* to quench and choak *Fire*, and so put a stop to the motion of its agitated parts; but the rekindling of extinguishd *Torches*, cannot be attributed to the *water*, but to the *Bituminous* and *Sulphurous* exhalations, that rise up from the *water*. For it is probable, that this *Fountain* did send forth *Vapours* mixt of *Fews-Lime*, *Brimstone* and *Nitre*, which rising up through the *Fountain* as through a *Chimney*, became inflammable in the open *Air*, especially when a newly extinguishd *Torch* was approacht to them.

GASSENDUS upon occasion of a *Fountain* mentioned by *PLINY*, which *Flows* and *Ebbs* thrice a day, mentions the *Collismartian Fountain*, which *Ebbs* and *Flows* 8 times in an hour; for the *water* being ready to break forth, discovers it self by a soft purling noise, and for about half a minutes time swells and encreaseth, and the 6 following minutes decreaseth again; and when the decrease is ceased, the *water* continues in the same state for a little while, and then begins to flow again. But the intervals between one *Eruption* and another, are not equal, being sometimes more, and at other times less; tho' it very seldom happens, but that in one hour 8 flowings or *Eruptions*, and as many *Cessations* or *Ebbings* may be perceived in an hour.

It is certainly a difficult matter to render a satisfactory reason of this interrupted flowing of the *water*; neither will the instance of the *Fountain* in *Epirus*, be of any great help to us towards the solving of it. For whereas the same abounds with *water* in the *day time*, which fails and ceaseth in the *night*, this may be attributed to the heat of the *Sun*, whereby *Fountains* in *Summer-time* are often dried up, and overflow in the *Winter*. But this cant be applied to the *Collismartian Fountain*, which observes its interrupted *Ebbings* and *Flowings* in the *night*, as well as in the *day time*. However, if I may speak my conjecture concerning so abstruse a *Riddle* in *Nature*, I am apt to believe, that within the *Hill* whence this *Spring* breaks forth, there is some hollow, or pit, which a *Rivulet* continually fills up: As likewise a passage through which some *subterranean steam*, or breeze continually blows, and keeps back the *water*, sending it back to the place opposite to that from whence it came; where it then swells and

and encreaseth, till being overcome by its own weight, it overbears the force of the *Wind*, and so runs down, until the *hollow* or *pit* be almost exhausted and remain dry. And after this the *Wind* having recovered its free passage again, doth as before withhold the *waters* that would run out, and continually drives it back, until by force of the *water* that breaks in, it be driven away again, and give way to it.

VI. A like *Fountain* to this is mentioned by F. MAIGNAM TOLOSAS in his *Horary Perspective*, which in *Summer time* doth every *hour* flow from a vast, and most deep *hollow*, and for a quarter of an *hour* encreaseth by degrees, with a very great noise; and the next quarter becomes a great *River*; the following quarter it sinks again, and the last quarter, lies still, and is in a manner quite dry'd up.

VII. Some *Fountains* are *Poisonous* and deadly, as was that famous one of *Terracina*, which was called *Neptunes*, in the Country of the *Volsci*, which was the death of all those that drunk of it, and therefore was stopt up with *Stones*, by the *Inhabitants*.

This may be occasioned when the *waters* of such *Springs* run through *Arsenical*, *Mercurial* or *Antimonial Mines*. For as the *Fumes* of *Arsenick* do kill *living Creatures*, so *waters* impregnated with the said *Steam*, produce the same effect. Of this kind is the *Lake Asphaltites*, because of the *Arsenical Jews-Lime* it abounds with; and many other *Fountains* that are found in the Countries about the *Alps*; but as soon as they are discovered they are filled up and stopt with *Stones*, which is the reason why so few of these deadly *Springs* are known.

VIII. In the Province of *Cyrene*, as *Historians* tell us, Whether it was a *Fountain* of the *Sun*, which was hot at *Midnight*, and afterwards growing luke warm by degrees, was cold at the breaking of day; and as the *Sun* rose higher, grew still more cold, so that at *Noon* it was cold to extremity; and from that time began by little and little to grow luke warm again, till at the beginning of *night* it was hot, and so grew hotter and hotter till *Midnight*.

Some *Philosophers* have endeavoured to give a reason of this change, by asserting that there are some *Seeds* of *heat* in *water*, which the *Earth*, when chill'd and contracted with the coldness of the *night* sends forth, but when dilated by the *heat* of the *day*, doth take in again. But I fear that in this case, we are vainly employed in searching for a true cause of a meer figment; seeing that *ARRIAN*, *CURTIUS*, *PLINIUS*, *MELA* and other *Historians* and *Geographers*, who give the description of this *Fountain*, did never see it, and had only by report whatsoever they relate concerning it. Every body knows how basely the *Priests* of *Jupiter Ammon* did flatter *Alexander*, when he visited that *Temple*, and therefore we cannot think strange if they made him believe many things, which they feigned, or by some imposture represented to him, to make him conceive a greater veneration for the place and them. And therefore I think it is but reasonable that we should be fully assured of the truth of the thing, before we trouble our selves about searching out the cause of it.

Well water in *Summer* is cold, and in the *Winter* hot, or at least somewhat luke warm.

This cold and heat doth not proceed so much from the *water*, as from our *Sense*, which finds the *water* colder in *Summer* than *Winter*. For when we touch any thing with a very cold *Hand*, it appears warm to us; as those things feel cold, which we touch with a hot *Hand*. This we experience when we enter into hot *Baths*, which are distinguished by several Degrees of heat; for when we are enter'd into the first *Bath*, we think it warm, because our *Body* is yet cold, but when we return again from the hottest *Baths* to the first where we entred, we take that to be cold then, and not hot as we thought it was at our first entrance into it. And the same is the case of *Grottos* and *Caverns*, which always are of the same temperature, but are thought to be cold, because in the *Summer* we come into them out of the hot *Air*, in comparison of which they seem cold to us: And in the *Winter* seem hot, because the *External Air* is much colder, than those *Grottos* or *Caves* are, with respect to which we think them warm. As before hath been shewed by the Example of *Oil*.

We must not conceit, as some *Peripateticks* do, that the *Steam* which in the *Winter time* appears upon *Well water*, doth impart any heat to them, because that *Steam* when felt by the *Hand*, will be found as cold, as the *Air* that surrounds it: Whereas the *water* it self will be found to be hot; which is a sufficient proof, that the *water* borrows no heat from the *Steam* that lies upon it. Moreover we find as much *Steam* lying upon the surface of hot *Baths*, as upon *Well-water*, and yet no body will say, that this heat which is in those hot *Baths*, proceeds from the said *Steam* or *vapor*, seeing that it scarcely covers the *water*, and disappears in a Moment. The reason therefore why *Well-water* in *Winter time* seems to be hot to us, is, because we come to it from the *External Air*, which is many Degrees colder.

The *water* of some *Springs* does inebriate like *Wine* or other strong *Drink*, and this effect is attributed to the *River Lethe*, which being drunk of too freely, does produce the same effect as *Wine* does. Others again being drunk cause *Madness*, or *Dull stupidity*.

The cause whereof must be ascribed, to the *Jews-lime* wherewith those *waters* do abound. For *Jews-lime*, doth strongly affect the *Brain*, and by obstructing the *Pores* of the *Nerves*, doth dull and stupify the *Senses*; much in the same manner as the seeds of wild *Parasnes*, (as *AGRICOLA* tells us in his 2d Book of things flowing out of the *Earth*) being wrapt in a thin *Linnen*, and put in *Wine* do; as also the powder of the *Flowers* of *Hermodactils*, which being put into *Wine*, do presently, and strongly inebriate. And thus *Jews-lime* being mixt with *water*, doth inebriate those that *Drink* of it, and makes the *Body* heavy and lumpish.

We are told of a *Fountain* in *Arcadia*, near the City *Clitor*, and from thence called *Clitorius*, which makes those that *Drink* of it to have an aversion for *Wine*, as *Ovid* assures us.

Who with *Clitorian Streams* his Thirst allays,
Doth *Wine* abhor, and *water* Drinks always.

IX.
What is the reason of the heat that is found in Well water in the Winter season.

X.
The steam that lies upon the water doth not communicate any heat to it.

XI.
Of Springs that make the persons that Drink of them, Drunk, and others that make the Drinkers to run Mad.

XII.
A Fountain that makes the Drinkers of it to hate Wine.

The Reason is, because, as *Wine* doth cause a nauseousness, not only to those that are drunk, but also after that they are grown sober; so those who drink of those *Fountains*, impregnated with *Jews-Lime*, and having had their Heads clouded and troubled thereby, become affected after the same manner as those who are sick of an *Ague*, and abhor *Vine* and the smell of it.

XIII. Some *Waters* are endued with a *Medicinal Virtue*, and are made use of by *Physicians* for the curing of several *Diseases*.

The *waters* derive this their *virtue*, from some *Metalline* or *Mineral Matter* which they pass through, as *Brimstone*, *Salt*, *Vitriol*, *Alomes*, *Nitre* and *Jews-Lime*. And hence proceeds that great variety which we find in *Waters*; for *Sulphurous Waters* do heat and attenuate; *Bituminous* do dull and cloud the *Brain*; *Aluminous* do dry moist and running *Sores*; and *Vitriolick* do adstringe. Some of them are immediately conveyed to the *Bladder* and *Urinary passages*, by opening and dilating the pores that make way for the said *water* to pass to those parts.

XIV. As to those *Fountains*, of which many *Miraculous Effects* are reported, we may take it for granted, that their highly extolled *Virtues* are commonly grounded upon the reports of some poor People, who are many times set on by others, for Money, to tell many Lies concerning the *Miraculous Effects* they have performed. For whatever some may talk, there is no *Universal Remedy*, or such as is able to cope with, and overcome all *Diseases*. And seeing that great numbers of People do drink, or otherways make use of these *Miraculous Fountains*; those that suppose themselves to have been benefited by them, do extol them; when in the mean time we hear nothing of those to whom they have been of no use at all.

CHAP. IV.

Of Fountains and Rivers.

I. Nothing is more frequent, than to see *Springs* break forth from the *Bowels* of the *Earth*, and mounting upwards, contrary to the natural weight of *Waters*, to make their way through the tops of *Mountains*.

Different Reasons are given by several Men of this Eruption of *Fountains*. Some suppose that the *subterranean waters* do mount upwards through certain *Pipes* or *Channels*, much in the same manner as the *Blood* in the Body of an *Animal* is conveyed through the *Veins* to all the parts of it, to the *Head*, as well as to the *Feet*. This Opinion *PLINY* seems to favour in his 2d Book, Chap. 65. For seeing that the *Earth* is dry and thirsty, and cannot consist of it self without Moisture; nor the *Water* neither without the *Earth's* supporting and containing of it; it seems necessary that we admit some *Veins*, through which the *Water* may be conveyed, and get up to the tops of the *Mountains*. But yet it does not seem probable that the *water* should be this way conveyed in the *Earth*, as *Blood* is in the Body of an *Animal*. For tho' the *water* be driven out of the *Sea* into the *subterranean cavities*, and by this force impressed upon it, do continue to mount upwards; yet

no sufficient Reason can be given, why the *water*, by that time it is risen as high as the surface of the *Sea*, should not stand still there, or fall back again, seeing that the force wherewith it was pushed upwards, now ceaseth.

Whereupon it seems more likely, that the original of *Fountains* ought to be ascribed to *Vapours*, or particles of *Water*, separated from each other by the force of *subterraneous heat*. For seeing that under *Plains* and *Mountains* great *Cavities* lie hid, that are filled with *water*, it cannot be questioned but that a great part of them are continually resolved into *Vapours*, and sublim'd to the surface of the *Earth*, and the tops of the highest *Mountains*; which by succeeding Cold being afterwards turn'd into *water* again, cannot return back the same way by which they mounted, and therefore find out other open passages between the Intervals of the *Crusts* or *Shells* whereof the *Earth's* surface doth consist.

Some *Fountains* flow continually, and much with the same force, and abundance of *waters*; whereas others are subject to a great decrease in *Summer* and *Autumn*, and some do wholly dry up.

The reason of this decrease in some *Springs* is, because the pores of the *Earth* are very open during those *Seasons* of the *Year*, by reason of the *Heat* that dilates them; and by this means furnish the *Vapours* a ready and open way to fly away, and mingle with the *Air*, and therefore can no more supply the *Spring* with *water*, as they did whilst they continued shut up within the *Earth*. And it sometimes happens, that this *Evaporation* is so great, as to dry up the *Spring* altogether. But as to those *Springs*, that flow continually, and much with an equal force, the reason of their perpetuity is, because the *Channels* by which their *waters* are conveyed, are so deeply lodged in the *Earth*, the *Summers Heat* cannot reach them to dilate their *Pores*: which is the reason why the *Vapours*, being always furnish'd in the same quantity, must also produce an equal and continual springing, or flowing of the *water*.

Hence it is also, that in some hollow parts of the *Earth*, *Oyl* breaks forth instead of *water*, viz. when the *Heat*, that is in the *Bowels* of the *Earth*, is of force enough to lift up thick and gross *Exhalations*; which meeting with the cold parts of the *Mountain*, become thereby condensed, and joining together, constitute a thick *Liquor*, very like *Oyl*. Thus we are told of a *Valley* in *Alsacia*, called *Lebertal*, from whence there breaks forth a fat and thick *Liquor*, which *Waggoners* make use of to grease their *Wheels*. In *Scotland* also, 2 miles from *Edinburg*, there is a *Spring*, the surface whereof is covered with a *Black Oyl*, which the *Inhabitants* make use of to soften their *Skins*, and to heal the *Chops* and *Roughness* of it. So likewise amongst the *Antients*, the River *Liparis*, in *Cilicia*, was very famous, because those that bathed themselves in it, were as good as anointed with the *water* of it, which was so soft and *Oily*. But such *Springs* as these are very rare, forasmuch as thick *exhalations* do arise with much more difficulty than *watry vapours*, and stand in need of a great degree of *heat* to raise them to the surface of the *Earth*.

Why some
Springs a
round with
water in
the Winter
and in
Summer
are dried
up.

VII.
Why Rivers
cannot run
but on a
sloping
ground.

IV. *Why Spring Water is fresh.* Spring-water is generally fresh, without retaining ought of the saltness of the Sea, whence it is derived.

The Reason is, because the fresh particles of the Sea-water are most proper for sublimation, as being both thin and limber; whereas the saline particles, being stiff and hard, cannot be changed into vapours, nor pass through the crooked and winding pores of the Earth. Fountains therefore are fresh, because they consist only of those parts of the water that have been strained through the narrow pores and windings of the Earth, or that have been sublimed into Vapours by the force of Heat.

V. *The Original of Salt Fountains.* There are some Salt Fountains in France, as near Caen and Bordeaux, besides several here in England; and a great many almost every where upon the Coast of Africa; in the East Indies, near Corman-del, almost all the Wells are Salt. So likewise in the Island of St. Vincent, many of these Salt Springs are found: and on the Shoars of Peru, several Salt Lakes. Besides all these waters which had their original, either from an inundation of the Sea, or by some inlet from the Sea; such is that Lake in Holland, commonly called Haerlem-Meer. There is also a Salt Lake in the Island of Madagascar, and in that of Cuba, which is 2 Leagues in compass, and is not far distant from the Sea. Now the cause of these Springs and Lakes is, because the passages of the Earth, through which their water is conveyed, are very large and open, so that very few or none of their Saline Particles can be strained from them; or else because their waters pass through some Saline Veins, and so become impregnated with Salt.

VI. *Why some Springs are bound with water in the Winter, and in Summer are dried up.* Some Springs run copiously all the Winter long, but during the heats of Summer, their waters fail and run no longer.

Such Fountains as these, owe their Rise to Rain and Snow, which supply them with their current. For there are many great Caverns under the Earth, and especially under high Hills and Mountains; which being fill'd with Rain and Snow-water, do, according to their largeness, in a longer or shorter time, exonerate themselves. And thus we find, that after long and continued Rains, new Springs are seen to break forth; which upon great and long continued Heat and Drought, are dried up again, until the said Caverns be supplied again, and filled by frequent Showers, or the melting of Snow, and so begin to run as before. Thus we read, that in the time of Elias the Prophet, the Springs were all dried up; for the Doors of Heaven being shut up, neither Rain nor Snow fell down upon the Earth, to supply the continual expence of the said Springs.

VII. *Why Rivers cannot run but on a shelving ground.* All Rivers have their Current from a shelving ground, and where they lie upon a perfect level, they continue unmoveable.

The Reason is, as before hath been hinted, because those parts of the water that are uppermost, do by their weight press those that lie under them; which being fluid, and readily giving way, slide downwards, where they have more room to spread themselves, and are not so much straitned. For a shelving ground, or down-hill, is, as it were a continued Range of Perpendicular Lines, in which the water cannot be pressed, but it must fall upon the bottom of the shorter perpendicular. For if

the Channel, along which the Rivers run, were not shelving, no reason could be assigned, why they should run this way, more than that way; more towards the East, than towards the West. Moreover, the Sea, when it swells with the Tide, would be of an equal altitude in the Rivers, in case they did run along an Horizontal Plain, and not along a shelving ground.

Thus from the Springs and Current of Rivers, we know that some parts of the Earth are lower than others. Forasmuch as that part of the Earth, to which the water flows, is lower than from whence it flows. Hence it is that we know Bohemia to be higher than Holstein, from the Current of the Elbe. And thus likewise from the Danube, Visurgis, the Rhine, the Maes, &c. we take our Judgment of the Altitude of the several places through which the said Rivers pass. Thus Switzerland and the Country of the Grisons, are counted by some to be the highest ground of Europe, because the Rhine, the Rhone and the Danube proceed from them. Now as great as is the Down-hill of these Rivers, so great is the altitude of the Mediterranean places, above those on the Sea-coasts.

And the greater the Down-hill or Declivity of the Channels of Rivers is, the swifter is their Current; and the less it is, the slower is their Course. And the same thing is the reason, why one and the same River, runs more swiftly in one part of its Course than in another, which is observable in many places of the River Rhine. For if the bottom of a River, within the compass of 200 paces, lean down one pace, the water runs so swiftly, that it cannot be navigated without danger. In those places therefore where there are Cataracts, or Downfalls of Water, there the Rivers run with the greatest swiftness. And therefore it is that Brooks run with that violence, because they are precipitated from the tops of Mountains.

All great Rivers flow towards the West, and none of them towards the East.

This hath been generally believed, but without sufficient ground; seeing it is evident, that the Rhine, the Nile and Ob flow towards the North; the Rhone, and the River Indus, towards the South; the Danube, the River of the Amazons, and that of St. Laurence, towards the East. Whence we conclude, that Rivers do not tend to one particular part of the World, but are indifferently carried to any part of it.

It is sometimes found that fresh water springs in the Sea, tho' not far from the Shoar. Yea, some Historians assure us, that in the Province of Jucatan, in America, a vein of fresh water springs a cubit high, above the surface of the Sea.

The reason whereof is, because the Receptacles of water that are in the neighbouring Mountains, have their vents or out-lets so disposed, as not to tend upwards towards the top of those Mountains, but downwards: So that the waters flowing out from them, do meet together with a large Channel, where they constitute a Spring or Fountain; and therefore must needs break forth in some low place, that is, from the bottom of the Sea; and because their eruption is forcible, they spring sometime above the surface of the Sea-water. The reason why some Rivers, running into the Sea, do for a great way retain their freshness is, because their

VIII. *From the Course of Rivers, we know the Altitude of Places.*

IX. *What is the reason of the swift current of Rivers.*

X. *Whether the Course of Rivers be always towards the West.*

XI. *How it comes to pass that fresh water sometimes springs in the midst of the Sea.*

their Current is so swift and violent, that they push back the Sea-water, and keep it from mingling with them, till at last, by a longer process, their force being weakened, they mingle with the Salt-water, and are lost in it.

XII. The Cause of the constant Inundation of the River Nile, after the Summer Solstice.

The River Nile, which is but 18 foot deep, doth sometimes swell to the height of 18 Cubits, that is, 27 foot, and at other times to 12 Cubits. And this Inundation is so constant, that it always happens at a set time, that is, presently after the Summer Solstice.

The Common Opinion of the Antients was, that this swelling of the Nile was caused by the anniversary winds, called Etesiae, which did blow about that time; and driving against the mouths of this River, did stop the vent of its waters into the Sea, and by consequence made its Channel to swell, and run over its Banks; according to the account the Poet Lucretius gives us of this Inundation, in his 6th Books.

In Summer Nile o're-flows, his Streams do drown
The fruitful Egypt's Fields, and his alone;
Because the Mouth of that wide River lies
Oppos'd to North, from whence th'Ethel's rise
From heavy Northern Clouds, and fiercely blow
Against the Streams; those stop, and rise, and flow.

But this doth not seem to be the genuine cause of the overflowing of Nile; since it is certain, that the Nile sometimes overflows, before that these soft winds begin to blow, and consequently before they can stop the Mouths of it, in order to cause the said Inundation. And that this overflowing ceaseth, before they cease to blow, and to drive its waters upwards, as is supposed. Wherefore the cause of this Inundation may, with more ground be ascribed to the great and frequent Rains that fall in Ethiopia, from about the middle of June, till September; because the time of their Winter is from the end of May, to the beginning of September. And in like manner, the River Paraguay, or as the Spaniards call it, Rio de la Plata doth overflow, at the time when great Rains fall on the Mountains of Peru, which obligeth the Inhabitants for 3 Months to live in Boats.

XIII. What is the reason of the suddain rising and vanishing of some Fountains.

It is observed, that Fountains do sometimes, all on a suddain, break forth on the Mountains, which were never seen before; and that others on the contrary, do as suddainly vanish and disappear.

This sometimes is caused by Earthquakes, whereby the hidden Sources of Springs are broken up, and the obstacles that retain'd and kept them from breaking forth, are removed. And they dry up, and suddainly disappear, when some new obstacles are cast up to stop their way; or when the water is sunk down into such deep Caverns, from whence it can no more be elevated: For in this case it is forced to change its course, and turn aside another way. Who does not know that a vast heap of waters is hid in the hollows of Mountains, which being opened by an Earthquake, way is made for the said waters to break forth?

XIV. Why some Rivers run under Ground.

Some Rivers, in the midst of their Course, run and hide themselves under ground, and afterwards start up again like new Rivers. Thus the River Niger, in Africa, which some suppose to be de-

rived from the Nile, by a subterraneous passage, by that time it meets with the Mountains of Nubia, runs down under ground, and breaks out again on the West side of the said Mountains.

The Reason of this is twofold. 1st. The obstacle of a higher ground than is the bottom of the River. 2dly. The Hollow that is under the ground, at the place where the River hides it self, or the looseness of the ground, which easily gives way to the force of the River. Thus the River Tigris, in Mesopotamia, after it hath passed the River Arcthusa, meeting with the Mountain Taurus, runs down into a Cave, and ariseth again on the other side of the Mountain; and afterwards having passed the Lake Tbespis, hides it self again under ground, and riseth up again about 6 German miles farther.

CHAP. V.

Of the Sea.

THE great Mass of the Waters of the Sea, appears higher than the Earth, and seems to be raised much above the surface of it. And therefore to those who take a prospect of the Sea, from the Shoar, the Sea seems higher than the Land; and when from the Sea, they look to the Shoar, that appears lower than the Sea.

Some persons, measuring all things by their Eye-sight, suppose the Sea, because of the same convexity it hath with the Earth, to rise by degrees above the Earth; and that it is not only higher than the ground or bottom of the Earth that supports it, but is also higher than the Islands and Continents. But this is no better than a deception of the sight, which reaching forwards towards the more remote parts of the Sea, is directed towards them by Rays, which the more they recede from a Perpendicular, the further distant and higher it represents them. This we find by experience, not only in the Sea, but in any great Plain. And on the other hand, the reason why the Shoar, beheld from the Sea, appears lower than it, is because the height thereof is contained in the least Visory Angle, which the Rolling Waves do intercept, and take away the sight of; so that it is no wonder if the Shoar seems to be more depressed than the Water.

But besides this, we have a very convincing Argument to prove, that the Sea, setting aside the swelling of its Waves, is not higher than the Earth. For this supposed, it must follow, that the Water, by its natural gravity, would overflow, and quitting the upper part of the Earth, would only take up the lower. Or forasmuch as the parts of the Water do push forwards one another, and the upper parts press those that are under them, the whole surface of the Earth would presently be covered by them, and both Islands and Mountains be overwhelmed by the Sea. Besides, how would Rivers be able to return to the Sea, if the Sea were higher than the Earth; and if the surface of the Earth were lower than that of the Sea? For nothing that is heavy does naturally tend upwards, as every Body does that tends to a Body, that lies higher than it self.

And

I.
Why the
Sea seems
to be higher
than the
Earth.

II.
That the
Water is
not higher
than the
Earth, pro-
ved.

To the Honourable
of Seaton-Delaval
Knight, one of the
executing the Office of
of England; and joint
rall of their Ma-
jesties Fleet.

This Plate is humbly

Dedicated, by Richard Blome.

III. And therefore it was a vain Fear into which the *Mathematicians* cast the *Kings of Egypt*, when they dissuaded them from cutting a *Channel* from the *Red-Sea* into the *Nile*, or the *Mediterranean*; supposing the *Red-Sea* to be 3 Cubits higher than the *Mediterranean*, and that therefore a *Deluge* would be the consequent of that Enterprize. For indeed, had the *Red-Sea* been only one Fingers-breadth higher than that part of the *Mediterranean* which washeth the Shoars of *Egypt*, the whole compass of *Africa*, would not hinder it from running thither, till both Seas were reduc'd to a Level. Thus, because the *Caspian Sea* is higher than the *Euxine*, therefore it empties it self into it: And because the *Euxine-Sea* is higher than the *Ægean* or *Archipelago*, therefore it falls down into it.

IV. This discovers *ARISTOTLE's* Error, who asserts the *Ocean* and the *Earth*, to be higher toward the North, than about the *Æquator*; because the *Ocean* seems to flow from the North parts of the *World*, as from its Head or *Fountain*. But indeed, nothing of certainty can be thence infer'd: For it is doubtful as yet, and hath never been sufficiently proved, neither from that motion can it sufficiently be cleared, whether the *Northern Countries*, and more particularly the *Channels* of *Northern Rivers*, be higher or lower than the *Channels* of those that are about the *Æquator*. The Reason is, because this motion is not General or Universal, as not being found in all *Northern Countries*. And tho' we should grant this motion of the *Ocean* from the North, yet doth it not follow from thence, that the *Ocean* there is higher, because it is to avoid this greater height, that the *Sea* flows from the North towards the *Æquator*.

V. But some Body may Object: If it be so that the *Sea* is not higher than the surface of the *Earth*, how comes it to pass, that it is more hard to get *Ships* out of the *Haven* into the *Sea*; than it is to enter into it from the *Sea*?

I Answer, That the Reason of this is, not because the *Sea* is higher than the *Earth*; but because when a *Ship* is getting out of the *Haven*, it hath but little *Wind*, because the *Shoars* and *Banks* break the force of it, and hinder it from rushing with a full swing against the *Sails*. Whereas, when a *Ship* enters the *Haven*, nothing hinders the *Wind* from coming with full force against them.

VI. *Rivers* continually exonerate themselves into the *Sea*, and having pass'd through several Tracts of the *Earth*, return to it again; and yet the *Sea* is never increased by this accession of the *Water* of innumerable *Rivers*, that continually, without ceasing, run into it.

The Cause hereof is, that continual Change, whereby the *Sea-water* is turned into *Vapours*, and they again changed into *water*. For as we see in an *Animal*, that the *Blood* runs out of the *Hollow Vein* into the *Heart*, and presently after is from thence dispersed through the *Great Artery*, to all the parts of the *Body*: So the *Vapours* arising from the *Sea*, are convey'd through the Passages of the *Earth*, to the tops of *Mountains*, and there being condensed by the Coldness of the place into *water*, become *Springs*, and afterwards *Rivers*; which through the flanting places of the surface

the *Earth*, are carried again towards the *Sea*, which is the place from whence they first proceeded: So that as much *water* as is thus evaporated from out of the *Bowels* and *Caverns* of the *Earth*, so much flows into them again from the *Sea*; and as much as runs from the *Sea* through these *subterranean Passages*, so much the *Rivers* return to the *Sea* again.

Neither is it any matter of wonder, that the *Water* of the *Sea* continues salt, notwithstanding she receives the *Fresh-water* of so many *Rivers* into her Bosom: And so much *Salt-water* continually flows from her into the *Bowels* of the *Earth*, and which leaves its *Salt* in the places where they are distill'd into *Vapours*. For besides that the *Sea-water* may be convey'd into the *Earth* to those places where it is thus distill'd, by such large and open Passages, that the *water* which is left after the *Evaporation*, may carry back all the *Salt* which it could not elevate, into the *Sea*; the *water* which runs continually through the *Mines* of *Salt*, do carry along with them at least as much of it to the *Sea*, as the *Sea-water* convelghs into the *Bowels* of the *Earth*: Whence it is evident, that the *Sea* must always keep its saltness, as we see it doth.

In the Heat of Summer the *Sea* is found by Experience to be *Salter*, than at other times: Which they who live under the *Æquator* and *Torrid Zone* are very sensible of.

The Reason is, because the *Sun*, which is extream hot in those parts, doth evaporate the thinner and fresher parts of the *Sea*, leaving the more thick and gross parts behind. And the more vehement this heat of the *Sun* is, the more are the outward parts of the *Water* agitated, and a greater abundance of *Vapours* are sublim'd; which being condensed in the *Air*, and reduced again to *water*, do not always fall down in the same place from whence they proceeded; but frequently having taken a large turn in the *Air*, fall down to the *Earth*, at a great distance from the place of their first elevation. An Example whereof we have in *Salt-water* that is boyled over the *Fire*, which the longer it is boyl'd, the *salter* it grows; because the fresh particles are continually exhaled from it.

Hence it is that our Modern *Physicians* suppose our *Spittle* to be salt and *sourish*; for when we spit upon a hot *Brick* or *Iron*, it leaves a white Spot behind it, which is nothing else but a collection of *saline particles*, that because of their *Stiffness* and *Heaviness*, could not fly away together with the watry particles.

The Reason why the *Sea* is more salt betwixt the *Tropicks* is, because the *Sun* dispenseth more heat towards the *Equinoctial Line*, than in more salt places at a farther distance from it, and consequently resolves more of the *Particles* of fresh *water* into *Vapours*, and by the extraction of them leaves the *Sea-water* *salter* than it was before. To which may be added, that the *Sea* is of a far greater extent between the *Tropicks*, than in the *Frigid* and *Temperate Zones*, and less *Rivers* empty themselves into it.

And from hence we may easily perceive the Reason, why the *water* of the *German Ocean*, and of other parts of the *Northern Sea*, is not so good to be boyled into *Salt*, as is the *water* of the *Spanish*

VII. Why the Sea always preserves the same degree of saltiness.

VIII. Why the Sea is found to be more salt in the heat of Summer.

IX. How it may be prov'd, that our Spittle is salt.

X. Why the Sea is more salt betwixt the Tropicks than elsewhere.

XI. Why Sea-water near the Equator is more proper for Salt, than others.

Spanish Sea, the Canary Islands, and Cape Verd, or the Green Promontory in Africa; viz. because these last parts of the Sea are nearer to the Torrid Zone, and receive its waters from the Ocean of that Place. But yet it cannot be deny'd, but that some of these Seas are more proper for the making of Salt, than others. Thus the Sea-water that is upon the Coast of Guinea, in the Ethiopick Ocean, doth at one boyling afford a Salt as white as Sugar, such as neither the Spanish-Sea, nor the Sea-water of any part of Europe can afford at the first boyling.

XII.
How Sea-water may be made fresh.

Dig a Pit on the Sea-shoar, a little higher than the Tide reacheth, and as deep as the lowest Sea-mark; and when the Tide comes in, you'll find it fill'd with Fresh-water. This is an Experiment commonly try'd by the Inhabitants of the Sea-Coast of Barbary, who have little other Fresh-water, but what they get after this manner.

The Reason of this Experiment is, because the Sea-water loseth its saliness by straining through the Sand, between which it leaves its Corner'd parts, which are the cause of its saltness. But yet it is not necessary, in order to the ridding of Sea-water from its saltness, that the pores through which it is strained, be extream strait and narrow; for if they were so, they would presently be stop'd up, by the first saline Particles that entred them, and so there would be no way left for the particles of the Fresh-water to pass. But it is rather necessary, that the Sea-water be strained through those Bodies, whose pores are large enough, and full of Corners and Windings, proper to stop the particles of Salt from running along with the Fresh-water. It is also necessary, that the Body through which it is strained be large enough, that so, since it can rid it self of the Salt all at once, it may have a sufficient space to drain through, to rid it self thereof by degrees, by passing through the several Crooked windings of it; and therefore some time is required, before the Sea-water can pass through that space, which is necessary by filtration to separate its Salt from it.

XIII.
Why the Sea-water is salt.

Reasons may also be assigned, why it pleas'd the Creator of all Things that the Sea should be salt; viz. 1st, That it might not be apt to putrifie, corrupt and stink. 2^{dly}, That the Sea-water might not be so easily resolv'd into Vapours, as the Fresh is, by reason of the Heaviness the Salt imparts to it. 3^{dly}, That the flesh or substance of the Fishes, that breed and live in it, might be the firmer. 4^{thly}, That it might be the more able to resist the violence of Winds and Storms. For Salt-water is more firm and consistent, than Fresh. 5^{thly}, That it might be the better able to resist cold, and not be so easily frozen, as Fresh.

XIV.
Why the Water of the Sea runs Westward.

Constant and known Experience hath inform'd Sea-men, that the Sea moves from East to West: So that by this means Ships have a shorter or more speedy Navigation to the West-Indies, than to the East. And all Navigations to the East, are found more difficult, and take up more time.

This proceeds from the Inequality of the parts, whereof the Earth and Water do consist. For tho' this Terraqueous Globe, by its Diurnal motion, moves from West to East, about its own Center; yet because the Earth is more solid and heavy than the Water, therefore it is whirl'd about its

Center more swiftly, than the water: So that the water, which is more slowly carried about, seems to move towards the West; in like manner as a Boat, that moves more slowly towards the same place, appears to tend the quite contrary way to another Boat that moves more swiftly.

This motion of the Sea-water from East to West, is most perceived between the Tropicks, and in the Torrid Zone; because tho' the Earth be Spherical, yet because that part of its Roundness which is between the Tropicks, is whirl'd about with the greatest force towards the East, as being furthest from the Poles; whereas that part which is without them, because of its nearness to the Poles, is moved more slowly, therefore it is that this motion is only perceptible between the Tropicks.

XV.
This motion is only perceptible between the Tropicks.

Besides the General motion of the Sea, which belongs to the whole Mass or Body of it, there are also several particular motions observed in it, which are called Currents; whereof some happen constantly at certain Seasons of the year, but others are not subject to any fixt time. They that Sail to the East-Indies, observe some very swift Currents in their way thither: For tho' the Tide, in those Seas, do not rise above 2 or 3 Foot; yet they extend themselves the space of 12 or 13 Hours towards the North, and the rest towards the South, with such an extream Violence, that it sometimes breaks the strongest Cables of Ships lying at Anker.

XVI.
Of Currents observed in the Sea.

There be 2 sorts of these Currents, the one constant and fixt, the other inconstant and irregular. It seems probable, that the constant Currents that are observed between the Tropicks, do proceed from hence, because the waters that run Westward, are more strained in some places, than in others; either because the Bottom of the Sea is more deep there, or because of a range of Rocks in Parallel Lines, which oblige them to follow their direction. And as to those Currents that are found without the Tropicks, and which continue always the same, it is very likely that they proceed from some Rivers, which continually discharge themselves into the Sea. For as there are some Rivers which appear above the Earth; so there are others also that lye hid, and which flow beneath the surface of it.

XVII.
The Cause of certain and fixed Currents.

As to those Currents which are Incertain and Irregular, both as to the time, and the determination of their motion, they seem to be caused by the Unevenness of the Bottom of the Sea, by reason of divers Rocks ranged in Lines, differently tending towards the 4. Principal parts of the Horizon. For this suppos'd, whenever there is a stiff Gale of Wind, it must needs drive the water forceably between these Rocks, and by so doing must force them to take a Course by so much the more violent, as the Wind is stronger, and the space betwixt the Rocks straiter.

XVIII.
The Cause of inconstant and irregular Currents.

The Sea-water doth more powerfully resist the Bodies that are put into it, than River-water: As we see that sometimes those Ships which were born up by the Sea, do sink in the River or Haven.

XIX.
The Sea-water can bear more heavy burthens, than the Fresh-water.

The Reason is, because the water of the Sea is more heavy, as consisting of more thick and solid Parts, and which may lye in a less room, and therefore are more able to bear the burthens put upon

upon them. This is most evident in the *Dead-Sea*, which because of its extream *saltness*, will buoy up a Man, that is cast into it with his Hands and Feet bound. *HIERONYMUS FLORENTINUS* relates, that he saw a Man that was cast headlong, bound *Hands and Feet*, into the *water*, yet was kept up by it for a whole Night: And *POSSIDONIUS* affirms, that he saw in *Spain*, Tiles made of an *Earth* wherewith they scour *Plate*, swimming on the top of the *water*. Neither can any other Reason be given, why a *Ship* draws more *water* when she Rides in an *Haven*, than at *Sea*; but because the *water* in the *Haven* is not so *salt* as the *Sea-water*, and therefore doth not buoy up the *Vessel* so strongly, as the more *Salt-water* of the *Sea*.

XX. This also is the Reason why *Wine* that is strained through a *Flannen-Bag*, commonly called *Hippocrates his Sleeve*, doth lose the greatest part of its strength; because many of those *particles*, wherein the strength of the *Wine* doth consist, do continue sticking in the *pores* of the *Filter*, by which means the *Wine* being deprived of them, proves much more weak than it was before.

XXI. *Salt-water* is not good to quench *Fire* with, for it rather promotes it.

The Reason is, because the *particles* of *Salt*, which predominate in *Salt-water*, being *stiff* and *inflexible*, are easily agitated by the *Bodies* they meet with; and being thus agitated, are very proper to increase the *Flame*, seeing that of themselves they oft produce a *flame*, when at any time they break forth violently from the *Bodies* in which they are contained. To this may be added, that the *Sea-water* is much thicker and fatter, than *Fresh-water*, and so is more proper to feed and foment the *flame*, than to extinguish it. It was by this means that the *Fire-works* cast into *MARK ANTONY's Fleet*, in the *Sea-fight* at *Actium*, did much greater Execution, because the *Souldiers* not understanding the Nature of *Sea-water*, endeavouring to quench the *Fire* kindled in their *Vessels*, by pouring *Sea-water* upon the *flame*, did thereby strengthen and increase it.

XXII. Yea, it may be observed, that tho' *Water* be very contrary to *Fire*; yet there be some *Bodies*, which after they have *water* cast upon them, do flame so much the more. And therefore it is that *Smiths* sprinkle *water* upon their *Sea-Coal*, to make them burn the more violently. And nothing is more evident, than that a small quantity of *water* cast upon a strong *flame*, doth but augment it. But *Salt-water* doth this with greater efficacy, because of the stiffness of the parts of it, which darting into the *flame* like so many little *Arrows*, and hitting against other *Bodies*, have a great force to shake and agitate them: Which is the Reason why *Salts* are made use of for the melting and solution of *Metals*.

to the *Body* of the *Moon*, which by pressing the *Matter* that runs between her and the *Earth*, doth drive the *water* also towards the *shoars*. For as that part of the *Street* is made more narrow, which hath some part of its breadth taken up by some thick *Body*; and as that *Wind* is the strongest and most forceable, which passeth through a narrow place; so likewise, because the presence of the *Moons Body* doth streighten the space that is between her and the *Earth*, the *Air* and the *Water*, which are *fluid Bodies*, must needs give way, and rise higher towards the *shoar*. In the very same manner as we see, that *water*, or any other *Liquor*, poured into a *Vessel*, riseth about the sides of the *Vessel*, if it be prest by any thing, and leaving the middle of it, is carried towards the *Edge* of it. But to clear this yet further, let us suppose *T* to be the *Earth*, and *E F G H*, the *water* which compasseth the *Earth*; *B*, the *Moon*, running through her *Circle* in a *Months* time; *N O P Q*, the *Vortex* of *Heaven*, which hath the *Earth T* for its *Center*, and which together with the *Moon* is continually whirled about the *Earth*. For the same *Heavenly matter* which tends to *O*, and thence continues its course to *P* and *Q*, requires as much space on one side of the *Earth*, as on the other, and so would press it every where alike. But because the *Moon* is at *B*, and doth not move so swift as the *Heavenly matter*; therefore the said *Matter* cannot but press the *Earth* more towards *P*, than towards *O* or *Q*, and consequently the *Earth* must remove a little from the *Center* of the *Vortex*, and come nearer to *D*; and by this means depresses the *water* which is at *F* and *H*. Moreover, because the *Earth* is whirled in 24 Hours about its own *Center*, that part of it which is now at the *Point F*, where the *Sea* falls, within 6 Hours, will be at the *Point G*, where the *Sea* swells; and after 12 Hours at the *Point H*, where it falls again. And forasmuch as the *Moon* all this while makes some small progress also, and finisheth her Circumvolution about the *Earth* in the space of almost 30 Days, we must add 12 Minutes of an Hour to the time of each *Ebbing* and *Flowing*; so that the *Sea* takes up 12 Hours and 24 Minutes, in her *Ebbing* and *Flowing*, at one and the same place.

Whence it is evident, that this motion of the *Sea* must be attributed to the *Moon*; seeing that we find, that the *Tide* riseth every Day one Hour later, according to the motion of the *Moon*. For suppose we the *Tide* to come in to day at 12 of the *Clock*, to Morrow it will not begin till One, which is a sufficient Argument, that the *Tide* proceeds from the *Moon*.

The *Tide* doth not always observe the same time, but comes to some *Shoars* sooner, and to others later.

This difference may proceed from many Causes; but chiefly from the unevenness of the *Bottoms* or *Channels*, wherein the *waters* are contained, or from the situation and disposition of the *shoars*, by which the motion of the *water* is much advanced or hindered. Whereof we have an Instance in the *Banks* of *Rivers*, between which the *water*, according to the diversity of their situation, either runs headlong, or flows gently; goes winding, or else strait along.

Whence
the great
difference
of the
Tides doth
arise.

CHAP. VI.

Of the Ebbing and Flowing of the Sea.

The Sea, in the space of 24 Hours and almost 50 Minutes, does flow and ebb twice.
The Cause of this wonderful Effect, is ascribed

IV. Hence it is also that they have such great *Tides*, on the Coasts of *Normandy* and *Britanny*, so as that about *S. Michael*, and *S. Maluo*, the *Tides* rise sometime above 60 Foot high. For the *Sea* being driven from *South* to *North*, are beaten back by the *British Shoar*, and afterwards rebounding from the Coasts of *Normandy* and *Britany* they joyn in one *Angle*, and because of the narrowness of the place do swell and encrease.

V. The *Tide* doth not only tend from *East* to *West*, but also at the same time from the *Tropicks* to the *Poles*: But yet so, as that in certain places, the one of these is greater and more sensible than the other, which depends on the position or direction of the Coasts. As for Example, in the *Atlantick Ocean*, the *Tide* seems only to tend from the *Tropicks* to the *Poles*, and this because the Coasts of *America* do resist its motion from *East* to *West*. But on the contrary in the *Magellan Straits*, no other motion is perceived but from *East* to *West*; because the Coasts there resist the motion from the *Tropicks* towards the *Poles*.

VI. The Reason why only a very small *Tide*, or none at all is perceived in the *Mediterranean* is, because it contains many *Islands*, which resist and hinder it, as also because of the narrowness of its *Channel*, which does not afford the waters room enough to display themselves in. For tho' that part of the *Mediterranean*, which is beyond the *Tropicks*, hath intercourse with the *Ocean* by means of the *straits of Gibraltar*; yet because that passage is not above 3 or 4 Leagues over, all the water that can enter this way within the space of 6 Hours, is very inconsiderable, if considered with the height and breadth of that *Sea*. And moreover, as soon as the water is entred, it finds the *Sea* broad, and the *Shoars* so disposed, that it only moves along the *Shoars*; and therefore it is necessary, that there be only a continual course of the water, without any *Flood*.

VII. But yet we must here except the *Gulf of Venice*; for seeing that the waters that are there, being beaten back from the Coasts of the *Morea*, do soon reach the end of that *Channel*; it must needs follow that because the first rebounds are seconded and supported by the latter, they must cause a sensible *Tide*, as experience doth witness they do.

VIII. On the Coast of *Provence* in *France*, a small *Tide* only is observed, especially at the *New* and *Full Moon* of the *Aequinoxes*; for seeing that from that *Shoar*, to the opposit Coast of *Africa*, there are almost 8 Degrees of *Latitude*, without any *Island* lying between; and because it hath an open way from *South* to *North*, the *Sea* there, about the *Aequinoxes*, flows about 2 Foot high.

IX. So likewise in the *North Sea* beyond *Scotland*, towards *Norway* and *Greenland*, scarcely any *Tide* at all is observed, because that part of the *Earth*, is at a great distance from the *Tract* the *Moon* moves in; or because that *Sea* is extended from *West* to *East*, and is interrupted with many *Islands*, and jetting Points of *Land*: Whereas in *Hudsons Bay*, a great *Tide* is observed, because that *Sea* lies open from *East* to *West*.

X. And much a like account must be given, of that great variety of *Tides* observed in other places, for that the *Sea* flows many Foot high at *Venice*, and at *Ancona* riseth but little or nothing at all;

that on the Coast of *Syria*, it flows much higher, than in several parts of *France*, where it scarcely riseth 1 Foot high; the reason of this is, because the Coast of *Syria* is at the end of the *Mediterranean Channel*, and those of *France* about the midst of it; as we find in a *Boat*, that the rising and falling of the agitated water, is only perceived in the extreame parts of it, not about the midst, where the water is smooth and even.

Accordingly also, a Reason may be given why the *Tide*, in the *River of Garonne* in *France*, flows almost 120 Miles, in the space of 18 Hours, whereas the ebbing is performed in 12 only. For if the motion of this *Tide* be exactly Calculated it will be found, that if the *Flood* comes in at the *New Moon* at 3 of the Clock at *Midnight*, it will proceed almost 50 Miles in 6 Hours, that is, by 9 a Clock in the Morning; and afterwards in so many Hours more, will come to *Bordeaux*, and at 3 a Clock in the Afternoon it turns the *Ships* about, which shews that the *Tide* is coming in: And then at 9 of the Clock it reaches as far as the Town of *S. Merceur*, but is very weak and small there; and without making any stay there, is presently followed with the *Ebb*, which it is evident must not take up so much time by 6 Hours as the *Flood* did; because the water by its innate heaviness runs more swiftly to the *Sea*, than from the *Sea* into the *Rivers*. For the *Sea* being low, and much deeper than the *Rivers*, it cannot be otherwise but that the further the *Tide* reacheth up in *Rivers*, the more slow must its motion be, because it mounts all the way, and moves uphill. For the flowing of the *Tide* continues, till the water of the *Rivers* and of the *Sea* be of one and the same height.

Havens that are under the same *Meridian*, have not always their *Tides* at the same time, as is evident in that famous French Haven of *Havre de Grace*, which at the *Full* and *New Moon* hath high water at 9 a Clock in the Morning; whereas at *Diep* it is not high water till 10 a Clock, tho' these *Havens* be but at a little distance from one another, and scarcely differ half a Degree.

The reason hereof is, the many windings and turnings that are in the *Channel*, which change and turn the course of the water: As likewise the violence of the *Winds*, which is very considerable there. Thus at *Calice* and *Sluys* in *Flanders*, at *Full* and *New Moon* it is high water, about 11 a Clock, the *Moon* being enlightened on that part which looks Southward; at *Arnhem* and *Midelburg*, at 2 a Clock in the Afternoon or Morning; at *Zierick-zee* at 3 a Clock when the *Moon* is at *South-west*, and the *Sun* enters *Capricorn*; at *Bergen* 2 Hours and an half later; at *Antwerp* and *Dort*, the *Moon* being turned toward the *Aequinoctial West*, almost at 6 a Clock; at *Mechele* at 8, but yet so as that the *Tide* sometimes comes in faster, and at other times slower, according as the Weather is Fair and Calm, or Stormy.

The greatest *Tides* are at the *Conjunctions* about *D*, and at the *oppositions* about *B*, that is, at the *New* and *Full Moon*, than at the *Quarters*, or *Quadrate Aspects* at *A*, and *C*. And therefore the *Sea* men at the *New* and *Full Moon*, because the *Tides* are then greater and swifter, call it a *live Sea*, and at the *Quarters* a *dead Sea*.

XI. The Sea water sometimes takes up more time in flowing than in Ebbing.

XII. Why the Tide at Havre de Grace in France doth set sooner at the Full Moon, than at Diep.

XIII. The Tides are greater at the New and Full Moon than at other times.

The

This Plate is described by Richard Brome, Esq. in his History of the English Army, Vol. II. p. 100. It represents the Battle of Tewkesbury, fought on May 4. 1471. between King Edward IV. and King Margaret of Anjou. The King of France, Louis XI. was present on the French side. The English were commanded by Edward IV. and the French by Margaret of Anjou. The English were victorious, and Margaret was killed. The scene is described as follows: The King of France, Louis XI. was present on the French side. The English were commanded by Edward IV. and the French by Margaret of Anjou. The English were victorious, and Margaret was killed. The scene is described as follows: The King of France, Louis XI. was present on the French side. The English were commanded by Edward IV. and the French by Margaret of Anjou. The English were victorious, and Margaret was killed.

To the Right Hon.^{ble} Henry Lord
Baron of Milton, L^d. Lieutenant of
Lord Warden of y^e Cinqueports
nance, Collonel of their M^{ties}.
one of the Gentlemen of
and one of the Lords of
Honourable privy

This Plate is humbly

Viscount Sydney of Shepey,
Kent, Constable of Dover Castle,
M^r. Generall of their M^{ties}. Ord-
first Regiment of foot Guards,
his Majesties Bedchamber,
their Majesties most
Councill &c^a

Dedicated, by Richard Blome.

The Reason is, because the *Heaven* A, B, C, D, is not of a *Spherical*, but almost *Elliptical* figure, and hath more room in that part of it, which is between the *Earth* and A, C, than in the opposite part about B, and D. Now seeing that the *Moon* when she is about the *Quarters*, moves in these larger spaces, she consequently advanceth more slowly, and so presseth the *waters* less, and causeth a less *Tide*. Whereas at the *New* or *Full Moon*, she moves in the narrowest part of her *Ellipsis*, and therefore causeth a greater pression of the *waters*, and a greater and swifter *Tide*.

XIV.
What is the Reason of the great Tides that are in the River Seine about the Equinoxes and Solstices.

It is for the same Reason, that 3 great *Tides* are observed in the River *Seine* in *France*, about the *Equinoxes* and *Solstices*: For the 1st of them riseth almost 4 Foot high, the 2^d 8, and the 3^d 12 and upwards, and that with so great swiftness, that in 4 *Hours* it advanceth 25 french Leagues with a great Noise. For seeing that the *Tides* exceed about the *Equinoxes*, and about the *Full* and *New Moon*, the motion of the *waters* must be greater also; and seeing also that the *Channel* of the River *Seine* with respect to its Mouth, where it enters the *Sea*, doth resemble a *Trumpet*, which grows narrower and narrower by degrees, it cannot be otherwise, but that the *waters* must rush in with a great force into such a narrow *Channel*.

XV.
Whether the River Euripus Ebb and Flow so many times a day, as some ancient Historians have left upon Record.

The River or rather the narrow *Sea Euripus*, if we may believe the *Antients*, Ebb and Flow 9 times a day.

The cause of this effect may also be ascribed to the Interposition of the *Moon*, by the pressing whereof the *River* runs down, not towards one part of the *World*, as the *Seas* do, but every way; so as that one part goes to the *South*, another to the *North*, &c. which as they light upon the *Straits* of a narrow *Sea*, or upon neighbouring *Shoars*, accordingly the *Ebbing* is hastned or retarded. Tho' indeed we may have good reason to question, whether what the *Antients* have related of this *River*, be all agreeable to *Truth*; seeing that *TITUS LIVIUS* in his 8th Book, *Decad* 3^d denies it, and gives us sufficient occasion, to doubt of the faithfulness of *Authors* as to that Point. The *Straight* of *Euripus*, saith he, doth not ebb and flow at set times 7 times a day, as the common report is, but according to the *Wind* is sometimes hurried this way, and sometimes that way, like a *Brook* that falls headlong from a steep *Mountain*; so that it does not suffer the *Ships* to rest night or day.

XVI.
Why there is no Tide in Rivers and Lakes.

Rivers and *Lakes* have no *Tides*, and receive no change from the opposition of the *Moon*.

The Reason is, because their *Banks* are not sufficiently distant from one another, nor is their surface large enough to admit the pressure of the *Heavenly* matter. For even as *Vessels* the narrower they are, the less motion is perceived in them; so no other *water*, but the *Sea* which surrounds the whole *Earth* can have so much room, as at the same time to rise or swell in 2 several places, and to fall or sink in 2 others. And therefore it is that the *Rivers*, *Bays* and *Lakes* that are between the *Tropicks*, cannot admit of any *Ebbings* and *Flowings*.

XVII.
Nor any Tide in the Dead Sea, nor in the Euxine Sea.

As to those *Lakes* and *Rivers* that are without the *Tropicks*, neither are they subject to *Tides*, nor the *Seas* neither, that are considerably

great, in case they have no intercourse with the *Ocean*, or if they have any, yet the communication of the *waters*, is by a strait and narrow passage. Thus the *dead Sea* in *Asia*, and the *Euxine Sea* in *Europe* have no *Tides*, because they have no communication with the *Ocean*; neither hath the *Baltick Sea* any, for tho' it be united with the *Ocean*, yet the strait of the *Sound* by which it communicates with the *Ocean*, is so far turn'd aside, from the *Straight Line*, in which the *waters* move that are driven from the *Tropicks* towards the *Poles*, that they cannot enter in sufficient quantity into it, within the time of 6 *Hours*, to cause any sensible Elevation of the *waters*.

C H A P. VII.

Of Fire.

ONE Fire is produced or propagated by another.

The Reason hereof is, because the parts of the 3^d Element, being carried away by the 1st that surrounds them, meet with like parts of the 3^d Element, which they not only separate from their like parts, but also from those of the 2^d Element, so that these also being surrounded with the 1st, are snatch'd away by it. For as a *Ship* that is carried along by the stream of a *River*, doth more forceably push forwards other *Bodies* it meets with, than the *River* it self can; so these parts of the 3^d Element, being hurried along by the 1st Element that surrounds them, do agitate more strongly than the 1st alone can. Wherefore, if the force of these parts that are hurried away by the 1st be so great, that they be able to push far from them all the parts of the 2^d, which the neighbouring *Air* is full of, and keep them so; then the *Flame* appears, as we see in *Wax*, *Grease*, *Oyl*, *Brimstone* and *Gunpowder* set on *Fire*. But if they be not of force enough to do this, then the *Fire* lies overwhelm'd with much *Ashes*, as in *Leaves*, *Touchwood*, or any other dry *Fewel*.

Fire is also generated by concentrating the Rays of the *Sun*.

The Reason is, because *Light* is nothing else but the motion of the 2^d Element, produced by the 1st, whereby the 3^d Element is made visible. For it may happen, that upon the uniting of several Rays, some part of the 3^d, may be separated from its other like parts, and from the 2^d, and consequently be surrounded only with the 1st, whose motion it must then follow. Thus in our time *Burning-glasses* have been invented, by which *Metals* may be Melted, and *Wood* suddenly set on *Fire*.

Some kinds of *Fire* do shine, and yet are destitute of all heat. For they who use the *Sea*, observe that at sometimes when *Waves* are dasht against *Rocks*, they appear as if flames of *Fire* rebounded from them. And thus also Rays of *Light* proceed from *Rotten-wood*, and *Salfish*, but without any sensible heat.

The Reason is, because the Matter of the 1st Element, which is shut up in the Pores of such Bodies as these, tho' they be of force enough to push the Globuli of the 2^d Element, and to move the *Retina*, as much as is sufficient to produce the perception of *Light*; yet is it too weak, to separate the

I.
How Fire produces or propagates Fire.

II.
How Fire is generated by concentration of the Beams of the Sun.

III.
There be some Fires that shine without heat.

the *Earthly parts* from one another, and to excite that agitation in them, which is strong enough to produce *heat*. *Fire* therefore only *shines*, when the *Pores* of the *Terrestrial Particles* are so narrow, that they can only admit the first *Element*, and shut out every thick *Body*. Thus when the pointed *Needles*, as it were, of *Salt* do enter the *strait Pores* of *Fishes*, and drive thence the *Globuli* of the 2d *Element*, so as to be open only for the admission of the matter of the 1st *Element*, they by this means make the *Fishes Scales* to shine like *Glow-worms*. *Historians* tell us of a certain *Fly* in *New Spain*, of the bigness of a *Beetle*, called *Cocujus*, whose *Eyes* do enlighten the *Night* like a *Wax Candle*, so that it serves for a *Lantern* to those that walk by *Night*, and for a *Lamp* to burn in ones *Chamber*; and by the *Light* whereof one may read or write; and have the same effect when the *Insect* is dead, as when yet alive.

IV. Some *Bodies* afford great *Heat*, but are destitute of all manner of *Light*: As the *Blood* of *Live Animals*, *Horsdung* tending to putrefaction, *Quick-Lime* sprinkled with *water*, in which things there is a hidden *Fire* that burns and scorseth, without the appearance of any *Flame*.

The Reason is, because in such *Bodies* as these, the parts that surround the 1st *Element*, and that are agitated by it, are too soft and limber to transmit the *Action* of *Light*. For tho' some of them swim on the top of the matter of the 1st *Element*; and comply with its motions; yet because some *Watry* and *Aiery* plyable parts, are mingled with them, they have the power to kindle *heat* and *fire*, but not of receiving the action of *Light*. Hence it is that when the *Spirit* of *Vitriol* and *Oyl* of *Tartar* are poured together, an effervescence or boiling is caused, because the free passage of the subtil matter being hindered in them, doth produce a wrestling or contest betwixt these 2 *Liquors*, which is the cause of a vehement *heat*. And for this Reason *Horsdung*, and the *Blood* of *Live Animals* are hot, because the 1st *Element* is pent up by a softer matter, within the narrow pores of the parts. And therefore they are only hot, that is they have only the force to move those *Nerves* that are subservient to the *Touch*, but not of pushing the *Celestial Globuli*, wherein the nature of *Light* doth consist. *Quick-Lime* sprinkled with *water*, waxeth hot, because its parts are so suited and disposed, as to admit the *water* surrounded only with the matter of the 1st *Element*; so that the *Globuli*, being expelled, the matter of the 1st *Element* only bears sway. For those *Bodies* are said to have the form of *Fire*, whose particles do separately comply with the motion of the 1st *Element*, and imitate the agitation thereof.

V. *Flame*, by a natural propensity, mounts upwards towards *Heaven*; and to the end it may the sooner get thither, it quits its thickness, and takes to itself a *Conical Figure*.

It may be said that the *Flame* doth not so much affect to mount upwards, as it is by outward force driven up thither; for being on all sides surrounded by the *Air*, and by reason of its less degree of agitation, as it were, continually beaten by it, it rather tends upwards than downwards, because it meets with less resistance there. The way this is performed take as follows. The matter of the 1st *Element*, which is predominant

in the *Flame*, being in perpetual motion, strives continually to depart from the place where it is; and being lighter than the *Globuli* of the 2d *Element*, it is carried upwards, and withdraws it self from the *Center* of the *Earth*; and forasmuch as no *Body* can be moved, except some other, by a circular motion, enter into its place, as much *Air* returns towards the *Flame*, as there is *Smoak* that goes from it; and therefore the *Air*, which, as it were, licks the upper part of the *Candle*, mixing it self with the parts of the *Wax* or *Tallow*, affords *fuel* to the *Flame*: So that the power of dilating the *Fire*, and driving it upwards, may in some sort be attributed to the *Air*. Now the reason why the *Flame* is of a *Conical Figure*, and ends in a sharp point, is evident, because the middlemost parts of the *Flame* have more agitation, and consequently move with more force, and are sooner carried upwards, than the outward parts, whose agitation is diminished by the nearness and contact of the *Air*.

From what hath been said, it is evident, that a *Pyramidal Figure* is accidental to *fire*, because the *Air*, by compressing the parts of the *Flame*, doth form it into that figure. For if we take a *Wax-Candle*, and place it in an *Iron Pipe*, and put the said *Pipe* into a *Porringer* full of *Spirit* of *Wine*, and afterwards set the *Wax-Candle* and *Spirit* of *Wine* upon the *fire*, we shall find that the flame of the *Wax-Candle* will be dilated, and swell 4 or 5 times greater than it was, and will then appear of a *round*, and not of a *Pyramidal Figure*.

In the *Winter*, when the *Air* is most compressed and condensed with *Cold*, the *Fire* burns most fiercely; and in *Rainy Weather*, and more especially when the *Sun* shines upon the *hearth* more weakly.

The Reason is, because *Sulphureous Particles* are necessary for the preservation of the *Fire*, which do break forth from the combustible matter; and *Nitrous* also, which are mingled with our *Air*: Now seeing that the *Air* in *Winter*, doth most of all abound with these *Nitrous Corpuscles*, it cannot be otherwise, but that the greater quantity of these must make the *Fire* burn more fiercely. Whereas, when the *Sun* shines upon the *Hearth*, the *Nitrous Particles* in the *Air* are scattered, and consequently the force of the *Fire* debilitated and almost extinguish'd. Hence it is that when a *Lamp* or other *Light* is put into a large *Glass*, fit for that purpose, as soon as the *Air* is pumped out, it is presently extinguish'd; not so much because it is choaked by its own *Smoak*, as because it wants this *Nitrous Aliment* contained in the *Air*.

A *Candle* that burns with a long *Wick*, *smoaks* more than another that is new snuff.

The Reason is, because in a longer *Wick*, the thicker parts of the *Candle* being mingled with the *sulphureous*, are without any loss carried upwards. But in a snuff *Candle*, that more fat and *sulphureous* matter which constitutes the *Smoak*, by being much agitated in the *Flame*, is reduced into most minute parts, as may be easily gathered from the crackling noise they make. This is the reason also, why a *Plate* of *Iron*, or other *Metal* being approach'd to the utmost parts of the *Flame*, contracts only some little smuttiness, because the *Terrestrial Matter* is by the force of the *heat* reduc'd to so small parts, that they are no longer perceptible.

VIX.

VI. A *Pyramidal Figure* is accidental to *Flame*.

VX.

VII. The *Fire* burns more fiercely in the *Winter* than in the *Summer*.

VIX.

VIII. Why a *Candle* with a long *Wick*, *smoaks* more than that with a short one.

VIX.

ble in their egress from the *Flame*, nor adhere to any *Body*: But when this *Plate* is thrust into the midst of the *Flame*, it is covered all over with *Smut* and *Soot*; and that by means of those grosser particles, that are not thoroughly subdu'd by the heat of the *Flame*.

IX. How a Candle may be made to burn without smoke. But if a *Cotten Wick* be laid to steep 24 hours in *Whitewine Vinegar*, impregnated with half its quantity of pure *Nitre*, and afterwards expos'd to the *Sun* to be dried, it will not send forth any *Smoak*, because the *saline* and *volatil parts* of the *Nitre* and *Vinegar*, do so divide and agitate all the *moisture*, that no part of it can escape the force of the *Flame*.

X. How two liquors pour'd together, produce heat. *Spirit of Vitriol* and *Oyl of Tartar* pour'd together, produce an *Ebullition*, or *Effervescence*. The Reason is, because the *pores* of one of these liquors are so formed, that they can only admit the *branchy parts* of the other liquor, wrapt about with the *matter* of the first *Element*; by which means the first *Element* having repulst the *Globuli* of the 2d, does alone bear sway. Or because the *subtil matter*, being wont to flow and move otherwise in the *Spirit of Vitriol*, than in the *Oyl of Tartar*, when its free passage is stop't, it causeth a kind of contest between the 2 liquors, and an effervescence or ebullition by reason of the mutual agitation of their parts.

XI. Why Fire is of a Bellows, or otherwise kindled by a blast. *Fire* is commonly kindled by a *Blast*, whether of a *Bellows*, or otherwise. Because by this means the *Ashes* which cover the *surface* of the *Coals*, and obstruct their more open *pores*, is driven away; by which means the *Fire* that was about to break forth, is driven inward, and there so separates and divides the parts of the *Coals*, and thoroughly penetrates them, as to invade and kindle the fat and inflammable particles also. And hence it is that the *flame*, when blown upon, makes a noise, which is caused by the resistance of its parts, and the mutual combination that is between them.

XII. How Fire comes to be quenched. *Fire* is quenched, when its parts are scattered and disperst, as it is kindled by the uniting of them. Thus we find, that either too fierce and violent a *Blast* of *Wind*, or a copious affusion of *Water*, doth dissipate the particles of *Fire*: The same effect is also caused by a steam that is shut up, and hath no vent to get out by; for then the said *Vapour* being beat back, and rebounding upon it self, doth divide the parts of *Fire*. And by this means it is that a *Candle* is often put out in a *Vine Cellar*, filled with the steams of *New Wine*.

XIII. Smoak hurts the Eyes, and moves Tears. The *Smoak* that proceeds from *Wood*, makes the *Eyes* smart, and produceth *Tears*.

The Cause thereof are the sharp and biting particles whereof the *Smoak* consists; which, twitching the *surface* of the *Eye*, and contracting the same, cannot but cause *Tears* to break forth. Forasmuch, as by this contraction, the *Kernels* in the *Corners* of the *Eyes* are squeezed, and consequently let out the humour contained in them. *Onions* produce the same effect, when they are cut, or otherwise divided into *Parts*; at which time a sharp *vapour* or steam proceeds from them; which reaching the *Eye*, provokes *Tears*. And probably it is for the same reason, that some *Fumes* are of use to still the *Toothack*, whilst by their sharp particles they do open the pores of the *Gums*, and not only make way for the Pain-causing Humour

to pass away, but also excite it to evacuation. Thus a *Fumigation* is made with the *Bran* of *Wheat*, mixt with fine *Sugar*, which is found to be of use for this purpose.

Some sorts of *Fire*, by Authors called *Greek-fires*, cannot be quench'd with *water*.

These *Fires* derive this effect from the solidity of their parts, and the swiftness of their *Agitation*, whereby they beat back the parts of the *water*. For one of the chiefest things required to the preservation of *Fire*, is this, that it have a sufficient quantity of *earthly particles*, which being driven and agitated by the first *Element*, have the power to hinder the choaking of it by the *Air*, or other *Liquors* pour'd upon it. Which force doth most of all abound in *Bituminous*, *Oily* and *Sulphureous Substances*, whereof these *Greek-fires* are compos'd. Forasmuch as these, by reason of their *Thickness*, and the sticking together of their *Branchy Parts*, are most proper to keep their station, and so to move the *water*, as to beat back the *Aethereal Globuli*, which by their irruption might extinguish the *Fire*.

The contrary hereunto happens in *Vaults* and *Wine-cellars*, especially when the *New Wine* is working in the *Vessels*; for then not only the *Candles* that are brought lighted into the *Cellar*, are extinguish'd, but even *Torches* also; because their flames being fill'd with the steams of the *New Wine*, do not consist of any such matter as is able to repress and put by the *Air* that hangs over them; nor are they strong enough to force it to enter into it self.

Fire is struck out of a *Flint*, with a *Steel*; yea one piece of *Steel* rub'd against another, doth produce *fire*. There are also some *Stones*, that are called *Live-stones*, that being struck with a *Nail*, or hit with another *Stone*, do send forth *Sparks*. And in like manner the *Indians* also procure *fire* by joining 2 *Sticks* together, and then take a 3d, which they very swiftly twirl about between them, till they be set on *fire*.

The cause of this production of *Fire* is, because when the hard and brittle parts of the *Flint*, and the other mentioned *Bodies*, are hit against by a hard *Body*, many of the spaces, which lie between their particles, and which were wont to be filled with the *Globuli* of the 2d *Element*, are made more narrow than they were before; and therefore as soon as the *Heavenly Globuli* are driven away by the force of the said *stroke*, nothing remains besides the most subtil matter, for to receive these thick particles, and to turn them round very swiftly. And therefore, forasmuch as the parts of *Flint* are very stiff, and apt to fly into shivers, they do indeed give way to the force of the *stroke*, but immediately rebound again; and thereupon being separated from each other, and hurried away by the motion of the first *Element*, they turn to *Sparks*, and constitute the form of *fire*. And thus in like manner is *fire* kindled by the vehement rubbing of *Sticks* against one another; because by this continued violent motion, their particles are first drawn together, and afterwards being with great force separated from one another, whirl round; by which means, not only the parts of the *Air*, but also the *Aethereal Globuli*, that surround them, are separated from each other; and being whirl'd round by the vehement agitation of the first Ele-

XIV. *Greek fires*, so called, cannot be quenched with water.

XVI. How *Fire* is to be struck out of *Flint*, *Steel*, *Stones*, and some sorts of *Wood*.

ment, turn to sparks, and exhibit the appearance of fire. Thus the *Apulians* wind *Cords* about a Stick; and by swiftly twitching them this way and that way, do set them on fire.

XVII. When *Hay* is laid up before it is thorow dry, it grows *hot*, and *burns*; which never happens when it is spread in a large and open field.

Why Hay, it grows hot, and burns; which never happens when it is spread in a large and open field.

The Reason is, because *Hay*, whilst it is yet New, doth abound with many *Spirits*, and several *Juices*; which being accustomed to move thorow the *pores* of the *Green Herbs* from their *Roots*, to their upper parts, do still continue in them for some time after that they are cut down. Which as soon as they are shut up in a close place, the *particles* of these *Juices*, passing from one *Herb* into another, do find the *pores* of them more narrow than they were, by reason of the contraction of their *Fibres*, so that they cannot enter them, without leaving the *Globuli* of the 2d Element behind them; and being only surrounded with the *particles* of the first, and so complying with their most rapid motion, are of sufficient force to agitate and heat the thicker parts of the *Hay*. As for Example, if the Interval, which lies between the 2 *Bodies* B and C, be supposed to represent one of the *Pores* of a green *Herb*, and the small strings 1, 2, 3, surrounded with little round *Bodies*, exhibit the pieces carried by the matter of the 2d Element; and the Interval D and E, another narrow pore of an *Herb*, that is in part dried, through which the fore said particles 1, 2, 3, pass, no longer swimming on the 2d Element, but on the 1st only: It is evident, that those that are between B and C, must follow the temperate agitation of the 2d Element; whereas those betwixt D and E, will be forced to comply with the most swift agitation of the 1st Element. I said, In case the *Hay*, before it is fully dry, be laid up in some narrow or close place; because as long as it is exposed in any open place, the *juice* which runs through the *pores* of the *Herbs*, is easily dissipated in the *Air*, without passing through the *pores* of the other strings, wherein it might excite a *heat*, and cause a *Conflagration*.

XVIII. Nothing is more easily kindled than *Gunpowder*.

What the reason is why Gunpowder is so easily kindled.

The Reason is, because it is compounded of *Brimstone*, *Nitre* and *Charcoal*, which of all things do most easily take fire: For *Brimstone*, we know, flames immediately, because it consists of *particles* of sharp *juices*, which are wrapt about with the thin and close branchy *particles* of an Oily Matter, so as that many *pores* between the said *Branches*, can only admit the matter of the first Element. But *Nitre* consists of longish and stiff *Particles*, which being agitated by the *particles* of *Brimstone*, do diffuse themselves into a larger space. And seeing that the *Charcoal* also doth abound with many *Pores*, the *Brimstone* and *Nitre* do readily enter the same, and by them are straitned. By which means it happens, that as soon as any fire toucheth a grain of *Powder*, composed of these materials, it presently enters the same through the *pores* of the *Coals*, and presently agitates the parts of the *Brimstone*, which afterwards move those of the *Nitre* and *Charcoal*.

XIX.

Some Lamps have been

Authors tell us of *Lamps*, that of old times were used to be put into the *Sepulchers* of the *Dead*, and continued burning many ages, without any

diminution of their *Light*. LUDOVICUS found that VIVES in his notes upon the XXI Book of St. Austin de Civitate Dei, tells us, That upon the breaking open of a certain *Grave*, a *Lamp* was found that had burnt 1500 years, but that as soon as it was touched with the hand it mouldred into the smallest *Ashes*. FORTUNIVS LICETUS also informs us, that about 100 years since, in the *Papacy* of Paul III, a *Lamp* was found in the *Sepulcher* of TULLIA, Cicero's Daughter, but upon the admission of the *Air*, and *Light*, was presently extinguish'd.

GASSENDUS reckons these *Lamps* amongst those *Ludicrous Lights*, which burn when the *Air* is shut out, and vanish as soon as it is admitted; when according to him, they ought to be rather kindled a-new upon the letting in of the *Air*, and so burn the stronger. But as for my part I see no reason why a fire or flame may not be preserved in *subterraneous places*, where it cannot be impaired or disturbed by the blowing of the *Wind*, or the distemperature of the *Air*. For it may so happen, that the *particles* of the *Soot*, which proceed from the *Candle* or *Lamp*, may close together about the *Flame* of the *Lamp*, and so constitute a kind of little *Vault* or *Arch* about it, by which the *Air* may be kept off from rushing upon the *flame*, and so overwhelm and choak it. For such an *Arch* as this would be of use to infringe the force of the *flame* from kindling the further parts of the *Oyl* or *Wick*. So that by this means the 1st Element in such a *Lamp*, being wrapt up round like a *Star*, would repel the *Aethereal Globuli* that are round about it, and so diffuse its *Light* throughout the whole *Sepulcher*; which tho' but weak and dusky, yet upon breaking in of the *Air*, and the dispelling of the *Soot*, which did encompass it, doth discover a bright and shining *Lamp*.

The *Flame* of *Spirit of Wine* doth not consume a Rag of *Linnen*.

The Reason is, because that to the end a *Body* may be fit to feed the fire, it must have many *particles* fit and suited to the fire which it is to preserve, and the same so joined to one another, or to other thicker than themselves, that by the driving or impulse of the *particles* of the said fire, they may be separated as well from themselves, as from the adjoining *Globuli* of the 2d Element, and by this means take upon them the form of fire: Whereas the *particles* of the *Linnen Rag* are not thin enough to be agitated by the *flame* of the *Spirit of Wine*, and to be separated from one another.

For every fire is by so much the more strong and vehement, the more fat and tenacious the matter is that feeds it. Again, amongst fat *Bodies*, some are much more apt to kindle than others. For *Spirit of Wine*, the purer it is, and the more highly rectified, the more inflammable it is also, because it hath little or no *Pblegm* remaining with it. Thus that kind of *Stone* which is burnt into *Quick-Lime*, cannot without great difficulty take fire, because its parts being very closely joined together, the fatness that is contained in them, cannot easily be disentangled or driven out from them, to the end it may be kindled into a flame.

When

XX. A Flame proceeding from Spirit of Wine, doth not burn a Linnen Rag, but only the Spirit of Wine is self.

XXI. All fat things are not kindled after one and the same manner.

When

XXII. When a *Cats Back* is strongly rubb'd with ones hand, Sparks of Fire seem to proceed from it.

The Reason whereof seems to be this, because this Rubbing drives out some Particles of Moisture, and causeth them to be dissipated into the Air; whereupon the particles of the fire, or if you will, the Sulphureous, greasy Particles, wherewith the Hair and Skins of Animals do abound, and those of Cats more than any other, croud and meet together, whence proceeds fire, and from the fire, light. Now this fiery Steam, or Exhalation, is easily retain'd or kept close in this Thicket of Hair, which consisteth wholly of Sulphureous filaments, becomes easily entangled amongst the said Hairs. Which is the true Reason, why a Garment lin'd with Fur doth so obstinately retain the heat committed to it, and keep off the Cold. But it is to be noted, that these sparks of Light, which by stroaking are forc'd from the Back of a Cat, do only appear in the Dark, because a greater Light obscures and swallows them, as the Light of the Sun does that of the Stars.

CHAP. VIII.

Of Earthquakes, and Subterraneous Fires.

I. The Cause of Earthquakes.

THE Country of *Campagna di Roma*, in Italy, Trembled for many days, by an Earthquake in the beginning of the year, when L. CORNELIUS and Q. MINUTIUS were Consuls, and that with such frequent and reiterated Concussions, that, as LIVY acquaints us, the People were not only tired and afflicted with the frequent returns of the Earthquake, but also by reason of the Holy-days that were appointed upon that account, to deprecate the Wrath of Heaven.

Some do impute the Cause of Earthquakes to the Sun, as supposing that by his heat, he doth attract those Exhalations out of the Caverns and Holes of the Earth, to the surface of it. But Reason assures us that this cannot be, because the Sun's Rays cannot penetrate so great a Depth of Earth: For tho' the Earthy particles, being beat upon by the Rays of the Sun, do agitate others which are near to them, and to which the Rays themselves cannot reach; and these again, others that lye near to them, and so on; yet is not this Commotion of the parts of the Earth sufficient to kindle a fire in it. Wherefore it seems more Rational for us to attribute the Cause of these Earthquakes to those Exhalations, which mounting through the Chinks and Cavities of the Earth, do there compose fat and thick Fumes, not much unlike to those which proceed from a Candle newly extinguish'd, and fill the whole space that is about it, which by a spark of Fire, either from Flints hitting against each other, or by some Candle that Miners make use of in their labour, are presently kindled; and being thereby vastly rarefied, shatter to pieces all the confinements of their too narrow Prisons, and force all the Bodies that stand in their way.

Thus AGRICOLA tells us, that in the Country of *Misnia* in Germany, there is a Mountain of *Smiths-Coals* that burns continually; where, according as the Flames spread and consume the Coals, the Earth sinks down and leaves deep Holes, which appear like so many burning Furnaces; the flame whereof sets any fit Matter on fire, that is at 4 Foot distance from them. In like manner, in the *Island Del Moro*, the Fire bursts forth with such exream Noise, that it equals the Thundering of the greatest Cannon, and with so thick a Smoak, that it may be compared with Midnight-Darkness; and with such a prodigious quantity of Ashes and Cinders, that Houses are crush'd under the weight of it, Cattle and other Beasts destroyed, and Fresh-waters turned into bitter.

Now whenever the Exhalations that are kindled in these Caverns, are not of force enough to break their way through the surface of the Earth, they only produce a shaking or trembling, that is, they only cause the Earth that is above them to rise: In like manner as Gunpowder heaves up the Ground under which the Mines are laid: And the said Exhalations appear outwardly, when they have strength enough to open the ground.

In Earthquakes, there are many times repeated shakings succeeding one another.

The Reason of this is, because the Matter that is kindled, is not always altogether in one and the same Cavity; but in many, which are only separated by a little sulphureous Earth: And therefore when the Fire takes in one of these Cavities, it gives the first shake to the Earth, and a second, when it kindles that which is in the next, after having consumed the sulphureous Matter that did separate them, and so on to the very last Cavity.

Some parts only of the Earth are shaken in Earthquakes, not the whole Ball thereof.

The Reason is evident, for that the Exhalations which abound in the Earth, and which have the power of shaking it, do not every where meet with a space wherein to dilate themselves. For since there are innumerable subterranean Cavities, and various hollows and windings, ready to admit any foreign Bodies, we cannot well conceive them to be all fill'd with the same Matter. For some of them contain Waters, which because of their innate Coldness, and the thickness and fœculency of their parts, do stagnate without any motion. Others are full of a thick and foggy Air, which being pent up within narrow Walls, is never driven out of its Holes without some force. Others again are taken up by fire, or rather fiery Steams and Exhalations; but such as are shut up in their Dungeons, and being unable to break forth, lye very quiet there without doing any mischief. Now these Steams or Exhalations, pent up within the Bowels of the Earth, from the various coalition whereof, Brimstone, Jews-lime, and other such like inflamable Bodies are made, like a smoking Torch, are kindled either by another Fire, or by the striking of hard Bodies against one another, or by the mixture of Liquors proper to produce an effervescence, and a consequent flame; and by means whereof being now more dilated, they push against the sides of their Dungeons and shake the Earth, till at last having broke through

II. Misnia in Germany, and the Island del Moro, have subterraneous Fires that burn in the Bowels of them.

III. Why in some Earthquakes there be several successive shakings.

IV. An Earthquake never assaults the whole Earth, but only some particular parts of it.

through their *Prison-walls*, they burst forth, and rush to take possession of a free and open *Career*. And forasmuch as these *Exhalations* are very inconsiderable, and bear no proportion to the whole *Globe* of the *Earth*, they can only shake some parts of it, without concerning the whole.

Sea Coasts of all other places are most subject to *Earthquakes*, because much fat and slimy Matter flows from the *Sea*, into the several *subterraneous Cavities*, which are very proper to feed the *Fire*. And therefore we find that *Earthquakes* very seldom are heard of in the *Northern* parts of the *World*, especially those that are remote from the *Sea*; because they have not Matter enough to produce these *Concussions*, the same being either drawn off by the heat of the *Sun*, or else because it is but gradually and in small quantities conveyed from the *Sea*. To which we may add, that in the Parts now mention'd, there are but few *subterranean Caverns* to admit this Matter: For this looseness of the *Earth*, and the wide and open *Cavities* contain'd in the *Bowels* of it, do much conduce towards the causing of these *Earthquakes*; because fresh Matter is laid up in store in them, for the producing of these Effects.

Accordingly we find, that *Earthquakes* are most frequent in those places where the *Earth* abounds with *Caverns* and *subterraneous Cavities*, which are the proper and fit receptacle for those *Exhalations*; except the said *Cavities* be open towards *Heaven*, and so afford a free passage for the *Exhalations* to fly away. Wherefore also *Earthquakes* chiefly happen, when abundance of such *Exhalations* are found in the *Earth*; as in the *Spring* and *Autumn*.

Every *Earthquake* is followed by a *Noise*, not much unlike that of *Thunder*, which always accompanies, and sometimes goes before it.

The Reason hereof is, because the *Fire* which is rarefied within the *Cavities* of the *Earth*, doth rebound and return upon it self: For seeing that in these *Caverns* there be innumerable winding Passages, which the kindled *Exhalations* go through, it cannot be but that the sound must needs be multiplied in its passage through them. Thus we know that *Echo's* are most frequent in *Caves* and *Hollow places*: And thus we find, that from certain crooked *Horns*, which the *Musicians* from their windings call *Serpents*, a kind of *Lowing Noise* doth proceed, which is only to be attributed to those windings and turnings by which the said sound is conveyed to our *Ears*. Every *Earthquake* therefore is accompanied either with a greater or less *Noise*, according as the matter is more swiftly or more slowly kindled, and as the rarefied *Exhalations*, do break forth with greater or weaker force, and display themselves by many or fewer *Concussions*.

The *Earth* in many places casts forth *Fire* through the top of many *Mountains*: Thus *Mount Aetna* in *Sicily*, *Vesuvius* in *Naples*, *Hecla* in *Iseland*, &c. do disgorge *Flames*, and cover the *Neighbouring Countries* with *Ashes*. The *Mountain Vesuvius*, now called *Monte di Somma*, according to the Relation of *DION CASSIUS* did burn in the year that *TITUS VESPASIANUS* and *FLAVIUS DOMITIANUS* were the 7th time *Consuls*, and breaking forth at the top, at first cast forth

Stones, and afterwards such a vast quantity of *Flames*, that 2 *Towns*, *Herculaneum* and *Pompeium* were thereby consumed; such thick *Smoak*, that they darkned the *Light* of the *Sun*, and last of all pour'd forth such a storm of thick *Ashes*, that it cover'd all the *Neighbouring Country* like a high *Snow*, and which by the force of the *Wind* was carried over into *Africa*.

There is no question to be made, but that *Fire* is generated in the *Earth*, seeing that a vast quantity of *Brimstone* and *Jews lime* is contained in the same, which are of a very Fat substance above all others, and are most readily kindled: Neither do we find any matter within the *Bowels* of the *Earth*, is better suited for the production of *Fire*; and therefore we may well conclude, that whatsoever burns, or is hot, is preserved and maintained by the mixture of both these. And therefore no *Fire* breaks forth any where, neither doth any heat manifest it self, where both of these, or at least the one of them doth not bear sway. The *Wind* also may contribute not a little to the increase and dilatation of the *Fire* that lies hid in the *Caverns* of the *Earth*, whilst by entering into them, it doth more or less blow them up and kindle them, and makes the flame more violent.

When *Fires* first began to break forth from this *Mountain*, doth not appear from *History*: *VIRGIL* tells us, that in *ÆNEAS* his time, when in his Voyage to *Italy* he put in at *Sicily*, *Mount Aetna* poured forth *Smoak* and *Cinders*, with a horrid roaring *Noise*. And *THUCYDIDES* acquaints us, that this *Mountain* burnt in the 76th *Olympiad*, that is, 476 years before the Birth of *Christ*. And several times after that, as in the time of *CALIGULA*, &c.

In the Year 1580, a *Mountain* in the *Isle* of *Java*, not far from the *City Panacura*, began to burn, the top of it being burst open with a violent eruption of *Brimstone*, so that 10000 Persons were consumed in the *Country* thereabouts, and cast forth vast great *Stones* upon the *City Panacura*. Moreover, for 3 days together it sent forth so much thick *Smoak*, mixt with *Flames* and *Cinders*, that it did cover the *Sun*, and almost turned the *Day* into *Night*.

There are found some other *Mountains*, that now burn no longer. Thus in the *Island Quercmoda*, not far from the Mouth of the *River Rio de la Plata*, there is a *Mountain* that burnt formerly, but hath now ceased. So likewise there are several *Mountains* in *Congo* and *Angola*, as also in the *Azores*, especially those of *Tercera* and *St. Michael*, which formerly cast forth flames, whereas now nothing but *Smoak* proceeds from them; and this, because the *Sulphur* and *Brimminous matter*, which is the most proper to kindle and feed *Fire*, is quite consumed in them.

The Reason why these *Subterranean flames*, do generally get up to the tops of *Mountains*, and thence make their terrible *Eruptions*, is to be taken from the Nature of *Fire*, which being pent up in these *Cavities*, and not being able to dilate and spread it self, makes a breach in the *Walls* of its *Prison* upwards, rather than elsewhere, because there it finds less resistance, and being once broke forth, it continues burning as long as the *fuel* lasts.

The

What inds places are most subject to Earthquakes.

VI. When and where Earthquakes are most frequent.

VII. What is the Cause of the great Noise that is consequent upon Earthquakes.

VIII. Whence that great Fire that proceeds from Aetna and Vesuvius, is caused.

XXX. Why the Fire doth not break forth from the Mountains only at certain times and seasons.

IX. When Aetna first began to burn.

X. When the Mountain in the Isle of Java began to burn.

XI. Of some Mountains that burnt formerly, and have now ceased.

XII. Why these Subterranean Fires do commonly break forth at the Tops of Mountains.

XIV. Why the Flames break forth from Mountains only at certain times and seasons.

XV. Why upon an approaching Earthquake, the water comes troubled.

XIII. *Subterraneous Fires* seldom break forth from lower grounds; but very frequently from the Bowels of *Mountains*.

Of this, a twofold Reason may be given; First, Because *Mountains* contain many *Cavities*: And, 2dly, because those great fragments, whereof the outward Crust of the *Earth* doth consist, and which are so posited as to lean upon one another, do afford a more easie Egress to the flame, than the other parts. And tho' these Openings of the *Earth*, do close again, as soon as the flame is broke forth from them; yet there may be so great a quantity of *Brimstone*, and *Bitumen* or *Jews-lime* carried up from the Bowels towards the top of the *Mountain*, as may furnish sufficient Matter for a long continued burning. And as for those Steams which are afterwards gather'd again in these *Cavities*, and kindled, they easily afterwards make their way by the passage that is already open'd for them.

XIV. *Burning Mountains*, after some time cease to cast forth Flame and *Smoak*, and after this Cessation return to the same task again.

The Reason is, because that when the Sides of these *Mountains* are burst open, *Water* comes flowing in to the said *Cavities*, and stops up the Passages to them, so as that the Matter of *Exhalations* cannot so quickly be gather'd there again, and afford Matter to succeeding flames. It also very frequently happens, that by means of this vehement eruption of flames, the parts of the *Mountain* are overthrown, and fall down into the bottom of the Deep, from whence the fire did proceed; and the way for the *Exhalations* to break forth at, being thus stop't up, no further Burnings can be expected, till a fresh quantity of *Brimstone* and *Jews-lime* be gathered and kindled; which by its breaking forth may open those stop't Passages again, by casting up that which obstructed them. And this is the Reason why these *Fire-vomiting-Mountains* do not always retain the same Bigness: For *Vesuvius*, in Ancient Times, was of far greater bulk than now it is, and is scarcely an *Italian Mile* high, all its windings and turnings reckon'd in.

Nor will scorcht *Ætna* ever vomit Flame,
Since from beginning't did not do the same.

Ovid. XV. *Metamorph.*

XV. When an *Earthquake* is near, the *Water* of *Wells* becomes troubled and muddy, and sends forth a stinking smell.

This Effect is produced by the steam proceeding from the *Subterraneous fire*, which like a *smoak* breaking forth from a piece of *Wood* that is not thoroughly kindled, insinuates it self into the narrow pores of the *Earth*, and mingles it self with the said *Well-waters*. The said waters do likewise send forth a Noisom smell, because this steam, which ariseth from the Bowels of the *Earth*, proceeds from sulphureous and bituminous Bodies, wherewith the inward parts of the *Earth* do abound; which being of a strong and unpleasant smell, no wonder if their steams communicate a like odour to the waters.

CHAP. IX.

Of Ashes and Coals.

Ashes, or that light powder which remains after that the flame hath consumed all its fuel, in Combustible Bodies, are by Chymists compared unto Snow, and they commonly call it the Snow of the Earth.

Because, as Snow doth consist of most small Drops, which by means of a subtil Vapour are woven or entangled together into flocks; so in Ashes, the smallest particles of the Earth, by a subtil interweaving of filaments, are joyned together in lesser flocks, which may be discerned by the help of a Microscope.

Ashes soak up so much Water, that a Vessel fill'd with them doth very near contain as much Water, as another empty Vessel of the same bigness.

The Reason is, because the Pores that are intercepted between the parts of the Ashes, are like so many flocks, that take in the Liquor poured upon them. And they are perceived to have little Bodies, like to cast Skins that suck in the water, and hide the same within their thin surfaces. But yet we must not from hence conclude with the Peripateticks, that there is the same quantity of water in a Vessel fill'd with Ashes, as there is in an empty one, seeing that the Ashes can scarcely imbibe a 5th part.

Ashes are of great use for the scouring and washing clean of Bodies. And therefore those who take the spots of Oil, or any other greasy Matter out of Bodies, do make great use of Ashes, by means whereof they restore things to their former cleanness and neatness.

The Reason of this Effect is, because Bodies are made smooth by rubbing against one another, and lose all their Roughness: And therefore by the rubbing of Bodies with Ashes, all the dirt and the filth that sticks to them is washt away with help of Water, which is that Vehicle, whereby the Ashes are carried into the most intimate retreats of the Body, where the filth or stains do lurk; for having some part both of fatness and sharpness, they become entangled with them, and by rubbing fetch out whatsoever Unevenness remains in the Cloth. And thus by the mixture of Ashes and Water, a Lye is made, whilst the water being as it were strained through the pores of the Ashes, and taking along with it their sharpness and fatness, it is made very efficacious for the washing and cleansing of things, from those stains and spots that stick to them.

Hence it is observed, that the Ashes of Fig-trees have a peculiar virtue for the Cleansing of Bodies from filth and stains; because the leaves and wood, whereof they consist, do abound with fatness and sharpness, or acrimony, which entring into the inmost parts of Bodies, do carry the filth along with them. And it is for the same Reason, that these Ashes are found to be a good Remedy to stop the Fluxes of the Belly, and for the opening of Obstructions, making the Humors to run freely through the Body, and through the passages appointed for them.

I. Why Ashes are called Snow.

II. How it comes to pass, that a Vessel full of Ashes, contains almost as much water, as another Vessel of the same bigness that is Empty.

III. Why Ashes are of use for the cleansing of Linens and VVoolen.

IV. The Ashes of Fig-trees very proper for the washing out of Spots.

V.
Ashes pre-
serve the
Roots of
Plants
from the
cold.

The Roots of Plants in Winter are covered with Ashes, to preserve them from being damaged by the cold, and that the melted Snow or Ice running down to them, may not hurt or injure them.

The Reason of this common use is, because Ashes are dry, and almost destitute of all manner of Juice, and therefore drink up the melted Snow, and hide it within their Pores. For Ashes are hot, and are agitated with intestine motions. For as Vinegar and the Lees of Wine, do retain a warming Virtue; so Ashes are partakers of a Fiery quality, and are endued with a Virtue, that resists the effects of cold.

VI.
How Ashes
contribute
towards
the mak-
ing of the
Earth
fruitful.

And for the same Reason it is, that Ashes conduce to make the ground fruitful, because of the Salt that is in them. For the Fatness of the Earth is lodged in Salt and Nitre, which being resolved by moisture, and heated by the Sun, doth ferment, and yields new productions. And therefore those Ashes whence the Salt hath been extracted, are of no use for this purpose, which may be proved by this Experiment: Dig a quantity of Earth deep out of the Ground, and having divided it into 2 parts expose them to the Air, the one in the same Condition as it came out of the Ground, and the other washt several times by pouring water upon it, and suffering the same to run through it: And you shall find, that this latter will produce nothing, whereas the other will bring forth Herbs, Worms and little Pebbles within some short time after.

VII.
Why Coals
are of a
black co-
lour.

Coals and all other adust things, as Soot and such like are of a black colour. The Reason is, because there are more Pores in Coals, and also in the burnt parts of Animals and Vegetables, than there were in the same Subjects before the Fire had touched them, and which may be seen in Charcoal, by means of a Microscope. Now this multiplicity of Pores swallows up the Light, and hinders it from being reflected to the Eye. And from the multiplicity and largeness of these Pores, remaining in stead of the grosser matter, that hath been turned into Smoak and Steam, the Lightness of Charcoal doth proceed.

VIII.
Why Coals
keep Fire
a great
while.

Coals do preserve Fire a good while, especially if they be covered with Ashes, and so kept from the Air coming to them.

The Reason is, because the Fire which lies hid in the Coals, is lodged in some thin and branchy Particles, which being intangled with others that are thicker, tho' they be most swiftly agitated, yet can only get out successively, that is, one after another. The Fire that is hid within the Pores of any Body, doth stand in need of some time, to have all its Particles dissolved, that by this means it may extricate it self from them; and probably before they can get thus free, the parts of the Coal must be worn and wasted by a long motion, and every one of them be subdivided into other parts again. But as long as the Air hath free access to Glowing Coals, they are much sooner consumed, because the Air doth by its motion blow away the Ashes, and entering into the Pores of the Coal, dilates them more than ordinary, and so makes way for the Fiery Particles to fly away.

IX.
How Wood
is turned

Thus a piece of Wood being put into a Vessel and covered with Sand, within a short time after that Fire hath been put under the said Vessel, the

Wood becomes turned into Charcoal, if so be the Vessel cover'd with Sand be not presently removed from the Fire, but so ordered that it may cool by degrees, nor too suddainly lose all its heat. For if as soon as the Vessel is taken from the Fire, the Sand be removed, the Wood upon the letting in of the Air, will presently begin to Flame, and be wholly resolved into Ashes. Because the Branchy Particles of the Wood, become by this means separated from each other, and upon the removing of that which hindered, are dissipated in the Air.

If a little water be sprinkled upon a live Coal, the heat is thereby encreased.

Because the moisture by entering into the Pores of the kindled Body, doth drive the Particles of the Fire into the inmost parts of it, and becomes mingled with them, but being forced to return by reason of the predominating heat, it carries the Particles of Fire, which lay hid in the Pores along with it, to the extrem parts of the Body. And the same is the reason, why water which extinguisheth small Fires, yet by the fatness which it contains doth make great Fires burn more fiercely, because by the motion of its flexible parts, it carries forth the heat, and raiseth the flame to a greater height.

In the making of Gunpowder, Charcoal-dust is mixed with Brimstone and Nitre, and being moistened with some Liquor, this Composition is formed into small Grains, which of all other matter do most readily kindle and take Fire.

The Reason why Charcoal-dust is made an ingredient of Gunpowder is, because it abounds with Pores, and therefore is most easily penetrable. And no wonder that Charcoal is very porous, seeing that before the Fire had wrought upon it, the wood it self had many little passages, which afterwards by the operation of the Fire, and the evaporation of so many Particles in Smoak and Steam, were much encreased: To which may be added, that Charcoal chiefly consists of 2 kind of parts, whereof the one are Thin and Branchy, which as soon as they come near the Fire are easily kindled; as having already been agitated by the force of the Fire, but yet continuing entangled together by their slender and manifold Branches, which also would have made their escape, if the quenching of the Fire, had not stop't their flight. The other parts contained in Charcoal are thicker, which if the Fire had acted longer upon them, would have been turned into Ashes. So that in this Composition of Gunpowder, the Branchy Particles of the Brimstone, and the sharp Needles of the Nitre, penetrating into the large Pores of the Charcoal, become entangled with its Branchy parts and closely drawn together, especially by that time they are dried, after that the whole mixture, by the addition of some moisture, hath been formed into small Grains. This composition becomes kindled in this manner; First, the Fire being applied, immediately kindles the Brimstone, and at the same time puts the Particles of Nitre into motion, which thereupon requiring a greater space wherein to take their turns, do rend the Bands of the Charcoal, and resolve the Grain into Flame and Smoak. For the resistance of the Charcoal doth greatly promote that swiftness, whereby the whirled Needles of the Nitre do break forth into a suddain Flame.

Ashes

XII.
Why Ashes
are white.

Ashes are commonly of a whitish colour, which grows much darker when water is cast upon them.

Ashes are white, because the Particles which constitute them, are Spherical; which our Touch can convince us of, forasmuch as they feel smooth without any roughness at all: And consequently reflecting the light on all sides, they exhibit a white colour; which becomes darker upon the affusion of water, because moisture, as has been said, promotes blackness.

XIII.
How Wheat
comes to
grow from
the Ashes
of it.

Credible Authors answer us, that Wheat hath sprung from the Ashes of it Sown in the Gound.

The Reason is, because the Salt which remains in the Ashes is a solid substance, and contains a great portion of Earth, and consequently is most proper for the generation of Plants, since it cannot easily be exhaled, and becomes resolved by the force of Heat. Wherefore these rudiments of the Plants remaining in the Ashes, being dissolved by some convenient moisture, and the warmth of the Air, spring forth into a new Plant. Thus Hogs-dung produceth Sowthistles, and that because it is common for these Animals, to feed upon them; for the Seed of Sowthistles remaining in the Dung, and resolved by heat and moisture, produce other Plants of the same nature.

XIV.
The Ashes
of a Plant
contain
the princi-
ples of a
new Plant.

Hence it is that if we put the Ashes of any Plant into a Vessel with water, and expose the same to the Air in the Winter-time, as soon as the water is frozen, the resemblance of the Plant will be express on the Ice, at least the Leaves of it. Which is a pregnant Argument, that in the Ashes there remains a Principle of a new Life.

CHAP. X.

Of Glasses.

I.
What Ashes
are most
proper for
the mak-
ing of
Glasses.

THE most proper Ashes that are known, for the making of Glasses, are those of the Herb Kali, and Fern.

Tho' the parts of Ashes be very gross and irregular, and cannot, tho' they lean one upon another, so unite together, as to compose a hard Body, because the Air which fills the Pores that are left between them, doth hinder their Rest; yet the Ashes of the Herb Kali and Fern, are therefore the most proper for the making of Glasses, because they abound with abundance of fixt Salts, which are very porous and spongy; so that when these Ashes are put into a violent Fire, their corners are consumed by it, and by this means the surface of their parts is made so smooth and even, that they touch in more Points than they did before, and afford a free passage to the Beams of Light, and cannot be rendred dark or opaque without the mixture of some Foreign Matter.

II.
Why Glass
is Transpa-
rent.

Glass notwithstanding that it is a hard Body, and made up of the thick and irregular Particles of Ashes, yet doth constitute Transparent and Light-some Body.

The cause of this perspicuity of Glass, may be easily gathered from the make of it. For whilst the matter of it, was by the violence of the Fire reduced to a liquid form, and all its Particles in agitation, the Fire flowing round about them, hollowed many Cavities in them, which the 2d Element freely entering, diffused the action of Light

to all parts, in right Lines. And forasmuch as the said Pores, are after the Glass is made, continually preserved and kept open, by the incessant passage of the subtil matter, and are filled as before, they cannot but transmit the Light as formerly, so that the same transparency which was in the molten and liquid Glass, remains in the cold and hardened. For this is a thing common to all Bodies that are melted in the Fire, that whilst they are yet in that liquid form, their parts do easily accommodate themselves to any Figure, which they retain after that they are grown cold. If at any time any darkness be perceived in Glass, that proceeds from some Dregs, Clouds or Bubbles that are mingled in its texture, which since they are much more numerous in thick Glass than in thin, therefore we must impute the darkness of thick Glass to them.

Glass is very Brittle, and will not suffer it self to be extended, but upon the least stroak breaks to shivers,

III.
Why Glass
is Brittle.

The Reason is, because tho' Glass be a hard Body, and does consist of parts that are thick enough, yet forasmuch as the surfaces by which they touch one another, are very small, so that they joyn only in Points, for this reason it is, that if they be never so little separated from each other, they lose their union and fly into bits. Whereas many soft Bodies are much harder to be broken, because they have their parts so intangled, that they cannot be separated, without the breaking of many of those Branches, by which they were held together.

It is a thing known by long experience, that Glasses after they have lasted a long time, do at last break of themselves. More particularly this is notorious to them, who grind those Glasses that are used in Prospective Glasses; for they find that after they have been polished a long time, they split of themselves. The cause whereof is, because the Saline Particles, being agitated by the subtil Matter, do endeavour to break loose: As may be gathered from hence, that in the Winter season, and Rainy weather, something may be wiped from Glasses, that hath a Salty taste. And not long since there was a certain man at Amsterdam, who broke Rhenish-wine Glasses only with his Voice, and that not very strong neither, but tuned to a certain Pitch.

A Glass newly taken out of the Furnace, if it be exposed to the cold Air breaks immediately; and so likewise if any water be cast upon it.

The Reason is, because when the cold doth draw together and narrow the Pores of the Glass, the subtil Matter and the fiery Particles are by this means lockt up in them: And whilst the former of these press to make their way through the Pores of the Glass, and the others endeavour to get out from it, they by striving to widen the Pores, make the Glass to fly in pieces.

If a cold Glass be held so near to the Fire, that it heat in one part more than in another, it presently breaks.

The Reason is, because when the Fire is got in to the Glass, the Pores of it are not all equally dilated by it, and therefore when the subtil matter gets into them, seeing the Pores where the Glass is cold, are not wide enough for its free passage, it makes way for it self by rending the Glass to pieces.

IV.
Glass some-
times
breaks of
it self.

V.
Why Glass
that is
newly taken
out of the
Furnace
doth break
when ex-
posed to the
Air.

VI.
A cold
Glass held
so near the
Fire cracks.

pieces: But if it be by degrees, and by little and little held to the fire, it will suffer no hurt at all; because all its pores will by this means be sufficiently dilated, so as to afford a free and open passage for the subtil matter. And therefore when Glasses that have contained any hot Liquor, are suddenly emptied and exposed to the Air, they crack immediately; because the subtil matter, which is pent up in the pores of Glass Vessels, striving to get out, finds no way for it self, because the pores are constricted by the coldness of the Air; and therefore makes its way by breaking the brittle sides of the Glass.

VII. To avoid this breaking of Glasses, they that belong to the Glass-houses, take the Glasses that are newly blown, and set them in a place at some distance from the fire to Neal, as they call it, removing them every 6 hours, the distance of 8 or 10 Foot, before they expose them to the Air; by which means all the parts of the Glass being insensibly and equally cool'd, there is an equal constriction of the Pores, so as that the subtil matter which can pass one of them, can with like ease pass all the rest.

VIII. How Glass seems to have something of a Magnetick Virtue; for when it is strongly rubb'd, so as to be heated thereby, it draws the neighbouring Bodies to it self.

The Reason is, because the agitated particles of the 1st Element, continually pass from the Glass into the Air, and others from the Air return to the Glass, to take up the room of the former; and because those particles which return from the Air, have not all of them the same degree of Agitation, those which have less, are driven towards the little flux; which have no correspondent Pores in the Air, and being, as it were, heaped upon one another, do constitute certain wreaths, which in process of time acquire determinate Figures, which afterwards are not easily changed. Wherefore when Glass is strongly rubb'd, so as to grow hot, these wreathed particles being driven out, are diffused indeed through the neighbouring Air, and enter into the pores of Bodies that are about them: But forasmuch as they do not there find an open and ready way for themselves, they return to the Glass immediately, and carry along with them any little Bodies they meet with in their way.

IX. When in the melting of Glass, a Metal is mix'd with it, the parts whereof cannot so easily be smoothed and polished by the action of the Fire, as those of the Ashes are whereof the Glass is made, then the Glass becomes ting'd of divers Colours.

The Reason is, because the metalline particles, which are very irregular, do insinuate themselves into the pores of the Glass; and by this means, make the parts of the 2^d Element, that pass through the same, to move and roll differently from what they did before, and consequently to represent those Colours which are caused by these their different rollings.

X. Glass is very stiff, and cannot be bent without the danger of Breaking. Wherefore, if it be never so little bended one way, it presently springs back like a Bow, and returns to its former Figure.

The Reason is, because this bending doth some what change the figure of the Glass, and straitens the pores of it; so that the particles of the 1st E-

lement, that before pass through them, finding their way not so easie as before, and yet pursuing their motion as far as they are able, force the sides of them, and endeavour to reduce them to their former figure. For this property of leaping back, is not peculiar to Glass only, but to all hard Bodies, whose particles are joined by immediate contact, and not by the weaving or intangling of Branchy parts: As is evident in a bended Bow of Steel or Wood, which presently leaps back to its former state, except it have continued bent too long; and that the subtil matter hath found or made it self other passages to run through.

Glass is melted by the action of fire, and whilst it is so, is easily formed into all sorts of figures.

The Reason is, because the parts of Glass having been before worn and polished by the force of fire, are easily moved, and obliquely creeping, and flowing one upon another, they begin to touch each other in some small part of their surfaces, and following one another, constitute a fluid Body, which may be formed into any figures, according to the pleasure of the Artist. Moreover this fluid Body, as it grows Cold, becomes tough like Bird-lime, so as that it may be drawn into thin Threads; because as long as that motion is continued in it, whereby its parts do flow, lying obliquely upon one another, it may the more easily be drawn out into Threads, than it can be broken.

Glass beaten into Powder, according to the opinion of some Physicians, becomes Poison.

The Reason of this, as I suppose, may be, because the pieces of Glass are hard and sharp, which hurting and wounding the Membrans of the Stomach and Guts, as well as of the other smaller vessels, become destructive to the Body of Man. For I do take Glass, when it is yet whole, to be no Poison at all; forasmuch as many have swallowed it without any hurt; which is an argument, that all the hurt that can accrue to our Bodies from Glass, must proceed from the hardness and figure of its little particles.

CHAP. XI.

Of the Air.

THE Air is insipid, and makes no impression of Taste upon the Tongue.

The Reason is, because it swims upon our Spittle, and doth not mingle with it, and therefore cannot affect the Nerves of the Tongue. And hence also we may see the reason why water is insipid; as likewise why fat Liquors are less discernible by their taste, than dry things.

The Region of the Air, which is nearest to the Earth, is found to be warmer than that above it, where Cold hath a greater dominion, and where Hail, Snow, and other cold Bodies are generated.

The Reason is, because the Rays of the Sun being copiously reflected from the Earth, do agitate the parts of it more than ordinary. For a violent agitation of the parts of the Earth produceth Heat, especially if it be caused by the Light, and do continue for some time. And forasmuch as the Rays that are reflected from the Earth, are not in so great abundance carried up to the higher Regions

XI. Why Glass melts by the force of Fire.

XII. Glass beaten to Powder becomes a Poison.

I. Why the Air is insipid.

II. Why the Air that is nearer to the Earth, is hotter than that which is further off.

which is
further off.

of the *Air*; and those which get up thither, do communicate their motion all along to the *Bodies* they meet with, it cannot be, but that cold must succeed upon this diminished agitation, and so give occasion to the condensation of *Clouds*, and the production of *Snow* and *Rain*.

The *Air* being thrust and crowded into any vessel, does become more heavy, than that which is diffused in a free and open place. Which *GALILEUS* made an Experiment of after this manner. I took, saith he, a large *Glass Bottle*, and carefully applied to the Mouth of it the Neck of a *Bagpipe*, by which means I crowded into it a very great quantity of *Air*; for because of its easie condensation, 2 or 3 *Bottles* full of *Air* were thrust into it over and above that which was in it at first. Now by this Experiment *Galileus* learnt, that the crowded *Air* had made the *Bottle* more heavy than before; and that as soon as the Mouth was unstopt again, the weight of it was again diminished.

The Reason is clear and evident; because in the condensation of *Bodies*, the parts come nearer together and are more intimately joyned; And therefore being in greater quantity, they cannot but weigh more than before; for a greater quantity of *Air* makes the *Vessel* more heavy than a less quantity. As will be evident, if this *Bottle* with *Air* be fitted to another *Bottle* full of *Water*, with a hole at the bottom of it, which may be opened at pleasure: For when the *Bottles* are thus joined together, and a passage left open for the *Air* to enter into the *Bottle* full of *Water*, as much *Water* will run out as there was of condensed *Air* that was crowded into the other *Bottle*. And therefore we are to suppose, that the quantity of *Air*, that was with forced driven into the *Bottle*, is equal to the quantity of *Water*, that was driven out from it through the *Bottle*.

It seems to be difficult to determine how much the *Water* is heavier than the *Air*; forasmuch as the weight of the *Air* is not the same in all places. Yet may the same be, in some sort, determined from a late Experiment; by which, well-nigh, all the *Air* having been contracted out of the great *Glass Vessel* of the *Pneumatick Engine*, and the Mouth of it stopt, it was laid in a *Scale*, to know exactly how much the *Vessel* weighed without *Air*; and afterwards when the *Air* was let in again, it was weighed a 2d time, and then found that the *Vessel* weighed about an ounce and half more than it did before: So that according to this Experiment the *Water* should seem to be almost 1000 times heavier than the *Air*.

For the further clearing of this, and the following *Phænomena*, I think it will not be useless to give here a description of the foresaid *Engine* or *Machin*. It consists chiefly of 2 parts, viz. of a *Syringe* or *Pump*, and a *Glass Vessel*, which is called a *Recipient*, whence the *Air* is pumped. Between the *Syringe* and the *Recipient* is a *Copper Pipe*, through which the *Air* passeth out of the *Recipient* into the *Syringe*; and in the *Pipe* is a *Peg*, by the turning of which the *Air* is either suffered to pass out of the *Glass* into the *Syringe*, or stopt from passing. When therefore the *Sucker* is pulled up, the lower part of the *Syringe* is stopt with ones *Finger*, that the *Air* may pass out of the *Recipient* into the *Syringe*; and when the

Sucker is prest down, then by turning of the *Peg* the *Air* is hindered from passing out of the *Recipient* into the *Pump*; and by removing ones *Finger*, the *Air* is driven out of the lower end of the *Syringe*; the rest will be easily perceived by the *Eye*, or understood from the Figure. A is the *Pump*, at the bottom whereof B is a little hole, which is shut with ones *Finger*, when the *Sucker* is drawn up, by means of the *Handle* belonging to the indented *Wheel*, and of a plate of *Iron* also indented, which is fastned to the *Sucker*. When the *Sucker* is drawn up, the *Air* rusheth forth out of the *Recipient* F, through the *Pipe* I, into the *Pump*: For then by turning the *Peg* L, the *Air* hath an open passage afforded it into the *Syringe*; but when the *Sucker* is thrust downwards, and the *Peg* turned the contrary way, the *Air* is stopt from returning into the *Recipient*; and then upon taking away ones *Finger* B, the *Air* is thrust out through B, and the *Recipient*, by degrees, is emptied: And this pumping must be reiterated so long, until the *Recipient* F be emptied of all the *Air* that was in it. Having thus set down the Frame of this *Engine*, we will proceed to some Experiments that are made by it.

1st. After that the greatest part of the *Air*, contained in this *Engine*, is evacuated, the *Stopple* which shuts the upper Mouth of it, cannot without difficulty be removed, as being prest down with a greater weight; but is most easily removed, when by turning of the *Peg* the *Air* is let in again; for when that Hole is shut, the outward *Air* doth more strongly prest the *Engine*, than when it is open.

2dly. Upon the same Evacuation, the *Sucker* is very difficultly drawn upwards; but being drawn up, doth of it self run down again, tho' an 100 pound weight were fastned to it; because upon the exhausting of the shut up *Air*, which before balanced the outward *Air*, this being now become more heavy, forceth the *Sucker* to enter into the *Pneumatick Pipe*, so as that being, as it were, bound with strong Bonds, it cannot be separated.

3dly. A *Square Glass Bottle*, tho' it be of thick *Glass*, upon the evacuation of the *Air*, breaks immediately; whereas a round *Glass*, tho' it have a crack in it already, doth not only not break, but also keeps the external *Air* from entering into it; because, by how much the External *Air* doth more prest the parts of the *Glass*, the more they do mutually support each other, as we see it is in arched *Roofs*, so that none of them can give way: But the case is different in a *Square Bottle*, which hath much less force to resist, as being unable to withdraw the force and weight of the External *Air*.

Hence it is, that if you tie the neck of a *Bladder*, after that you have squeezed the *Air* out of it, and so put it into the *Glass Recipient*, upon the Evacuation of the *Air*, that was in the *Recipient*, you will find the *Bladder* begin to swell, and to that degree, that sometimes it bursts, with a great noise. The same thing may be seen in the common *Torricellian* Experiment: For if you put the *Bladder* of a *Carp*, almost void of *Air*, into the *Pipe*, it is presently blown up, because the remaining parts of the *Air*, being loosened by the neighbouring *Air* in the *Pipe* do extricate themselves. And therefore as soon as the *Air* is let in again into the *Recipient*, or into the *Pipe*, the swollen *Bladder*

Figure
20.

VI.
According as the *Air* is either exhausted or let in, so the *Stopple* of it is either more hardly, or more easily removed.

VII.
The same effect happens to the *Ping*.

VIII.
A *Square Glass Bottle* breaks upon the evacuation of the *Air*.

IX.
A *Bladder*, upon the evacuation of the *Air*, swells in the *Pneumatick Engine*.

immediately falls again. The same thing also happens when the parts of the Air are agitated by Heat; for we see that a Bladder, which is not above half full of Air, if it be laid near the Fire, is blown up to the utmost, and becomes very hard.

X. *Aqua Fortis* and *Vinegar* do swell in the *Pneumatick* Engin.

Aqua Fortis, in which a Metal hath been dissolved, and *Vinegar* impregnated with the solution of *Coral*, do wonderfully swell in the *Recipient*, upon the extraction of the Air, and seem to boil, because the Particles of the Air, that are shut up in the pores of these Liquors, being set at liberty by the pressure of the Ambient Air, do dilate themselves into a larger space. And to the same it hath been observed, that if a *Swine's* Bladder, be put into the *Recipient*, after that the Air is drawn out, it becomes plump up again, and looks as stiff, as if it had been but newly plucked from the Tree, and if the Skin of it be broke, a kind of a froth breaks forth from it, as if it were roasted at the Fire.

XI. *How* Bullets are discharged from *Wind Guns*, by the compression of the Air.

The Air when shut up in any Vessel, and compressed by outward force, becomes endowed with a power to leap back or rebound, as is evident in *Wind Guns*, from which leaden Bullets are discharged with so great force, as they seem to exceed the force of those that are discharged by Gunpowder. So likewise there are many other Engins, which by compressing of the Air only, cast up waters to a great height.

XII. *What* is the reason of the sudden and violent eruption of fermented Liquors out of the Bottles, where in they have been pent up.

The Reason is, for that when the Air is compressed within these Pipes or Engins, every one of its particles cannot enjoy that round space it stands in need of, to turn round about its own Center; but other neighbouring particles encroach upon it. And seeing that the same force of heat, or the same agitation of the said Particles, is preserved by the motion of the Heavenly Globuli, and that they cannot freely display themselves, being hindered by their Neighbours pressing in upon them, they hit and push one another with their Corners, driving each other out of their places. And thus with united forces strive to recover their former liberty, and a larger space to move in.

XIII. *Why* a Bladder that is blown up, being struck against the ground, doth rebound again.

In like manner small Wines, and new Beer or Ale, being put up into Bottles, break forth, as soon as they are opened with a great force; because the parts of the Tartar or Wine Lees, being pent up within the sides of the Bottles, cannot be separated, or flee from one another; and therefore by means of their intestine agitation, do so cut and divide one another, that tho' they be mixed, yet there is no connexion between them; which is the Cause, that as soon as the Bottle is unstopped, they break forth with great noise and violence, in the form of froth.

Thus also blown up Bladders, being struck against the Ground, do rebound again: for the Air being compressed in the Bladder, is agitated by the subtil matter, which is lodged between the parts of it, and striving to recover its former freedom, lifts up the Bladder; and being unable to bear any greater compression, beats back the hard Bodies it meets with. The same Elastic Force is clearly demonstrated, by putting a Swine's Bladder, distended with Air, into the Pneumatick Engin; which upon the evacuation the Air, doth ordinarily distend it self to bursting: Sometimes lifts up 50 pound weight, because the shut up Air being

delivered from the weight of the External Air, doth endeavour a greater dilatation, and by extricating it self, takes up a greater place.

Accordingly also a reason may be given of the descent of the water in a Weather glass, when it is hot: For the Air that is contained in the Glass, being agitated by stronger Beams of the Sun, or with more Heavenly Matter, doth dilate it self, and consequently bears down the water, which cause is no sooner removed, and the dilatation diminished, but the water riseth again as before.

XIV. *Why* the water is pressed down in a Weather Glass, when it is hot.

But you'll say, if the Air be endued with an Elastic Force, how comes it to pass, that when it is shut up in thin Glass Bubbles or Drops, Hermetically Sealed, it doth not break through the thin Walls of its Prison?

XV. *How* it comes to pass, that a weak brittle Glass can resist this Elastic force of the Air.

In Answer, that these weak Bubbles are not broken, because as the Glass is prest by the inward Air, so in like manner the outward Air dasheth against the said Glass, and because the force is on both sides equal, it cannot break the Glass. For the same reason it is, that Bubbles swimming on the water, continue whole for a considerable time without breaking; and so making way for the pent up Air to get out. Which could never be, without the pressure of the Ambient Air; forasmuch as the Air, by its Elastic Force, is able to break very thick Glass to pieces.

Take a Glass Pipe 3 foot long, having one end of it stopp'd up, and the other open, and fill it with Quicksilver to the top, then turn it with the open end of it downwards into a Vessel likewise full of Quicksilver, so that it may run down into the Vessel. And you will find that the Quicksilver will not descend to the Bottom of the Pipe, but will continue 27 Fingers breadths high, or thereabouts.

XVI. *How* the Heaviness of the Air may be proved.

The weight of the Air is the cause which keeps the Quicksilver at the height, and doth not suffer it to sink lower. For tho' the Quicksilver that is in the Pipe be very heavy, yet can it not run down into the Vessel that lies under it, without raising the Quicksilver that is in it, and consequently the whole Mass of the Air that lies above it. Now the thick and agitated parts of the Air, do hinder its further condensation, because it is not without reluctance that they suffer any compression, and are reduced to a more narrow space and compass. But yet we must not imagine that every Air hath a like force to resist, but that the same varies according to the degrees of its Rarity or Density, that is, its looseness or compactness: For a loose and thin Air, and whose parts are more weakly dilated by Heat, is more easily bent, and doth less resist the pressure of the Quicksilver, than that Air which is more thick, and the Particles whereof are more vehemently expanded. And for this reason it is that the Quicksilver sinks lower in Fair, than in Cloudy and Rainy Weather, and that the Air which is on the top of Mountains, doth less oppose the driving of the Quicksilver, than in a Valley or shady place; because in this latter place the Air is thicker, and more weakly agitated by the heat of the Sun. Wherefore it is evident that the Quicksilver contained in the Pipe, is kept up by the weight of the Air, and that it would sink till it came to be level with that which is in the

XX. *Why* a Bladder full of Air doth sink the slower, nearer comes to the bottom of Water.

the *Vessel*, in case it were not hindered by the weight of the *Air* that lies upon it.

XVII. Thus we experience, that when the *North-wind* blows, and it is *Fair-weather*, the *Quick-silver* riseth higher, and sometimes to 28 fingers breadths; whereas when the *South-wind* blows, and in *Rainy-weather*, the *Air* is much lighter, and the *Quick-silver* only riseth to 27 fingers breadths. Thus also by the means of *Pumps*, the higher that the *Quick-silver* is in the *Barometrum*, or Instrument to distinguish the weight of things, the higher the *water* riseth, that is, 32 foot high, when the *North-wind* blows; but during a *South* or *West-wind*, and in *Rainy-weather*, scarcely 31 foot high, and so much the less as the *Pump* is placed on higher ground.

XVIII. The mutual contact of *Bodies*, whence they derive their firmness and connexion; is a pregnant Evidence of the weight of the *Air*: For we find, that 2 *Marble Polish'd Bodies*, besmear'd with *Oil*, do sometimes so closely stick together, that a closer Connexion can scarcely be apprehended. But no sooner are these 2 *Bodies* put into the *Pneumatick Engin*, but immediately, upon the evacuation of the *Air*, the piece of *Marble* that lies undermost, is immediately separated from the upper; because the *Air*, that lies under the Lower *Marble*, doth no longer bear it up, and is no longer able to keep it close joyned with the upper.

XIX. And if at any time it happen, that 2 *Marbles* stick close together in a *vacuum*, the Cause is only this, because the *subtil Air*, which pierceth through the sides of the *Glass*, doth not find any entrance between 2 exactly polish'd *Marbles*: And therefore the lower *Marble* cannot fall down without pressing and raising the fore-said Substance, which resists more than it can be pressed by the *Body* that lies upon it. But when *Marbles* are anointed with *Oil* or *Spirit of Wine*, that by means thereof they may be the more closely glewed together, then, as soon as the *Thicker part* of the *Air* is drawn out of the *Recipient*, *Airy Bubbles* do immediately arise from the said *Oil* and *Spirit*; which *Bubbles* being afterwards dilated by the *Elastick virtue* of the *Aethereal substance*, do separate the *Marbles*, that before stuck together.

XX. Hence we may conclude, that a *Bladder* fill'd with *Air* requires the greater force to press it downwards, by how much the nearer it comes to the bottom of the *Water*; because the *Air* riseth the more slowly from the bottom of the *Water*, towards the *Region* of the *Air*, by much the nearer it approacheth to it. And the Reason is, because fewer parts of *Water* do lye upon it, which by lifting up the *Bladder* or *Air* from beneath, push it upwards. Wherefore, if we should suppose the *Flame* to mount up through the *Air*, quite to the Orb of the *Moon*, it would still move slower and slower, the higher it ascended; because the *fire* doth not mount upwards by any virtue of its own, but is only driven upwards by the *Air* that surrounds it. For the Parts of the *Air* that are nearer to the *Earth*, being more compress'd by those that lye upon them, they do with more force push forwards the *flame*, than when they are more remote from the *Earth*; where, because they have fewer parts pressing them downwards, they lye the

looser, and consequently drive up the *flame* more faintly.

If a *Glass-Pipe* that is not 27 fingers breadth long, after the manner as before explained, be filled with *Quick-silver*, it will not at all sink down in it; but will continue fill'd to the top, without any subsidence.

The Reason is, because the particles of the *External Air* are so agitated, and do so comply with the motions of the *Heavenly Globuli*, that they cannot be compress'd by the weight of the *Quick-silver*, that is, less than 27 fingers breadth high, and consequently do so dull its force, as to hinder its descent.

The *Water* is raised in *Pumps* by the motion of the *Sucker*, but cannot be raised above 31 foot high.

The *Water* mounts up, together with the *Sucker*, when it is drawn upwards, because there is no *Vacuum* in Nature, and all Spaces are fill'd with *Bodies*, so that there can be no motion, without a total Circulation of the *Bodies*, that are about the thing which is moved. And therefore it happens, that as soon as the *Sucker* is drawn up, it makes the *Air* that was above the *Pump*, to move about the midst of it, and that which was about the midst of it, to come into the place where the *water* is, which mounting upwards comes in the room of the *Sucker*. For the *Water* chiefly moves that way, where is the least pressure of *Air*, that is, within the Bore of the *Pump*, which the *Sucker* hath left. Now the Reason why the *water*, by means of *Pumps*, cannot ascend above 31 foot, is, because the *Air*, by its natural weight, having driven up the *water* without condensation, and being afterwards unable to bear a greater weight of *water*, is by the motion of the *Sucker* shaken with greater violence than ordinary, and by this means plyes and is broken; and because the *subtil matter* is driven out above the *water* in the Bore of the *Pump*, the *water* settles at the due height of 31 foot.

And it is for the same Reason that the *water* mounts up in a *Pipe*, upon the sucking of it; for the *Air* by its weight presseth all the parts of the *Water*, or other *Liquor* that is in the *Vessel*, in which one end of the *Quill* or *Pipe* is dipt, except only those parts which are directly under the Lower-end of the *Quill*, which is opposite to the upper part of it, which is in the Mouth of him that sucks: Whereupon, as soon as the *Muscles* have lifted up the *Palat* and the *Breast*, the *Air* within dilates it self, and being dilated, is not of strength enough to hinder the *water* from entering the *Pipe*, into which the *external Air* drives it; whence it is, that when we suck through a *Pipe* of a certain length, it is all one as if the Mouth it self were extended so far. And it is by the same Reason, that an *Infant*, by applying his Mouth round the *Nipple* of his Mothers *Breast*, draws the *Milk* from it.

A *Hand* held forth in the midst of the *Air*, feels no Heaviness; tho' indeed the *Air* it self be Heavy, and consequently must needs press the *Hand*.

The Reason is, because the *Hand* is prest on every side by the *ambient Air*, and as much by that which is under it, as by that which lies upon it. For the *Air* which is under the *Hand*, is driven

XXI. By what means the *Quick-silver* is hindered from sinking lower in the *Glass-Pipe*.

XXII. Why the *Water* in *Pumps* cannot rise above 31 Foot high.

XXIII. How Sucking is performed.

XXIV. Why a mans *Hand* stretched out in the *Air*, doth not perceive any weight.

by the weight of the other parts of the *Air* that are on the sides of it. Like as the *water* which answers to the bottom of a *freighted Ship*, is driven towards the bottom of the *Ship*, by the weight of the *water* that surrounds it at the top. Seeing therefore that the upper *Pillar of the Air* hath no more Power to drive the *Hand* downwards, than the lower hath to drive it upwards; it is no wonder that we are not sensible of any weight, when we reach our *Hand* out into the *Air*. Hence it is also, that when we lay our *Hand* upon the *Mouth* of a *Vessel*, whence the *Air* is extracted, it begins to swell.

XXV.
Why a
Glass Vial
breaks,
when put
into the
Recipient
of the
Pneuma-
tick Engin,
after that
the Air is
exhausted.

And the same Reason must be given why a *Glass Vial* being put into the *Recipient* of the *Pneumatick Engin*, after that the *Air* is pumped out of it, breaks to pieces; for seeing that there is no outward *Air* that might *repel* the force of the inward, and resist the force of its endeavouring to dilate it self, the *Air* which is within the *Vial*, bearing against the sides of the *Recipient*, hath the power to press and draw it together, and at last to break it to pieces.

XXVI.
Why the
flesh swells
upon the
application
of Cupping-
Glasses.

And for the same Reason it is, that when the *Air* is dilated by the *Flame* in *Cupping Glasses* that *Chyrurgeons* make use of, as soon as the *Fire* is extinguish'd, the *Flesh* that is contain'd within the *Cupping Glass*, begins presently to swell; because that part is less prest upon, by the rarefied *Air*, than that which bears the weight of the outward *Air*. And this makes it appear, that the *Sucker* in the *Pneumatick Engin*, after that the *Air* hath been exhausted out of the *Syringe*, the under Orifice whereof is stop't, cannot be drawn up because of the weight of the *Air*. For the *Pillar of Air* which is of the same Bulk with the *Sucker*, must first be removed out of its place. But when this outward *Air* is extracted,

then the *Sucker* is without any trouble at all drawn out of the *Syringe*, tho' the lower Orifice be stop't.

The same Reason also must be assigned why *water*, that is in a *Glass* or *Cup* that is not filled to the brim, seems to be low in the midst, and more raised towards the *Edge*, as hath been already mentioned; for the middle part of the *water* is prest on every side, but not the extreame or outside parts, upon which the *Air* exerts its force more weakly and obliquely. But on the contrary, when the *Glass* is fill'd to the top, the *water* swells in the midst. For besides that the *water* cleaves close to the sides of *Glass*, its middle parts are only compressed by the *Air* that lies above it, whereas the outides are prest every way; and the *Air* that lies under it, and is beneath the *Horizontal Line*, exerts its force upon that part of the *water* which toucheth the sides of the *Glass*; which makes the *water* strive to get thither, where the pressure is weakest.

Before a *Shower* or *Storm*, the *Air* is not so heavy as it was before; and the same is when the *South-wind* blows, tho' no *Shower* follow.

The Reason of this seems to be, because the *Steams* or *Vapours* which arise out of the *Earth*, and which mingle themselves with the *Particles* of the *Air*, are precipitated, and condensed into *Clouds*: By which means the upper part of the *Air* becomes much dilated, and quitting those *Bodies* that mixed with it, becomes more thin and subtil. For there is no question to be made, but that the *Air* contains in it self many parts of *water*, from the Coagulation and Condensation whereof *Clouds* and *Showers* are formed. This appears in Mr. BOYLES *Pneumatick Engin*; for as soon as the *Air* enters the void *Recipient*, it appears, as if it were all covered with a *Mist*.

XXVII.
Why the
water that
is in a
Glass, doth
sometimes
appear
lower in
the midst,
and some-
times
higher.

This Plate is humbly
Dedicated by Richard Blome.

The Fifth Part OF THE HISTORY OF NATURE.

Things dug out of the Earth.

CHAP. I.

Of Metals in General.

I.
Whence the
variety of
the Metals
that are
in the
Earth
doth arise.

THE great use that *Metals* afford to the Life and Convenience of *Mankind*, may seem in some degree to excuse their *Covetousness*, who break up the *Bowels* of the *Earth* to come at them. For doth not *Gold* and *Silver* furnish us with *Money*, *Rings*, *Jewels*, and a thousand *Ornaments* and *Utensils*, for our *Cloaths*, *Houses* and *Tables*? And who is ignorant of the absolute necessity of *Iron*, or of the great usefulness of *Tin*, *Lead* and *Copper*? *Provident Nature* having so order'd it, that there should be a variety of *Metals*, suitable to our several *Necessities*.

The Reason of this multifarious production, must be fetch'd from the different *Juices* that lodge in the *Bowels* of the *Earth*, and are condensed there; for seeing that to the generation of *Metals* are required *sharp Spirits*, *Oily Exhalations*, and the *Fumes* of *Quicksilver*; these continually ascending from the *Bowels* of the *Earth*, to the more *Exterior* parts, do there leave the *Metalline particles* they bring along with them, and according to their difference, are generated a great variety of *Minerals*, *Metals*, and other things dug out of the *Ground*. For as we find, that in the *Fruits of Trees*, the grosser Matter doth constitute such parts of them, and the more pure and subtil, others: So sometimes in the same *Vein* many *Metals* are generated, whereof some require a more crude and less elaborate Matter, as *Iron*, *Lead*, &c. and others a better prepared and more refined Matter, as *Gold*. Which is the Reason why a greater quantity of ignoble *Metals* are found in the *Mines*, than of the pure and noble; forasmuch as *Nature* needs much more time for the bringing these to Perfection, than the other.

All *Metals*, except *Quicksilver*, are Malleable.

II.

This Property of *Metals*, is the consequent of their Nature and frame; for seeing that *Metals* are nothing else but *hard Bodies*, composed of many *Integral parts*, which, as to their figure are long and branchy, it cannot seem strange to any Considerative person, that they are malleable and ductile when they are forged on the *Anvil*, or drawn into *Wire*: For it may be easily conceived, that their parts being thus figured, may be so disposed, as that they may glide a good while one over another, or side-ways to each other, without wholly separating from one another. After this manner *Lead*, *Iron*, *Silver* and *Gold*, more than any of them, may be drawn into *Wire*, or beat into *Leaves*, of an incredible thinness.

Why Metals are malleable.

Mines of *Metals* are chiefly found under *Mountains*, and especially in those parts that face the *East* or *South-Sun*.

III.

The Reason is, because at the bottom of *Mountains* there be many *Cavities* and *Clefts*, in which the sublimed particles of *Metal* may unite, and mount up together to the outward surface of the *Earth*, especially in those places which are most expos'd to the *Sun*, and admit its strongest and greatest heat. For tho' the *Sun-beams* do terminate on the surface of the *Earth*, and do not penetrate to the inmost parts of it; yet is it not to be question'd, but that the *Heat* produc'd by them, doth reach to the most abstruse and inward parts of it, and most strongly affect those parts which they most directly strike against. For the *Earth*, by the heat of the *Sun*, being cleft into Gaps and Slits, way is made for the more easy mounting of the *Juices*, that are hid in its *Bowels*, and which deposit their Burthens, to wit, the *Metalline particles* they are charg'd with in the Upper parts of the *Earth*. And for the same Reason it is, that *Springs* do frequently rise at the Foot of *Mountains*, because the *water* finds a more easie passage through, and more ready ascent to them. Wherefore, whensoever any

Why Metals are found at the Bottoms of Mountains, lying East and South.

Mineral or Metal is found mingled with the Upper-part of the Earth, we may conclude, that the same was carried up thither, together with the ascending Vapours and Exhalations.

IV. *What places do most abound with Metals.* And this is the Reason why Metals are most frequent in those places, which are most expos'd to the Solar-Rays, and which receive most of their heat; because Heat, by wasting of the moisture, makes such places full of Clefts and Slits, through which the Juices and Metalline Exhalations, may more easily ascend.

V. *Metals first detected by the Burning down of Woods.* Tho' Metals consist of several Juices, and are now generally found in the Mines; yet it seems very probable, that their first Invention or Detection was owing to the conflagration of Woods. Thus ARISTOTLE tells us, that in Spain, when some Shepherds had set a Wood on fire, which kindled the Earth also, molten Silver was perceived to run down in the same place. Neither will this seem strange to any who shall consider, that in many places the Veins of Metals are found, reaching to the Roots of Great Trees, about which they are wrapped; wherefore when such Trees are burnt down, no wonder if the said Metals, that are entangled amongst the Roots, do melt down with the heat of the fire: In like manner as in the dreadful Fire of London 1666, the Bells in some Steeples were melted.

VI. *The Ground that is most rich in Metals, appears outwardly most barren.* The Ground which is rich in Mines, is generally Barren: And besides exhales noxious Steams and vapours, which are very prejudicial to the health of the Inhabitants, and are the cause of many Diseases.

The Reason of this Barrenness is, because the Alimentary Juice, appointed by Nature for the Nourishment of Herbs and Plants, is otherways diverted, viz. to furnish Matter for Metals. And it is for want of this Sap or Juice, that in such places the Trees do languish, Herbs wither, and the Earth it self is bereft of its Vigour, Beauty and Ornament. These parts of the Earth also are more subject to noxious Exhalations, because of the great quantity of steams and vapours that abound within the Bowels of them. For we must not suppose, that all their Matter is spent in the making of Metals, but that the more subtil part of them being agitated by the Matter of the first Element passeth through Clefts to the surface of the Earth, and there mingling with the Air, doth infect the same, and becomes injurious to those that breath in it. This may be seen in most of the Lakes and Pools of Zealand, from whence they dig their Turf, which abound with Bitumen, and in burning give forth a nasty stink: Yea, the steams and fumes that proceed from them, do, as it were, gild over all the Furniture and Utensils of Iron, Copper, Tin and Silver, that are in the Houses where it is commonly burnt, and discolour all things but Gold.

VII. *Why Metals are found in some Rivers.* Metals are sometimes found in Rivers, according to what Historians tell us of the Rivers Tagus, Ganges and Pactolus, as abounding with particles of Gold and Silver, which are gathered by the Inhabitants, and melted down into Ingots.

We must not imagin that Metals are generated in these Rivers, as they are in the Bowels of the Earth; but because the waters of those Rivers runing through the Grounds which abound

with Metalick Veins, carry great store of their particles along with them. For Water of it self is not a fit Element for the generation of Metals, forasmuch as nothing can be expected from its union with Earth, save only a little Mud or Clay.

Metals are considerably rarefied by Heat; but are not subject to be condensed by Cold.

The Reason of this is, because Metals are already in the state of the highest compression, and have the whole weight of the Atmosphere lying upon them. Being therefore already thus compressed, they are not capable of any further condensation; but well of Rarefaction. Thus we observe, that the Air is but little condensed by Cold, but very much rarefied by Heat; and that whenever it is freed from the weight of the Air that lies upon it, it becomes much more extended, than it can be compressed or condensed by the most strong and effectual Engins.

When Metals are calcin'd, that is, are reduced into Powder, by the means of Corrosive Spirits, they flow in grains like Sand; but if they be melted, they run like water.

The Reason is, because in Calcination they are not resolved into the very least particles they are capable to be resolved into; but only into small grains, which are still capable of a further dissolution or division. But when the said Grains are dissolved by the violence of fire, they are divided into much smaller particles, and constitute a more continuous Body, like water.

And much for the same Reason it happens, that Metals, by reason of an Acid sulphur which abounds in them, do fly away with it, and are dissipated into fumes. For when Silver is melted with Lead, as soon as a little Brimstone is cast into it, the Silver vanisheth, and is turned into fumes, except that its flight be stopt by wet Linnen. In like manner, Copper that is mixed with a piece of Gold, and cemented with common Salt, and the Powder of Bricks, it mounts upwards, and carries up some Gold along with it; except the Pot, in which the Operation is performed, be covered. Because the Particles of the Metals are carried upwards by the force of the Fire, and do not quit their agitation, but by meeting with some cold Body.

CHAP. II.

Of Quicksilver and Brimstone.

QUICKSILVER, to which Chymists give the Name of Mercury, is the heaviest of all Metals, excepting Gold: And therefore all other Bodies swim on the top of it, without sinking to the bottom.

The Reason of this Ponderosity is, because there are fewer pores in Quicksilver for the subtil matter to pass through, than in other Metals: For the multitude or deficiency of Pores is the only Cause of the Heaviness or Lightness of Bodies. For tho' it might be granted, that the Parts of other Metals are of the same bulk and figure, and alike moved; yet forasmuch as they have many more Pores, they must needs be lighter than it. And this is the only Reason why Gold is heavier than Quicksilver, and sinks down in it, even because it hath

VIII. *Why Metals are more capable of Rarefaction, than Condensation.*

IX. *Why Calcined Metals flow like Sand, and being melted, run like water.*

X. *Why Metals are resolved into Vapours.*

hath fewer Pores, and doth not admit so much of the matter of the 1st Element; tho' indeed in this respect it doth not much exceed Quicksilver, seeing that the proportion between them, is as 44 to 43.

Which makes me the more admire, what ground PLINY could have to assert, lib. 33. cap. 3. that Gold is not so heavy as Lead, when experience assures us, that Gold is as heavy again, and compared with Blacklead, is as 10 to 6, and to common Lead, as 10 to 5 $\frac{1}{4}$.

Quicksilver is liquid, and except it be contained in some Vessel, it runs away like water.

The Reason is, because Quicksilver is divided into many little Particles, which are agitated by peculiar motions differing from one another, and continually shift their places. And tho' it doth not wet or moisten the Hand that handles it, yet cannot this hinder its fluidity: Because Moistness and Liquidity are not one and the same Quality, nor are they of the same Nature. For Fire is liquid, and Molten Metals flow, and yet neither of them can be said to wet or moisten. Forasmuch as nothing else is required to constitute the nature of Fluidity, but the motion of the insensible parts of any Body, or their being so loose, as to be easily put into motion by the subtil matter. The cause therefore of the Fluidity in Quicksilver is, because the Particles whereof it consists, are so smooth and slippery, that they cannot be closely compacted together, and because being thicker than the parts of the water, they scarcely afford any entrance to the Globuli of the 2d Element, but only to that most subtil matter, which we call the 1st Element.

Hence it is said, that Quicksilver when put on the Fire, doth not become dissipated into Fumes; but being received into a Vessel, it soon after returns to the same form it had before, without the loss of any part of its weight.

Quicksilver that hath been fixed with Quicklime, being put into a coated Retort, passeth into the Recipient, and there appears in its former shape.

Quicksilver is fixed when the Particles of Brimstone, and of many other ingredients unite themselves with those of the Quicksilver, fixing the Points or extremities of their little Branches, in their Pores; and if it chance that the Particles of the Quicklime, being put in motion by the Fire, carry away with them the Particles of the Brimstone, or of any of the other ingredients, that united themselves with those of the Quicksilver, and hindered them from being moved, whether by stopping the passage of the subtil matter, or by rendring their figures too irregular, the Quicksilver returns again to its former state.

Quicksilver always forms it self into round drops.

Because the Intervals, which the Particles of the Quicksilver leave between themselves, are so little, that neither the more gross, nor the more subtil Air can enter them, and therefore can only act upon the surface of it, that is, by continually pushing back the parts of the Quicksilver towards the Center, until the said parts resist them equally on all sides; which they never do, till they form themselves into a spherical figure. Whence it follows, that the Air must of necessity make the

drops of Quicksilver more exactly round, than those of any other Liquors whatsoever.

But notwithstanding the parts of Quicksilver be thus Round, Polisht and Slippery, yet doth not this hinder, but that by means of Quicklime, Brimstone and other Ingredients, it may be fixed, by darting the extremities of their little Branches into the Pores of it, which makes the surface of them so irregular, that the subtil matter which moved them before, being no longer able to agitate them, the Quicksilver becomes changed into a hard Body.

Quicksilver seems to bear a great affection to Gold; and therefore they who are anointed with any Mercurial Ointment, if they hold a gold ring in their Mouths, the Quicksilver penetrating through the Body, fixeth it self on the Ring, and maketh it to appear as if it were Silver, but being put into the Fire recovers its former Brightness.

The Reason is, because Quicksilver, which we have said to be a Fluid Body, and to have its parts in continual agitation, by a moderate heat doth exhale, and fly away into Fumes, and therefore being mixt with those Steams, which together with the Breath are thrust forth from the Lungs, it is carried upwards to the Mouth, where meeting with the ring, which is a compact and cold Body, it is stopt there, and by the union of its parts returns to its former state. Much after the same manner as water, in an Alembick by heat is turned into Vapors, till meeting with a cold Body, it loseth its agitation, and is changed again into the form of water. The Quicksilver therefore doth not attract the Gold, as some suppose, but only cleaves to it, and by thrusting it self into its Pores becomes coagulated again, and recovers its former state. And therefore Physicians advise those that have been anointed, with such Mercurial Ointments, to keep a ring of Gold in their Mouths, or to take Gold inwardly, that the Fumes of the Quicksilver may stick to it. And therefore those persons, who do frequently handle Quicksilver, as those who Guild Metals, or are employed in Chymical operations, do commonly hold a piece of Gold in their Mouths, to catch the Fumes of Quicksilver, which otherwise might prove dangerous to their Bodies.

But you'll demand of me, why the evaporating Fumes or Particles of Quicksilver, do rather tend towards the Gold, than any other way.

The Reason is, because the most subtil parts of the Quicksilver, being carried away by the agitation communicated to them, betake themselves that way, where they find it most easy for them to continue their motion; and it is certain that they can pursue the same more readily in the Gold, than in the Air, because there is nothing in the Pores of the Gold that doth oppose them, whereas the Particles of the Air do continually thwart and cross their tendency. And accordingly we find, that when we handle Quicksilver with one Hand, and have Rings on the other, the same presently become discoloured by the Quicksilver.

Whereas formerly the Spaniards at the Mines of Potosi in Peru, did separate the Gold and Silver from their drofs, with incredible charge and labour, Fernandes de Velasco taught them a more compendious way, which they ever since put in practice,

Gold and Silver are delivered from their drofs by the means of Quicksilver.

II.
What is the cause of the Fluidity of Quicksilver.

III.
Quicksilver loseth nothing of its weight.

IV.
How Mercury may be fixed, and afterwards reduced to its liquid state again.

V.
Why the drops of Quicksilver are round.

to their great profit and advantage. He took *Quicksilver* and *Salt*, which he mixed with the Mine, and so put them together into close covered *Pots*, which he placed in convenient *Furnaces*, and by this means the *Gold* and *Silver* uniting themselves with *Quicksilver*, became separated from their dross, the *Amalgama* or mixture of the *Quicksilver*, and *Silver* being afterwards cleansed, and made bright by reiterated *Lotion*.

X.
Litharge
mortifies
the sour-
ness of Vi-
negar.

Litharge when put into *Vinegar*, doth take away its sharpness, and communicates a kind of sweet taste to it.

The Reason is, because the sharp pointed and unequal *Particles* of *Vinegar*, which do constitute its sourness, cleaving to the *Particles* of the *Litharge*, are thrust down to the bottom with it, and therefore no wonder, if the *Vinegar* being freed from those sharp pointed *Particles*, which prick the *Gums* and *Tongue*, appear to be of a sweetish taste.

XI.
Sublimate
loseth all
its corrosive
acrimony,
by being
sublimed
with Quick-
silver.

If to *Mercury Sublimate*, which is extremely corrosive, an equal quantity of *Quicksilver* be added, and exposed to *Sublimation*, the *Sublimate* loseth all its venomous corrosiveness, and becomes insipid, and a good *Medicin* in many cases.

Because the added *Particles* of *Quicksilver*, become increased in bulk by the *Particles* of *Salt* that are in *Sublimate*, by why means they become thicker, and their *Points* are blunted. After the same manner as when *Spirit of Vitriol*, and *Oyl of Tartar per Deliquium*, when mingled together lose all their sharpness: For these *Salts* being of different kinds, the one an acid *Salt*, and the other an *Alkali*, are no sooner mixed, but they act upon one another, by which means both their *Points* are blunted, much in like sort as when by rubbing the edge of one *Knife* against the other, both thereby become blunted.

XII.
Quicksil-
ver taken
inwardly,
in any con-
siderable
quantity
causeth
Death.

If a considerable quantity of *Quicksilver* be taken inwardly, it endangers the *Life* and often causeth *Death*.

The Reason is, because *Quicksilver* being a very Heavy and fluid *Body*, doth easily enter the *Veins*, and mingling with the *Blood*, doth interrupt or quite stop its motion. Forasmuch as by the weight of this *Metal*, the *Blood* becomes so condensed, and its motion so much retarded, that it cannot furnish *Spirits* enough to the *Brain*, for the supply of the *Nerves*. For the *Particles* of the *Quicksilver*, lying upon one another because of their weight, do condense the *Blood*, and stop its agitation; and by this means, so small a quantity of *Spirits* are conveyed from the *Brain* to the *Nerves*, that they can only interruptedly, and by intervals fill and distend the *Muscles*. And this is the true cause, why those who get *Quicksilver* out of the *Mines* have their *Gums* flaggy, and their *Teeth* loose, because the *Mercury* entering into the inmost parts of the *Body*, doth destroy and weaken their connexion.

XIII.
Quicksil-
ver is very
hurtful to
the Body
of Man by
reason of
its Acidity.

The *Miners* that labour in the *Quicksilver* *Mines* of *Carinthia*, and others who are much conversant about *Quicksilver*, are generally subject to those *Diseases*, which are caused by the excessive use of *Acid things*, as with the *Palsy*, shaking of the *Limbs*, and other such like *Diseases* which affect the *Nerves*. For *Sourness* and *Harshness*, seems to be predominant qualities in *Quicksilver*. For by its *Acidity*, it doth corrode most *Metals*;

and being mixed with *Vitriol* and *Salt*, doth provoke copious *Salivation*; but when *Alkalious* or *Lixivious Salts* are mixed with it, it *Salivates* less, because these do mortify the force of *Acids*. And tho' these *Miners* fasten *Bladders* to their *Mouths*, to keep off the poisonous fumes of this *Metal*, yet they commonly dye of the *Consumption* or *Palsy*; because *Mercury* by the tenuity of its parts, doth attack the original of the *Nerves*, and relaxes the *Veins*, and above all the *Lymphatick Vessels*.

Whence we may take notice that *Quicksilver* then chiefly exerts its *Virtue*, when it is divided into the smallest *Particles*. For seeing that its parts are very *Penetrative*, they disturb the Mass of the *Blood*, excite *Fermentations*, and frequently hurt the Members of the *Stomack*, whence *Bloody Flux*, *Vomiting of Blood*, and terrible *Gripes* do proceed. Because the *Blood*, which by a continual *Circulation* runs through the *Body*, not being able to endure this troublesome guest, and finding it self unable to discharge him by *Sweat* or *Urin*, because the *Pores* of the *Skin* and *Kidnies* are too small for that purpose, sends all away by the *Celiacal Arteries*, and so causeth a *Bloody Flux* or violent *Loosness*.

Brimstone is found in great quantity, in the Country about *Sienna*, and in several *Islands* in *Sicily*, and in *Naples*, which abound with *Subterraneous Fires*.

The Reason is, because the *Branchy Particles* of the *Exhalations*, which in conjunctions with those of sharp and *Metallick pieces* do constitute *Brimstone*, are put into motion by the force of the *Subterraneous heat*, and carried upwards to the surface of the *Ground*, where they are coagulated into a fat and oily concretion, which we call *Brimstone*. And for the same reason it is, that *Grease* and *Fat*, which likewise consist of soft and thin *Particles*, do affect hot places, as abounding most in those parts, where the heat is strongest, as about the *Heart* and *Reins*, and other such like where the heat abounds most. And as the *Fat* or *Grease* is generated in the *Bodies* of *Animals*, so is *Brimstone* formed in the *Earth*, when the most *Oily parts*, by heat are carried up, and become condensed about the surface of the *Earth*.

Brimstone is very apt to be kindled, and in a moment, as soon as it toucheth the *Fire*, breaks forth into a *Flame*.

The Reason is, because it consists of the *Particles* of sharp Juices, which are so intangled with the thin, and close *Branches* of an *Oily matter*, that many of the *Pores* between the said *Branches*, can only transmit the *Particles* of the first *Element*. Now it is evident, that the most thin parts are first put into motion, and seized by the intercurrent matter. And therefore *Brimstone* is judged by *Physicians* to be hot in a high degree.

But yet we are told, that a kind of *Red Brimstone* is dug up in *Carniola*, which neither burns like other sorts of *Brimstone*, nor hath a stinking smell, but when it is put to the *Fire* it melts like *Wax*. And therefore the *Romans* and *Grecians* made use of this in the *Expiation* and *Lustration*, of their Houses and other Places.

some Is-
lands in
Sicily, and
in Naples.

XVI.
Why Brim-
stone is
so inflam-
mable.

XV.
In Gold it
hides a
green vi-
ne again
many Dis-
eases, if we
may be-
lieve the
assertion of
some Phys-
icians.

Flame, with a vehement noise: For all the *particles* of the *Powder*, being kindled in one and the same moment, the force of the *Flame* proceeding from them, opens the *pores* of the neighbouring *Bodies*, and dissolves the contexture of their *parts*, to make way for the *Gold* that is flying away, which breaks forth with that suddainness and violence, that it seems to imitate the noise of thunder, and the quick *Flame* of *Lightning*, both at once.

XII. Some have supposed, that the force of this *Aurum fulminans* did only tend downwards: But this is a mistake, and the contrary may be proved by experiment. For if we put 2 grains of this *Powder* into a *Silver Spoon*, and cover it with a *Crown Piece*; as soon as the bottom of the *Spoon* is made hot by holding a lighted *Candle* under it, we shall find not only a deep dint made in the *Spoon*, but also that the *piece of Money* is carried upwards. Which is an evident argument, that the force of this *Powder* doth not only tend downwards, but is diffused every way.

XIII. This *Powder* is composed of 3 parts of *Nitre*, 2 parts of *Salt of Tartar*, and 1 part of *Brimstone*; which being heated in a *Spoon*, flies away with a thundring report. For it seems very probable, that the *Brimstone* and the *Salt of Tartar* contain abundance of the first *Element* in their *Pores*, which makes their parts very much disposed to swim on the said matter, and to fly away as soon as the volatil part of the *Saltpeter* is sufficiently agitated by the heat of the *Candle*, to put them into motion; and as soon as the *Acid Salt of Sulphur* is sufficiently divided, for to penetrate the *Salt of Tartar*.

XIV. Experience seems to confirm this, for when we kindle this *Fulminating Powder* with a vehement fire, it makes but very little noise, which probably proceeds from hence; because the *Brimstone* having not had time enough to melt, the *Acid Salts* could not sufficiently divide themselves, in order to their penetrating the parts of the *Salt of Tartar*; which makes the *Salt* to rise with more difficulty, and consequently less able to give a great report.

XV. *Gold* contains a virtue, proper to cure many *Diseases*. For it is found to afford manifest relief to those that are infected with the *Venerical Distemper*; it cures the *Elephantiasis*, which is supposed to be the same with the modern *Leprosie*: It fastens loose *Teeth*, and heals all *Ulcers* and *Sores* of the *Mouth*.

But for my part I cannot think that *Gold* can cure any *Diseases* in the *Body of Man*, unless it can be digested in the *Stomach*, or altered by the heat of the *Body*. For the virtue of a *Medicament* consists in this, that the *particles* of it do insinuate themselves into the *Body*, expel the noxious humours, or by their congruity, cherish and corroborate the diseased parts. But how can this be done as long as the *Gold* continues whole and entire, and loseth nothing of its substance? Is it not notorious that the *Leaf Gold* wherewith the *Apothecaries* guild their *Pills*, doth pass through the *Stomach* and *Bowels* untouched, and is cast out whole with the *Excrements*? And yet the said *Leaves* are so very thin, that if the natural heat could exert any efficiency upon *Gold*, it would not fail to do it upon them, by reason of their great tenuity.

Neither is it to any more purpose that *Physicians* do boast of their *Potable Gold*, forasmuch as this is found a meer invention of some *Mountebanks* to pick peoples Pockets. But should we suppose that such a *Potable Gold* might be prepared, yet would it be of no use in *Physick*, because there would be no difference between this *Potable Gold*, and the common *Solid Gold*, but that the one is compact, and the other in a state of solution or fusion.

But you'll say, that *Corrosive Spirits*, distilled from *Salts*, can dissolve *Gold*, and make it fit for a *Medicinal use*. I do not deny that *Gold* can be dissolved in *Saline Spirits*; but yet I affirm, that this solution cannot be of any use to the *Body* for the cure of *Diseases*, because of the mixture of the said *Corrosive Spirits* which are of a Deleterious Nature. And tho' it be common with *Physicians* to order the boiling of pieces of *Gold* in the *Broths* and *Gellies* of their *Patients*, for the strengthening and reviving of them; yet is not this their practice founded upon any sufficient experience, that *Gold* thus used, doth produce this effect; but only upon an inveterate Tradition received amongst them. For seeing that nothing of the substance of *Gold* is communicated to these *Broths* or *Gellies*, it doth not appear how they can be of any use to the *Patient*; so that this custom may very well be reckoned amongst those usages which neither hurt nor help, and are only, as we say, like a *Chip in Potage*.

Chymists can change *Lead* and *Iron* into *Gold*, of which that famous *Nail* kept in the *Duke of Florence* his *Repository of Rarities*, is a pregnant instance, which is so far *Gold*, as it was dipt in a certain liquor by a *German Chymist*.

Tho' all persons that see this *Nail*, generally believe the one part of it to be pure *Gold*, and to have been made such by a transmutation of the *Iron* into *Gold*. Yet for my part, I am more apt to be of *TACHENIUS* his Opinion, who supposeth that this part of *Gold* hath been artificially joined to the *Iron* part of the *Nail*, by *Apposition*, without any *Transmutation* at all. For after that this *Artist* had thus joined a piece of *Gold* to the part of an *Iron Nail*, it was easie for him to give to the *Golden part* the Colour of *Iron*, that so the whole *Nail* might appear to be *Iron*: But being afterwards put into the *Fire*, and then held in *Oyl* for sometime, the superadded part appeared to be true *Gold*.

Another thing observable in *Gold* is, that it is not obnoxious to *Rust*; and this because no *steams* proceed from it; and tho' sometimes it seem to be *Tarnisht*, this doth not proceed from it self, but from the too frequent handling of it.

CHAP. V.

Of Silver and Tin.

SILVER doth strangely resist *Fire*, and is hard to melt, because its parts being very small and solid, makes a *Body* so compact and continuous, that the *Fire* cannot easily penetrate it; which is the reason that *Silver Smiths* and others, are obliged to make use of some expedients to make it melt the more readily.

XVI. Whether there be any Potable Gold.

XVII. If Potable Gold could be had, it would be unprofitable and dangerous to be given inwardly.

XVIII. Whether Lead or Iron may be changed into Gold.

XIX. Gold is not subject to Rust.

I. Why Silver is hard to melt.

II. *Why Silver may be beaten into thin leaves.* Silver is easily extended under the Hammer, because its parts being long and branchy, they may glide a long while one over another, without breaking asunder.

III. *Why Silver is of a white colour.* The reason of the whiteness of Silver is, the solidity of its parts, which reflect the whole light they have received; and with the same action wherewith they have received it. For the particles of Silver being of a Spherical Figure, and having a circular motion, consequently make no change in the Rays of Light; and tho' some of them may be conceived to be rough, yet do they reflect the Rays every way, and send them to the Eye, without any detorsion, or turning of them aside. Yet is not this Colour constant and perpetual to this metal; for when it is polish'd, it loseth its whiteness, and becomes Bright and Shining; because its white particles do now reflect the Light towards one part, which makes all the other parts to look dark and black, as being hindred to reflect the Beams they have received, to the Eye.

IV. *How it comes to pass that Silver draws black lines upon Paper.* Silver, tho' it be white, yet draws black Lines upon Paper; because by this rubbing of it against the Paper, some small particles of the Silver are rubb'd off; which forasmuch as they are thin and rough, do as it were imbibe or swallow the Beams of Light, and consequently exhibit a Black Colour. But yet they retain something of their former splendor, because some of the greatest particles stick out above the rest; which preserving their former Texture, do reflect the Rays after the same manner as they did before; because being very solid, and consequently very capable of being reduced under an even and polish'd surface, they resist the Suns Beams; and causing them to be reflected under the same Angles, as they received them, they produce the sensation of Light, for the reasons we have set down at large in our Institution of Philosophy.

V. *Why Silver yields a shriller sound than Gold.* Silver yields a most shrill sound, and being struck with a Hammer or other Instrument, doth affect the Ears with a more smart and loud noise than Gold.

The reason of this is, because Silver is bent like a Bow, whose parts being left at liberty, do presently return to their former state. For it is evident that the Strings of a Lute yield a shriller or more Treble sound, the higher they are wound up, because it is then they are most swiftly moved, that is, make most frequent Excursions. Whereas Gold being softer, and having fewer pores, doth more easily give way to its being struck, and doth more slowly move the Air. Now the swiftness of the trembling motion, or undulation of the Air, makes a shrill or Treble sound; as the slowness of them, a Base or Deep Sound. And therefore Speaking or Singing makes a greater noise, than a violent Wind, because the Air that strikes the Wind-Pipe, when we are Singing, is much more swiftly moved than the Winds are. Silver therefore gives forth a more shrill sound than Gold, because its bent parts do more swiftly drive the Air, and impart a greater trembling or undulation unto it.

VI. *If Brimstone be cast upon Silver that is melted, it reduceth it to powder.* Melted Silver, by casting Brimstone upon it, becomes turned into a Calx, and is reduced into a small Powder.

This Change is brought about by the flaming Brimstone, which enters the pores of the Silver,

and mingles with it, and by this means breaks some of the thinner parts of it, or drives some of them away from the rest, leaving the grosser, and in a manner, the whole substance behind. For by Calcination, the Chymists understand nothing else, but the reducing of the Body of a Metal into Powder, by the ridding of it from its volatill parts only. This being the difference between the Ashes and Calx of a thing, that Ashes are the Remainders of those Bodies, whose greatest part hath been consumed by Fire; but Calx of those Bodies, which do in a manner remain whole and entire after they have been burnt in the Fire.

Silver is readily dissolved in the Spirit of Nitre, or Aqua Fortis, but not in Aqua Regalis, which dissolves Gold.

The Reason is, because the Spirit of Nitre hath such an Analogy with the Pores of the Silver, that it enters the same, only accompanied with the matter of the first Element, by which means the particles of it have all the quickness of that Element communicated to them, and thereby is made fit to unravel the whole Texture of that Metal. And the reason why the Aqua Regalis doth not touch Silver is, because the Pores of the Silver are so small, in comparison of those of Gold, that the Royal Water which enters the body of this latter only surrounded with the first Element, cannot penetrate the Pores of the former.

That the Pores of Silver are lesser than those of Gold, and of all other Metals appears in that the particles of Lead in fusion, do mingle and join themselves more readily with any other Metal than with Silver, which they do only slide over. The same may also be gathered from this Experiment, that when we make the Infernal Stone, which is nothing else but Silver, made corrosive by the Salts of the Spirit of Nitre, we find that one ounce of Plate Silver is only encreased 3 drams in weight; whereas when we employ courser Silver for this Operation, we find the weight augmented no less than 5 drams. Which difference, in all probability, ariseth from hence; for that Plate Silver, being more fire and pure, hath lesser Pores than the courser Silver, which has an allay of other Metals, and therefore retain more of the acid parts of the Nitre.

Tin, which Chymists look upon as a middle thing between Silver and Lead, hath properties distinct from them both; for Vessels that are tin'd over, are found to resist the Fire better than others, and are not so easily melted.

The Reason is, because Tin, which abounds with Quicksilver, doth easily stop up the Pores and Cavities of Vessels, and therefore hinders the particles of the fire from separating the parts of it so readily, as they would otherwise do. And therefore Chymists commonly call Tin the Defender of Metals, because it preserves them from the force of the Fire; for it enters so deep into the pores of the Metals, that it cannot, without extream heat, be expelled thence. But yet if we touch the Tin with a Red hot Iron, it presently melts; because by this means the particles of the Fire are introduced into the wider pores, which causeth the immediate separation of the parts of it.

Tin is the lightest of all Metals, but when Calcined it is heavier, than when it is whole and entire.

VII. *Spirit of Nitre easily dissolves Silver.*

VIII. *The Pores of Silver are less than those of other Metals.*

IX. *A Vessel that is tin'd over, doth more resist the Fire than another that is not.*

X. *Why Calcined Tin is more heavy than that is not.*

The *Lightness* of *Tin* is not to be attributed to the less quantity of *moisture* it contains, in comparison of other *Metals*, as *Silver*, *Copper*, &c. but to the *magnitude* of the *pores*. For seeing that *Tin* is no simple *Body*, but contains many *Heterogeneous Parts*, which cannot so exactly close together, consequently large *intervals* must be left between them, to be filled with the *subtil matter*. Now nothing is more evident, than that the *Lightness* of *Bodies* proceeds from the *magnitude* and *multiplicity* of their *pores*: And therefore the reason why one *Metal* is lighter than another, is only this, because it hath more and wider *pores*, which set their *parts* at a greater distance from one another. But that *Calcined Tin* should be more heavy than *uncalcined*, seems strange, so much as we find the contrary in other *Bodies*. Thus *Dough* is more heavy than *Baked Bread*, and a *Calcined Stone* is much lighter than another that is not *calcined*: However no other reason can be assigned hereof, but that the *pores* of the *Tin*, by *Calcination*, are more contracted, which is sufficient to make it more heavy, than it was before *Calcination*.

XI. But how comes it to pass, that seeing *Tin* is malleable, yet it may easily be turned to powder, if being melted, it be stirred continually till it be grown cold.

The Reason is, because this continual *motion* separates its parts one from another, in such a manner, as that they can no longer unite themselves together; not only because the *Air*, which is got between them opposeth their union; but also because their small *Branches*, being grown *Cold*, are not pliable enough to entangle one another, and therefore they remain in *Powder*.

XII. A *Tin Bullet*, shot into a *Mans Body*, makes a more dangerous wound than a *Lead Bullet*, tho' they be both of the same bigness, and discharged with the like quantity of *Gunpowder*.

The Reason is, because the outward parts of *Tin* are more rough, and abound with sharp prominences: By this means, as they enter the *Body*, they do much more plentifully affect the *Fibres*, by tearing and rending them to pieces: Or else we may say, that those small *Bits* and *Shavings* as it were, which the *Bullet* leaves in the wound, do infect and taint it; as we see that the *Teeth* of a *Mad Dog*, and of a *Viper*, do poison the wound, which poison soon after is conveyed throughout the whole *Body*, and causeth the *Death* and *Corruption* of it.

CHAP. VI.

Of Lead, and Copper.

I. *LEAD* is easily bent, and as readily melted when put upon the *Fire*.

The Reason hereof is, the weak and slender adhesion of its parts; for *Lead* consists of such particles, as are all of them easily separable from one another, and therefore they are no sooner set upon the *fire*, but that they are immediately put into *motion*, and readily separated from one another. For soft *Bodies* differ from *Hard*, in that the parts of the latter touch one another, and are at rest; whereas the parts of *fluid Bodies*, whose Nature soft *Bodies* partake of, are agitated with

various *motions*, and whirl'd about their own Centers. *Lead* therefore readily melts, because the *fire* with great ease enters the *pores* of it, dissolves its parts, and varies their Position. Hence some have been of opinion that a *Lead Bullet* might be melted, merely by a swift motion. But I cannot imagine that this can ever be effected by motion alone; for it was never found that *Lead Bullets* were ever found melted upon their being discharged from a *Musquet*.

Lead doth not differ from *Iron*, save only in this, that it consists of parts that are less, and more smooth, and whose *Branches* are more tender and pliable than those of *Iron*: For because the parts of *Lead* are smoother, therefore they lie more close together, and so compose a more compact *Body*, such as contains more of its own matter than *Iron* doth under an equal surface.

And seeing that the *Branchy Particles* which constitute *Lead*, are more soft and pliant, than those that compose *Iron*, therefore they less resist division, and consequently are not so hard as those of *Iron*.

Lead is endowed with a *Cooling Virtue*, and mitigates the *præternatural Heat* excited in *Mans Body*: Yea some, whose recovery hath been doubted, have been restored to their former health, only by the application of a *Plate* of *Lead*; as it is related of a certain *Musician*, who wearing a *Lead Plate* upon his *Breast*, only to preserve his *Voice*, was by the same means cured of a most dangerous *disease*.

The Reason of this *Refrigerating Virtue* in *Lead* is, because its parts are very slowly and remissly moved; and lying upon one another, are in a manner quite at rest. For *Cold* doth not consist in absolute Rest, or a total privation of *motion*, but it is sufficient to constitute a *Body Cold*, if the parts of it be very slowly moved, and that the *Organ* of him that toucheth it, be more than ordinarily affected therewith. For a *Body*, whose parts are very swiftly moved, is more sensible of *Cold*, than another whose parts are more remissly agitated. A *Plate* of *Lead* therefore doth cool an *overheated Body*, because it diminisheth the *motion* of its particles, and doth mitigate and allay the noxious heat, which consists in motion. Hence it is that *Plates* of *Lead* are applied to the *Reins* of those who are troubled with involuntary *Emissions*, caused by the heat of their *Reins*. *CALVINS*, the *Orator*, made use of this means to quell and repress the motions of *Lust*, to the end he might preserve all his *Bodily Vigour* and strength, for his *Study*. *Chyrurgeons* also make use of *Lead*, for the drying and healing of *Wounds*; for by obstructing the *pores* of the *Body*, by its coldness, it stops the *humour*, and hinders it from spreading any further.

Molten Lead, being stirred with a *Stick* continually, turns into a fine *Powder*.

The Reason is, because by this vehement and continual *motion*, the more thin and slippery parts of the *Lead*, that kept the grosser parts together, fly away into the *Air*; as we see in *Boiling Water*, which, when it is stirred, doth send forth a thicker *smoak*; for the heat having separated the particles of the *Water*, many of them fly up into the *Air*. And thus the more *Oily particles* of the *Lead*, being left by themselves, do come nearer together,

II. Why Lead is more heavy than Iron.

III. Why Lead is less hard than Iron.

IV. How Lead comes to be useful in Physick and Chyrurgery.

V. Why Lead, being melted, and stirred with a Stick till it be cold, turns to Powder.

together, and are joined together more firmly than ever before, much after the same manner, as by the continual beating and concussion of Cream, its superfluous particles unite together, and constitute the Body of Butter, a-part from the Whey, where-with they were mingled before.

VI. *Why Lead cannot be dissolved in Aqua-fortis.* Lead is not dissolved in Aqua-fortis, tho' it be left in it never so long.

The Reason is; because the Particles of Lead are not proportioned to the bigness or figure of the Particles of that water, or corrosive Spirit, which therefore cannot penetrate them; or if they do, which indeed seems more probable, they penetrate them accompanied with the matter of the 1st and 2d Element, yea, and it may be with the more subtil part of the Air also, which makes the motion of them so slow, that they are not strong enough to break the Ranks and Files of the Particles of the Lead.

VII. *Why Copper is so hard to be melted except it be kindled with Fire.* Copper is accounted amongst the hard Metals, which because of the close connexion of its parts doth long resist the Fire, and is not melted except that it be first kindled, and shed so much Light, as that it appears like a bright shining Star in the Furnace.

The Reason hereof is, because the 1st Element is so shut up in the strait and narrow Pores of the Copper, that the insensible parts of that Metal swim upon it, and are so violently tost together by the said Element, and whirled round about their own Centers, that they affect the Optick Nerve at a distance, and the Nerves of the Touch nearer hand. However when it is thus melted, it cannot endure any moisture to touch it; for if water be pour'd upon it, or any moist Body be dipt into it, it causeth a great noise, and the Copper leaps out of the Vessel. Because the water which is heavier than it, doth easily enter its Pores, where it becomes dilated because of the intense heat of the Copper, and being not able to continue there by reason of the straitness of the place, it breaks forth with violence, and carries the neighbouring Particles of the Copper along with it, and scatters and spills them: In a manner not much unlike to that whereby Gunpowder, that is covered over with little Stones, as soon as it is kindled, breaks forth with a noise and scatters all the Stones abroad.

VIII. *Whence the Effervescence or Ebullition proceeds which is seen in the dissolution of Copper.* When Spirit of Nitre is poured upon Silver, it presently causeth a great Ebullition, so that it heats the Vessel, and continues till the dissolution of the Metal be performed.

The cause of this Effervescence is, because the Particles of the Spirit of Nitre, are of such a magnitude and figure, that they enter the Pores of the Copper only, accompanied with the matter of the 1st Element, which carries them along with it, with so much swiftness, as that they are able to separate the parts of the Copper, and to cause that Ebullition and heat which upon the solution of the parts is produced. Which is an evident proof, that the Pores of Copper are much more open, than those of any other Metals. For this great Effervescence which happens upon the dissolution of Silver in this Spirit, seems probably to proceed from nothing else, but from the largeness of the Pores of Copper, which are so great that the acid Particles of the Spirit of Nitre, enter into them surrounded with much of the matter of the 1st Element.

Copper and Tin being melted together grow very hard, beyond what each of them were apart, before they were mingled.

IX. *Why Tin and Copper when melted together become so very hard.* The Reason is, because the Tin doth penetrate and fill up the Pores of the Copper: For certain it is, that Tin is a Metal of such a penetrating subtilty, that it joyns it self with other Metals, after a most peculiar manner; for it penetrates them even before that they be melted together, and by this means hardens them, as may be seen in Iron, that is tind over, and Pins, which when made red hot in the Fire, are dipt into Tin for to whiten them, and to bring them to that hardness which we find they have.

X. *Why Copper contracts a Blewish coloured Rust which is proper to it, and therefore called in Latin Erugo, which grows to it, and sullies it.* Copper easily contracts a Blewish coloured Rust which is proper to it, and therefore called in Latin Erugo, which grows to it, and sullies it.

This Erugo or Copper rust proceeds from the Exhalations, and Sulphureous Particles, which continually steam forth from the Particles of the Copper, and stop the Orifices of the Pores thereof. It derives its original from the moisture of the Air, which is mingled with the parts of the Copper, which being put into motion by the subtil matter, doth break forth, and being stoppt on the surface of it, doth there grow together into a Rust. After the same manner as we see that an hoary moldiness doth grow on the outside of Flesh, Leather, Bread, and other like Bodies, if they be kept in a moist place, and especially if they be sprinkled with Salt, because the Salt doth open and widen their Pores, and makes an open way for the Sulphureous Spirits to evaporate. Hence it is, that clean and smooth Copper, doth more easily contract its Rust, than that which hath a rough surface; because in smooth and scoured Copper the Pores are wider, and consequently the moist Air doth with more ease insinuate it self into them.

XI. *How Copper Rust is caused, and why Gold is not subject to Rust.* This Copper-rust is caused by sprinkling Salt, and Vinegar upon plates of Copper; because both these do open and widen the Pores of it, and makes a ready way for the steams to come forth: Moreover, this mixture of Salt and Vinegar stops the Particles of these Exhalations on the surface of the Copper, and causeth them to grow together there, so as to cover the top of it. And it is for the contrary reason, that Gold is not subject to any Rust, because no steams proceed from it, so that it is not subject to be sullied or discoloured by any thing that comes from it self.

CHAP. VII.

Of Iron and Steel.

I. *How Iron which is so hard a Metal comes to be extended by being made red hot.* Iron is the hardest of all other Metals, as being more difficult to be melted than any of the rest; and yet being put into the Furnace and made red hot, it becomes extended in length. For if we take a Plate of Iron of the same bigness with a piece of Wood, and cast it into the Fire till it be red hot, we shall find upon the taking of it out, that it is grown longer than it was when we put it in.

The Reason is, because the Fire that is got into the Pores of the Iron doth widen them; for seeing that there can be no penetration of dimensions, and that 2 extended substances cannot be in one and the same place, it cannot be, but that the Iron must be

be dilated by admission of the fiery Particles, and consequently acquire a new Extension.

II.
Why Iron
is one of
the lightest
Metals.

Tho' Iron be hard to melt, yet it is one of those Metals that are lightest, and are most easily dissolved in corrosive Spirits, and destroyed by Rust; for the small Branches of the parts that compose it, being greater and at a farther distance from one another, than those of the other Metals, make this Metal much more Porous and Spungious, than some of the more compact and solid Metals.

III.
By what
means Iron
may be
changed
into Cop-
per.

Iron besmeared with Vinegar and Alom becomes like Copper. At Smolnick there is a Well, the water whereof being turn'd in Channels disposed in 3 rows, turns plates of Iron into Copper.

The cause of this Transmutation is not as some would have it, the loss of a former substantial Form, and the generation of a new one, but only an accession of new parts, whilst the Particles of Alom and Vinegar fill the parts of the Iron, and so change the former connexion of its parts. For seeing that Vinegar is of that sharpness, whereby it easily penetrates into the Pores of the Iron, by this its penetration it changeth the order and disposition of them, and by this means a new colour is produced in the Iron. Neither doth the Alom conduce less to this Transmutation, which being endued with a very adstringent Virtue, doth transplace those Particles which before stuck very close together, and were firmly entangled. And therefore it is no wonder, that when the Texture of the parts of Iron is changed, it should by this means come to resemble Copper.

IV.
Why Iron
grows
harder by
being cast
into water
when it is
red hot.

If Red-hot Iron be taken out of a Forge or Furnace, and put into the water, it becomes harder, than when it is only exposed to the Air, and cooled there by degrees.

The reason is, because the Pores of Iron when red hot, are very open, and only filled with the matter of the 1st Element, but mingled with many particles of the 3d Element, which swimming upon the Fire, do continually enter them, and come out again. Whence it comes to pass, that when, in this state, it is exposed to the Air, to grow cool, the self-same particles of the Air, continuing their course through its pores, cause the pores to be straitned by degrees, and make the parts of the Iron to retain the same Form they had in the Furnace. Whereas, when red hot Iron is plunged into Water, it cannot indeed hinder the matter of the 1st Element from breaking out from the pores of the Iron; but because there is nothing that can take up those places, besides the subtil matter which is in the Water, whose particles are too small to keep the pores open in the same manner as they did before, they thereupon become suddenly straitned, and consequently come nearer together; which is the cause of its attaining a greater degree of hardness, which is nothing else but a close compression of the parts of a Body, and their mutual contact.

V.
Why Rust
stops, and
hinders
conception.

Rust stops the Courses of Women, and given inwardly, hinders Conception.

The Reason is, because Rust consists of Sulphureous, Branchy and Angulous parts, which are very adstringent, and stop up the Orifices of the Pores they light into. As may be seen in the Hands of those that handle it, which cannot without great difficulty be washed clean.

It is found by Experience, that Iron and Steel have abundance of Pores, which are turned and go winding like Screws, and that by means of these, it approacheth to the Loadstone.

The cause of these Screw-like Pores that are in Iron and Steel is, those little Striate Particles, which according to what we have delivered in our Institution of Philosophy, continually coming forth from the inward parts of the Earth, and passing into the outward, have so penetrated the substance of the Iron and Steel, as to make passages for themselves through it, which they will still keep open by continuing their motion through them. Which they could not do, without framing the Pores of the Steel and Iron like so many Screws, which differ nothing from the Screw-like Pores that are in the Loadstone, save only in this, that the little Branches of the Particles of the Iron and Steel, which rise in their Pores, stand in need to be beaten down, and smoothed by the Particles of the Loadstone, for to afford them a free passage.

And therefore Iron is said to be of kin to the Loadstone, because both of them are dug out of the same Mines, and are of the same colour; but more especially, because they agree and correspond in their Fibres and Pores: For the Striate matter finds a free passage through both of them, much in the same manner, as it doth through the midst of the Earth, which it cannot do through any other Body. Hence Iron is said to cherish and strengthen the Virtue and Life of the Loadstone, much in the same manner, as the water and virtue of Fountains, is preserved by conveniently disposed Channels for it to pass through.

Steel that is made by fusion in a vehement Fire, becomes softer if it be made red hot again, and afterwards cooled by degrees.

The Reason is, because when it is thus cooled, the cornerd and rugged Particles of it, which by the force of the heat were driven from the surfaces of the Clots of it to the more inward parts, begin to appear outward, and entangling together, do as it were with little Hooks, joyn the Clots of the Steel together: By which means it happens, that these Particles are no longer so closely joyned to their Clots, nor do the Clots any longer so immediately touch one another, but do only hang together as it were by Hooks or Links; and consequently the Steel is not very hard and stiff, nor brittle, but soft and flexible. In which respect it doth not differ from the common Iron, save only in this, that when Steel is made red hot a 2d time, and afterwards suddenly quenched, its former hardness and stiffness is restored, whereas by the same means, the same is not performed in Iron.

Some Historians tell us, that Wood by being put into some Pools, becomes turned into Iron. Thus MAGINUS tells us of a Pool in Ireland, into which if a Stake be thrust, that part which is covered with the Mud becomes changed into Iron, and the other that is covered with Water, into Stone.

The Reason of this is, because the Wood by being long buried in the Mud, becomes penetrated by a Metallick steam, which insinuating it self betwixt the Fibres of it, becomes one Body with it, and filling up all its Pores by degrees, at last communicates to it the hardness and appearance of Iron.

VI.
How it
comes to
pass that
Iron and
Steel have
Pores turn-
ed like
Screws.

VII.
Wherein
Iron and
the Load-
stone do a-
gree.

VIII.
Why Steel
becomes
softer by
being cooled
leisurely
and by de-
grees.

IX.
What is
the reason
that Wood
in some
Pools is
changed
into Iron.

X. In like manner, *Bones* and *pieces of Wood* are changed into *Stone*. Thus many *Bones* are to be seen at *Rome*, *Amsterdam* and in other places which have been turned into *Stone*. Thus *pieces of Wood* have sometime since been taken up at *Aquasparta* in *Italy*, which seem to be nothing else, but the fragments of *Stakes*, which having for a long time been covered with the *Earth*, have been so penetrated by a *Bituminous* and *Sulphureous Steam*, and grown to that *Stony hardness*, as to be no longer capable of being cleft. Thus likewise *Cockle-shells* are turned into *Stone*, by being fill'd with such a kind of *Petrifying Juice*, which in time reduceth them to the hardness and consistence of *Stones*. For the same *Cockle-shells* that abound on the *Sea-shoar*, have been often found far from the *Sea* on *High Mountains*. Thus in the *Guerinean Cavern* or *Grotto*, *Leaves of Oak*, *Holm*, *Alder*, *Poplar*, *Bay*, *Ivy* and other *Trees* have been found turn'd into *stone*, by means of a *Petrifying Humour*.

XI. *Steel* is more stiff and hard than *Iron*, and hath a greater force to leap back, than any other *Metal*.

The Reason is, because the parts of *Steel* are not joyn'd together with entangling *Branches*, as those of *Lead* are; but by a multiplicity of *surfaces* lying one upon another like *Glass*, which is the reason that when *Steel* is bent, the ranging of its *Parts* is not changed, but only the figure of its *pores*; upon the change whereof, the force of the *Body* running against them is increased. And by this means the *Steel-Spring* of a *Watch* is of great use to the performing of all the *motions* of it. And for the same Reason, *Steel* must needs be more brittle than *Iron*, because the *Drops* whereof it is composed, are only joyn'd together by the contact of their *surfaces*, which, like the parts of *Glass*, only touch one another in a few *Points*, and must therefore be somewhat Brittle.

XII. For the cleansing of *Iron* from *Rust*, *Cerufs-Plaster*, and other such like, are commonly made use of; but there is nothing that takes it away better or more speedily, than *Oil of Tartar*, which presently looseth the *Rust*, and is then easily wiped off. And to prevent *Iron* from *Rusting*, there is nothing better than to besmear it with the *Marrow* of a *Deer*, or with *Oil*, which by obstructing the *pores* by their clammy Matter, hinder any watry Moisture from entering into, or *Stems* from coming out of them.

CHAP. VIII.

Of the various Generation of Stones.

I. *ALL Stones* have their Rise either from *Sand* or *Clay*; and that either from *Sand dissolved*, or *Sand consolidated*.

Stones are generated of dissolved *Sand*, when any quantity thereof becomes coagulated; whence therefore proceeds a *Stone*, transparent like a grain of *Sand*, and of a different figure, as it is variously compressed by its Neighbouring *Bodies*: So some *Precious Stones* are found of no distinct shape or figure, and others that have 6 sides or *surfaces*. Again, *Stones* are generated of consolidated *Sand*, that is, when a great number of the grains of *Sand* do grow together, by

means of *Stems* or *Exhalations* filling the Intervals between them, and joyning them together; and therefore these *Stones* are opaque or dark, and rugged, by means of many *Prominences*, and therefore may be made use of for the sharpening of *Stones*. It may be also added, that *Stones* may be made of *Clay*, which by the admission of some petrifying *Exhalations* may become *Stone*.

There is a sort of *Stones* found in *Provence* in *France*, whereof some are *Red*, and others transparent like *Crystal*, and of the figure of a *Lozenge*, which when they are broken, fall into parts of the same figure, tho' subdivided never so often.

The Reason of this is to be attributed, to the more perfect and elaborate disposition of the Matter whereof these *Stones* are generated, which is so regularly distributed, that every one of its least particles bestow their own figure upon the whole, and upon the lesser, as well as greater parts of it. We must therefore suppose, that in the first formation of these *Stones*, some particles of the petrifying Juice, were by the force of Heat stretched out in length, to which others joyning themselves, did by degrees constitute some small *Tables*, to which others afterwards were joyned, lying athwart them, so that the *Angles* somewhat resembled those of *Talk* or *Izinglass*. As we find that in the formation of *Salts* their basis is of a square figure. Thus the particles of *Sal-Gem* are of a square figure like a *Dice*, and breaks into Bits of the same figure; and after the same manner, and for the same Reason, do these *Stones* before-mentioned break into bits that express the figure of *Lozenges*, and tho' broke never so small, retain the same figure inviolably.

Sometimes *Glassy-stones* are found in the *Earth*, which do equal others in weight, as well as hardness; save only that they are brittle like *Glass*, and are easily broke to pieces.

The Original of these *Stones* must be attributed to *Sand*, which being melted by a most vehement fire, and afterwards cooled, become as hard as *Stone*. After the same manner as the particles of *Ashes*, when agitated by a most vehement fire, have their ruggedness pared off, and become smooth, and sticking together constitute *Glass*. Thus it sometimes happens, that after great *Burnings* of the *Earth*, many of these *Glassy-stones* are digg'd forth from the *Bowels* of it, which are of different shapes and figures, according to the variety of those places into which the melted *Salt* lighted. *PLINY* is of Opinion, that the making of *Glass* was first found out by a Casual melting of *Sand* and *Nitre*: It is reported, saith he, that a *Merchant's Ship*, laden with *Nitre*, being arrived, when the *Ships Company* were about to prepare a *Feast* upon the *Shoar*, and wanted *Stones* to fix their *Kettles* upon, they took great lumps of *Salt-Peter* out of the *Ship* for that purpose, which catching fire, and being mingled with the *Sand* of the *shoar*, made transparent *Rivulets* of *Liquid Glass* to run down. Book 36. Chap. 20.

Stones are generated in the *Body of Man*, differing in bigness as well as hardness: For some of them are easily crumbled to powder, whereas others are hard, and cannot easily be dissolved.

The Original of *Stones*, that are formed in the *Kidneys*, or in the *Bladder*, is the same with those that

II. Whence it is that some Stones are found in Provence in France, of the figure of a Lozenge, or Quarry of Glass.

III. What is the Cause of those Glassy-Stones that are sometimes found in the Earth.

IV. How Stones are generated in the Body of Man.

that are generated in the *Earth*, viz. when by reason of the obstruction of the pores, the grains of *Sand* are lockt in, and at last growing together, do constitute a hard *Body*. For it is certain, that the *Blood* and *Urine* are strained, and do carry along with them the particles of *Terrestrial Bodies*, which are endued with such figures, as that when the *Blood* or *Urine* are more slowly moved in the *Reins* or *Bladder*, they grow into a *Stone*. For the *Sand* or *Gravel* which is generated in the *Body* of *Man*, have very uneven and rough surfaces, by means whereof they are easily entangled together, and constitute a mass or lump of *Stone*. And this is the Reason why they are discharged out of the *Body* of *Man* with such extream pain; for being carried with the *Urine*, and hitting against the *Membrans* with their sharp Corners, they rend and tear them.

V. *Women* are less troubled with the *Stone* than *Men*, because they can discharge the peccant Matter with greater ease than they, by reason of the wideness of the *Passages* through which it is to pass, as also because they are both straiter and shorter, their *Terms* also being beneficial to them in this case. Moreover it is observed, that *Fat* and *Purisy persons* are most troubled with this *Disease*, because such *Bodies* abound with *Earthy dregs* and *volatile acids*; as also, for that by reason of the bulk and weight of their *Body*, they are fain to live an idle and sedentary *Life*, which alone contributes not a little to the forming of this *Disease*.

VI. Some suppose that there is a *Petrifying Spirit* in the *Body* of *Man*, which is the Cause of this generation of *Stones*, more especially in the pores of the *Kidneys* and *Bladder*, which transmutes the dreggy and thicker parts of the *Blood* into *Stone*, to which formation that *Volatile Salt*, which is hid in the *Stone*, and drawn thence by *Chimistry*, doth not a little contribute; for by means of these *saline Volatile particles*, the thicker parts of the *Blood* are joyned together. Now that there is such a *Petrifying Spirit* in *Nature*, may be proved from many *Springs*, which turn all the things that are cast into them into *Stone*; such as is that *Spring* which is near *Bergen* in *Norway*, and many others elsewhere. And therefore some think, that the like spirit may lye hid in the *Bodies* of *Men*, seeing that it is evident beyond contradiction, that a spirit not much unlike this is found in it, which changeth the parts of the *Chyle* into *Bones*, *Gristles*, &c.

VII. That *Stones* in the *Bodies* of *Men* do sometimes grow to a great bulk, is testified by *ISRAEL*, a *Professour* of *Heidelberg*, who says, that a *Woman* had a *Kidney* cut out of her *Body*, that was wholly turned to *stone*: Yea, what is far more strange, he tells us, that a whole and entire *Birth*, compleat and formed in all his parts, and which the *Mother* had carried in her *Body* no less than 28 years, was after her *Death* found as hard as *Marble*, and taken out of her *Body*. Which wonderful Effect cannot be ascribed to any thing else, but this *Petrifying* or *Volatile acid Spirit*, which is always endued with a great virtue of *acting*, *figuring*, and *congealing*: For the swiftness of this spirit doth readily pass through all pores, and clinging to them, makes the *Body* to become harder, much like *Coral*, which being taken out of the bottom of the *Sea*, is hardened by the *Volatile Acid* which is lodged in the *Air*, and becomes *stony*.

The *Disease* of the *Stone* is frequently conveyed from *Parents* to their *Children*; for seeing that the *Particles* whereof the *Stone* is formed, owe much of their tendency towards the producing of this *Disease*, to the *Texture* of the *Fibres* through which they are strained; and that the same depends on the first forming of the *Parts* of the *Body*, which proceeds from the *Parents*, this *Disease* may very well be said to be traduced by them to their *Posterity*.

MERSENNUS makes mention of a *Stone*, which being cast into *Fresh-water* lies quiet; but when put into *Vinegar*, or *Spirit of Vitriol*, is moved; and more in *Spirit of Vitriol*, than in *Vinegar*.

The Reason of this may be supposed to be, because this *Stone* is full of pores, which do readily admit the particles of *Vinegar* and *Spirit of Vitriol*; but are not fitted to receive the particles of *Fresh-water*. So that *Particles* of *Vinegar* entering the pores of this *Stone*, drive out the particles of the *Air* or *Water*, which dilating themselves at their coming forth, do lift up and agitate the same.

Some *Historians* tell us, that there are certain *Quarries* of *Stone* near *Rome*, the stones whereof are changed into wood.

But I should be much more apt to believe, that these *Stones* are not changed into the substance of *Wood*, but only represent the outward appearance of it. Much in the same manner as that *Vein* of *Stones* which is found at *Novigentum*, on the *River Sein*, do imitate the figures of certain *Plants* and *Trees*.

There is a certain *Stone* as white as *Alabaster*, by some called the *Eye of the World*, which being for some time suffered to lye in the *water*, doth not only become more heavy, but likewise grows transparent, and receives a new *Colour*.

The Reason is, because the *Liquor* that enters into the pores of this *Stone*, doth more dilate and diffuse the *Light*, and refracts the *Rays* much in the same manner as the grains of *Sand* might do. For it cannot be doubted, but that this *Stone* hath many pellucid particles, and that the *Air* which is got into the pores, being thrust out by the particles of the *water*, make the *Stone* to lose its transparency, and to be changed into a white *Colour*; for as soon as the *Stone* is dried, it loseth its white *Colour*, and becomes transparent, as before.

Stones are frequently generated in *Rivers*; yea, it hath been found that the whole bottoms of some *Rivers* have been changed into *Stone*. PATRIUS tells us, that whilst he studied at *Avignon*, he frequently went to swim, in the lesser *Arm* or branch of the *River Rhone*, and that he found that the Bottom, which he had known before to be soft and smooth, was all cover'd with *stone*.

The Cause of this Change might be from the *Earthquake*, which sometime before hapned about the *Shut-up Valley*, so called. For the *Earthquake* might probably cast up a great heap of *Sand*, which being conveyed from the *River Sorga* into the lesser Channel of the *River Rhone*, and settling there, might grow into a great multiplicity of *Stones*. And this Conjecture seems the more probable; because those who frequent the *River Rhone* and *Druent*, assure us, that they very often found at the Bottom of them, *Horses-shoes*,

Whether
it be true
that Stone
is turned
into Wood,
not far
from Rome

XI.
Of a Stone
that being
cast into
the water,
changeth
its colour.

XII.
How the
Stones are
produc'd,
which are
found at
the bottoms
of Rivers.

shoes, Nails, and other Iron-work, to which the Sands did stick so close, and were grown so thick about them, that they were wholly cover'd with a Crust of Stone, by the coalition or growing together of the said Sands upon the Iron.

XIII.
Whence
those Stones
proceed,
which are
found on
the surface
of the
Ground.

Great abundance of Stones are frequently found in Fields, that are in all respects like to those that we meet with at the bottom of Rivers; being of the same bulk and figure, somewhat Oval and inclining to a round figure.

It is probable, that these Stones were carried by the force of waters from the Tops of Mountains to the Fields that lye under them, or else by the overflowing of the Rivers. For it is apparent that the Stones which are scattered up and down the Fields of *Crautia*, come from the overflowings of the Rivers *Rhone* and *Druent*, which left Mud and Sand enough behind them, for the forming of the said Stones. For all the Stones that are found there are not equal, but different in bulk, tho' not in figure: For those that are about the midst are bigger than the rest, and are lessened as they withdraw from it; and those are least of all that are towards the Extream parts; because the fore-mentioned two Rivers having stagnated there for a good while, more Sand was gathered about the midst, than about the other more remote and outward parts. And that this was the true Cause of the generation of these Stones may be gather'd from hence, that those Plains, which are far remote from any Mountains, are destitute of these Stones, there being not so much as the least footsteps of them to be seen.

XIV.
What is
the cause
of those
Shells that
are found
near Bri-
stol.

In some places not far from the City of Bristol, are found the shells of Fishes of a different colour and form; for some of them are twirl'd about like the Tendrils of a Vine; others, other-
wise.

As to the Original of these, it seems most probable, that they are not the effect of any Juice or Moisture, but were brought thither either by means of an Earthquake, or an Inundation; or by the entrance of some foreign Matter into their pores, which sticking there hath rendred them hard and stony.

XV.
What is
the Cause
of those
Stones
which are
found in
Springs.

Stones are likewise found to be generated in Springs; yea, sometimes the Bottom of them is so full of Stones, that they rise much higher than they were formerly. GASENDUS makes mention of a Fountain of *Dinia*, which covers all the Channels it runs through with a Stony Crust.

The Cause which generates Stones in Springs, is this: The Waters that constitute these Fountains, running through Rocks, do carry some particles of them along to the said Spring; which being no longer swiftly agitated, as they were when they were when they passed through the Rocks, begin to settle and grow together. And that some Waters in their passage through Rocks, are impregnated with Stony particles, may be proved from that Fountain which is at Rome, which hath so covered all the sides of the Pipe that it runs through, that it hath long since been quite stop'd with a kind of Alabaster. And the same happens in a Grotto near the City Tours in France, where the Drops of Water dropping down, are turned to Stone.

Wherefore we may conclude with *Peireskius*, that all Stones were not created at the Beginning of the World; but that many are formed in process of time, as owing their original to certain proper Seeds, but their configuration, partly to Nature, and partly to chance. For seeing that a petrifying Seed is found in several places, when the same is received into any Liquor, it immediately coagulates the same, as Rennet doth milk, and imparts a special form to it.

Flints are for the most part of a round figure or approaching to it.

The Reason is, because the surface or outward part of the Earth abounding with many Slits, it cannot be, but that the Air which circulates continually in them, must force the parts of Flints, to range themselves into a round figure, because by this means they do less hinder or obstruct its motion.

XVI.
New Stones
are formed
daily.

XVII.
Why Flints
are for the
most part
of a round-
ish figure.

CHAP. IX.

Of Pearls and precious Stones.

GEMS and Pearls are commonly called Stones, but with addition of the Epithet Precious, because they are highly valued, and not acquired without great labor, or high price. Precious Stones agree with Pearls in this, that they have all the same Figure, and tho' they be the product of several places, yet are never of a different form.

The Reason is, because Pearls are generated in Shells, that are so smooth and polish'd that they shine, which Politeness the Stones, that are generated in them do partake of. For Pearls in their first rise are a kind of swellings like Warts, or excrescences proceeding from the matter of the said Shells, which in progress of time become Pearls. But Gems owe their generation to certain exactly percolated Juices, which being only in small quantity, every drop of them constitutes a particular Gem, and cannot be encreased to a greater number, but by the occasion of more of these drops. And tho' it may be, they may differ in bulk, yet because the action of the subtil matter is the same in them all, they are all of them partakers of an uniform figure.

Hence it is that all Crystal is 6 corner'd, Emeralds 12 corner'd, Diamants and Rubies 8 corner'd, and so for the rest: Because in their coagulation they are split, and multiplied like the Grains of an Ear of Corn, within the same sheath or hull, and that by reason of their special Seeds, according to which Stones obtain as constant Configurations, as either Plants or Animals. Thus we see that Jaspis Stones, Porphyry and Marble are naturally streak'd and embellish'd with various colours, waved through one another. And a Nutmeg in divers colours, represents the winding turnings of the substance of the Brain. And the same may be observed in the Oak, Walnut and other Trees, which being sawn into Boards, and plain'd, exhibit a pleasing Labyrinth of multifariouly windings Veins.

Almost all precious Stones do differ in colour, for some of them are perspicuous, others are in a great measure Opaque; neither do those that are Transparent agree in all things. For the Car-

figures.

III.
Whence the
variety of
colours
that is in
precious
Stones doth
proceed.

buncle

buncle is of a Purple Colour, an Emerald Green; a Saphire Blue, a Jacinth of a Fiery Yellow, an Amethyst of a Violet Colour, an Opal, various, &c.

Precious Stones are Transparent, when the Steams and Vapours whereof the Juices consist, are not congealed till their slippery and fluid particles be exhaled, so as that the Globuli of the 2d Element can readily pass, and convey the action of Light through them. And on the other hand they become Opaque or Dusky, when the said Steams are stopt in some narrow Crevices of the Earth, and become there so entangled with several Terrestrial Particles, that the Globuli of the 2d Element can have no passage through them. The reason why some Precious Stones are adorned with several Colours, proceeds from the various mixture of Metalline Particles, which variously reflect the Light, and differently affect our Eyes. This is evident from the mixture of Wine and Water, where the Colours of both are so confounded, that the Water espouseth the Redness of the Wine, and the Wine embraceth the Paleness of the Water.

IV. For we observe that coloured Gems are, for the most part, found in Mineral Veins, or near to them; and sometimes amongst the very Oar of Metals. Thus it is notorious, that Granates are found in the Iron Mines of Norway. And Mr. BOYLE assures us, that Amethysts are drawn out of Iron and Tin Mines. And those who have visited the Copper Mines of Hungary tell us, that besides the Vitriolick Water, which changeth Iron into Copper, there is found another White Water which changeth the remainder into a hard and white Stone: But if before its coagulation it pass through a Copper Mine, then it produceth a Stone called Malochis, of a Blue Colour, which Colour would be Brighter, and of the Tincture of a Turkois, in case this petrifying Juice should happen to pass through a Mine, wherein it meets with any Silver Oar. From all which it appears highly probable, that the Colour of Gems proceeds from the mixture of Metallick Particles.

V. Stains do arise in some Gems, and Spots in others, as in the Agat, &c.

The Reason is, because the juice, whereof they are formed, is gathered together in some receptacles, as it were in a Matrix, and there rests for some time before it is coagulated, by which means, any thing of impurity contain'd in it, doth by degrees sink to the bottom. But if the Juices be congealed before that the Heterogeneous parts be sunk to the bottom, and united into one Mass, the Precious Stones become blemished with several Spots, or Streaks; thus Flies, Pismires and other Insects are found sometimes in Crystal, because falling into the Petrifying Juice, the same was coagulated into a hard lump, before they had time to settle to the bottom. Yea, Historians tell us, that a Serpent has been found in the midst of a Stone, and a live Toad in the midst of another, without the least footstep of any passage through which the Animal might have entred.

VI. From hence we may infer, how fabulous it is what some Authors relate of Amber, that there are some very high Trees in Norway, from whence it distils in the form of a Gum, and that falling down, it becomes hard. Seeing that it is well known, that Amber is dug out of the Earth in Sicily.

Which may be farther confirmed from the Flies and other Insects that are found in it. And whereas abundance of Amber is taken up in the Baltick Sea, we must conclude the same to have been carried thither by the force of the Waves, which often driveth it to the Shoar, where it is frequently found.

Crystal is found in Mountains, especially those which are continually covered with Snow, and where the most intense Cold bears sway.

The Antients were of opinion, that Crystal was generated of Frost and Snow, or as others, that it was nothing but water, congealed to that degree of Hardness, by extream Cold. And accordingly SENECA expresseth himself thus concerning the Generation of Crystal, The Heavenly Water, that bath little or nothing of Earthly Feculence mixt with it, being once congealed, by the obstinate continuance of Frost, grows still harder and harder; till that all the Air being excluded, it become most closely compressed in it self; so that that which before was Water, is now become a hard Stone. In the 3d Book of his Natural Questions. But we have many Arguments to prove this a mistake. First, Because Crystal doth not melt when it is set to the Fire; neither is any thing diminished by the most intense heat, which yet is the Property of all moisture, that is coagulated by Cold only. Again, if Crystal owes its original to Snow Frozen to such a degree of Hardness, how comes it to pass, that Fire, by a strong Rubbing may be struck out of it? Who ever could strike Fire out of a piece of Ice, as it may be out of Crystal? Lastly, if places abounding and covered with Snow, do favour the rise and growth of Crystal, why is it not found in those Mountains where the Snow is perpetual, and where the Cold never suffers intermission?

Conclude we therefore, that Crystal, as well as other Gems, is the effect of a strained petrifying Juice, and that the same derives its difference in Transparency and Hardness, from the diversity of the matter whereof it consists. We have great reason to believe this, because we find that Artificial Crystal is the product of Sand melted by the help of Salts. And tho' sometimes Crystal be found in Rocks, as if it were something produced by them; yet is this only to be ascribed to this Petrifying Juice, which falling into the Chinks of Rocks, becomes there congealed, in the form of falling drops.

From what hath been said, we may understand the reason why Precious Stones have a thick and dark ground: For seeing that the clear Liquor whereof they are formed, doth for some time rest in their peculiar Vessel or Womb, it must needs happen, that whatsoever is impure in the said Liquor, must sink to the bottom; and this makes the ground of them more dull and dark than the other parts of them.

Now it is apparent, that not only Crystal but Diamonds and Amethysts derive their original from a Limpid Liquor. But yet we must not imagine, that when they are coagulated, the entire Liquor grows into one Lump or Mass, but that they are all by flits divided into several Stones; and like the many Grains in an ear of Corn are multiplied within the same Sheath; so as that according to the peculiar nature of the Seed, they are

VII. Crystal is frequently found in Mountains.

VIII. The Generation of Crystal is much like that of Sand.

IX. Why the Bottom of Precious Stones is somewhat dusky and dark.

X. Precious Stones are formed of a clear Liquor.

formed into a different Figure, as was mentioned before.

XI. Whether a Diamond cannot be hurt by Fire, and yields only to the Blood of a Goat, by means whereof it may be reduced to Powder.

The common or vulgar opinion concerning the Diamond is, that it is of an insuperable Hardness, which doth not in the least yield to any Iron Instrument, Hammer or Anvil: No not to the force of Fire it self; for that being cast into the most violent hot Furnace, it never so much as grows hot; and yet is reduced to powder, by the newly shed hot Blood of a Goat.

These particulars, tho' commonly received, are by experience found to be false; for it is certain that a Diamond yields both to the force of Fire and Iron. Thus BODINUS assures us in his 2d Book of Nature, that a Diamond may with a Hammer be reduced to dust, and ground to powder with an Iron Pestel. The Fire also masters it, for by a continual flame it is reduced to a Calx. Neither is that common report truer than all the rest, that if the Powder of it be taken inwardly, it procures the Bloody Flux, since it is certain, that some Servants, to hide their Stealth, have swallowed whole Diamonds, and without the least impairing of their Healths, have voided them again. Yea, The Powder of it hath been given inwardly to the quantity of a whole dram, without prejudicing the Health of the Taker, any more than if he had eaten so much Bread. Cardan. 2d Book Tract. 5. Contrad. 9.

XII. The Electric Virtue in Diamonds is changeable.

The Electric Virtue in the Diamond is not always unchangeably one and the same. For Mr. BOYLE hath observed concerning a Diamond of his own, that this Electric Virtue was frequently changed, being at some times much more strong, than at others.

The Reason is, for that a Diamond, tho' it be a Solid Body, and that its parts do seem very closely compacted, yet are not they altogether free from some inward motions; it being very probable that there are no Bodies so solid, but that their parts are more or less partakers of some motion. Now supposing this intestine motion in Bodies, it cannot seem strange, that upon the changing of the Texture of their parts, their Virtue should be changed also. Besides the changes of Colour that are observed in a Diamond, are an evident proof of the motion of its parts; because being rubb'd, it shines and sparkles much more bright and briskly at one time than at another; which change cannot be without motion.

XIII. What is the Reason of the Sparkling Brightness of a Diamond.

A Diamond sparkles the brightest of all other Precious Stones, and strikes the Eye with the most brisk and dazzling splendor.

The Reason is, because it consists of a most pure Juice, whose parts are so divided by straining, that they Reflect and Refract the Rays they have received from all sides of them. For all the particles of it are as so many Looking Glasses, which reverberate the light after the same manner as they receive it. This effect may also be ascribed to the Tincture, whereof it is capable in a high degree, not because of any connate likeness, as some suppose; but because such is the disposition and situation of its parts, that all the strokes of the Tincture do appositely agree together, and take up all the Pores of it; which how much it doth conduce to the Reflexion of the Rays of light, those who are any thing versed in Opticks, cannot be ignorant of.

Mr. BOYLE makes mention of a Turcois, which frequently changed its Colour, and afforded a different representation to the Eye. For after that it had caused a Painter to express most exactly the Colour of it, he found that at other times, it not only appeared to him variously from what it appeared when the Painter took a draft of it, but also perceived several Spots in it, which continually had shifted their places.

All this must certainly be attributed to that Intestine Motion which is in the parts, even of the most solid Bodies. Tho' indeed this motion be imperceptible, and not subject to our Sight. For what other reason can be assigned why the Stones whereof Houses are built, grow harder in process of time, except we allow this motion of their parts, whereby they come closer together? Mr. BOYLE hath also observed the vanishing of a Spot that was in an Agate, and that the Electrical and Radiant Virtue is not always the same in a Diamond, but is at sometimes much more strong and brisk, than at others; which is a sufficient proof, that the parts of the most solid Bodies are not altogether exempt from motion.

Very considerable Physical Virtues are attributed to some Precious Stones, whereby not only outward hurts, but many and great inward Diseases are cured.

It cannot be denied, but that many things which are commonly reported concerning the Virtues of Precious Stones, found little better than Fables. But in case they have any such, which I would not absolutely deny, because it is a thing unanimously attested by many very Learned and Famous Men, they must proceed from some Mineral Juices that are mingled with the matter of the Precious Stones, whilst they are yet fluid. And that such Juices do mingle with them, is evident from hence, because they may sometimes be separated from them, as we see they may in Granares; and for that they frequently encrease the specifick weight of Gems, and endue them with various Tinctures. For seeing that such penetrating Effluvia proceed from the hard Loadstone, and that Precious Stones are endued with an Electrical Virtue, it cannot be questioned, but that many thin and subtil steams do proceed from Precious Stones. Again, what a vast number of Minerals and Metals are there in the Bowels of the Earth, which may be coagulated with petrifying Juices, and unite themselves with the same before their coagulation; and being so united, may exert greater Virtues than are to be found in Minerals that are melted in the Fire, or dissolved in Sigi-an Waters, and by means whereof Precious Stones may dry, adstringe, consolidate, and produce many other effects.

Coral that grows under the Sea-water, in the manner of a Shrub, and is soft whilst it continues there, as soon as it is brought up into the Air, becomes hard, and loseth its former softness.

Supposing this to be true, the Reason may be, that Coral as long as it lies hid under the Sea-water, doth abound with much Salt; but when taken up thence into the Air, it grows hard and solid by the exhaling of its moisture. For the fluid particles of moisture, that lie lurking in the pores of Bodies, do dilate them, and shake the other parts of them by their motion, which is the proper cause

XIV. Precious Stones do not always afford the same appearance.

XV. Whether there be any Medicinal Virtue in Precious Stones.

XVI. Why Coral, which is soft under Water, grows hard as soon as it comes to the Air.

cause of the softness of those *Bodies*; but as soon as these *fluid particles* are evaporated, the remainders are more closely joined together. Thus young and tender *Plants*, because of the great abundance of *Moisture* and *Salt*, which distend their parts, are easily bent or *slit*, but when they are old, they grow hard, because of the exhalation of their *moisture*, and the *Air* entering, instead thereof, are much sooner broken, than bended or *slit*. Thus PETER PELLEPRAT tells us of a certain kind of *Clay*, which is found not far from the mouth of the *River* of the *Amazons*, which as long as it is covered with the *Waves*, is soft; but as soon as it toucheth the *Air*, grows so hard, that the *Inhabitant Savages* used in former times to make their *Hatchets* of it.

XVII. But when I consider that *Coral* is of a *Mineral Nature*, and a kind of *Precious Stone*, I am more apt to believe, that it is the product of some *Glutinous Juice*, which being turned into *Stone* by the binding *Virtue* of *Salt*, wherewith it abounds, springs up like a *Shrub*. For *Salt* conduceth very much to the encrease of *Plants*, and is that which causeth them to spread into *Sprigs* and *Branches*. And *Signior Paulo Boccone* witnesseth himself to have experienced as much, who being present, when some were *fishing* for *Coral* at *Messina* in *Sicily*, he put his *Hand* into the *net* before it was drawn out of the *water*, and found the *Coral* to be hard.

CHAP. X.

Of the Magnet or Loadstone.

I. IF a *Loadstone* be hung up in the *Air*, or be suffered to swim on the top of *Quicksilver*, it will wave this way and that way, till one of its *Poles* look towards the *North*, and the other towards the *South*: Yet not altogether in an even *Horizontal Situation*, but so as that that part which points to the *North*, will be depressed beneath the *Level* of the *Horizon*, to the end it may the better be directed towards the *Northern Pole* of the *Earth*.

The Reason of this Conversion must be fetch'd from the *striate matter*, whence the *Magnet* receives all its *virtue*; the *particles* whereof are so twist'd, that those which proceed from the *South Pole*, cannot enter in at the opposite *Northern Pole*; and therefore rushing obliquely into the *pores* of the *Loadstone*, swimming in the *Quicksilver*, they do by the force they have, drive them to continue their motion according to *Right Lines*. And by this means it comes to pass, that the *Magnet*, after some motions this and that way, returns to its natural state. So that being left to its liberty, the *South Pole* of the *Magnet* tends to the *North Pole* of the *Earth*, and the *North* to the *South*; because the *striate matter*, which passeth from the *North Pole* of the *Earth*, and takes its course through the *Air*, towards the *South*, comes first from the *South* part of *Heaven*, through the midst of the *Earth*; as that comes from the *Northern* part of the *Earth*, which returns to the *North*. Furthermore the reason why the *Loadstone* doth not keep it self in an *Horizontal Situation*, but declines towards the *North Pole* is, because we live

in the *North* part of the *World*, and consequently have the *North Pole* nearer our *Horizon*, than the *South*.

Wherefore if you apply the *North Pole* of a *Loadstone* you hold in your hand, to the *North Pole* of another swimming on *Quicksilver*, or *water* with the help of a *Cork*; this latter will withdraw from the *Loadstone* you hold in your hand, because the *striate matter* that proceeds from it, in taking its compass, doth hinder the other. But when this latter *Loadstone* turns its *South Pole* to that which is immovable in your hand, then it will approach to it; because the interposing *Air* being driven away by the *striate matter*, the *Loadstone*, by how much the less resistance it finds, is the more forcibly driven on by the *Air* that doth surround it.

Now that the *Magnetick matter* doth make a kind of *Vortex* about every *Loadstone*, may be evinced by several *Arguments*. We find that the *Needle* of a *Compass*, is put into various *situations*, according as it is differently posited about the *Loadstone*: being placed even with the *Poles* of the *Loadstone*, it lies in a straight line, and makes one Line with the *Axis* of the *Loadstone*; but is variously inclined when it is otherwise placed. Another experiment that makes out this, is, that if you pour out the filings of *Steel* upon *Paper*, having a *Loadstone* fitly placed in the midst of it, we shall find in the said filings the plain draught and appearance of a *Vortex*. For upon the shaking of the *Paper*, we shall with pleasure behold the filings of *Steel* ranging themselves, as it were, into certain *Rings*, whereof those are the largest which shall return to those parts that are nearer to the *Poles*. And if afterwards another *Magnet* be laid near to the former, then those *Rings* of the *Vortex* will appear under another *Figure*, to the end they may pass now through the *Poles* of this last placed *Loadstone*, in case that care be taken, that the *South Pole* of the one of these *Magnets*, be turned towards the *North Pole* of the other. Which *Experiments* demonstrate to the *Eye*, the various *Rings* and turnings the *magnetick matter* makes about every *Loadstone*.

When a *Loadstone* is divided in length, its *Poles* by this means are changed, and those parts of the *Fragments* or *Pieces*, which before this Division were join'd together, and pointed to the same *Poles*, do now withdraw and flee from one another. For if the *Parts A* and *a* were before join'd together, and so likewise *B* and *b* at the other end; as soon as this division is made, *a* will turn to *B*, and *b* towards *A*; so that the *North Pole* of the one doth no longer agree with the *North Pole* of the other; nor the *South* with the *South Pole*.

The Reason is, because the *Southern striate Particles*, which come forth through the *Northern Part* of one *Section*, must enter into the other through the *Southern Part*, and come forth through the *North*. Forasmuch therefore as the *striate Particles*, which come forth from the greater *Fragment A B*, are *Southern*, they must turn about the upper piece *a b*, and so fit and dispose the same, as that they may freely enter through *a*, and go out again through *B*. For *A* is supposed to be the *South Pole*, by which the *Southern Particles* do enter, that come forth from the other part of the *Segment* or *Division* through *b*, and which therefore

II. Why one Loadstone approacheth to another, or withdraws from it.

III. Arguments proving that there is a Vortex of the Magnetick Matter.

IV. When a Loadstone is divided, its Poles are changed.

Figure 21.

fore cannot enter through *b* into the upper part of the *Loadstone*, because it is *Northern*, and therefore unfit to admit the *Northern striate matter*.

V.
How a
Knife that
hath ac-
quired a
Magnetick
Virtue, by
being rub-
bed on a
Loadstone,
comes to be
deprived of
its Virtue.

A *Knife* that hath been rubb'd with a *Loadstone*, attracts *Iron* after the same manner as the *Magnet* it self doth; but if we pass it over the *Pole* of the *Loadstone*, a quite contrary way, than we passed it at first, it will lose the *virtue* of drawing *Iron*, which by the former rubbing or passing of it over the *Loadstone* it had acquired.

The Reason hereof is, because the *Knife* by being passed over the *Loadstone*, or rubb'd against it, was become a perfect *Loadstone*, for this reason only, because the *magnetick matter* had opened its *Pores*, and had smoothed those prominent little *Branches* of the *metallick particles* in the said pores that before hindred their free and ready passage through them. And so in like manner it loseth the *quality* of a Perfect *Loadstone*, by being passed in a quite contrary way over the same *Pole* of the *Loadstone*; because the *magnetick matter*, exerts now a contrary effect upon the *Knife* to what it did before, that is, it now raiseth again the prominent extremities of the *Branchy Particles* in the *Pores* of the *Knife*, which it had before couched, and smoothed.

Now that this is so, appears evidently from this Experiment, that if we lay some filings of *Steel* upon a *Paper*, as was before mentioned, and draw or pass a *Loadstone* over them, we shall see that the parts of the said filings will range themselves one upon the top of another, and constitute, as it were, so many *Hairs*, which all of them lie one way; and if then we pass the *Loadstone* over them the contrary way, we shall find the said *Hairs* to turn themselves, and to lay themselves a quite contrary way to what they were before.

VI.
What is the
Cause of the
Declinati-
on that is
found in
the Magnet.

The *Poles* of the *Loadstone* do not always point directly to the *Poles* of the *World*, but variously decline from the same, as may be seen in Dr. GILBERT'S Treatise of the *Loadstone*, who gives us an account of the observation of one Mr. BOROUGHS, who in the year 1580 at *Limehouse* near *London*, observed that the *Declination* of the *Loadstone* was 13 degrees and 35 minutes: And of Mr. GUNTER, who in the year 1622 found the said *Declination* to be only of 6 degrees, and 13 minutes: And last of all his own observation, who in the year 1634, found it to be only of 4 degrees and 2 minutes.

The decrease of these *Declinations*, proceeds from the *Earth's inequalities*. For it is certain that some places abound with *Iron Mines* more than others, and that the *Loadstone* is not equally diffused in all places; but is found much more plentiful in one than another. And therefore it is that the *striate particles*, which find a more free passage through the *Magnetick Bodies* than through any other, breaking forth from the inward part of the *Earth*, do flow in more abundance towards some places, than towards others: And by this means do frequently deviate from their course, and turn aside towards other *Bodies*, through which they pass more easily and readily. And forasmuch as the turning of the *Poles* of the *Magnet*, or of the *Points* of the *Needle*, doth only depend on the course of those *Particles*, it must needs point that way where there is a greater

quantity of *matter*, that is proper to draw it. This is evident in any *Loadstone* that is not of a *Round* or *Spherical Figure*: For if a small *Needle* be applied to the different parts of it, it will not always turn it self to the *Poles* of it in one and the same manner, but will frequently decline a little from them. And therefore it cannot seem strange to us, if the *Declination* of the *Loadstone* be changed in one and the same place; and that in process of time its *Poles* do not exactly point to the *Poles* of the *Earth*; Because this matter may shift its place; as for instance, in the bottom of the *Sea*, or in the *cavities* of the *Earth*; or the *Iron* may be dug out of the *Earth* in some parts, or be corrupted, and degenerate into another *Body*.

Hence it appears, with how little reason some *Philosophers* do endeavour to explain the *Declination* of the *Magnet*, by the *Deviation* of the *Little Bear*, or of the *Poles* of the *Ecliptick*, from the *Pole* of the *World*: Seeing that there be many places found, where this *Declination* is towards the *West*, as it is generally on the *Eastern* side of the *North* part of *America*; on the *Western* Coast of *Nova Zembla*; on the *Eastern* Shoar of *Africa*, and the *Western* of *Goa*. Yea, in the *Azores* Islands, which lie betwixt *Europe* to the *East*, and *America* to the *West*, it declines neither way: As in *Trinity Isle*, at the *Promontory* of *Needles*, near to the *Promontory* or *Cape* of *Good Hope*, at *Vienna* in *Austria*, and other places.

Some tell us that a *Spherical Loadstone* being placed upright on one of its *Poles*, hath less *declination*, than when its *Poles* are at an equal distance from the *Earth*.

The Reason of this may be, because the *striate particles* that are in the upper part of this our *Earth*, do not only turn from one *Pole* to the other, by *Lines* that are at an equal distance from its center; but also because every where (the *Equator* only excepted) some of the said particles do ascend from its inward parts, the turning of the *Magnet* set upright on its *Poles*, depending on these latter particles, but its declination chiefly on the former.

The *Loadstone* communicates its *virtue* to *Iron*, and doth so change it with a *Touch*, as to make it point towards the *Poles* of the *World*, in the same manner as it self doth. The famous *GASENDUS* observes, that the *Iron Cross*, which had been fixt a long time on the top of the *Great Church* of *Aix*, being cast down by a *Storm*, did acquire a *Magnetick Virtue* from the *Earth*, so as that the parts of it did attract *Iron Nails*, and turn themselves towards the *Poles* of the *World*. So likewise it is observed, that when a *Rod* of *Iron* has toucht the *Earth*, the lower part of the *Rod* draws the point of the *Needle* of a *Compass* that points to the *South*, to it self.

This happens because of the great affinity there is between the *Loadstone* and *Iron*: for they are so much alike, that the *Loadstone* may be called *Raw* and *Undigested Iron*; and *Iron* the *Riper* and more *Pure* part of the *Loadstone*. For *Iron* is melted out of the *Loadstone*, as out of its proper *Vein*. Hence it is, that in *England*, *Germany*, *Italy*, and other places where *Iron* is found, the *Loadstone* is found also, as proceeding both of them from the same *Matrix*. But as for the manner how

Figure
22.

Iron is made partaker of the *Virtue* of the *Magnet*, and by touching it, doth acquire the same *Inclination*: This we shall understand if we suppose that Iron is endued with fit *pores* to receive the *striate matter*, and that it wants nothing towards the obtaining of this *Magnetick Virtue*; but only that some little *branchy particles* sticking out in the *pores* of it, which do make them somewhat rough and uneven, must be bended one way for the easie passage thereof. Now upon the application of a *Loadstone* to Iron, the *striate matter* which continually takes a round from one *Pole* of the *Earth* to another, with vehement force and in great quantity, rushing like a *Torrent* into the *Pores* of the *Iron*, doth bend these prominent extremities of the *branchy particles* all one way; and therefore effects whatsoever is necessary to the making of it fit partaker of this *Magnetick Virtue*.

X. Hence it is that *Steel* is more proper to receive this *Magnetick Force* than *Iron*, because it hath more, and more accurately framed *Pores* for the reception of these *striate particles*. And doth also preserve the said *Virtue* longer, because the prominences of the extremities of these *branchy particles* that are in the *Pores* of the *Earth*, are less flexible, and therefore cannot so easily be bent the contrary way.

XI. The Famous *Mathematician* Mr. BUOT hath found by experience, that *Steel Scissars* or *Penknives* having been heated in a *Forge* till they be of a *Red Colour*, and then suddainly extinguish'd in *cold water*, and afterwards neal'd in the *fire* again, till they be of a *Blue* or *Purple Colour*, and then whetted and made bright on a *Whetstone*, if presently after they be made to cut, or pierce through *Plates* of *Iron* or *Steel*, by this means a *Magnetick Virtue* will be communicated to them, so as to attract *Iron Nails*. Of which no other reason can be assigned, but this, because the *Pores* are so disposed in *Steel* prepared after this manner, that the *Heavenly matter* can with more ease have *Egrefs* and *Regrefs* through them: So as that no out-flowing *particles* from the *Magnet* do remain, but doth only afford a free passage to the *External matter*.

XII. The *Armed Loadstone* A, doth bear up more *Iron* B and C, than another that is not: For GALLÆUS hath observed, that a piece of *Loadstone* weighing 6 ounces, will scarcely bear 2 ounces unarmed; whereas the same *Loadstone* armed will bear up 160 ounces; so as that it attracts 8 times more than when it is unarmed, and a weight 25 times greater than its own weight.

The cause of this encrease of the attractive *Virtue* is, because the *Iron* D E, wherewith the *Magnet* A is armed, is endued with *Magnetick Parts*, that are purged from *Terrestrial Filth*, and *Heterogeneous Impurities*; for which reason its *Pores* do most fitly correspond and agree with the *Pores* of the *Iron* that hangs at it B and C, and by this means the *striate particles* that pass through these *Pores* from the one *Iron* into the other, do drive away all the *intermediate air*, and makes their surfaces to touch one another immediately; by which means they cannot, without great difficulty, be separated; and therefore the weight B, or C, doth stick more strongly to the *Iron* D E. For nothing can be more proper to join 2 Bodies together, than immediate contact.

XIII. A *Loadstone*, being thoroughly heated, loseth its force of drawing of *Iron*, and doth no longer turn towards the *Poles* of the *World*. For if you heap live Coals about a *Loadstone*, you will see a *Blue Sulphurous Flame* to break forth from it; upon the dissipation of which you will judge it to have lost its attractive *Virtue*.

The Cause of this Loss of the *Magnetick Virtue* is, for that the *Fire* entering into the *Pores* of the *Magnet*, many of its thin and *slippery parts* are driven away; upon the removal whereof, a new texture of *Parts* is produced in the *Magnet*. As we see that a *Stick* being put into the *Fire*, becomes crooked by degrees; because the force of *Heat* brings some of its parts closer together, and at the same time separates others of them. The *Fire* therefore having thus changed and confounded the former situation of the *particles* of the *Loadstone*, the *striate matter* which was used to pass through them, finding the *Pores* much wider than they were before, doth exert but a very small force, or rather none at all upon them.

XIV. Tho' there be many great *Philosophers*, who deny that a heated *Magnet* can ever recover its lost *Virtue* again; yet the contrary hath been found by experience. Some indeed have observed, that a *Magnet* that hath been made red hot, is by this means robb'd of the greatest part of its *Virtue*, and changeth its *Poles* in case it be placed to cool in an inverted situation towards the *North*. Or if when it is a *cooling*, the situation of it be frequently changed from one position to another that is opposit, it will wholly change its *Poles*; so as that that which was before the *North Pole*, will become the *South*, notwithstanding that the *Loadstone* be then placed perpendicularly upon the *Horizon*.

XV. Thus those *Glass-Drops*, which upon the breaking off of their *Points* become shattered into the smallest *Dust*, being by degrees put to the *fire*, do lose their *Elastick virtue*.

The Reason is, because the *Parts* which before were stretched, are made wider by the admission of *Heat*, and by degrees sit looser from one another; and thus the *Texture* of the *parts* being changed, they are now no longer like *Sticks*, with *Wreaths* twisted hard about them, and therefore do not so strongly resist the force of the *Hammer*, and become wholly deprived of their *Elastick virtue*.

XVI. But if a Piece of *Iron* be applied to the *Pole* of a *Magnet* from the Right to the Left, it presently loseth the *virtue* it had before acquired; because the parts of the *Magnet* are changed, by this contrary passage of the *subtil matter* through them, and the *pores* differently ranged and formed from what they were before. And on the contrary, it hath been frequently found by Experience, that the *Iron-bars* of *Windows* looking towards the *North* or *South*, do retain a perpetual *Magnetick virtue*: Because the *striate Matter* that proceeds from the said *Poles*, by process of time, do hollow *pores* for themselves through the said *Iron-bars*.

XVII. A *Plate* of *Iron*, which we have said before, being joyned to the *Pole* of the *Loadstone*, doth increase its force to bear *Iron*, doth hinder the *virtue* it hath of turning *Iron* towards it. For the *Iron-Plate* D C D, doth hinder the *Loadstone*

XIII. A Loadstone thoroughly heated loseth its force to draw Iron.

XIV. A Magnet that hath been heated, may recover its lost Virtue again.

XV. Glass drops when put to the Fire, lose their Elastick Virtue.

XVI. A Loadstone upon the changing of its Poles, doth lose its Virtue also.

XVII. How a Magnet may be some time hindered from drawing the

XVIII. A B, Needs to it.

Figure 45. A B, to whose Pole it is joyned, from drawing the Needle E F towards it.

The Reason is, because the *striate Particles* that proceed from the *Loadstone*, do rather pass through *Iron*, than any other *Body*; and therefore the said *particles* are diverted by the *Iron-Plate*, from passing through the *Air* to E F. And certainly, besides the *Iron* or *Magnet*, no other *Body* can be substituted in place of the *Iron-plate* C D, by which the *Loadstone* A B is hindered from exerting its force upon the *Needle* E F; as hath been said in the *Institution of Philosophy*.

XVIII.
Whether
there be
any thing
of Truth
in the story
of Maho-
met's Tomb.

There is a Common Story goes of MAHOMET's Tomb, that it is pois'd in the midst of the *Air*, between 2 *Loadstones*, without touching either the top or the bottom of the *Temple* at Mecha.

I take this to be a meer *Fable*: For it is beyond the power or wit of *Man*, to get 2 or more *Magnets* that are altogether of the very same force and virtue; and if these could be got, yet would it still be as impracticable, or rather impossible to place them so, as that the *Iron* placed between them, should not be drawn in one part of it more than in the other: Seeing that a very small and inconsiderable difference in the *Loadstone*, *Iron*, or in the place it self, would be sufficient to overthrow that Equality. Neither are we to ascribe any greater Authority to the *Stories* that some *Authors* tell us of the *Horse of Bellerophon*, and of the *Statue* that was in the *Temple of Serapis*. These being nothing else but pure invented *Stories*, which have gained Authority by the *Credulity* of the *Vulgar*.

THE SIXTH PART OF THE HISTORY OF NATURE. OF METEORS.

CHAP. I.

Of Vapours and Exhalations.

I.
Why Va-
pours are
more copi-
ous in Win-
ter, than
in Summer.

MORE Vapours do seem to arise from the *Earth* in the *Winter*, than in the *Summer*, when the *Sun* with more direct *Beams* beats against the *Earth*, and more strongly agitates the fluid *particles* of *Pools* and *Rivers*. Hence it is that we have then greater store of *Rain*, and that the *Air* is more darkned with *Mists* and *Clouds*.

This is the *sentiment* of the *Common People*, who judge of the *OEconomy* of *Nature*, only by the outward *Senses*, and without examining, embrace whatsoever they offer first. But Reason will persuade us to be of another opinion: For the *Sun*, who, by his presence, raiseth *Vapours* and *Exhalations* into the *Air*, doth in *Summer* display his heat more upon *Pools*, and moist and boggy places, than in *Winter*; when his *Beams* do only obliquely or slantingly strike against the *Earth*; and consequently at that time produce a weaker agitation in the *waters*. Moreover, we find that the *waters* in *Summer* do signally decrease. Wherefore the true reason why *Vapours* are in

greater abundance in *Winter* is, because the *Air* being then *Cold* by reason of the *Sun's* absence, the *Vapours* cannot mount up to any considerable height in the *Air*, but are presently condensed, and so becoming heavy, fall down again to the *Earth*.

It is observed that *Exhalations* proceed more copiously from some parts of the *Earth* than from others; not only from those which are covered with thick and close *Woods*, but even in those which are equally enlightned by the *Sun*.

The Reason of this may be, some *subterraneous Fires*, which by putting the moisture that is shut up in the *Earth* into motion, do, through various passages, transmit and disperse it. For it is not to be questioned, but that there are *Fires* hidden in many parts of the *Earth*; which meeting with matter fit to be turn'd into *Steams* or *Exhalations*, do drive the same upwards. As we find that *Gardens* that are kept in good order, and *Ploughed Ground* do send forth more *effluvia* than other places, especially if they be much exposed to the heat of the *Sun*.

Vapours and *Exhalations* do not mount up to any considerable height in the *Air*, but there stop at different distances from the *Earth*.

II.

VII.
 Why some
 Bodies send
 forth
 beautiful
 and others
 horrid Ex-
 halations.

The Lower Region of the Air is hotter than the Middle, and the Middle hotter than the Highest, not only because they are nearer the *subterraneous Fires*, and those *fermentations* which are excited in the more outward parts of the Earth; but also by reason of the *Reflexion* of the *Suns Beams*, which is the chief cause why the heat of this Star is greater in those Regions. Now this supposed, it is evident that the *Vapours*, being lighter, may ascend to the highest Region of the Air, whilst the *Exhalations* can scarcely get up to the middle, where most of the *Meteors* are forged and produced; and this by reason of the great variety of degrees of Cold and Heat, which by turns do there bear sway.

IV. *Water*, when it is turned into *Vapour*, takes up much more room than before; forasmuch as the parts whereof the *Vapour* consists, because of their swift agitation, do spread themselves every way, and are swiftly whirled about, and thereby extend more in length; so that by this means every one of them are of force enough to drive away any neighbouring parts that would make an irruption into the Rings, which by their circulation they describe. Much in the same manner, as when the Stick L M, through which the piece of Cord N P, is put, being violently turn'd round, the Cord, by this means, is extended at its full length, and fills up the whole space of the Circle N O P Q, so that no other Body can enter the said space, but that the Cord, in this its motion, would drive it away.

V. This shews ARISTOTLE'S mistake, who was of opinion, that the Air may be so dilated, as to change its nature, and to take upon it the form of Fire: For it is found by experience, that if the Bladder of a Pike be prick'd with a Pin, and all the Air let out, and then it be so closely tied up again, that no Air can enter into it; if afterwards the said Bladder be put into a Glass Pipe, having a broad Bottom, and a wide Mouth, being tied close about with a Hogs Bladder, and Quicksilver put into it, it will display it self, and swell into the same dimensions, as it was when first it came out of the Fish, tho' the Air in the Bladder be above an 100 fold rarefied above what it was before, by the agitation of the subtil matter contained in it.

VI. The Steam proceeding out of a Mans Mouth, in cold weather, is condensed on the Panes of a Glass Window, into drops of Water or Ice. The Reason is, because the Vapours by the heat of the Stomach, are carried to the Windows, and being not able, because of their thickness, to pass through them, become there condensed into Water; and if the Weather be very cold and frosty, they turn to Ice, and represent several figures on the Glass.

VII. The Steams that proceed from Bodies, are distinguished by their smell; for some are good and healthful, others evil and hurtful. In places where abundance of Roses grow, the whole neighbouring Air is filled with a sweet Rose Odour: Whereas on the contrary, in places where Dug or Carrion is cast forth, the Air is annoyed with abominable and noxious Vapours, and stinking Smells.

The Reason is, because these Effluvia which wander through the Air, are nothing else but lively and active particles of Earthly Bodies; which

being agitated by the heat of the Sun, are carried upwards, in the very same manner as we see that a wet Cloath, hung before the Fire, doth send forth vaporous Steams. Wherefore all manner of Exhalations, are either healthy or hurtful, according as the Bodies from whence they proceed, are either sound, or tending to putrefaction. Thus we find that the Vapours which arise out of the Earth are dry, because they consist of dry terrestrial particles: Whereas those that are sublimed from the Sea, are moist and cold; because they consist of fluid and slippery Aqueous particles, which running together, constitute a liquid and cold Body.

Accordingly we find that observation to be very true which Sir KENELM DIGBY makes of London, in his Treatise of the Sympathetical Powder, viz. that in the Winter especially, the Air is filled with Soot and volatil Salt, from the Smiths Coals that are generally there burnt, which flying in the Air, enter the closest shut Rooms, Trunks and Chests; sullies and spoils the Furniture of Beds and Hangings. And it is not without reason, that Physicians attribute to this cause, that so many are troubled with, and die of Consumptions of the Lungs; because the Air abounding with such particles, is very apt to inflame and ulcerate the Lungs.

From what hath been said, we may easily see the reason why Steams are the cause of the infection of the Air, and of the corruption of the Bodies of Animals. For as the particles of Rennet being dispersed through the substance of Milk, do change the situation of its parts, and make that which before was liquid, a fixed and hard Body: So likewise the particles of pestilential Steams, penetrating the pores of the Air, do pervert and overthrow the Texture of its parts, and cause malignant Distempers.

And accordingly it is most certain, that innumerable Diseases are caused from poisonous Steams. And forasmuch as these Fumes do commonly proceed from Mineral Juices, therefore the destruction that is caused by them is so much the greater, as abounding with sharp and corrosive particles, which are the fruitful seeds of many malignant Distempers, and are very noxious to the vital Spirits. Thus we find that in several places such poisonous Exhalations break forth out of the ground; as at Puteoli, where there is a Pool or Lake which sends forth sulphureous Steams that are pernicious to the very Birds that fly over it. In like manner there are many places in Campania, where abundance of sulphureous and bituminous Exhalations proceed from some subterranean Cavities, some whereof are healthful, and others hurtful.

To these Exhalations and Steams, now mentioned, may be added that subtil Steam or Breeze, which being sublimed from the Earth in the day time, and falling down again after Sun-set, is called the cool evening Air, and found to be hurtful to many, especially to those who are of a less compact frame of Body, and whose pores are more open. This Steam is also wont to be more hurtful about the time of the Equinoxes, especially in places that abound with Mineral Exhalations. For a moderate heat raiseth a vast number of Vapours, especially in moist and morish places; which Steams, because they abound with sharp and corrosive

VIII. Why some die in London of the Consumption.

IX. Why some Steams are noxious to the Body.

X. Exhalations are the cause of innumerable distempers.

XI. The Evening Air is found to be hurtful to many.

rosive particles, enter through the pores into the Head, and cause Tooth-ach, and many defluxions; as also by their sharpness, opening the Capillary Veins, they occasion great bleeding and watchings, and are in a particular manner noxious to the instruments of Respiration.

XII.
Exhalations are not so easily carried upwards as Vapours.

Vapours are more easily carried upwards than Exhalations, as may be seen in the distillation of common Salt, Nitre and Vitriol, whose Exhalations do not rise without a great force of Fire.

The Reason is, because the water which furnisheth the matter of Vapours, consists of long smooth and slippery parts, figured somewhat like Eels; which tho' they be entangled together, yet are never so closely joined, but that they may be easily separated from one another. Whereas the Earth, whence Exhalations do arise, consists of more irregular parts, which, like Sprigs, grow close together in Hedges, are easily twisted together, and cannot without difficulty be separated again. Wherefore Vapours that consist of the thin and slippery parts of the water do more readily mount up than Exhalations; which because of the closer texture of their parts are kept down, and cannot ascend, except they be born up by other Bodies.

XIII.
Why our Breath feels more hot when breathed with an open Mouth, than when our Mouth is drawn together.

A hotter Steam or Breath proceeds from an open Mouth, than from one half shut.

The Reason is, because heat consists in the agitation of the little particles of the terrestrial Bodies; wherefore when we blow strongly against our Fingers, close joined together, we find that our Breath feels cold in the outward surface of our Hand; because being carried there most swiftly, and with equal force, doth not produce any considerable agitation; whereas on the contrary we perceive it to be considerably hot betwixt our Fingers, because being more slowly and unevenly moved betwixt them, it puts their small parts into a greater motion. And it is for the same reason that we feel that breath hot, which is breathed from our open Mouths, whereas that which is blown from them when almost shut, seems cold to us. As we find that commonly violent Winds are cold, and the gentle are commonly the hottest.

XIV
Why we can see our Breath in the Winter, and not in the Summer.

The Breath of Animals is visible in Winter, as also the Steams that proceed from them in swearing; but not in the Summer.

The Reason is, because the particles of the Vapours, which in Summer are carried through the Air, do more comply with the motions of the subtil matter, and give way to all its impulses. But in the Winter, when the subtil matter is more weakly agitated, the breath is condensed by the coldness of the Air, and is frequently turned into water; and in extrem cold and frosty weather doth turn to Iscles on the Hair of Mens Heads and Beards. Whereas in the Summer they are not perceived at all, because of the heat of the Air, which disperseth them far and near.

XV.
Steams proceed from all Bodies.

Wherefore it cannot be questioned, but that the most solid Bodies do send forth some Steams or Effluvia from them, which compose a kind of Atmosphere about them. As is evident, not only in Amber, Campfire, Spanish-wax, and the like, which diffuse their Odour through the Ambient Air; but also in Wooden Vessels, which being exactly weighed, will be found to have lost something of their weight: And in Eggs, whose sub-

stance evaporates, even in the coldest season; yea and in Ice it self, which being exposed to the Air in the Night, doth decrease in heaviness, and is considerably diminish'd as to its substance. And if in some Bodies, such an efflux of particles be not perceived, the reason hereof probably may be, because we have no Scales exact to discover the same, seeing that the Scales and Weights themselves are subject to this decrease by a continual efflux of particles, and are not always the same weight.

But these Effluvia are no where more sensibly perceived, than in the insensible Transpiration of Human Bodies. For SANCTORIUS affirms, that he by an exact weighing of himself, found that more than one half of our Food and Drink, passeth by insensible Transpiration; and that we evacuate more of our Aliments through the pores of our Skin, in one day, than we do by Siege in 15 days; which is an incontestable proof of the Steams that continually proceed from our Bodies.

XVI.
But most of all from Human Bodies.

CHAP. II.

Of Winds.

WINDS are more frequent in the Spring and Autumn, and do blow with greater violence, than in Summer or Winter.

The Reason why it thus happens in the Spring is, partly because of the melting of Snow, especially in Mountainous Places; and partly because the pores of the Earth are then opened, and send forth more Steams or Vapours; and partly also because the Air and Vapours are then more rarefied than in Winter. And in Autumn, the reason is to be ascribed to the frequency of Rains that then fall, as well as to the greater quantity of Exhalations; because the Sun's moderate heat, which then takes place, doth raise Vapours and Exhalations, but gross ones, and not sufficiently rarefied. Whereas in the heat of Summer, there are for the most part no winds; for the same reason that Rains are very scarce then; and because the Sun doth too much extenuate the Exhalations, and so prevents them from uniting in that quantity, which is requisite for the Generation of Winds. And in the midst of Winter, winds are less frequent, not only because less quantity of Vapours is at that time raised from the Earth, but also because those which are so raised, are either condensed into Snow, or at least by reason of the cold, are not so rarefied and dispersed as to be able to produce a Wind.

About the Sun's Rising, an East wind is commonly perceived, and about Sun Set a Western: which difference they are most sensible of, who sail in the Ocean, at a great distance from Land.

This proceeds from the presence of the Sun, which puts the particles of the Earth in motion, and lifts up Vapours into the Air: For seeing that a great part of the Earth is always illuminated by the Sun, it must of necessity raise many Vapours from thence, which upon its departure fall down again, and betake themselves to the East and Western parts of the World, to succeed in the room of those Vapours which the coldness of the Night hath condensed in those parts: And therefore they

I.
Why Winds are more frequent in the Spring and Autumn, than at other Seasons of the Year.

II.
Why an East Wind commonly blows in the Morning, and a West wind in the Evening.

III.
Who

That *Aspina* have a great affinity with the
 birds called *Grainhens*, which come from North to
 South, and being taken the birds have the bones
 and nerves common to both, and are the
 same called *Ornithos*, at *North* and *South*. They
 are sometimes taken flying in the night or dark
 clouds, and therefore it is observed, that *Aspina*
 are very rare in *France*, when *North* winds
 blow from the *North*.

And thus they are the same of which we have seen the effects in the former part of the book. The same effects are produced by the same causes, and the same causes produce the same effects. The same effects are produced by the same causes, and the same causes produce the same effects. The same effects are produced by the same causes, and the same causes produce the same effects.

Ch

Figure 24

III. Whence the difference of Wind, and the cause of the same.

IV. Why East winds are drier, than West winds.

V. Why the East Wind is drier, than the West Wind.

V. Why about the Sea Coasts, the Wind at Night blows from the Land.

Figure 24.

who live in the *Eastern* parts, perceive an *East-wind*; and those in the *West*, a *West-wind*. This will appear more clearly by considering the *Figure*, where A B C D represents the *Compass* of the *Earth*, S, the *Sun* opposite to it, who darting his *Beams* against the *Hemisphere* A B C, and making *Noon* at B, and *Midnight* at D, doth at the same time Set to the *People* that live at A, and Rise to them who live at C. For the *Vapours* about B, which are rarefied by the Heat of the *Day*, and do by opposite ways tend towards D, viz. by A and by C, to take up the place of those *Vapours*, which the Cold of the *Night* hath condensed, do produce a *Western-wind* at A, where the *Sun* sets; and an *Eastern-wind* at C, where the *Sun* riseth.

III.

Whence the difference of Winds doth proceed.

Whence it follows, that the *Fermentations* that happen between the *Tropicks*, produce *Winds* that are either contrary to, or agree with the *East-wind*, according as that part of the *Earth*, where they are generated, is differently situated with regard to the *Sun*. Whence it comes to pass, that the *East-wind*, which reigns constantly betwixt the *Tropicks*, is sometimes stronger, and at other times weaker, as Experience sheweth.

I have said before, that this diversity of *Winds* is most of all perceptible to them that *Sail* in the vast *Ocean*; because at *Land* there be many things that hinder us, that we cannot so well observe this order of the *Winds*, viz. the height of *Mountains*, and the great variety of *Climats*.

IV.

Why East-winds are dryer, than West-winds.

East-winds for the most part are dryer, and produce fair and clear weather; whereas those from the *West* are commonly moist, and bring dryer, than *Vapours*.

The Reason hereof must be deduced from the motion of the *Air*, which is carried about the *Earth* from *East* to *West*. For seeing that the *Winds* that are generated at C, follow the motion of the *Air*, they consequently drive before them all the *Vapours* they meet with, and dissipate them, and so hinder them from being condensed and turned into *Rain*. But those which are produc'd in the *West* A, seeing that they strive against the motion of the *Air*, and take a different course from it, they stop the motion of the *Vapours* they meet with, and drive them together into *Clouds*. And for the same Reason, winds that proceed from the *East* C, are generally stronger, and blow with greater force, than those that blow from the *West* A; because those which are forged at C, follow the course of the whole *Mass* of *Air*. Or else, because by reason of the longer absence of the *Sun*, the *Vapours* are more closely condensed in that part of the *Earth* which is between C and D, than in that which is betwixt D and A. Now it is certain, that the *Condensation* of *Vapours*, contributes to the force and violence of winds; which are by so much the more vehement, the more heavy the parts are whereof they consist.

V.

Why about the Sea-Coasts, the Wind at Night blows from up Vapours from the Sea and Earth.

On the *Sea-Coast*, the winds are found to blow from the *Sea* in the *Day-time*, and from the *Land* in the *Night*. This shifting of the *Wind* depends on the Illumination of the *Sun*, whereby it differently raiseth blows from up *Vapours* from the *Sea* and *Earth*. For whilst the *Sun* shines, he commonly raiseth more *Vapours*

from the *Sea*, than the *Earth*; because the *Earth* is dry in many places, and doth not afford such plentiful matter for *Vapours*, as the *Water*. And, on the contrary, when the *Sun* withdraws, more *Vapours* rise from the *Earth*, than from the *Sea*; because the *Earth* being a compact *Body*, and abounding with moisture, doth longer retain the Heat impress upon it, than the *Sea*. And therefore those strong winds, which blow from *Midland* places upon the *Sea*, are strongest next to the *Shoar*; but grow weaker, the further they proceed on the *Sea*. From whence COLUMBUS, the first Discoverer of the *West-Indies*, gather'd, that there were other *Countries* beyond the *Atlantick Ocean*, and those not far off neither; because he found such strong and violent winds to blow from the *Sea* towards *Europe*, which he concluded to be too vehement to proceed from the *Sea*.

There be some *Winds* that return at certain times, and always observe the same course; as the *Etesiae*, which every Year blow for 40 Days together, beginning 2 days after the Rising of the *Dog-Star*. *West-winds*, which blow from the *Vernal Equinox*, to the *Autumnal*, in the *Mediterranean Sea*: And *South-winds*, which are produc'd under the *Torrid Zone*, and have their daily, monthly, and 6 monthly Returns, or Reciprocatations.

The *Sun* is the only Cause of all these constant or stationary winds, who, according to his various approaches to, or recesses from the several Parts of the *World*, effects this great diversity herein. For as to the *Etesiae*, which are observed after the *Summer Solstice*, it is probable that they proceed from *Vapours*, sublimed by the virtue of the *Sun* from the *Earth* and *Water*, that are in the Northern parts, after that he hath continued a great while about the *Tropick of Cancer*. For it is certain, that he continues longer at the *Tropicks*, than in the Space that is between them. And we are to consider, that in the Months of *March*, *April* and *May*, the greatest part of the *Clouds* and *Snow* which were about our *Pole*, are resolved into vapours and winds; and that these winds, from the beginning of the *Spring* (at which time they are at the strongest) towards the *Summer Solstice* do grow weaker, as the Matter of them decreaseth. And that in *June*, the *Earth* and *Water* is not yet sufficiently heated there, to furnish Matter for a new wind: But when the *Sun* continues about the *Tropick of Cancer*, they become more strongly heated, and by this means produce the *Etesiae*, when the *Noon* of that long *Day*, which continues there 6 Months, begins a little to decline.

These *Etesiae* have a great affinity with the winds called *Ornithiae*, which blow from *South* to *North*, and bring back the *Birds* from the beyond *Sea* hotter *Countries* into *Europe*, and are therefore called *Ornithiae*, or *Bird-blowing-winds*. But yet sometimes these winds stop in the midst of their course; and therefore it is observed, that *Swallows* are very rare in *France*, when *North winds* have blown much towards *Africa* at the beginning of the *Spring*.

6 X

Experience

VI.

What the Cause is of the winds called Etesiae, and of other Constant winds.

VII.

The winds called Ornithiae, are near akin to those Etesiae.

VIII.
In the Indian Seas, and those of Arabia, the Winds blow constantly.

Experience teacheth us, that in the *Indian* and *Arabian Seas*, which are so situated with respect to the Continent of *Asia*, when the *Sun* heats the same from *April* to *October*, the *Air* which is condensed on the South-side of the *Aequator*, doth transport it self with so much impetuosity, towards the North-side of it, that it makes the North-east-wind not to be perceived, which blows at the same Latitude in the *Atlantic Ocean*. And, on the other hand, when the *Sun* doth heat the *Seas* which are on the South-side, from *October* to *April*, then the *Air* which becomes condensed towards the North by the Cold of the *Winter*, that remains there, doth take its course with that violence towards the South, that it doth entirely over-power the South-east-wind. Which is the Reason, why in these *Seas* there is only perceived a Periodical-wind, which blows one half of the Year on one side of the *Aequator*, and the other on the other side.

IX.
The West-winds blow at a certain time of the year in the Mediterranean.

In like manner *West-winds* usually blow in the *Mediterranean-Sea*, from the time of the *Vernal Equinox* to the *Autumnal*; because a great quantity of *Vapours* is, during the Heat of *Summer*, drawn up from the *Atlantic Ocean*; and some Hours after *Sun-Rising*, which answer to a set space of Time after *Midnight*, are driven towards the *East*, and continue their activity till *Sun-setting*. The winds betwixt the *Tropicks* are certain and stationary; because the *Sun* there darting direct and perpendicular *Rays* towards the *Earth*, doth by this means raise many *Vapours*, which being put into motion by the Action of the *Light*, do diffuse themselves and produce a wind. And in like manner it may be said of other winds, which rise at certain times; as of the *South-west-wind* by *West*, which blows from the *Eastern-shoar* of *Africa*, towards *Morambique*, from the beginning of *August* to the 15th of *September*; that they are caused by the *Sun*, who raiseth plenty of *Vapours* out of the *Indian-Sea*, from *April* to *August*, which take their course towards *Africa*, and having got more room, do there dilate themselves.

X.
How Artificial-winds may be made.

Winds may be raised by Art, as appears by that Instrument called the *Chymists Bellows*; which consists of a hollow *Copper-Globe*, so contrived as that it may be filled with *water*; and afterwards shut up close; having a *Pipe* with a very narrow Mouth jetting out from one part of it, which Instrument thus fill'd with *water*, is plac'd near a *Fire*, the *Pipe* being turn'd towards that *Fire* which is to be blown up: Whereupon, as soon as this *Globe* grows hot, the *water* becomes rarefied, and bursts forth through the narrow Mouth of the *Pipe*, in the manner of a strong blast or wind, and so serves for a *Bellows* till all the *water* be consumed.

In this case the particles of the *water* being agitated by the *fire*, dash together, and with strong Endeavours strive to get away from one another; and because they cannot dilate themselves, nor depart from each other, but only so far as some of them get out through the *Pipe*, all this force wherewith so many of them dash together, being united, doth drive the parts that are next to the *Pipe*, with great violence into the open *Air*, and by this means a blast or wind is caused. And forasmuch as by the *fires* continual Action, other

parts of the *water* are still rarefied, and being whirl'd about, do withdraw from one another, whilst others of them endeavour to get out of the *Pipe*; by this means the wind ceaseth not, until all the *water* that is in the *Globe* be evaporated, or that the *fire* be removed from it.

Winds do rage most in the *Winter*, and cause more stormy weather, than at other times; which *Sea-men* are very well aware of.

The Reason is, because the *Sun* at that time draws towards the *Southern Tropick*, and therefore occasions a less Resistance against the *North-winds*. To which may be added, That in the *Winter*, the *South-west*, or *South-west* and by *West-wind* comes down with more force from the *Mountain Atlas*, or the *Southeast-wind* from the *Mountains* of *Syria* and *Arabia*. But the *Winds* are never more stormy than in *March* and *September*, because the *Heaven* then is subject to many mutations, and frequent vicissitudes of heat and cold, moisture and drought.

The *South-wind* is, for the most part, unhealthful, and causeth Colds or Stuffings of the *Head*. Hence it is, that when the *South-wind* blows, People grow more peevish, and more unfit for their Studies.

The Reason is, because the *South-wind* being moist, carries many *Vapours* along with it, which enter into the open pores of the *Body*, and are carried to the Inward parts of it. Whence proceed Colds and Stuffings of the *Head*, and Dullness of the *Senses*, which when a man perceives, he is apt to be troubled and peevish; and consequently is less disposed for his Studies, or other Affairs, that require a clear and serene Mind.

Northern-winds do clear the *Air*, and cause Fair-weather.

Because by their impetuous blasts they drive away and disperse the *Clouds* that are already formed, and by their Coldness hinder the Generation of New ones: Whereas on the contrary, *South-winds* must needs produce a quite different Temperature in the *Air*, which is abundantly confirm'd by Experience in the *Isle of France*, *Burgundy* and *Campagne*, whither the *South-wind* always brings great Rains; for being opposed to the course of those *Vapours*, that are raised towards the *North*, and which blow towards the *South*, it stops them, and by its heat, doth in a short time change them into showers.

There are some winds that blow in some particular Countries only; as that *North-wind* which blows on the West-side of the *Alps*. Such also is the *North-east-wind* in *Apulia*, and in other places.

The Reason of these *Winds* must be deduced from the situation of the several Places, the Narrowness of the *Valleys*, and the Caverns of the *Mountains*. For it is evident, that a wind must blow with greater violence between the Streights of *Mountains*, by the same Reason that the *water* of a *River* runs more swiftly where its Channel is straightest, because the Fore-parts of the *water* are prest forwards by those that are behind. And therefore it is, that a *Wind* that breaks from a straight place into an open Country, doth rage with an extraordinary violence.

XI.
Why winds are most vehement in the Winter.

XII.
Why the South-wind is unhealthful.

XIII.
Why the North-wind commonly brings fair weather, and the South-wind, Rain.

XIV.
Some winds blow only in some particular Regions.

The

Why the
North-
wind is
cold, and
the South-
west
hot.

XV.
The Winds
that blow
in Temper-
ate Zones
are irregu-
lar.

XVII.
Winds
blow regu-
larly only
on the
Main Sea.

XVIII.
The most
violent
Winds are
dry, and
the most
gentle are
the most
moist.

XV. The North-wind is generally Cold, because it passeth through a Region cover'd with Snow, whence it brings many cold Vapours along with it. But the South-wind is Hot, because it comes to us from those parts that are nearer to the Torrid Zone, whence it brings along many hot Exhalations, which the Sun hath call'd forth, which makes it to feel hot to us. This Mr. BOYLE made an Experiment of in a Weather-Glass, in which there was a hanging Cylinder, or long Glass-Pipe fill'd with Water, and after having blown into it with a pair of Bellows, the water did not fall down, as it happens when the Cold is increased; but on the contrary, the Glass-Pipe began to grow hot, and received some degree of warmth upon blowing in of the wind: But when the outside of the Bellows was surrounded with a mixture of Snow and Salt, a colder wind came forth from it, and made the hanging water to descend. By which Experiment it sufficiently appears, that all winds bring some Steams and Exhalations along with them, that impart a different Temperature to the Air, which they fan with their Blasts.

XVI. The winds that bear sway in these Temperate Zones, are generally irregular; that is, are tied to no certain Rules or Laws. The Cause of this Inconstancy is to be fetched from the different situation of the Zones; for seeing that the Temperate Zones are placed betwixt the Torrid and the Polar frigid Zone, they sometimes receive the most intense heat from the former; and at other times, most extreme cold from the latter. Whereas the Cold and Hot Zones, for the contrary Reason, are accustomed to more Regular winds, which at certain set-times use to be very violent. Thus because Southern-winds with us, do most of all depend on the different force of Exhalations, therefore also they are free, and tied up to no Laws.

XVII. But after all, it may be said, that winds are scarcely Regular to exactness, save only on the Main-Sea, where the Fermentations that commonly happen in the Earth, cannot produce any Alteration; and that on the contrary, on the Land and in Seas, that are not very far from it, the winds must needs appear with all the Irregularities imaginable; not only with respect to the different parts of the Horizon, whence they blow, but also with respect to the force wherewith they exert their activity.

XVIII. The most violent winds are such as are dry; and the most gentle and soft, are those that are moistest.

The Reason is, because the most violent winds are able to carry away with them the watry particles that are in the pores of Bodies, that are exposed to their action; whereas on the contrary, the softest and gentlest winds, must needs be the moistest; not only because the particles of Air, and the Vapours whereof they are composed, are not of force enough to carry away the particles of the water, which are either in the pores, or on the surface of Bodies which they meet with; but also because the Vapours which are in the wind, being only endued with a small degree of Agitation, do stop at those Bodies, and make them moist.

A wind blowing against a Plate of Iron, or a wooden Board, exerts but little force upon it; whereas when it is driven against the Sails of a Ship, it hath so great a force as to drive forwards the greatest Ships so swiftly, as that they can run near 80 Leagues in 24 Hours.

The Reason of this difference is to be ascribed to the difference of the pores in these several Bodies; for those that are in Sails are formed by the weaving of Threads, through which, when the wind passeth, it doth as it were divide it self at the several Threads of the Sail, that separate the pores from each other, and exerts its force against them: Like a Torrent of water, which exerts a greater violence against a Dam, that hath slits or intervals between them, than against a wooden Board, or a stone Wall, which affords no passage to any part of the water.

Winds seem to be colder, than the still and calm Air, tho' they be little or nothing colder than it, as may be seen in a Weather-Glass, in which the water doth not mount higher when the wind blows, which yet ought to be, in case the Air that is shut up in the Glass, were made colder by the outward wind.

The Reason is, because the still Air doth only reach the outside of our Skin, which being colder than the Flesh which is hid under it, is therefore less sensible of the Cold that comes against it: Whereas the wind being more agitated, is driven deeper into our Bodies, and piercing the Flesh, is conveyed into the Inward parts, which being much hotter than the Skin, are more sensible of the coldness of the wind that reacheth them. For the same Reason that a hot Hand is made sensible of more cold when it touches a piece of Ice, than a Hand which is only luke-warm.

CHAP. III.

Of Clouds and Mists.

Clouds are suspended and poised in the Air, tho' they seem to be thick and heavy.

The Reason is, because the particles of Ice, or Snow, whereof they consist, are very small, and of much Surface, according to their bulk; and therefore are more hindered by the resistance of the Air from falling downwards, than they are driven down by their own weight; much like as a heavy laden Ship is born up by the resistance of the water that surrounds it. Besides, the winds that commonly blow near the Earth, consisting of a more thick and gross Matter, than those which are in the higher parts of the Air, are not only of force enough to stay and poise the Clouds in the Air; but also to raise them above that part of the Air wherein they are. Again, tho' the particles of Ice, being driven by the wind, do become contiguous to one another; yet are they not therefore closely joyned together, but on the contrary do constitute a Body which is so loose, light, and diffused, that except heat do melt some of the parts of them, and by this means do condense and make them more heavy, they would never be able to fall to the ground.

XIX. Why the Wind hath so great force against the Sails of a Ship.

XX. Why the Wind is felt colder than the Air, whereas indeed it is not colder than it.

III. How Clouds come to be poised in the Air.

I. How Clouds come to be poised in the Air.

VI. The highest Clouds are not so light as those which are lower.

V. How Mists are raised.

II. *Mists* are very frequent in the *Spring*, more than at other *Seasons* of the *Year*.

The Reason is, because at that time there is a greater *Inequality* between the *heat* of the *Day* and the *cold* of the *Night*; by which means it happens that a great quantity of *Vapours* do meet with the *Coldness* of the *Air*. For there are two things required to the turning of *Vapours* into *Water* or *Ice*: The first is, that their *particles* come so close together, that they may touch one another: The 2^d is, that there be *Cold* enough to stop and unite them, when they are come thus close together. For the *Cold* would be of no use, if the *particles* of the *Vapours* were at a distance from one another, and separated. And their *Connexion* would be of as little use, in case the agitation of *Heat* were so great to hinder their union. And therefore when in the *Spring*, *Vapours* are carried upwards by the *heat* of the *Day*, which by the *cold* of the following *Night* are again condensed, it cannot be otherwise, but that *Mists* must more frequently appear at that time, and the *Earth* be more abundantly moistened with them. And for the same Reason it is, that on the *Sea-Coast*, and in *Marshy places*, *Mists* are more frequently generated than in *Upland places*, and such as are remote from the *Sea*; for the *Water* in those places sooner losing its *heat*, than the *Earth*, imparts a coldness to the *Air*, where afterwards the *Vapours*, that proceed in great abundance from the *hot* and moist *Earth*, are condensed.

III. Sometimes a double range of *Clouds* appear in the *Air*, whereof the one is carried below the other.

The Reason is, because the *Vapours*, of which the *Clouds* are generated, do not with an equal force mount up into the *Air*, but some get up higher than others, before that they are sufficiently condensed for the forming of them. Whence it is, that we see some of them further from the *Earth*, and others nearer to it, and these too sometimes driven by different *winds*. Which is more especially perceived in *Mountainous places*, where the *sublimed Vapours* are more unequally driven by the *heat*, than in other places. Hence it is, that according to the greater, lesser, or equal weight of the *Cloud*, the same *Cloud* doth either ascend, descend, or hang equally poised in the *Air*: As a *Ship*, according to her greater, less, or equal weight, doth rise higher, sink lower, or keep in an equal station in the *water*.

IV. The highest *Clouds* are composed of *particles* of *Ice*, which may be gather'd from the *Tops* of the highest *Mountains*, which even in the midst of *Summer* are cover'd with *Snow*.

The Reason is, the great *Coldness* of that *Region* of the *Air*, which without doubt is colder, than that which lies upon the tops of the *Mountains*, or at least as cold; and because the *Vapours*, the higher they ascend, the more cold they meet with to condense them, and are the less liable to be pressed by the *winds*; therefore, for the most part, do the highest parts of the *Clouds* only consist of the thinnest *Capillaments* of *Ice*, situate at a great distance from one another.

V. *Clouds* appear of different *Colours*, sometimes black, at other times white, and sometimes are painted with all the *Colours* of the *Rain-bow*.

A *Cloud* appears black, when little or no *Light* is reflected from it, and then it is a sign of *Rain*; because the lower part of the *Cloud* is either already turned into *water*, or will be so suddenly. So on the other hand, when the *Light* is reflected from the *Cloud*, only by changing the *Order* of the *Rays* lighting upon the *Cloud*, without any other change of the *Beams*, then the *Cloud* appears white, and is a fore-runner of *Fair-weather*; because the said *Cloud*, consisting of distinct *Globuli*, or round *particles*, doth more readily vanish into the *Air*. And so lastly, when the *Light* is reflected from a *Cloud* in the same manner, as it is sent back from the *Matter* of a *Rain-bow*; then that *Cloud* appears of many *Colours*, like a *Rain-bow*, viz. Red, Green, and Purple, and may be a sign of *Changeable-weather*.

Mists commonly are generated in the *Morning*, when a clear *Night* hath gone before, and when the *weather* is calm and free from the least *Blast* of *wind*. And if any one of these be wanting, either no *Mists* at all do arise, or if they do, they presently vanish.

The Reason is, because a *Mist* chiefly riseth from a *Vapour*, which breaks forth from the *surface* of the *Earth*, being raised by a gentle *heat*, from *Boggy places* and *Rivers*, especially if they run slowly. Wherefore if the *Heat* be over-great, it doth too much dilate the *Vapours*, and makes them fly upwards and vanish away. The extream sharpness of the *Winter coldness*, and great and violent *winds*, are also a hindrance to the production of *Mists*, because then the *Vapour* cannot be kept in by the ambient *Cold*, and the *Thickness* is lost, which is necessary to the constitution of a *Mist*. Moreover, a *Rainy* or *Cloudy Night*, hinders it, because the *Rain* extinguisheth that warmth which is necessary for the raising of *Exhalations*. Lastly, When a *Cloudy Night* hath gone before, no *Mist* will ascend; for seeing that no *Dew* falls at that time, there is no matter for the raising of *Vapours*; and therefore it is necessary in order to the forming of a *Mist* above the ground, that the *weather* be still and calm, that the *Earth* be warm, and that a fair *Night* hath gone before.

A *Mist* is dark and dusky, and deprives us of the *Light* of the *Sun*.

The Reason is, because a *Body* that consists of many *particles* so ranged, that the *Light*, by reason of the said parts lying one upon the top of another, is the less transmitted, the deeper it drives amongst these little *Bodies*; such a *Body* as this is, I say, tho' at first it be transparent, yet will at last, by this its swallowing up of the *Light*, become dark and dusky. For after this manner it is, that *beaten Glass*, *foaming Waves*, and a thick or close *Wood* become Dark or Dusky. And the same is the case with a *Mist*: For *water* attenuated into its least *particles*, which is a *Vapour*, and the *Matter* of a *Mist*, tho' with these its divided *particles* it be so tost up and down in the *Air*, that it scarcely hinders the strait course of the *Light*; yet when the said *particles* come together again, it constitutes some *Drops*, which tho' every one of them singly taken be transparent, do so receive the *Light*, that not so much as one of the *beams* is transmitted or passeth through the whole heap of them.

When

VIII. When a *Mist* having its parts united is carried downwards it threatens *Rain*; but if it be rarefied by degrees, and so ascend, it is a sign of fair *Weather*.

The Reason is, because when a *Mist* in an united *Body* is carried upwards into the *Air*, it joyns to its self many *particles* of *Dew*, which are scattered up and down the cold morning *Air*, which being soon after put into a motion by the least heat, are dissolved into *Rain*. Whence we observe that a *Mist* is often suddenly raised, whereas the *Sky* before was very clear, and promised nothing less than *Rain*. For the heat agitating more forceably the little *drops* whereof the *Mist* doth consist, makes many of them to run together, into such great *drops*, that the *Air* being no longer able to bear them up, they are forced to fall down in *Rain*.

IX. When 2 or more *Winds* meet one another in their course, then *Mists* are formed in the place of their meeting.

The Reason is, because these *Winds* drive many *vapors* together to that place, which being united do either form *Mists*, if the *Air* thereabouts be very cold; or else produce *Clouds*, if the neighbouring *Air* be not cold enough to condense them, and so the matter of these *Vapors* mounting up higher into the *Air*, is there by the coldness of the place coagulated into *Clouds*. Yea, sometimes such a vast quantity of *Vapors* is gathered together in those places where 2 or more *Winds* meet, that the *Winds* cannot pass for them, neither above, nor under them, and so are forced to move round them, by which means they form a great *Cloud* of the said *Misty matter*, which being pressed on all sides by the *Winds*, gets a round and smooth surface.

X. If a man be look'd upon through a *Mist*, he appears like a *Giant*: Whereas the *Sun* being beheld through it, appears much less.

The Reason is, because many *Rays* are refracted in those *drops*, whereof the *Mist* doth consist, which being gathered within the *Eye*, do dilate and extend the *Object*. But the *Sun* appears less, because the *Beams* proceeding from him, by reason of their great distance are dissipated, and do not all of them light upon the *Eye*; so that some of the lateral *Rays* are lost, which are wont chiefly to magnifie *Objects*.

CHAP. IV.

Of Rain.

I. *Drops* of *Rain* as they fall down do settle themselves into a Round or Globular figure.

Some suppose this to proceed from an innate instinct in things, whereby they endeavour to preserve themselves from destruction; and that therefore the *drops* of *water* reduce themselves into a round figure, the better to preserve themselves from the injury of the *Air*, or the action of any other *Body* coming in their way. But this is to attribute *Understanding* and *Will* unto insensible things. Say we rather that the *drops* of *water* become smooth and round, by means of the *Heavenly Globuli* which surround them, and thrust themselves within the *Pores* of them. And because the *Heavenly Globuli* have another moti-

on amongst the parts of the *water*, than in the ambient *Air*, and endeavour to move in right lines, thus it comes to pass, that those of them which wander in the *Air*, are less hindered in their motion, when the *drops* of the *water* they meet with are *Globular*, than if they were of any other figure. Wherefore if any part of them chance to be prominent and not comporting with a *Globular figure*, the *Heavenly Globuli* in their Career through the *Air*, do with greater force dash against these prominences, than against the other parts; and so drive them towards the *Center*. But if the said part chance by this force to be driven too near the *Center*, then the *Heavenly Globuli* that are within the drop, do with greater force, drive it from the *Center*, and by this means it is that all *drops* of *water* are formed into an exact *Spherical figure*.

Hence it is, that when *drops* touch one another they lose their roundness, and run together; for in the point where *drops* touch, the *Aethereal water* presseth them more weakly than in others, and doth not drive all the parts of them equally towards the *Center*, as it did before.

It happens sometimes in the *Summer*, and in still and calm *Weather*, accompanied with great and sultry *Heat*, that *Rain* falls, before any *Cloud* can be seen.

The Reason is, because the *Vapors*, which are then in great quantity in the *Air*, being prest upon by the *Winds* of other places, as appears by the calmness of the *Weather*, and the fultriness of the *Heat*, are turned into *drops* of *Rain*, which fall down as fast as they are formed in the *Air*.

In some *Countries* it never, or very seldom *Rains*, as in *Egypt*, and more especially the upper parts of it. And the same is also asserted by *PLUTARCH* concerning *Lybia*, and some *Countries* of *India*, which are always dry, and never refreshed with any *Moisture*.

I cannot conceive that this is to be ascribed to the over-great *Heat* that reigns in those *Countries*, seeing there be others that are much *Hotter*, where it doth *Rain*. Wherefore the cause of this want of *Rain*, may with greater probability be attributed to the *Dryness* of the *Earth*, and the disposition of its parts, that have no water hidden under them, which being turned into *Vapors* might produce *Rain*; or if there be any such *Moisture*, yet because of the over-close compactness of the *Earth*, the same cannot get out into the *Air*. For as *Dogs* do never sweat, because of the compactness of their *Skins*, which is such that they cannot make way for the *steams* to get through: So the ground of *Egypt* may be of such a close and compact texture, as not to have *Pores* large enough for the transmission of *Vapors*. Neither can the *Etesiae*, which blow from the *Mediterranean Sea* towards *Egypt* convey any *Clouds* thither, that might turn to *Rain*; for it is not probable, that *Vapors* can be carried so far by the force of *Winds*; and besides, these *Winds* are not continual, but altogether cease at the first approach of the *Night*.

Rains are more frequent in some *Countries* than in others, as in *Languedoc* in *France*, and in *Ireland*, &c.

II. Why Drops lose their roundness when they run together.

III. Why it rains sometimes in the Summer when no Clouds appear.

IV. Why it doth not rain in Egypt, and some other Countries.

V. Why Rains are more frequent in some Countries than they are in others.

The Reason is, because the Situation of these Countries is such, that the Clouds which proceed more abundantly from the Sea, than the Earth, being full loaden by that time they come there, are forced to fall to the ground. It is found by experience in Languedoc, that the Clouds that come from the West, where the Ocean is, and those which rise from the South, where the Mediterranean lies, are so loaden with Rain, the former when they arrive in the upper Languedoc, and the other in the lower, that they can pass no further without falling down: But yet so as that those Clouds that come from the Ocean, do seldom come to the lower Languedoc, nor those from the Mediterranean to the upper; whence it is that it seldom Rains, with a West or North-west Wind beyond Carcassone, in the way towards the lower Languedoc; as it very rarely Rains with a South Wind, or South-West, beyond the same City, towards the upper Languedoc. And forasmuch as the force of these 2 Winds is spent about this place, it cannot be otherwise but that the Clouds must there fall down into Rain, which is the very reason why the Rains are so abundant about that City.

VI. Between the Tropicks almost continual Rains fall from July to September.

The Reason is, because the Sun at that time doth extremely rarefie the Air that is in the Northern part of the World, which makes the Air that is in the South part, to drive that way, and in its passage takes along with it all the Vapors that arise from the Sea of Ethiopia and the East Indies, which are very copious, and being come between the Tropicks, where the Air is hotter than else where, they are forced to turn into many small drops, which falling down in Rain, abundantly moisten the Earth, and make the heat of those Countries the more supportable.

VII. It Rains sometimes Milk and Blood. Thus PLINY tells us in the 56 Chapter of his natural History, that it rained Milk when M. Acilius and C. Porcius were Consuls. And LIVY makes mention of a Bloody Rain in his 4 Decad. Book 9th which fell for 2 Days together, in the Yard of the Temple of Concord. And amongst our modern Authors GEMMA FRISIUS relates Libro 2. Cosmocrut. cap. 2. that in the County of Embden in East-Friesland it rained Blood one Night in that abundance, that for the space of 5 or 6 miles all the Herbs and Linnen Cloth, and all things else exposed to the Air, were changed into the colour of Blood.

GASSENDUS supposeth Milky Rain to be nothing else, but a Whitish water, made so by the mixture of some Particles of Lead, Sugar of Saturn, Saltpeter and Vinegar, which are proper to tinge water of a White colour. And that a Bloody colour'd Rain, proceeds from Vitriolick and Bituminous Steams, which impart a Red colour to the drops of Rain, as soon as they reach the ground. But it seems more probable, that these Rains are the product of Vapors, which proceed from places that abound with Red-Lead, or Ruddle: As Historians tell us, that Red Snow sometimes is seen to fall in Armenia, because of the Red-Lead wherewith that Country doth abound, or from places where much Blood hath been shed; or this Red colour may be occasioned by the extrem heat of

the Sun; as we see that the Urines of those who are sick of an Ague or Fever, look Red, and the water that is made to run through hot Ashes acquires the same colour.

Some are of Opinion that the Bloody spots which sometimes are seen upon Stones, do not proceed from any Rain of Blood, but are caused by Caterpillars which turn to Butter-flies, and upon the changing of their Skin, leave those Bloody spots behind them: Which they confirm by this, first, that these spots can scarcely be ever washt off with water; and in the next place, because they are never found on the tops of Houses, and very rarely in Towns, but frequently in the Country, and in those holes where Caterpillars commonly do nestle.

What some relate of a Silver Rain, is not so altogether improbable, that it should be rejected as fabulous; seeing it is possible for Quicksilver to be sublimed so high in the Air, as that afterwards it may fall down in drops again, which may very well by the common people be taken for Silver drops. And that this is the true cause of this kind of Rain, may be confirmed from what the Historian DION hath Recorded, that it rained Silver in the Reign of the Emperor Severus, which lighting upon pieces of Copper communicated the colour of Silver to them, which after 3 days time vanished again.

AVICENNA tells us, that a Calf fell down from Heaven to the Earth in a great Storm of Rain.

I do not think that AVICENNA ever supposed that this Calf could be produced in the Clouds, or that there is any matter in them proper for the generation of Animals: But only that the Calf might have been snatcht up with a Whirlwind, and cast down elsewhere with a shower of Rain. For the Fluid substance of Heaven is altogether unfit, for the forming of such Bodies; neither could a thing of that weight be kept up in the Clouds, but would fall down, before it was fully formed.

And we are to pass the same Judgment, concerning that Norway Mouse called Lemmar; for tho' it be supposed to come down out of the Clouds, yet OLAUS upon dissecting of one of them found some raw Herbs in its Stomack, which is a pregnant Argument, that it was never generated in the Air, but snatcht up from the ground by some strong Wind, and carried into Norway, as it is certain that Locusts are sometimes after this manner carried from one place to another.

There is nothing more common amongst both antient and modern Writers, than the Raining of Frogs, wherewith the Fields, Hills and Ways have been frequently after such a shower, covered and annoyed.

Tho' I dare not absolutely deny, but that Frogs may be generated in the Clouds; yet neither can I wholly assent to those, who do so confidently assert it. My reason is, because we never read of their falling upon the Tops of Houses, or into Rivers, but either in the high ways, or other places abounding with dust, and perhaps their Spawn, of which, upon the falling down of the Rain it is probable they are formed. This conjecture of mine is confirmed by ÆLIAN in his 2 Book of Animals Chap. 5. I remember, saith he,

VIII. What is the cause of those Bloody spots, that are sometimes seen upon Stones

XII. What is the cause of the Raining of Frogs.

he, that in my Journey from Naples towards Di-
caercia, it rained Frogs, that had their fore-
parts formed, so that they crept with their fore-
Legs, whilst the hind part of them was nothing,
but a muddy slime without form. Which is a
very pregnant Argument, that these Frogs were
formed out of a Seed in the said Dust, mingled
with the fallen drops of Rain, and that conse-
quently they had their rise not in the Clouds, but
on the Earth. Besides, when should the Air or
Clouds be furnished with matter, proper for the
generating of such vast multitudes of Frogs? Or
how could they be kept up in the Air without
falling down? Or why should they at last fall
down, before they were perfectly and fully for-
med? Wherefore it is most probable, that these
and all others that seem to come down from the
Clouds, are generated in manner as above said.
Thus we see, that after the over flowings of Ri-
vers many Insects do swarm in the Fields: And
that after Rain, a vast number of Snails are pro-
duced; so likewise Oysters and other Shell fish are
sometimes formed of the drops of Rain, mixing
with Mud or Slime.

XIII.
The Seed
of Frogs
may be
carried up
to the
Clouds.

XIV.
But it is
most pro-
bable that
they are
generated
on the
Earth.

XV.
The Sun
shining at
a time
when the
Heaven is
covered
with
Clouds, is
a great
sign of
Rain.

XVI.
Signs of
Rain taken
from ina-
nimate
things.

Except it be said that the Seeds of these Ani-
mals, being mingled with the Vapors or Winds,
may be sometimes carried up to the Clouds; as
they are at other times to Pools and other places,
abounding with Mud and Moisture. As we read
that Coals, standing Corn and other such like
things, have been carried away by the Wind into
other places, where falling down, the people con-
cluded that it rained Coals, Corn, &c.

But indeed it seems more probable, that these
Frogs were at first generated in Ditches or other
places, but that at first they are so little as not to
be perceptible by the Eye, they being for some
days after they are first hatcht very small without
Feet, and with a long Tail, without bearing the
least resemblance with Frogs; and do afterwards
by degrees get Feet, and lose their Tails. So
that hiding themselves under the Hedges, and un-
der the Grass, it is a difficult thing to discern them
from the Dust or Mud of the Ground; so that
the Rain serves only to bring them forth out of
their lurking Holes, and present them to our view.
And that this is so, we have the greater reason to
believe, because Food hath been found in their
Stomacks, and Excrements in their Guts. So
that we may well conclude, that these Frogs are
not then formed, but only do then first appear,
tho' they were long before.

The Sky covered with Clouds, is a sign of Rain,
tho' the Sun may shine very clear in the East.

The Reason is, because there are no other Clouds
in the Neighbourhood of our Air towards the
East, which might hinder the Heat of the Sun,
from condensing those that hang over our heads,
or raise new Vapors from the Earth, whereby
the said Clouds might be encreased. But this
cause taking place only in the Morning, if it
doth not Rain before Noon, it can be no sign of
what will happen in the Evening.

Other signs of approaching Rain are these; the
Sun shining bright early in the Morning, or ap-
pearing of a Blewish colour; for this is a token,
that there is great store of Vapors in the Air. So
likewise when the Moon appears of a Pale colour,
it is a forerunner of Rain: And when the Stars

seem to twinkle more than ordinary. Yellow
Clouds also near the rising of the Sun, are a
prognostick of Wet-weather; but the same colour'd
Clouds in the Evening, do promise Fair-weather
the next day. For the Vapors at Sun-rising are
carried upwards, and are resolved into Rain.

From other inanimate things and Animals, Prog-
nosticks may be taken of the changes of Wea-
ther; for the subtil Vapor which is diffused in
the Air, enters into the Pores of their Bodies.
Hence it is that Doors creak, that Wood laid upon
the Fire crackles. And as for Animals, Kine lift up
their Heads towards Heaven, Gnats and Flies sting
more violently, Hogs pick straws, Earth worms
creep forth out of the Earth, Pismires retire to
their hillocks, Leeches swim on the top of the
Water, because they then lye in wait for Flies
and other Insects, which the steams or winds do
bear down toward the Earth. Frogs croak more
frequently, because they delight in a moist Air;
or because they are more prest upon by the lower-
ing Clouds.

The drops of Rain are commonly greater in the
Summer, than in the Winter.

The Reason is, because the drops in the
Summer, do fall down from a much higher
place, and having a long tract to pass through
the Air, they grow bigger in their passage. For
Rain falls from the Clouds 2 several ways, either
when the lower Air by giving way, or the up-
per Air by falling upon the Clouds, doth give
them occasion to fall down. Wherefore when the
Air that is under a Cloud doth contract it self, then
a small Rain like dust falls down upon the ground.
So in Egypt no Rain is known, but what falls
down in very small drops. But thick Rain and
violent Showers happen when a Cloud descends
being born down by the Air that is above it; for
then the drops of Water falling down from a great
height, do meet with other particles of water,
and joyning with them become greater than they
were before.

CHAP. V.

Of Hail and Snow.

HAIL falls more generally in the day
than at night, and oftner in the Spring,
Summer and Autumn, than in the Winter.

The Reason is, because a Cloud cannot be mel-
ted but by Heat, and therefore it is that Hail falls
only at that time, when there is sufficient Heat to
produce this effect. Wherefore tho' Hail may be
generated in the Winter, Spring, Summer and
Autumn, and in the night, as well as in the day;
yet does it fall more seldome in the night, and in
Winter, because then the Heat is too weak to be re-
flected up to the higher Clouds, so as to dissolve
them into drops of water of which Hail is
made.

Small Hailstones are sometimes Transparent;
whereas the greater are only so towards the Sur-
face, having some Snow within them, and are of
a white colour.

The Transparency of Hail proceeds from the
coldness of the Wind, which freezeth the drops
of water into Ice. Because in this case, the Pores
remain much the same as they were before in the
water,

water, through which the Globuli of the 2d Element passing without hindrance, transmitted the action of Light every way in Right lines: As was said before concerning Glass. But when the cold Wind approacheth the Flocks of Snow, that are not quite melted, it drives the Heat, that is, the most swiftly agitated subtil matter into their Pores; because the Wind it self, cannot so easily or so swiftly enter them as the Heat or subtil matter that is in the Air can. Now when this Heat is thus shut up within the Pores of these Flocks of Snow, it endeavours to approach their Circumference, rather than their Centers, because the subtil matter (in the agitation whereof Heat consists) is more freely moved there, and so proceeds to melt them more and more, before they begin to Freeze again, and the most Fluid, that is, the most agitated particles of water, which are else where found in the said Flocks, approach to their Circumferences; the rest of them, which cannot melt so suddainly, abiding about the Centers of them. Which is the reason, why the greater Hailstones are Transparent towards their Surface, and inwardly of a white colour.

III.
What is
the reason
of the un-
usual great-
ness of some
Hailstones.

Sometimes Hail equal in bigness to great Stones falls down from Heaven. And I have heard an acquaintance of mine relate, that he had seen Hailstones as big as ten Eggs. And Historians relate of some that were no less than a mans Fist. In the year 1666, in Gelderland, some were seen of about 3 pound weight.

This bigness proceeds from the Cold Wind, by which the Hail is formed, which driving the Snow downwards from on high, drives many of the Flocks of it together, and by means of the Cold condenseth them into one Mass. Or else we may say, that such great Hailstones are generated in the highest Clouds, and that they encrease continually all the way they come down, and by this means grow into a great and extraordinary bulk. For it may so happen, that they may meet in their way with much moisture, which sticking to them, may be Frozen into one Mass with them. And by this means the Hail is encreased, by the addition of new Surfaces or Coats: As we find that Candles by repeated dipping into the melted grease, do still grow thicker.

IV.
Why Hail-
stones are
of different
figures.

Hailstones are sometimes of a Spherical figure, and at other times appear under various configurations.

The Reason is, because the Flocks out of which the Hailstones are formed, being seized of the Cold Wind, are congealed by it. For if the Cold Wind, that is the efficient of Hail, meets with drops of water already formed, it makes the Hailstones round, save only that it frequently makes them somewhat flattish on that side, where it drives against them. But if it meets with Flocks of Snow that are not quite melted, then it frames them into irregular figures.

V.
What is
the reason
of the great
noise that
is heard
before the
fall of
Hail.

Commonly before the Hail comes down, a great noise is heard in the Air.

This is caused when the frozen drops dash against one another. And when this noise is heard some interval before the Hail falls, it is an Argument that the said Hail is formed in the upper parts of the Air; so that there is no necessity at all in this case, to have recourse to an Antiperistasis.

We find by experience, that the Snow whereof the Clouds do consist, becomes condensed, and reduced to a less extension.

To apprehend this well, we need only to consider that the Heat which commonly rarefies most Bodies, doth commonly condense Snow, the parts whereof are so scatter'd and divided, that the very least agitation is sufficient to bring them nearer together. Whence it comes to pass, that when the Air which is so near to the Earth, and is always hotter than that which is at a greater distance from it, begins to raise it self towards the Clouds, either by the driving of some Wind, or by the action of some new Fermentation, which causeth it to swell, it cannot but condense the Snow, whereof the Clouds do consist.

The particles of Snow are commonly figured like Stars, as may be perceived by catching the Flocks of Snow on a dry Cloth, and separating the parts of it from one another: Tho' sometimes also they be found Hairy, and sometimes in the figure of Roses.

The reason of this various Configuration is, because the Flocks of Snow, before that they fall to the ground, do undergo manifold changes in the Air, and according to the vicissitudes of Heat and Cold partake of different figures. Starry figured Snow is formed, when the Leaves of it, as the Heat approacheth, are melted leisurely, so that the Liquor into which they are dissolved spreading it self over the Surfaces of the Leaves, doth fill up all the little inequalities it meets with there; and makes them so smooth and even, as those parts of the Liquid Bodies are, tho' it presently after freezeth there again. For seeing that the Heat then is no stronger, than what is required to resolve those small Capillaments, on all sides surrounded with Air, into water, the others still remaining whole and entire; it cannot be strong enough, to hinder that small quantity of water, that is fallen upon their Icy surfaces, from being congealed again by Cold. Afterwards this Heat passing through other Capillaments, which every one of the Flocks of Snow have in their Circumference, where they are surrounded with 6 other such like Capillaments, doth promiscuously bend this way and that way those Capillaments which are at the furthest distance from the 6 nearest Globuli, and by this means joyns them to those which stand over against these 6 Globuli. For these being kept Cold by the neighbourhood of the said 6 Globuli, do not melt, but on the contrary do immediately Freeze or turn to Ice, the matter of the others that are joyned to them; and by this means 6 Points or Rays are formed about every one of the said Flocks, which are capable of receiving divers figures, according as they are more or less compressed, the Capillaments thick and long, and the Heat which forms them slow and moderate. Again, Hairy Snow is generated, when the Icy particles whereof the Flocks do consist, are condensed by the Heat, and soon after being Frozen by the Cold, are turned about their Center, and are bound up by other Icy fragments. So likewise Snow formed in the figure of Roses is produced when the Rays that shoot out from the Snow, are bended by the Heat, and falling together with their points, are in that manner congealed again.

VI.
How the
Snow comes
to be con-
densed.

VII.
What is
the reason
of Starry,
Rose-like
and Hairy
Snow.

The

VIII. The *Night*, which renders most other *Bodies* invisible, hath not that effect upon *Snow*.

The Reason is, because *Snow* consisting of an infinite quantity of little round *Bodies*, doth reflect the *Rays* of *Light* better than any other *white Body*. For tho' in the *Night* there be but a very weak and scatter'd *Light* spread over the *Earth*; yet there is that in *Snow*, which by a stronger Reflexion of it, doth make it self visible.

IX. An extraordinary *whiteness* is proper to *Snow*, which yet it loseth, when mixed with *water*, and returns to *water*, whence it proceeded at first.

The Reason is, because *Snow* is like a *Vapour* turn'd into *Froth*, the Flocks whereof consisting of innumerable *Globuli*, reflect the *Light* every way; forasmuch as there is never a Point in all those *Globuli*, from which *Rays* are not reflected to every Point of the *Medium*. And this is the Reason why *Snow* is hurtful to the *Eye-sight*, because that by reason of the foresaid *Globuli*, it darts forth on all sides a fuller and stronger *light*. Hence it is, that when we come into a *House*, after we have walked through *Fields* cover'd with *Snow*, we cannot well discern the *Objects* we meet with. It is also found by Experience, that those who live in places that abound with *Snow*, have weak *Eyes*; and some tell us, That *Souldiers*, by long *Marches* through places cover'd with *Snow*, have lost their *Sight*.

X. But if the new fallen *Snow* seems to be of a blackish Colour, the Reason is, because some Cavities are interspersed between the flocks, which swallow up the *Rays*, and do not rebound them back into the *Air*. But *Snow* wholly changeth its colour, when mingled with *water*, which filling up the Cavities of the *Snow*, hinders the Reflexion or Refraction of the *Rays*, and causeth the *Light* to be modified after another manner. Hence it is that the *white Colour* of some *Fruits*, is only owing to the parts of it that are formed into *Bubbles*: For we see that *Apples*, when squeezed, lose their Colour, because these *Bubbles* being broken by this compression, hinders that Refraction which is necessary to constitute a *white Colour*, as likewise such a copious reflexion of *Rays*, as is requisite to that purpose.

XI. Upon the handling of *Snow*, we find our *Hands* soon after to glow and burn.

Some suppose this to be done by an *Antiperistasis*, because when the *Cold* is driven out, *Heat* is introduc'd. But we own no such Contrariety in *Nature*, and therefore rather conclude, that this *Heat* proceeds from the *Frozen particles* of *Snow*, which having the watry humour for their *Vehicle*, do enter into the pores of the *Hand*, beat back the *Blood*, and hinder it from being disperfed through the *Veins* in the *Hands*; by which means the *Hands* swell, and appear of a red Colour. And therefore if we chance to put them to the *Fire*, we are sensible of a very sharp pricking and shooting pain; for the *Fire* being forceably thrust into their pores, doth dilate the *Icy particles* more than ordinary, and doth not drive them thence, without some twitching of the parts. Wherefore we ought to keep our *Hands* in a moderate warmth, to grow hot by degrees, and so be restored to their former condition.

Snow, tho' it be a *Frozen-water*, yet doth warm the *Earth*, and keeps the *Corn* from freezing.

The Reason is, because the pores of *Corn*, that is cover'd with *Snow*, having been drawn together by the fore-going *Frost*, and the Matter of the 2d Element, endeavouring to enter through them, as soon as it begins to thaw, would not fail of rending the Texture of its parts, if it were not hindered by the presence of the *Snow*, which having nothing in its pores, besides the most subtil matter of the 2d Element, can easily open again the pores of the *Wheat* by degrees, without tearing them, till they be open'd large enough to let the biggest Matter of the 2d Element pass through them.

Snow doth also contribute to the making of the *Ground* fruitful, if it lye on for some time, and be dissolved by degrees.

The Reason is, because when *Snow* covers the *Ground*, it keeps in the *Alimental Juice* of *Plants*, and hinders the strength of the *Ground* from evaporating into *Steams* and *Exhalations*. And therefore *Countrymen* tell us, that their *Grounds* yield a more abundant Increase, after they have been a long time cover'd with *Snow*, because it keeps back those fat *Exhalations*, which would otherwise break forth, and turns them into *Aliment* for the *Fruits* of the *Earth*. Or, it may be said, that the *Snow* melting by degrees, doth afford a fat and cherishing *Moisture* to the *Plants*, whereby they are fed, and become more vigorous. As is manifest when the *Snow* is thaw'd, and the *Earth* expos'd again to the heat of the *Sun*; and therefore it frequently happens, that in those *Mountains* that are cover'd with *Snow*, the *Exhalations* that break forth, do make a kind of *Arch* or *Crust*, under which the *Grass* springs forth very thick.

I know well, that some *Physicians* are of another Opinion, who order *Gardiners*, to cover the surface of the *Ground*, in which *Plants* are set, with *Stubble* or *Straw*, to preserve it from the injury of the *Snow*: But I suppose they do not give these Instructions, because they suppose the *Snow* to be prejudicial thereunto; but lest the *Roots* being thoroughly moistned by the thawing of the *Snow*, a sharp *Cold* or *Frost* following upon it, might freeze the *Juice* within their pores; since it is evident, that the *Roots* of *Plants* thoroughly soak'd therewith, do presently dye; nothing being more hurtful to *Plants*, than melted *Ice* or *Snow*, to chil and kill the *Roots* after a cold Thaw.

CHAP. VI.

Of the Dew, Hoar-frost, Honey and Manna.

The Dew is observed to be more copious in moist and moorish Places, than in dry. Hence it is that the Banks of Rivers are commonly cover'd with Dew, when in dry and barren places there is no appearance of it.

The Reason hereof is commonly ascribed to the Vapours which mount up from the Earth in great abundance, about the Banks of Rivers, and being

XII. *Snow* preserves the *Corn* in the *Ground* from being frozen.

XIII. How *Snow* conduceth to make the *Ground* fruitful.

XIV. How *Snow* may be hurtful to the *Roots* of *Plants*.

I. Why the Dew is more copious in moist, than in dry places.

raised a little way up into the *Air*, do fall down to the same place whence first they broke forth. But I cannot altogether concur with this Opinion; forasmuch as the highest *Mountains* are in the *Summer* moistened with *Dew*, and in the *Winter* cover'd with *Hoar-frost*. For *Vapours* are not only condensed near the *Earth*, but also on high in the *Air*. For those which are carried up a great height by the *Sun's* force, are afterwards by the cold of the *Night* condensed and turned to *Dew*. And whereas *Shoars* are more abundantly cover'd with moisture at Break-of-Day, than other more dry places; the Reason is, because the dry *Earth* drinks up the Drops of *Dew* as fast as they come down upon it, and does not suffer them to be condensed on the surface of the *Ground*. But *Shoars*, or the *Banks* of *Rivers* being, as it were, glutted with moisture, do not take in the *Dew*, but leave it on the surface. Thus the drops of *Dew* run together upon *Cabbage-Leaves*, because their surface is somewhat fat and oily; but are immediately drunk up, when they light upon *Sand*.

II.
Why the
Dew is
more copious
in the
Spring and
Autumn,
than at
other times.

The *Dew* is observed to fall more copiously in the *Spring* and *Autumn*, than in the *Winter* or *Summer*.

The Reason is, because in the 2 former Seasons, the heat of the *Sun* is strong enough to raise *Vapours*, and the cold of the *Night* sufficient to condense them; whereas in the *Winter*, the *Plants* being depriv'd of their *Leaves*, are no longer able to turn the *Vapours* that light upon them, into little drops: And the heat is so violent in the *Summer*, that the *Vapours* can't be sufficiently condensed, by the cold of the *Night*, to fall down again into small drops.

III.
Why the
Drops of
Dew are
round.

The drops of *Dew* are Round, or at least resemble the figure of an *Hemisphere*.

The Reason is, the motion of the particles of the 2d Element, which equally pushing upon all the parts of the drops of *Dew*, makes them to be equally distant from the Center. For as the water of a *River* running freely through the *Herbs* it meets with in its course, is so diverted by the *Stones* that interrupt its Current, that re-bounding upon it self, it makes several little *Whirl pools*: So the Globuli of the 2d Element, freely flowing through the *Earthy* parts wherewith they are interrupted, their fluid parts are so diverted by the *Air* that meets them, that turning into a Round drop, they drive the *Terrestrial* parts of the said Drop, with an equal force towards the Center. For then any liquid Body becomes round, when all the parts of the Circumference of that Body, being driven with equal force, are at an equal distance from the Center of that Body.

IV.
When no
Dew is
found upon
the Ground
in the
Morning,
it is a sign
of Rain.

If in the Morning the *Ground* be not sprinkled with the *Dew*; and that the *Mist* which is wont to moisten the *Earth*, is carried upwards, and leaves the *Earth* wholly dry, this is a sign of *Rain*.

The Reason is, because this can scarce happen, but when the *Earth* hath not been sufficiently cooled in the *Night*, or over-heated in the *Morning*, and therefore sends forth many *Vapours*, which driving the *Mist* upwards, cause the Drops of it to run together, and by this means become so thick and heavy, that soon after they are forc'd to fall down in *Rain*.

The *Hoar-Frost* is observed to make some *Herbs* more tender, as *Coleworts*, and the like; which being in *Winter* expos'd to the *Air*, become more short and tender.

V.
Why the
Hoar-frost
makes some
Herbs more
tender.

The Reason is, because the supervening Cold doth constringe, and, as it were, draw together those *Herbs*, and by bringing together their particles nearer to one another, doth quite change the order and situation of them. So as that having already undergone this preparatory Alteration, when the *Culinary* fire begins to act upon them, their Texture is easily broken, and their *Fibres* being before lessened, and in part dissolved, are wholly separated from one another. Thus *Flesh*, expos'd to the cold of the *Night*, becomes also more tender, because the parts of it being more closely joyned and drawn together by the cold are afterwards slackned by the heat, and more readily comply with its motions.

The parts of *Hoar-Frost* stick together, the contrary of which we Experience in *Hail*; which is distinguish'd into several *Stones*, which have no Connexion at all together.

VI.
Why the
parts of
Hoar-frost
hang together.

The Reason is, because *Hail* stones falling from on-high, as soon as they are come to the inward Tract of the *Air*, because of the great heat they meet with there, their outsides begin to melt, and lose their prominent particles, which make them rough; but the case is not so with the *Hoar-Frost*, which always retains its sharp-pointed protuberances; and therefore the particles, by reason of this their Roughness, are easily entangled and cling together. To which may be added, That the *Hoar-frost* consists of a more viscid or clammy substance, than *Hail*; because the *Rain*, whereof *Hail* is made, is meer *Water*, which presently mounts up into the *Air*: Whereas the *Hoar-frost* is a kind of condensed *Dew*, which is much fatter than the *Rain*, as being made up of diverse particles, proceeding from *Animals*, *Plants*, and *Things* dug out of the *Ground*. Now it is manifest, that a moisture that is extracted from such great variety of Bodies, must needs be more clammy, than a pure watry Humour; which is the reason why the parts of *Hoar-frost* cling together, whereas *Hail-stones* are all several.

Those who give their minds to *Husbandry*, and more diligently search into the Miracles of *Nature*, observe that *Bees* do in a very short time make *Honey*, and fill their *Hives*. Some, who have been very exact Observers of the Labour of *Bees*, have observed, that the *Bee-Hives* are sometimes quite Empty in the beginning of *May*, and within a short time after have found them fill'd up with *Honey*.

VII.
How Honey
is made by
Bees.

It is not yet certainly known, whether the *Bees* draw that Juice out of *Flowers*, which of it self is presently turned into *Honey*; or whether they themselves, by an inborn Natural property, do transmute the said Juice into such a Taste, and other Qualities, as constitute *Honey*. Some are of Opinion, that *Bees* have not the Faculty to make *Honey*, but only the skill of gathering it. Whereas others suppose them endued with a Virtue or Faculty, whereby they turn the Juice they suck from *Flowers* into *Honey*. And I readily agree with those that are of this latter Opinion; for I find that *Animals* transmute the residue of their Aliment into *Milk*, in their *Breasts*, whereby it becomes changed

To the Worship- full Francis
 Gosfright of the City of London Esq^r
 This Plate is humbly Dedicated by Richard Blome.

changed into a new kind of Substance. And why may not the Bees, in the same manner, after that their Bodies have been nourished with some part of the Aliment, transmute the Remainder of it into Honey, which they daily hoard up in their Hives. It is a difficult thing to find by Experience, whether they cast up the Juice, which they draw from Flowers, through their Mouths, or evacuate it from any other part; tho' it seem more consonant to Reason, that they evacuate it backwards, especially if it be elaborated in their Stomachs. Neither doth it hinder the Truth of this Assertion, that Bees very greedily lick up the Honey they meet with in any place, and leaving their Flowers, betake themselves to it; because they desire it as their proper Food, wherewith they are sustained, and which, when they have lick'd in, they do convert again into other Honey. As Women that give Suck to Children, do also take in Milk for their Nourishment, and after it hath been digested in their Stomachs, do in their Breasts, turn it into a new sort of Milk.

VIII.
Why Honey is not gather'd in all places.

Tho' Honey be made of Dew, yet is it not gather'd either by Bees, or Men, from Plants, in all places.

The Reason is, because these Exhalations do not every where meet with such a disposition, as is proper to retain them; for seeing that the most clammy and Earthy particles of the Dew, are the chief Matter of Honey, and that these can only be gather'd in dry places, we cannot think it strange, that these are not found on the moist Leaves of some Plants. Hence it is that Bees do not gather their Honey very Early in the Morning, but after that the watry Vapours have been dispersed by the heat of the Sun.

IX.
What is the Reason of the difference of Manna in several Countries.

Manna is very different, according to the Countries where it falls, and is only gather'd from the Leaves of some certain sort of Trees. PLINY's Opinion is, that it is most commonly coagulated upon Oaks or Lime-Trees. In Calabria, it is chiefly found on Ash-Trees, and in Syria, on Cedars.

The Reason is, because Manna is only coagulated on the Leaves of Trees, which contribute much to its consistence and hardness. For seeing that Manna only consists of Exhalations, its particles are of such figures, that they cannot so well stick close to the Leaves of other Trees. And therefore the Lord BACON tells us, that the Country of Calabria affords the best Manna, and in the greatest plenty; for he supposes, that there is a kind of Coagulating virtue in the Leaves of Mulberry-Trees, on which it is commonly gather'd, whereby the Dew is thickned. Which Virtue he is the rather inclin'd to attribute to the Mulberry-Leaves, because they are rough and hairy, and therefore very proper to retain a Liquor that lights upon them. But yet this Juice must not be confounded with Honey, forasmuch as it is of a different Nature, and different Efficacy: For Honey doth stimulate and increase Gall, whereas Manna drives it out of the Body; for the Nitrous Salt, which Manna is not destitute of, doth provoke Nature to evacuate by Siege:

CHAP. VII.

Of Storms and Thunder.

The same Storms rage more violently on the Sea, than on the Land.

The Reason is, because the Vapours that are sublimed from the Waters, are more moist and gross, than those that breath forth from the Earth, and that proceed from dry Bodies. Hence it is that those Steams carrying more Air and Exhalations along with them, do furnish Matter for the strongest Winds. And for the same Reason it is, that Winds in all places are not endued with the same Qualities; but those which are dry in one Country, may be moist in another. Thus it is observed, that South-winds, which generally in all places are moist, yet are dry in Egypt, where the dry Deserts of Africa, parch'd with heat, and destitute of all moisture, supply the Matter of them.

Swallows, upon the approach of a Storm, fly near the Earth.

The Reason is, because the Clouds which then fall lower, and press down the intervening Bodies with their weight, drive the Flier, which Swallows feed upon towards the Earth, which in Fair-weather are wont to fly aloft in the Air.

The Sea doth never Rage more dangerously, than in those Storms which are called by the Portuguese, Travados, these of all other being most formidable to Sea-men.

These Tempestuous Gusts are chiefly perceived beyond the Cape of Good-Hope, because there, the Vapours, which in great quantity are raised from the Sea of Ethiopia (as being of a vast extent, and exposed to the greatest heats of the Sun,) can easily produce a West-wind, and stop the violence of those Vapours, which proceed from the Indian-Sea that is opposite to it; and by this means drive them together into a Cloud. Which Cloud, since it riseth from the Inequality that is interposed between those two great Seas, and this Tract of Earth, which is also of a vast breadth, must of necessity be of a greater bulk, than that which is formed in our Regions, where it depends only on those lesser Inequalities, which divide our Champion Countries, and separate Lakes and Mountains: So that this high Cloud, having acquir'd a great weight, doth fall down all together, and driving the Air before it, raiseth a great Tempest, which commonly is so much the more vehement, the lesser the Cloud did appear at first; because it is supposed to be very high, and at a greater distance from the Earth. Now it is evident, that the force of a Ponderous Body, is by so much the stronger, by how much higher the place is whence it descends, and the greater the Space is it runs through.

These Storms are frequent about the Equator, especially in those Months in which constant Winds are less frequent. They are very common upon the Coast of Guinea, and at the first their Force is very violent, and by the help of them Sea-men often pass the Line, forasmuch as the settled Winds are now and then wanting in the Months of April, May and June, and also at other times. Wonderful Storms of this kind do also happen in the Entrance

I.
Storms as Sea are more violent than about the Shore.

II.
Why Swallows, upon the approach of a Storm or Tempest, fly near the Earth.

III.
What is the reason of those dreadful Storms called Travados.

IV.
In what Places these Tempests are most frequent.

trance of the Sea of Arabia, when a thick and black Cloud, mixed with a number of Flame-colour'd little Clouds, like a Burning-Furnace, vomiting thick Smoak, darkens the Day, whereupon a sudden and most vehement (but not long lasting) Storm ariseth, which casts down a great quantity of red Sand upon the Land and Sea.

V. Where proceeds that boiling of the Waters, which is observed in the Gulf of Lions, and in the Garonne.

In the Gulf of Lions the Waters are sometimes as much agitated, as in the most violent Storms, tho' the Air be very calm.

This extraordinary Agitation proceeds from those Vapours, which penetrate quite through the Waters. For it cannot be question'd, but that there is an inward Heat at work under the Sea, besides that of the Sun, which loosens, or sets at liberty a vast number of Vapours and Exhalations, which proceed with extraordinary precipitancy, and in great abundance from the said Gulf of Lions. And from the same Cause we may deduce the Boiling or Agitation that is observed in the River Garonne in France, near to Bourdeaux, which is an infallible prognostick of a certain Wind called Mascaret; and conclude it to be produc'd by Vapours or Exhalations, which ferment or work successively from Bourdeaux, towards the Head of the River; as that Ebullition which is observed in the Gulf of Lions, is caused by the Vapours and Exhalations, which in that part mount up in great abundance through the Sea.

VI. What is the Cause of those Hurricans that happen about the Caribby Isles.

Hurricans are very frequent in some of the Caribby Islands.

The Reason is, because many sulphurous and Nitrous Exhalations are sublimed from divers parts of the Earth, that lies below that Sea, which do agitate the Waters with that extream Violence. Whereof this is a pregnant Instance, That after every Hurrican, a vast number of Fishes are found dead; which shews, that the Waters have been violently dash'd together, not only on the surface of the Sea, but at the bottom also.

VII. Of Castor and Pollux, and why they are accounted to be signs of a happy Voyage by Sea-men.

It sometimes happens in great Storms, that certain Meteors, in the appearance of Fire, fix themselves on the Tops of Masts, which are called by Sea-men Castor and Pollux, if there be two of them; but if only one appears, it is called Helen. The former being look'd upon to be a happy Omen; but the latter, unhappy, as portending an increase of the Storm.

These Fires are produc'd by Exhalations, which are mix'd with Vapours, that compose a Cloud; which, forasmuch as by reason of the solidity of their parts, and their irregular figures, they cannot be pusht forwards by the falling Cloud, with the same force as the Vapours are, by the motion of the Air, are separated from them: And accordingly these Exhalations being united into several Curles, flying as high as they can along with the Cloud, meeting with Ships in their way, stick to the Masts, or to the Tackle; the Cloud in approaching to the end of its motion, driving them down thither. And the Reason why two of these Fires are a sign of better Hope, is, because Storms are commonly more violent towards their going off; and therefore when these Fires are more than one, the Tempests are broken, and many Clouds lying one upon the top of another, are in a short time dispersed. But when a single Fire appears, a greater Storm is to be look'd for, because there may be many other Clouds remaining, which fall-

ling down, may with renewed Violence dash the Waves together.

Thunder is much more frequent in Summer than Winter.

VIII.

Why Thunder is more frequent in Summer, than Winter.

The Reason is, because Thunder is caused after the same manner as Storms are, viz. by the falling of Clouds one upon another, that is, when the higher Clouds rushing down violently upon the lower, do produce that Noise in the Air; we call Thunder. Now this could not happen, if a warm Air surrounding the Upper Clouds, did not by degrees condense them, and make them more heavy. And seeing that in the Winter, a heat sufficient to melt the Upper Clouds cannot get up so high, it is evident that Thunder, for this Reason, must be more frequent in Summer.

The Noise caused by Thunder is very different; and doth not always strike our Sense of Hearing alike; for sometimes it represents a continual Rumbling, and at other times the repeated Discharges of Great Guns.

IX.

What is the Reason of the different Noise made by Thunder.

The continued Noise is to be ascribed to the various Reflexion of Bodies, and the Resounding of the ambient Air. For as the Noise caus'd by the Discharge of a Great Gun, is heard with a continued noise or rumbling, because of the Hills, Buildings, and other things, that beat back the Sound: So the rumbling Noise of Thunder is continued the longer, because of the Air that every way surrounds it, and the Bodies that are so disposed to reverberate it. And whereas Thunder sometimes gives different and interrupted Claps, the Reason is, because the parts of the higher Clouds, do either all of them fall down together, or one after another; or more slowly or swiftly; or, for that the lower Clouds are greater or less, thicker or thinner, and so make more or less Resistance.

After a great Shower of Rain commonly the Thunder ceaseth.

X.

Why Thunder commonly ceaseth after a great Shower of Rain.

The Reason is, because the Upper Cloud falling upon the Lower, is of such force as to cast it wholly down; and tho' perhaps it be not of force enough to drive it down altogether, yet it shakes out some flocks of Snow, which passing through the warmth of the lower Region of the Air, are turned into Rain. And it is for the same Reason, that Men endeavour to abate the violence of Thunder by the discharging of Guns; for the Snow being shaken by the agitation of the Air, is disscut, and forced to descend.

But we are here to observe, that tho' the Discharging of our Great Guns be useful to dispel Thunder, when the Clouds are somewhat remote from the places where the said Noises are made; yet is the effect quite contrary, when the Clouds are directly over against those places.

XI.

Why a great Noise dissipates Thunder.

The Reason is, because when the Clouds that carry the Thunder, are at some considerable distance, the agitation of the Air, caused by the Sound is capable to disperse them, or at least to oppose their approach; but when they are just over against the places where the Guns are discharged, the Air being shaken by their Sound, and dashing against the lower part of the Clouds, weakens them, and so determines them to break at the bottom, and to let the Lightning escape.

XII. The *Lightning* is much more swift than *Thunder*, and therefore is always seen before the other is heard, tho' indeed the *Thunder* is ever before the *Lightning*.

The Reason is, because the *Sight* is performed by the help of the *Heavenly Globuli*; which being solid, and not capable of any division, do neither waver nor turn aside: Whereas the *Hearing* is performed by the *Tremulous Agitation* of the *Air*, whose particles being very flexible, and separated from one another, do bend upon themselves and waver, not having the direct steadiness of the *Globuli* of the *Second Element*.

XIII. The *Noise* and *Concussion* of the *Air*, caused by *Thunder*, makes *Wine* and other fermented *Liquors* to be troubled, and change their former *Qualities*.

The Reason is, because *Fluid Bodies* are not moved of themselves, but receive their agitation from the intercurrent *subtil matter*, wherefore also their motion must necessarily be proportionate to the Agitation of the said *Aethereal Matter*. And forasmuch as when the *Aether* is shaken with *Thunder*, the matter that is intercepted between the *Pores* of it, is very much dissipated, and put into irregular motions; thereupon the particles of the *Liquor* are also variously tost and bent, and by this means do introduce a confusion in it. Thus *Physicians* also observe, that tho' the *Blood* be not changed at all as to its outward appearance, yet it contracts a malignant *poisonous quality*; or on a sudden causeth a *Fever*, and this merely from the disturbed motion of the *subtil matter*, which in a confused manner agitates the whole mass of *Blood*.

CHAP. VIII.

Of Lightning and Thunder-Bolts.

I. *High Places* are more frequently struck with *Lightning*, than low and level *Grounds*. Hence it is that *Mountains* feel more its effects than *Valleys*; and that the tallest *Trees* are most obnoxious to be hurt by it.

The Reason is, because *Lightning* consists of kindled *Exhalations*; which because of their loose *Texture* and volatility, are distinguished from *Vapours*, and therefore rushing down towards the *Earth*, must rather strike the tops of *Steeple*s and *Mountains*, than lower places. For the *Lightning*, upon the breaking of a *Cloud*, doth commonly dart forth from that part of it, which is most weak, and least able to resist the force of it: And seeing that *Steeple*s, *Rocks*, *Mountains* and other *Eminences* do most of all oppose it, therefore the *Clouds* are most easily broken by meeting with such like *Bodies*, and consequently also discharge their force and violence against them.

II. Things that are struck with *Lightning*, do tremble before they are smitten, being shaken by the *Wind*.

The Reason is, because when ever this *Fiery Exhalation* is darted from any *Cloud*, at the same time a great quantity of the *Air* that lies between the *Clouds*, is pushed away together with it: Which *Air*, as the *Forerunner* of the *Lightning*, shakes high *Steeple*s, lofty *Mountains* and tall *Trees*, as being nearer to it, before the *Lightning* can reach them.

Sometimes there is a *Stone* generated by the *Lightning*, which is discharged together with it from the *Clouds*, which is commonly called the *Thunder-Bolt*; because it breaks all *Bodies* it meets with, and casts them down.

This happens when many *Fat* and *Sulphureous Exhalations*, consisting of thick and dreggy parts, and like unto the setting of those *Vessels* wherein *Rain-water* hath stood for some considerable time, are joined with those that form the *Lightning*. For as Experience informs us, that if we mix a certain proportion of *Saltpetre* and *Brimstone* with this *Earth* or *Mud*; and then set this mixture on fire, it will in a moment be turned into a hard *Stone*: So in like manner we may conclude, that a *Thunder-Bolt* is generated of clammy and *Terrestrial Exhalations*, mingled with *Brimstone*, which it may meet with, either in the *Cloud* it self, or in its descent through the *Air*. Wherefore sometimes not only *Stones* are thus hurled down together with the *Lightning*, but also *Iron*, and other metals: *AGRICOLA* tells us, lib. 5. de *Ortu Subterraneorum*, that when it lightens in *Persia*, pieces of *Brass* fall down, which will not melt in the hottest *Furnaces*, but the moisture of them is turned into *Smoke*, and the rest of the *Body* into *Ashes*.

But for all this, some think there is reason enough for us to look upon this *Story of Stones*, that are together with the *Lightning* discharged from the *Clouds*, as a meer fiction. Certain it is, that none of the *Ancients* ever made mention of it before *AVICENNA*: And it seems very strange, that if there be any such, none of them should ever be found in great *Cities*, such as *London* or *Paris*.

Gold, *Copper* and *Silver* are by the *Lightning* melted in *Peoples Pockets*, without the least scorching of them: And the *Wine* that is kept in *Barrels* is consumed, without the least sign of hurt done to the *Vessels*. And *MARCIA*, a *Roman Princess*, being struck with *Lightning* when she was big with *Child*, had the *Birth* in her *Womb* killed without suffering the least hurt her self. *Pliny*, lib. 2. Cap. 51.

These strange effects must be ascribed to the various matter whereof the *Lightning* consists. For some consist of very subtil *Exhalations*, which are of the nature of *Volatil Salt*, or approach to that of *Aqua Fortis*. Now such as these do not touch loose and soft *Bodies*, but break and dissolve those that are solid and compact, and do resist their force. And therefore no wonder if such sort of *Lightning* do melt *Brass*, *Silver* and *Gold* without touching the *Purse* or *Bag* wherein they are: As we see that *Aqua-Fortis* doth not corrode *Wax*, tho' in a very short time it dissolves *Iron*, and other hard *metallick Bodies*. Whereof *SENECA* gives this Reason in Chap. 52. of his *Natural Questions*. The *Lightning*, saith he, doth dissipate strong and solid *Bodies* with more vehemence, because they oppose a greater resistance to it; whereas it frequently passeth yielding substances, without the least hurt to them: It contends with *Stones*, *Iron*, and other very hard and solid *Bodies*, because it cannot make its way through them but by force; and therefore by extream violence opens it self a passage whereby it may get out. But on the other hand, spares loose and soft

III. What is the cause of the Stone, which is produced by Lightning, and is commonly called the Thunder Bolt.

IV. There is some reason to question the truth of these Thunder Bolts.

V. How the Lightning can melt Gold in a Purse, and consume Wine in a Barrel, without hurting either the Purse or Barrel.

Bodies, tho' they seem the most proper for its Flames to fasten upon, because they let it pass without opposition.

VI. As to the Lightning consuming Wine, without touching the Vessel; the Reason is, because the most subtil matter, passing through the Pores of the Vessel, by its most swift and violent agitation, doth so diminish the parts of the Wine, and reduceth them to that extream littleness, that they can freely pass through the pores of the Vessel. By which means the Wine being wholly turned into Vapours, is in a short time thrust through the sides of the Vessel. Wherefore some, to prevent this disaster, lay a Bar of Iron with Flints and Salt upon the Vessel, which being hard Bodies, the Lightning exerts all its force upon them, and so the Wine or other Liquor in the Vessel escapes without hurt.

VII. Accordingly Mr. BOYLE assures us, that having seal'd up a Glass Bottle Hermetically, which he had fill'd with Beer; he found upon the opening, that the Thunder had not in the least chang'd the Taste, or any other of its Qualities; when at the same time that which was kept in Vessels was all turn'd sour.

The Reason is, because the Exhalations that constitute the Lightning, being diffused through the Air, do penetrate the Vessels, but not the Glass. He also tells us, that when Smuts Coals are kindled in Wine-Cellars, when it Thunders and Lightens, it preserves the Beer from turning sour; and this either because the Fire doth dispel and discuss those Sulphureous Exhalations, or because it dulls the force of them, by changing the Figure, Magnitude or Texture of the particles whereof the said Steams do consist.

VIII. As to the Story of MARCIA, who being struck with Lightning, brought forth a dead Child; this effect needs not to be attributed to the Power of Lightning, since probably it might be only the effect of her Fear; who being affrighted at the Lightning, miscarried thereupon. Or if we will suppose that she was struck with Lightning, the cause why it killed the Infant in her Womb, without hurting of her, might be, because the Exhalations, whereof that Lightning did consist, was of an Oily Nature, and burning only with a weak Flame, could only exert its force upon the weak and tender Body of the Infant, without touching the Mothers Body, which was more hard and solid. For so we find that Lightning sometimes consumes soft and tender Bodies, without hurting those that are more strong and solid; as the Hair, Cloaths, and the like, without any injury done to the Flesh. And that because the particles of the Exhalation, that form the Lightning, are like those of Spirit of Wine, which when set on fire do not touch a piece of Linnen so as to consume it, as being too weak and slender to separate the particles of the Earthly Bodies they meet with from others that are like to them, or from those of the 2d Element.

IX. These Exhalations are also supposed the cause of the death of some Animals, found dead without the least sign of Burning or Scorching. For by the violence of these Exhalations, Animals may be so overpowered, as that thereby their Muscles design'd for Respiration may grow stiff

and without motion; whereupon, no wonder if they be presently choaked. For these Exhalations may be so extreamly subtil and pure, as to be able readily to enter the Body, and hurt the inward parts of it, without the least sign of damage appearing upon the outward parts thereof.

Nothing is more commonly received amongst Ancient Authors, than that a Bay-tree is never toucht with Lightning, as being endued with a peculiar virtue, which resists and repels its deleterious Spirits. It was for this Reason that the Emperor TIBERIUS wore a Crown of Bay-leaves, when the face of the Sky seemed to threaten Thunder and Lightning. And COLUMELLA adviseth to cover the Eggs on which a Hen sits with twigs of the Bay-tree.

Some attribute this virtue of the Bay-tree, to the figure of it, which is very round, and hath a very smooth and close Bark: From whence they infer, that the Exhalations of the Lightning cannot fix upon it, but gliding from it, leave it untoucht. But this seems to be but a very weak Reason, forasmuch as Marble Pillars, which for Roundness and Hardness do far exceed the Trunk or Body of the Bay-tree, are frequently struck with Lightning, and damaged by it; as CARDAN assures us, Subtil. lib. 2. At Florence in the Great Church is to be seen a Marble Pillar, struck and hurt with the Lightning. For I suppose it to be a meer Fable, what is commonly reported of the Bay-tree; seeing that many Authors do assert, that Bay-trees have been sometimes struck with Lightning; as amongst others the Conimbricenses, and Vicomercatus in his Comentaries upon Aristotles Treatise of Meteors, by several instances proves the exemption of the Bay-tree from being hurt by Lightning, to be fabulous. The Reason probably why the Ancients attributed this virtue thereunto might be, because they abound with Balsamick, Odoriferous and Spirituous Steams, which may be of some force, in keeping off the efficacy of poisonous Exhalations. Tho' indeed it be not at all probable, that the Leaves or Stock of the Bay-tree should be of such a superlative virtue, as to resist the force of Lightning, or to secure those that shelter themselves under its Branches, or wear the Leaves of it. And the same may be said of Coral, whatsoever PLINY saith to the contrary, Lib. cap. 55.

Authors assure us, that Sea-Calves are never struck with Lightning; and for this Reason the Generals Tents were used to be made of the Skins of this Animal. And SUE TONIUS tells, that AUGUSTUS CÆSAR was so afraid of Lightning, that he always had some of them along with him in his marches.

Some attribute this virtue to the loose Texture of the Skins of these Creatures, because the Lightning pierceth through the Pores of them, without doing any hurt. But this Reason is not solid enough to prove such an extraordinary virtue to reside in these Skins. For how can that person be said to be exempt from the force of Lightning, who is covered with these Skins, if it can so easily pass through the open Pores, and loose Texture of them? Wherefore I am most apt to believe that this virtue was attributed to the Skin of Sea-Calves, because of the wonderful Sympathy they have with the Sea; for the Hairs of this Animal stare and Bristle,

Brittle, when the Sea is tempested, and lifted up into Waves; but lie flat and smooth when a Calm returns. And therefore Seamen were used to carry these Skins along with them, to foreknow the changes of the Weather, and to provide for them; which afterwards may have given occasion to some to imagine that these Skins were of sovereign use against Storms and Lightning, and that the Tents which were covered with them, were exempt from the stroke thereof.

CHAP. IX.

Of the Rainbow.

I. The Primary or Original Rainbow is of more strong and lively Colours than the Secondary.

THE Primary or Original Rainbow, and which for the most part doth appear alone, is of more strong and sprightly Colours, than the Secondary, which is seen above the former; whose Colours are not only weaker, but also appear in an opposite situation to those of the Primary Rainbow.

The Reason hereof are the Rays, which from both these Rainbows arrive at the Eye. For they which proceed from the Primary and Interior, as in a Glass Viol arrive at our Eye after two Refractions and one Reflexion. And therefore the Rays meet under the same Angle they make with the common Axis, in the same point of the Eye, from the same base of the Cone. But the more outward or Secondary Rainbow is produced because the Beams that fall upon the lowest quarter of the drops, get out from them and reach the Eye after two Refractions, and as many Reflexions; which makes the Red, Yellow and Green Colours with all the rest, that are very conspicuous in the Primary Rainbow, to be very weak, and exhibited in an inverted posture, in the outward or Secondary. Forasmuch as the Rays, which after two Refractions and one Reflexion, leave a lesser Angle of Elevation, when another Reflexion is added, will make a greater; and on the contrary those which made a greater, for the most part, at least, will make a lesser.

II. Why the ends of a Rainbow appear sometimes at an unequal distance.

The two ends of a Rainbow appear unequally distant.

This happens when the Rain is bounded on that side where the Spectator stands on a Plain so inclined to the Axis of Vision, as to make an Acute Angle towards the Left Hand, and an Obtuse one towards the Right: For then it is necessary that the Conical Figure which determines the drops that we must see coloured, do meet with them in such a manner, as that those which are on the Left, be much nearer to the Eye of the Spectator, or to the Axis of the Vision, than those which are on the Right Hand: And because these two sorts of Drops do form the two ends of the Rainbow, therefore it is that they appear at an unequal distance: And if we have a mind to fix the center of this Rainbow, in a point equally distant from both the ends of it, then must they of necessity meet without the Axis of Sight or Vision.

III. Whether ever any inverted Rainbows do appear.

Some tell us, that they have seen a Rainbow, with the ends of it turned upwards towards Heaven, as the same represented in the Figure by FFF.

Many suppose this to be no better than a Dream or Imagination: Yet for my part, I cannot see but

that the thing may be possible enough; that is, Figure when the Rays of the Sun by Reflexion, light upon the surface of some Sea or Lake; and this at a time when there is a great Calm, without the least breeze of Wind to wrinkle the Water. Especially if at the same time a Cloud, such as is represented by G, do lie over the said Water, and hinder the Light of the Sun, directly tending towards that part of Heaven where the Rain is, from suppressing or extinguishing that Light, which the water sends back thither. True it is, that such Rainbows as these are seen but very seldom: But it is not therefore presently to be rejected as an Imagination, because there are but few that ever saw such a one. It is sufficient, if ever it was seen, to make us enquire into the cause of it.

Let us suppose therefore, that the Sun Beams, proceeding from that part of the Heaven, marked S S, fall upon the water D A E, and from thence rebound to the Rain C F, the Eye placed in B, will see the Rainbow F F, whose Center is in the point C. so as that when the Line C B, is drawn out further to A, and A S, passing through the Center of the Sun, the Angles S A D, and B A E, be equal, and the Angle C B F, of about 42 Degrees. Yet may the Eye be so placed, with respect to the Sun and Rain, as to behold only the lower part of the Circle, which makes up the whole Rainbow, without seeing the upper part; and so may make us to take it for an inverted Rainbow, tho it be then beheld, not by those that look towards the Heaven, but by those that look towards the Earth or Water.

The Rainbow is commonly lookt upon to be a certain sign of Rain.

Tho' this be commonly received by Philosophers as an undoubted truth, yet cannot it be universally admitted, forasmuch as experience shews us, that Fair Weather follows after the appearance of a Rainbow, as well as Rainy Weather. For tho' the Cloud, in which it is represented, be Dewy and big with Rain, yet may the Temper of the Air be such at that time, that all the water that is contained in it may be evaporated, and by the heat of the Sun, vanish away into the Air: Which being so, it will not seem strange to any, if no Rain should follow upon it, but Fair Weather. Whence it is Evident, that it is not generally true what Aristotle asserts, that a Rainbow that begins presently after Noon, doth always bring copious Showers; but that which appears about Sun-set, doth only threaten some small sprinklings, rather than any great Rain. Seeing that these signs do often fail, and that Rainbows appearing in the Afternoon, are sometimes followed by Fair Weather; and on the contrary, those that are seen about Sun-set are accompanied with great Showers. And therefore I am more inclined to be of Pliny's opinion in this case, who saith, that frequent Rainbows do not with any certainty portend either Rain or Fair Weather.

Sometimes three Rainbows have been seen at a time, so as that the third supervening, hath encompassed the two common ones, but withall hath appeared paler, and less strong and refulgent than the other, and at the same distance from the 2d. as the 2d. was from the 1st.

The appearance of this 3d. Rainbow, is caused by the Hail that is mingled with the Dewy or

IV. The Explanation of an inverted Rainbow.

V. Why the Rainbow is a sign of Rain.

VI. What is the Reason why sometimes three Rainbows have been seen at one time.

Rainy

Rainy Cloud. For seeing that the *Hailstones* are round and transparent, and that a greater *Refraction* is produced in them, than there is in the *Air*, the outward *Rainbow* must needs be much greater, and so appear above, and surrounding the other. And the inmost, which for the same reason must have been much less than the middlemost of *Rain*, may by reason of the great Brightness of the former, have altogether lost its appearance, so as that both of them may have been taken for one; but yet for such a one, the *Colours* whereof were otherwise placed than in the *Ordinary* or *Common* *Rainbow*. Wherefore the 3d. *Rainbow* agrees with the *Primary*, because it is formed by *Rays* falling on the upper part of the *Drops*, and therefore do both of them represent their *Colours* in the same order, save only that in the 2d. the *Colour* does by degrees grow weaker than in the 1st. and in the 3d. than in the 2d.

VII. The *Ancients* have observed, that a sweet *Odor* is perceived in all places whither the *Rainbow* inclines, or which it hovers over. The Reason is, because the soft and pleasant *Dew* of the *Rainbow* is proper to draw forth the perfume of *Odorous Bodies*. For we find that moderate *Showers* have the same effect, tho' not in so high a degree; for nothing affords to the *Ground*, or fills the whole *Air* with a sweeter fragrance, than the *Dewy Rain* of the *Rainbow*, wherefore it falls. So that for ought we know, there may be a fragrance in the *water* it self that composeth the *Dewy Cloud*; seeing that a *Rainbow* is nothing else than drops of *water* clustered together, which cannot come down in *Rain*, but from that part of the *Air* which is near the *Earth*, and therefore more proper to imbibe and retain the fragrance of the *Herbs* and *Flowers*, like a distilled *water*. For *Rain* or any other *Dew* that falls from a great height cannot retain the sweetness which was dissipated whilst the *Exhalation* was mounting so high. And therefore *PLINY* observes, lib. 12. cap. 24. That whatsoever *Plant* the *Rainbow* hangs over, it doth impart to the same a sweetness like to that of the *Rose* of *Jerusalem*; but to that *Plant* a most inexpressible fragrance.

VIII.

The *Rainbow* does not appear the same to all.

The *Rainbow* appears not the same to all, but every one sees his particular *Bow*: So that as many *Bows* are represented in the *Dewy Cloud*, as there be *Eyes* directed towards it. The Reason of this multiplicity is manifest; because the *Rays* which come to the *Eyes* of one person, do not reach the *Eyes* of another. For tho' every drop do reflect one of the *Sun's Beams*, yet the whole *Cloud* only sets forth the coloured representation of the *Rainbow*, whilst it is so posited, that it makes its *Reflexion* at a certain *Angle*: Wherefore as any approacheth nearer to the *Rainbow*, or withdraws further from it, he doth not see the self same *Bow*, but still a different one, according as the said *Angle* encreaseth by his approach to, or decreaseth by his withdrawing from it.

IX.

The *Moon* sometimes forms a *Rainbow*.

The *Moon* sometimes affords the appearance of a *Rainbow*, which *ARISTOTLE* tells us, happens only one day of the *Month*, viz. that of the *Full Moon*. It cannot be questioned, but that the *Lunar Beams* may fall upon a *Cloud*, and exert its action

in such a manner upon every one of the drops of it, as that by *reflexion* to our *Eye*, they may represent a *Rainbow*, which is weaker indeed than that which is formed by the *Sun*, nor deckt with so great a variety of *Colours*. *BOMBACHIUS* assures us that he saw such a one at *Oxford* in the Month of *June* 1606. But whereas *ARISTOTLE* tells us, that it is only to be seen at a certain time, that I suppose to be without ground of Truth, since there are *Authors* who assure us that they have seen the same twice in the space of two years, and that on several days, and that not at the *Full Moon*, but at the *Quarters*. And *SCALIGER* in his 8th. *Exercitation*, speaks of it as a common thing in the *Isle* of *St. Thomas*; where he saith, If *Rain* hath preceded, there is always a *Rainbow* formed by the *Moon*, the *Colour* whereof represents, as it were, a whitish *Mist*. I myself once beheld a coloured *Lunar Rainbow* in *England*, near *Hampton Court*, about the middle of *October*, when the *Moon* was at her *Quarter*; and had *Sir Charles Waldegrave* for a witness of this unusual sight, and who was not a little surprized to see such a one in the *Night*. For it appeared so plain, and with such distinct *Colours*, that it was very like a *Solar Rainbow*, save only that the representation of it was not so strong and refulgent.

It happens sometimes that we see circles of the colour of the *Rainbow* about *Lamps* and *Candles*. Such as are in the *Figure* represented by the Letters *AB, CD*, more especially after that any one hath for some time kept one of his *Eyes* shut.

There are some who attribute this effect to the *Air* that compasseth the *Candle*, which by its thickness reflects the *Rays*, and transverts them. But that this is a mistake, is most evident from hence, because this *Circle* is not seen by all, which must be in case it were an effect of the thickness of the *Air*. We shall therefore easily apprehend the manner of the forming of it, by discovering the cause of the *Transverse* or *Cross Rays*, which sometimes appear there. Which I say may then happen, when there are one or two little wrinkles in any one of the surfaces of the *Coats* or *Membrans* of the *Eye* *EM P*, which because of the *Figure* of the *Eye* *F O, S M N*, we'll suppose to be circular, and have their *Center* in the *Line* *E O*; as frequently there be there others also extended according to the *Right Lines*, which disscutate or intersect one another in this *Line* *E O*, and make us see some great *Rays* scattered this way and that way, about the burning *Candles*; and this notwithstanding, any *Opaque Body* might intervene, either betwixt *E* and *P*, or elsewhere on the side, as long as it doth but circularly diffuse it self. Or lastly, The same may happen, because the *Humours* or *Membrans* of the *Eye* have in some sort or other changed their *Temperament* or *Figure*. For it is very common with those who have sore or weak *Eyes*, to see these *Circles*, neither do they appear to all persons alike.

Particularly we are here to take notice, that their outward *Rims*, represented by *A* and *C*, are for the most part *Red*, quite contrary to those which we sometimes see represented about the *Stars*. The reason whereof will evidently appear if we consider that in the production of those *Colours* whereof they consist, the *Crystallin Humour* *P N M*, per-

X. How Circles come to be formed about Candles.

Figure 26.

XI. Why the outward Rims of these Circles are commonly Red.

performs the office of a *Prisme*, and the *Retina* F G F, the part of the *Linnen-cloth* that receives the *Beams* passing through the *Prisme*. But some may question, forasmuch as the *Crystalline Humour* is able to perform this, why it doth not do as much to all other Objects, by representing the colours of the *Rainbow* about them? Wherefore we must take notice, that many *Rays*, from every single point of the Objects, do arrive at the several points of the *Retina*; and because some of them pass through the part N, of the *Crystalline Humour*, and other of them through the part S, therefore also they act in a contrary manner upon them, and destroy one another, at least as to the production of Colours. But that here all those which come to the part of the *Retina* F G F, do only pass through the part N, of the *Crystalline Humour*, and therefore that the *Rotation* which they acquire there may be felt. All which perfectly agree with those things which we have delivered in our *Institutions of Philosophy* concerning Colours.

CHAP. X.

Of Fires kindled in the Air.

I. Why those Meteors called Wills with the Wisp, do lead men towards Pools and Rivers.

WILLS with the Wisp or Wandring Lights, do frequently lead persons to Lakes and Boggy Places, and make them fall into Precipices, or lose their way.

This effect may be explained from what we have said before concerning Winds. For seeing that more *Kapours* are raised in the Night from the Earth, than from the Water, this is the cause why these Wandring Lights or Fires, that follow the motion of the Air, do take their course towards Waters and Pools, because thereabouts the Air is more cool, by reason of a lesser agitation, and consequently becomes thicker and more condensate, than that which lies close upon the Earth; so that these Wandring Fires, being in a manner born up by the Wings of the Air, and complying with the motion of the same, are carried thither from the neighbouring grounds.

II. Why these wandring Fires follow those that flee from them, and flee from those that follow them.

Nothing is more commonly asserted by Philosophers, than that Wills with the Wisp do flee from those that pursue them, and follow those that flee from them. And this they prove from many Examples, as may be seen in FROMUNDUS.

The cause of this is imputed to the Air, which being light and fluid, and shaken by the agitation of the person that walks along, doth either drive them forwards, or drags them along after him, when he runs from them. For if this Meteor stand before him that walks, by his driving the Air before him, it is driven forwards, and so flees from him that follows it: But if it be behind him that walks, forasmuch as the following Air accompanies him, it also follows him fleeing from it.

III. Why these Fires are much seen about Churchyards and Common-sewers.

Wills with the Wisp are commonly seen about Churchyards, Common-sewers, Fire-vomiting Mountains, and other places where great slaughter of Men or Beasts have been made.

The Reason is, because these Wandring Fires consist of fat and viscid steam, which having no such quantity of subtil particles mixed with

them, by means whereof they might be carried upwards, do fluctuate in the lower part of the Air, and are forced, because of the cleaving tenacity of their parts, and the Earthly Matter that is mixed with them, to tend downwards by their weight, rather than mount upwards, and move especially about Churchyards, Lay-stalls and such like places, as abounding with a greater quantity of Fat and Oily Particles.

We read in the Writings of the Ancients, of Fires or Flames that have been seen hanging upon the Hair of Children, and that without hurting or scorching their Hair. According as VIRGIL tells us, that this hapned to *Ascanius* the Son of *Aeneas*, Lib. 2. *Entidos*:
Lo from Julius Crown a flaming Light
Was seen to rise, and harmless Fire did spread,
With a soft touch, and round his Temples fed.

The cause of these flames is, when a subtil and penetrating Exhalation (such as participates of the nature of Salt) doth enter the Pores of another that is Fat and Sulphureous. This being of it self sufficient to kindle some thin and subtil flames, as well on high, as in the lower parts of the Air. For certain it is, that not only a violent agitation, but the mixture only of different Bodies, is sufficient to produce Fire. As we see in Quick-lime that is sprinkled with Water; and innumerable other Examples which daily occur to Chymists.

These Lament Flames may also be caused from a commotion of the Spirits, that rush out from the Body, and being intangled together, represent the appearance of Fire. Thus Historians tell us, that ALEXANDER the Great, in the heat of Battle, darted sparks from his Body; and that something like this hapned to the fierce Horse of the Emperour TIBERIUS, from whose Head a flame was seen to break forth. For Alexander being of a fiery complexion, and addicted to the drinking of Wine, it cannot seem strange that he sent through his Pores such Spirits as were proper to kindle flames: No more than that from TIBERIUS his Horse, when he had heated himself with running, a fat and viscid sweat did break forth, which kindled into a flame, but such a one as was harmless, and without any burning or scorching quality. In like manner as the flame of a Spirit of Wine, which hath some aqueous particles mixt with it, doth not burn the Linnen Cloth that is moistned with them.

And it is for the same reason, that when we rub a Cats back contrary to the hair, especially in the Winter, sparks of fire dart forth from it, because Cats in the Winter are fatter than in the Summer, and therefore are able to furnish a greater quantity of a fat clammy humour, proper for the exciting of these Sparks. But because in the Summer these Steams do more easily break forth into the Air, and are dispersed there, it cannot seem strange, that when the proper matter for the generating of these Sparks fail, they should cease also, and not then appear upon the rubbing of the Cats backs.

IV. What is the cause of those Flames that sometimes appear about, or upon the Hair of Children.

V. These Flames may also proceed from a Commotion of the Spirits.

VI. Why sparks of Fire proceed from a Cats Back when rub'd.

VII.
What Fall-
ing Stars
are.

In clear Nights, Stars seem to shoot or fall from the Sky.

The cause is, when after a very hot and dry season, the space which is between two Clouds, is filled with copious Exhalations, that are very subtil, and proper to take fire; For if these be so light and loose of Texture, that one of them falling from on high, doth not produce any noise of Thunder, nor cause any Tempest in the Air, yet the Exhalations lying between the said Clouds, may be so twisted together, as to exhibit the appearance of some lesser flames, which are commonly called falling or shooting Stars. Because by inflammation the combustible particles, which were the cause of their ascent, were thereby consumed and vanish; and therefore the Star, which at the beginning of its deflagration, complied with the motion of the Air that carried it, was called a running or shooting Star; afterwards, when its more subtil parts were burnt away, falls down, because the weight of the Earthy and viscous matter, doth exceed the heaviness of the Air that lies under it; and then is called a falling Star. And therefore these Meteors receive a different denomination from the various specification of the kindled Exhalation. For if an Exhalation that lies at length, becomes kindled, it is called a Beam; if at the bottom it be somewhat broader, 'tis called a Pyramid; if it be broad about the midst, and small at both ends, 'tis called a flying Dragon, &c.

VIII.
Why those
Fires which
are formed
near the
Earth do
continue for
some time,
whereas
those that
are produ-
ced high in
the Air are
of no long
continuance

Fires generated near the Earth, continue for some time; whereas those formed in the uppermost part of the Air do presently vanish.

The Reason is, because a flame doth cleave more strongly or weakly to any matter, according as the said matter is more or less close and compact. Now forasmuch as these Meteors which are formed in the upper Region of the Air, do consist of a very loose and thin matter, it is plain that their flame cannot continue long. For indeed if this matter were thick and close, it would by its own weight sink towards the Earth, and leave its former station. And therefore A R I

STOTLE in the first Book of his Meteors, supposeth them to be like that flame, which runs along the smock or stream of a newly put out Candle, which is apt to be kindled again by another that stands near it.

IX.
What is the
cause of the
Representation
of Armies
in the Skies

In the Sky is sometimes represented the appearance of Armies, and Soldiers fighting. Such a Representation as this is reported to have been seen in Silesia in 1545. A Bear appeared in the East at the head of an Army, and was met by a Lion, who led an Army from the West: Between both these Armies there appeared also a most bright Star; and presently after they engaged, so that the blood seemed to drop from the Bodies of those who were wounded, and many as it were fell down dead. As these Armies were fighting, an Eagle coming from an high Rock, hovered over the Lions Army. And after the Battle was ended, the Lion shone bright in the midst of his Forces; but there was no appearance of the Bear. The place where both the Armies stood was all covered with dead bodies, and by them some old Men, venerable for their Gray Hairs. Afterwards the Lion led off his Army towards the West; who after he was got some way from the place of the

Battle, a person riding upon a white Horse, adorned with Trappings, returned from the Army to the place where the Battle was fought, and set a young Man armed Cap-a-pee upon that Horse, and having accompanied him some part of the way towards the East, vanished together with all the other Apparitions.

I am very well aware how greedily such stories as these are embraced by the common People, and how ready they are to lay hold of any thing, which they imagin may discover to them the knowledge of future Events. And therefore if they do but see two Clouds standing over against one another, and enterchanging some Refractions or Reflexions, this is sufficient for them to apprehend two Armies fighting, that the more bright portions of them are Soldiers in whole and bright Armour, that they hear the clashing of Arms, discharging of Musquets, &c. I my self once in a clear night in Flanders saw some Vapours scatter'd in the Air, in an unusual manner, and giving some light from them, which did so terrifie the Inhabitants, that the next day all the news was that they had seen Armies in the Air, heard the rattling of Pikes, the discharging of Musquets, the clashing of Swords and the sound of Trumports.

But because it may happen that such appearances as these may really be seen in the Air, I will here add two probable causes whence the same may proceed. The First is, That there may be in the Air various Clouds of that smallness, as that every one may exhibit the appearance of a Soldier; and rushing one upon another, may contain a sufficient quantity of Exhalations, to produce some small flashes of Lightning, and cause some sounds or noises; and so represent the fighting of Souldiers. The other is, when all these small Clouds do shine, and reverberate that light which the Lightning of some great Tempest hapning at so great a distance, as that they can not be perceived there from the Earth, do reflect upon them.

X.
The Com-
mon-people

Stories as
these.

XI.
What may
be the cause
of an Ar-
my appear-
ing in the
Air.

CHAP. XI.

Of Circles about the Sun, or Moon, and of Mock Suns.

Circles about the Sun or Moon, never appear but in fair weather, and in this are distinguished from the Rainbow, which seldom appears but in rainy weather, tho' perhaps it may not rain in that place where the Spectator is.

The Reason of this difference is, the variety of their composition. Because these Circles are not formed by the Refraction of Rays from drops of water, as the Rainbow is generated, but by that Refraction which proceeds from the little Stars or Spikes of transparent Ice; and tho' these Stars do never fall from the Sky but in cold weather, and the frosty Months of the Year; yet reason convinceth us, that they are produced at any other time also: Yea, and forasmuch as they stand in need of warmth, which of white as they are at first, may make them transparent, it seems very probable that the Summer time may be the most proper for the forming of them.

Why no Cir-
cles appear
about the
Sun or
Moon but in
fair wea-
ther.

Some-

II. Sometimes double Circles have been seen in the Sky, so placed as that one of them did seem to encompass the other, and to appear concentric with it.

This is caused when two Ranks of such particles of Ice are placed together, so as not to exclude the Rays of the Sun: For then those Rays which pass through both these Ranks at the end of these little Stars, being almost bent as much again as those others that pass through one Rank only, will produce another coloured Circle, much greater in compass than the former, but less bright. So as to make two Circles appear, whereof the one doth encompass the other, the more outward whereof is of less lively colours than the inward.

III. Circles are not usually seen about the Sun or Moon, whilst they are near to the Horizon, that is, when they do either rise or set.

The Reason is, because then the rays of these Luminaries do fall so obliquely upon the particles of Ice, that by reason thereof they cannot penetrate them: And consequently there can be none of those Refractions, which are the formers of these Circles.

IV. Many Mock Suns sometimes appear in the same Circle. Thus it is recorded, that in the year 1625. the King of Poland saw no less than six of them; and five appeared to the People of Rome in the year 1629. and that for four hours together.

These Parbelia or Mock Suns are formed in a Cloud, consisting of a continuous piece of Ice, the surface whereof being very even and smooth, is illustrated by the Sun elevated towards its Meridian Height, and reflects the rays it hath receiv'd against the Snow of the Cloud that doth compass it. For then the Snow appears to those who behold it from the Earth, like a great white Circle, wherein one Circle is seen by means of the rays which flow from the Sun directly; and the two following from their refraction, and the rest by the reflexion of them.

V. Many Sun appearing in the Heavens, are not seen alike by all; for some Spectators see more Suns in one and the same Circle, others less.

The Reason is, because the rays that proceed from these Suns, are not after the same manner conveyed to every Spectator; forasmuch as some may be so placed, as to see no more than two of them; and others again so as that they can see three, four or more of them, according as the place is from whence they direct their Eyes towards them. For the rays do not affect the Eyes of all Spectators alike; neither do those which fall upon the Eyes of one Spectator, reach those of another: Seeing it is certain, that he who moves from one place to another, doth see still other and other Stars; and as upon shifting places, we see other Circles about the Sun or Moon, so likewise different Mock Suns. Moreover, seeing it is certain, that either the Earth or Sun must move, it cannot be; but that when the Sun shifts its station, or when the Spectator is whirled about together with the Earth, the Angle of Sight must needs be changed, and those Stars which he saw before, will have lost the Latitude under which they appeared to him at first. Whence it is that every Spectator sees such and such Mock Suns, according to the difference of the place, where he is at this or other times.

Mock Suns commonly have a long Tail, of a very bright and refulgent white Colour.

The cause is, either the reflexions which are made on the surfaces of the little Icy Bodies which are turned towards the Sun; or those contrary refractions which the rays suffer in passing through them: Or, it may be, from both these causes together; as seems to be confirmed by Experience in those small drops of Rain, which are about a great Cloud, that hides the Sun from us: For we see that these little drops of Rain, or particles of Snow half melted, receive a bright whiteness, not only by the rays reflected from their surface, but also from those which by penetrating them, do suffer contrary refractions, that is to say, which destroy one another.

Historians assure us, that the Sun hath been sometimes seen at Night, and appeared above our Horizon, when yet it was certainly far under it.

The Reason of this strange appearance was this, because there were Clouds made up of little Icy Stars, placed in so high a Region of the Air, as that the rays of the Sun, then below the Horizon, could reach them. For if we do well consider those reflexions and refractions which two or three little Clouds, situate in divers places, and receiving light one from another, can produce, we shall easily apprehend how they may in the nighttime exhibit a very strange and unwonted light, and cause, as it were, the Sun to appear above our Horizon, at that time when it is indeed under it; and the shadows on our Sundials to be nearer or farther off than they ought to be, and consequently point at another hour than it is indeed.

It is observed that the appearance of Mock Suns have been the fore-running signs of the revolution of Kingdoms, the death and murder of Princes. Hence it is that almost all Meteorologists assert, that those six Mock Suns which were seen by the King of Poland, did prognosticate the taking of Francis I. of France at the Battle of Pavia: And that those Mock Suns which appeared in the year 1157. did foretell the great dissention that hapned soon after amongst the Electors, in their choosing of a King of the Romans.

It cannot be denied but that after the appearance of Mock Suns, some strange and uncommon effects do frequently happen: But who will say that they proceeded from this Meteor, and not rather by meer accident, and without any the least reference to the same? Or shall we say that there is such a close Union and near Relation between the Heavenly Bodies, and the Affairs of Mankind, that when ever such and such Meteors appear, such effects must follow in the other? Sure it is that Mock Suns would appear, tho' no such effects were to follow; and strange things would happen in the World, tho' no signs in Heaven should utter them in. Or shall we suppose, that Nature will surcease its activity, and natural causes not unite in order to the producing of their effects; except Kings wage War, People dispatch their Princes, and overturnings, devastations and slaughters happen to Governments? How many Kings leave this world, how many Countries are wasted, when yet no Mock Suns have appeared to give any warning of these Accidents? If therefore after the

VI. Why Mock Suns have commonly long Tails.

VII. What is the cause of the Sun's being sometimes seen at night.

VIII. Whether Mock Suns be the fore-boding signs of great Calamities.

appearing of *Mock Suns* any great *Slaughters* or *Revolutions* chance to happen, this cannot seem strange, if we consider the Temper of Men, who are never content with their own condition, but are always reaching after that which is another's. Besides, why should *Mock Suns* portend such events any more than many other natural *Phænomena*? And is it not merely accidental, that they appear this time rather than another? What an unaccountable *Pride* and *Vanity* is it in Man, to imagin himself to be of that value and consideration, that for his fake *Prodigies* must be formed in *Heaven*, that *Comets* must appear when ever the humour takes him to wage *War*; and that *Suns* must be multiplied, when the great *Men* of the *Earth* are at variance together, or some other *Emblems* must be

represented in the *Air*, when ever they are *Sick*, or drawing near to their last end! Pray let us never have so high an opinion and conceit of ourselves, as to imagine that all these *appearances* are formed in the *Heavens* on purpose to warn us of future events. But let us rather consider that all these are *natural effects*, which cannot but be formed and appear when ever their causes do concur and meet together. That their appearing but very seldom, cannot in the least conduce to their efficacy, or to render them more considerable: For their Rarity or Infrequency doth no more prove them to be *Prodigies*, than it is an argument that a *Lion* is a miracle in Nature, because we very seldom see any, or for that they are not so common as other *Beasts* that are frequent amongst us.

The Seventh Part OF THE HISTORY OF THE NATURE OF PLANTS.

CHAP. I.

Of the Parts of Plants.

I.
Why every
Plant hath
a Root.

EVERY Plant hath a Root, neither is there any supposed to want this necessary part, except only the *Indian Plant* called *Malabathrum*, whose *Leaves* grow spreading upon the *Water* as if they had not any Root at all.

The necessity of this part is obvious from the nature of *Plants*, to the conservation whereof it is absolutely necessary, that some part of it cleave and stick fast in the *Earth*. For a *Plant* without its Root, as with a hand or claw lays hold on the *Earth*, and by its spreading *Fibres* takes possession of a part of it. To this may be added that *Vegetables* make use of their *Roots* for a *Mouth*, where-with they suck in their *Nourishment* out of the *Earth*. For seeing that the life of *Vegetables* consists in perpetual motion, their inward moisture would be soon consumed, except a new supply were continually conveyed to them from the Root. Neither indeed, if the matter be narrowly examined, will the *Indian Leaf* called *Malabathrum*, nor the *Herb* common amongst us, called *Duck-weed* be found altogether without *Roots*, whatsoever *An-*

them *Writers* may have left recorded concerning them: For when we do more narrowly behold these *Plants*, we shall find them to have a small stalk which reaches to the bottom of the place whence they are taken. And therefore when we dissect a *Root*, we find parts in it that are as substantially the same with the little *Root* of the *Seed*, as the *Members* of a *Man* are the same with the *Organs* of a *Birth* in the *Womb*. So that the *Root* of a *Plant* seems to be nothing else but a spreading of the *Stalk* or *Stem* into several little *Branches* and *Capillaments*. Neither doth it contradict what we have here asserted, that *Mistletoe* *Dodder* of *Thyme*, and others of the same nature, have no *Roots* that stick in the ground; for tho' they have none, yet the *Plants* on which they grow, and to which they are fastened, have theirs fixed in the *Earth*.

Hence it was that *DEMOCRITUS* was of opinion, that straight *Trees* were shorter lived than crooked ones, forasmuch as their *Roots* were weaker, and for that the straightness of their *Pas-* sages or *Vessels* were not so proper to retain their *Aliment*. Tho' we find the contrary in the *Palm*, *Fir* and *Cypress Trees*, which tho' they be very straight, yet are long lasting, and that because of their thick and long *Roots* by which they suck in their *Aliment*.

II.
Why
straight
timber'd
Trees are
not so last-
ing as o-
thers.

The

To George London of their Majesties Royall
 Garden in S.^t James Parke Gent. Deputy Superintendant
 and Master Gardiner of their Majesties
 Gardens and Plantations in England.

This Plate is humbly

Dedicated by Richard Blome

The Garden of Eden, as described in the Bible, is a place of perfect happiness and peace. It is a garden of delights, where the fruits of the earth are abundant. The garden is situated in a beautiful landscape, with a river flowing through it. The garden is a place of perfect happiness, where the people of the world are to live. The garden is a place of perfect happiness, where the people of the world are to live.

 VI.
 Why the
 Bodies of
 Trees are
 round.

III.
Why the
Roots of
some Plants
are round,
others long
and slender.

The Roots of some Plants grow more thin and slender, as they enter deeper into the ground, and end in a Cone or slender Point, as the Roots of Trees. But the Roots of other Vegetables swell into a round Root, as Turneps, Tulips, Onions, &c. The Reason why the Roots of Trees, and most other Vegetables are slender towards the ends, is because the Juice passing through them, is carried upwards, and abides longer in the upper part of the Plants; for tho' the heat, by the virtue whereof Nutrition is performed, doth extend it self into all parts, and be carried upwards and downwards, yet it is certain, that it is always more strongly conveyed to the upper parts, than towards the lower; and therefore seeing that the upper part of Trees doth receive more nourishment, and is longer nourished, it is no wonder if be also bigger and larger, and that the Roots end in a point. But the Roots of Turneps, &c. are Round, because their nourishment is received into the first joint of them, which consisting of several entangled parts, and being endued with narrow pores, the nourishment cannot freely pass or be strained through them, and therefore it is necessary that the said matter be diffused sideways, and that the Fibres which are big and swelled with juice, spread and enlarge themselves.

IV.
The Compression of the Earth makes the Roots to grow the faster.

If an Herb be cut up by the Roots, and put again into the Earth, and the same be strongly beaten down, and this about the beginning of Winter, the Roots will be found extremely encreased the following Summer.

The Reason is, because moisture having by this means been hindered from entering into the inward parts of the Plant, doth the longer continue in the Root, and dilate the same. And therefore it is common with Gardeners after they have sowed Onions and Turneps, to press down the loose Earth round about them with Rowlers or the like.

V.
Why the Stalks of some Herbs are hollow.

Some Plants have hollow Stalks, as all sorts of Reeds, and the Straw of Corn, but with joints.

The Reason is, because the Fibres which serve to convey the nourishment, are not derived from the Pith of the Plant, but from the sides of the budding Knot; which because they withdraw from the middle, and observe a certain distance, do leave a certain space there, and produce a Cavity. Hence it is that in Onions the Pipe is larger about the midst, because the ends of the Fibres spread further from one another, and affect a spherical Figure. For the several Coats of Onions are like so many Leaves, which being broader about the midst, are roll'd together like the surface of a Cylinder.

VI.
Why the Bodies of Trees are round.

Almost all the Bodies or Trunks of Trees have the same Figure, viz. a round one, tho' they differ in length, and other manifold varieties.

The Reason of the roundness of the Trunks of Trees, is the same with that of the Roundness of the drops of Liquid Bodies. For as the Celestial Globuli, by their equal pressing of the parts of water towards their Center, do make them spherical; so the same Globuli, by dashing against the outside of Trees, drive the same to a Roundness. And tho' Plants be much inferiour in softness to Water, and therefore cannot be so readily figured by the surrounding subtil matter; yet this doth not hinder but that the same which is done, as it were in a moment, in the parts of Liquid Bodies,

may be done in a larger time, and with often reiterated attempts in harder Bodies. So we see that Iron Work which was rough before, becomes smooth'd and polish'd by frequent handling, or even rubbing against ones Cloaths.

The outward part of the Tree, and which covers it like a Shift, is wont to be harder than its inward Substance. Hence it is that most Trees shed their Bark in the Spring.

The hardness of the outside of Trees proceeds from other Bodies that dash against it. For there are innumerable little Bodies, not only of the 1st and 2^d Element, but also particles of the 3^d Element, which continually push and dash against the surface thereof, and drive all the parts towards the midst. Thus our Hands and Feet by the impulse of other Bodies, do contract a brawny hardness; likewise so the Crust of Bread, and the surface of Roastmeat, grows hard by the heat of the Fire acting upon it, and much compacter than the inward substance. The reason why Trees in the Spring do lose their Barks, is, because the copious affluence of the alimental moisture, being at that time in greater abundance betwixt the Trunk and the Bark, doth loosen the Glew wherewith they were fastned together.

But for all this, we are not to suppose with some, that all the nourishment of Trees is conveyed betwixt the Bark and the Wood; or, which is the opinion of others, through the Pith only, but rather both ways; tho' indeed nothing hinders but there may be a mutual communication or irroration of both these ways with each other. Forasmuch as we see there are some Trees which live and grow, when their Pith is quite consumed, as Walnut, Willow, &c. as on the other hand there be Trees which grow after that their Barks are taken from them.

Almost all the Leaves of Plants differ, and are of different Figures. For some are large and broad, as those of a Gourd; others small and slender like Hair, as the Pine Tree; and some thick and fleshy, as in Purslain, &c.

The conformation of the Leaves is caused by the different texture of the Fibres, which as they do diversly meet together, and become entangled, or else separate from one another, so they form Leaves of different shape and figure. For tho' the Leaves of all Plants consist of the same parts as their Branches and Trunk doth (because the thin Skin of the Leaf is nothing else but the enlargement of the thin Skin of the Branch, which partly by the occasion of new parts, and partly by the extension of its former parts becomes spread into that breadth) yet do they receive their figure from the various disposition of the Fibres. Hence it is that some Leaves are long because their Fibres lie only stretched out in length, others round, when the Fibres display themselves more winding and turning, and so for the rest. For seeing that most of them derive their original not from the Bark alone, but from the inward substance, so it is that Alimentary Juice is differently suck'd and strain'd, according to the disposition of the Navel Knot of the Tree, whence the diversity of the Fibres, and of the figure of the Leaves doth arise.

Hence it is that some Plants have long and slender Leaves, as the Willow; others bent and crooked, like Orris; others round and hollow, like Na-

VII.
What is the reason of the hardness of the Barks of Trees.

VIII.
The Aliment of Trees is not only transmitted through the Pith, nor only betwixt the Bark and the Wood.

IX.
What is the cause of the great variety of the Leaves of Plants.

X.
Of the different Leaves of Plants.

C H A P. II.

Of the Virtues and Efficacy of Plants.

SOME Vegetables have a *Warming Virtue*, and a power to dilate *Bodies*, as *Coleworts* or *Cabbage*, *Capers*, *Cinamon*, *Radish*, *Onions*, *Rocket*, &c. others have a power of *Cooling Bodies*, and drawing them together, as *Barly*, *Cow-cumber*, *Purflan*, &c.

The *warming virtue* that is in *Plants* consists in this, that their thinnest *particles* surrounded with the *subtil matter*, do enter the *Pores* of the *Bodies*, and do so penetrate them, and agitate their parts, as to dissolve their texture, and interrupt their continuity. And therefore from this hindered course of the *subtil matter*, a kind of contest or variance ariseth, and consequently a greater heat, and agitation of the *Parts*. As may be seen in the mixture of *Spirit of Vitriol* and *Oil of Tartar*, which produceth an *Ebullition* or *effervescence*, because the accustomed motions of them both are disturbed, and one of them exerts its force upon the other. Again there are other *Vegetables* which produce *Cold*, whose insensible *particles* are of such a make, that they are able to hinder, or lessen the agitation of the parts of our *Body*. Thus *Purflan* and *Barley* are said to be *Cold*, because their *particles* are not easily dissolved by the *subtil matter*, and because they either altogether stop, or allay the motion of the *Vital Spirits*. And consequently we may conclude, that the greater *particles* of the *subtil matter* are predominant in *warm Bodies*, but the lesser and weaker in *cold ones*, because these are less agitated, and more easily reduced to Rest.

Amongst *Vegetables*, some are cold in the 1st, others in the 2^d, others in the 3^d, and others again in the 4th Degree. Coldness in the 1st belongs to *Roses*, *Violets*, *Mallows*, *Barley*, *Prunes*, &c. In the 2^d to *Sorrel*, *Lettice*, *Plantain*, *Gourds*, *Oranges*, &c. In the 3^d to *Opium*, *Poppy*, *Purflan*, &c. In the 4th to *Meconium* or the juice of the Heads of *Poppy* and *Hemlock*, which latter by its extrem coldness extinguisheth Life, by stopping the circulation of the Blood.

Beans, *Asparagus*, the *Roots* *Satyriion*, *Parsnips*, *Rice* and such like, do provoke Lust, and encrease Seed.

For Seed consists of Blood that hath been very well concocted and strained, and the fore-mentioned *Vegetables* have the power of agitating, loosening, and so disposing the *Organs* appointed for the generation thereof; that as soon as the Blood comes to those parts, it is readily strained through them, and by this means the quantity of Seed is encreased. Amongst these *Earth-nuts* or *Pig-nuts* may also be reckoned, as producing the same effect. But on the contrary, *Lettice*, *Anise*, *Hemlock*, *Purflan* and the Seed of *Rue* diminish Seed, because they, with their *particles* do obstruct the *Pores* of those wonderful *Strainers*; and besides, by thickning the Blood, make it less fit to be strained.

Purflan cures the *Teeth* when set on Edge; and restores the *Gums* to their natural disposition, when by the eating of any sour or harsh things, they are drawn together.

The

velwort; some like a *Sithe*, as *Moonwort*. So likewise the surface of some *Leaves* is smooth and shining, as those of the *Ivy*; others hairy or downy, as the *Malabathrum*; some curled, as in some sorts of *Cabbage*; in some rough, as those of the *Fig Tree*; in some stinging and prickly, as the *Nettle* and *Thistle*; and in some the *Leaf* is nothing else but prickly, as the *Juniper Tree*.

XI. Neither do the *Leaves* only of different *Trees* vary from each other, but even those of the same *Tree*; so as it will be hard to find two *Leaves* on the same *Tree* that are exactly alike. Who would not think that the *Leaves* of *Olive Trees*, above all others, were most exactly like one another? And yet you'll find that all of them differ. And the reason is plain, for tho' the *Principles* whereof they are formed, do perfectly agree together, yet for all this similitude there may be a very great difference between them in relation to the magnitude, number or figure of their parts, and in many other Circumstances.

XII. So likewise it proceeds from the same cause, that some *Trees* shed their *Leaves* in *Winter*, because when the *Pores* of the *Bark* are drawn together by cold, the *Alimentary Juice* can no longer pass through them. But in those *Trees* whose *Leaves* proceed from the *Inner Bark* or *Rind*, they are not so apt to fall off, by reason of Cold, but only by the encrease of the Shoot that proceeds from the *Bud* or *Knob*, which takes possession of the *Leaves* place; and so causeth it to drop off. Hence it is that in *Brazile* and *Egypt*, the *Trees* are ever *Green*, nor ever lose their *Leaves*.

XIII. There is a certain *Liquor* or clear *Juice*, which in the *Spring* doth in so great abundance mount upwards into the *Trees*, that it is tapt in great quantity from them, without any prejudice to the *Springtime Trees*, as the *Birch*.

The cause why this *Liquor*, at the beginning of the *Spring*, mounts up through those wooden Pipes, called *Spirals*, is, because the *Lymphaducts* or *Vessels* of the *Bark*, through which it is conveyed all the *Summer*, begin but then first to be formed. Wherefore seeing it finds no passage this way, it takes its course through the *Airy Vessels*. But as soon as the fore-said *Lymphaducts* have attained their due consistence and extension, then the *Juice* returns out of this by-way into the great road, and quitting the *Air* or *Wind pipes*, betakes it self to these as its proper *Receptacle*.

XIV. *Leaves* and *Fruits*, when they are come to their full maturity, are of a *Yellow Colour*.

The Reason is, because that after the *Juice* hath been well strained and concocted in them, their *particles* become like to those that compose *Gold*, which are so rough, that they produce such a *Reverberation* of the *Light*, wherein the *Globuli* are less whirld round, than they are when they exhibit the appearance of a *Red Colour*, and more altered than those that represent a *White Colour*; which is the reason why their superficies is *Yellow*. This may be further confirmed by looking upon them through a *Microscope*, for then their surface appears distinguished with many rising little *Pellets* or round *Bodies*, which leaving great *Intervals* betwixt them, do cause a great variety in the *Reflection* of the *Light*.

Some Vegetables are endowed with a warming, and others with a cooling virtue.

II. The difference or several degrees of coldness in Plants.

III. Why some Vegetables provoke Lust.

IV. How Purflan restores our Teeth when set on Edge.

The Reason is, because this Numbness of the Teeth proceeds from the particles of four Bodies, which penetrating through the Gums, draw together the Jaw-bone, and consequently the Teeth themselves. And forasmuch as Purslane aboundeth with Clammy Juice, which as soon as it comes into the pores of the Gums, the foresaid four and sharp particles stick to them, and are carried off by the Spittle. Salt is also said to produce the same effect; for when we rub our Teeth with it, it opens the pores of the Gums, whence the Spittle flowing in great abundance, carries those sharp Bodies along with it. Thus the Root of Pellitory of Spain, is often with good success held in the Mouth by those who are troubled with the Tooth-ach, because it draws the humours powerfully into the Mouth together with our Spittle. For it causeth a kind of Salivation, being held in the Mouth only, which may it be it would do both for a longer time, and more copiously, in case it were taken inwardly in a small, but often repeated Dose.

V. Some Vegetables make Bodies hard and solid; whereas others make them soft and flexible. Bodies grow hard by the mixture of some Herbs, when the particles whereof they consist, having before been agitated by heat, and separated from one another, are seized by the Juice of these Vegetables; which entering their Pores, and putting a stop to their Agitation, makes them to come nearer to one another; for by the operating of their thinner particles, the remaining become so much the closer united together. And on the other hand hard Bodies become flexible, when their particles being separated by heat, a foreign moisture getting between them, keeps them at a distance, and by its interposition makes them flexible. For the softness or pliability of any Body consists in this, that its parts are divided from one another, and have something running between them. Amongst those Vegetables that are endued with a consolidating virtue Thorough Wax is one.

VI. Some Herbs are endued with a Diuretick Virtue, as the Roots of Fennel, Saxifrage, Smallage, Juniper Berries, Nettles, Bitter Almonds, and the like, which provoke Urin.

This faculty in these Plants proceeds chiefly from their heat, because their particles are easily agitated by the subtil matter. For seeing that obstructions are the cause of the retention of Urin, these are endued with a penetrative power, and consequently are proper to remove those obstructions which stop the free course of Urin. For entering into the pores, they attenuate and cut the tough Flegm, and dissipate the grains of Gravel, which before, by means of some slimy moisture stuck together, and carry them off. So that the pores of the Kidneys being loosed by this commotion, the matter contained in them becomes dissolved, and easily passeth through them in order to its evacuation by urinary passages. And the case is much the same with those Herbs that move Womens Courses, by thinning and diluting their stagnating Blood, such as Saffron, Penny Royal and Sage, because by their heat they open the obstructions of those vessels by which the Blood is conveyed to the Womb. And accordingly we find by experience, that almost all Diuretick Plants are hot, as Rhadish, Rocket, Cinamon, &c.

Dandelion is reckon'd amongst Diuretick Plants, which by opening of the obstructions of the Meseraick Veins, conveys a greater quantity of Urin into the Bladder, than little Children are able to contain, and so makes them let go their Urin when they are asleep in their Beds: And therefore the name of Pissabed is also given to this Herb. So likewise the Decoction, Juice and distilled water of Sefeli or Hart-wort, or the Seed of it in Powder is very efficacious for the moving of Urin, breaking of the Stone and expelling it; and is to that purpose exhibited to Infants as well as grown Persons.

Some Vegetables have an Anodyne Virtue, that is, such as mitigates the pains of the Flesh, and heals Wounds.

All Adstringent Plants are endued with this virtue, and which consist of Particles like to those of Aloë; which entangling together, and penetrating the inward parts, do suck and draw out the hurtful and superfluous moisture from them; by which means the part is disposed to admit and receive its due and proper Aliment, so that the Wound by degrees is filled with new Flesh, and so brought to a Scarr.

Amongst Vulnerary Herbs are accounted Ad-ders Tongue, which is an excellent Wound-herb, whether inwardly taken, or outwardly applied. The Green Leaves of it do conglutinate Wounds and cure those that are troubled with Ruptures: It is exhibited in the distilled water of Horsetail for the healing of inward Wounds: And some Physicians assure us, that the Powder exhibited for many days together cures all manner of Ruptures. The Herb called Ladies Mantle, is also an excellent Traumatick or Wound-herb, it heals, dries, adstringeth, stops bleeding, and stops the Whites and Courses of Women. The Leaves, Top and Root of this Herb is often added to vulnerary Potions, Plasters and Ointments.

Thus Marsh mallows, Wheat, the Root of White Lillies and Camomile do assuage pain; and St. Johns Wort, Mastick, Barley-flower and Birth-wort do restore the Flesh in a Wound or Ulcer. Thus Plantain, Pomegranate-shells, &c. have a Glutinating Virtue, because they are Styptick or Adstringent, and consist of such particles which entangle one another, and pressing upon the part that lies under them, do as it were squeeze the superfluous moisture of it.

Poppies, Quinces, the Juice of Pomegranates, and other such like, stop fluxes of blood.

The Reason is, because the particles of these Bodies insinuating themselves into the Pores, do divide the agitated particles of the blood, and by interposing themselves, make a separation between them: So as by this means they are no longer so much agitated as they were, and by this means come closer together. Or else the cause of this effect may be, because the Juice of Pomegranates, for instance, lying upon the mouths of the Veins and Arteries, obstructs their narrow passages, and doth not suffer the Blood to come forth. For we find by experience, that the efflux of blood is stopp'd by cold; as when in the bleeding of the Nose we apply cold water to our Temples or Nostrils, or a plate of Iron or a Key to the Nape of our Necks.

Poppies and
Quinces are
endued
with a vir-
tue to stop
fluxes of
Blood.

Horse-

XII.
Of Styptick
or Adstring-
gent Plants

Horsetail is a powerful *Adstringent*, and is accordingly used with great success in *spitting* or *vomiting* of Blood, stops excessive *blood-fluxes*, and all other *fluxes* of the *Belly*: For which purpose either the Herb it self may be taken in *powder* to the weight of one *Dram*, or of the decoction of it in *Wine* four *Ounces*, Morning and Evening, or if three *Spoonfuls* of the *distilled water* be drunk for two or three days together. Much the same virtue is also found to be in the Herb call'd *Great-water-dock*, all the parts whereof, *Stalks*, *Leaves*, *Flowers*, *Seeds*, but more especially the *Roots*, do very powerfully *adstringe*, *harden* and *conglutinate*. And therefore this Herb successfully puts a stop to, and *heals* all putrefying spreading *Sores*, as the *Rose*, whether whole or ulcerated, *Ringworms*, *Fretting*, *Ewils*, *Gangrenes*, &c. And stops all manner of *Fluxes* of Blood whether of *Emroids*, or of *Womens Courses*.

XIII.
Why some
Herbs en-
crease Milk.

Some Herbs conduce much to the encrease of *Milk*, as *Fennel*, *Poly-mountain*, *Milkwort*, &c. Others encrease *Seed*, as *Sparagus*, *Pine-nuts*, *Rice*, &c.

The former of these help to encrease *Milk*, because they nourish much; and therefore being mingled with the *Alimental Juice*, they open the *pores*, and remove the obstructions of those passages through which the *Chyle* is conveyed to the *Breasts*. For it is certain, that by a slight straining only, the *Chyle* becomes changed into *Milk*. And the Reason is much the same as to those Herbs which promote the *generation* of *Seed*; save only in this one thing wherein they differ from the former, *viz.* that they abound with more *Salt*, and diffuse a greater *heat* through the *Body*. By which means the *Organs* appointed by nature for the *generation* of *Seed*, are more opened, and consequently give a more free passage to the *matter*.

XIV.
Why
Worm-
wood, Bit-
ter Al-
monds, &c.
destroy
Worms.

Wormwood, *Bitter Almonds*, *Hartshorn* Philosophically calcin'd, &c. kill *Worms* and expel them out of the *Body* of *Men*.

The Reason is, because these *Simples* are *bitter*: For *Worms* delight only in things that are of a *sweet taste*, and with which they are nourished, as well as they were generated at first from them. For *bitter things* consist of rough *particles*, and which on all sides are surrounded with *prickles*, and consequently entering into the soft and spongy *Bodies* of *Worms*, they rend and tear their *inwards*. And by this means the *Worms* are killed, or avoiding the said *bitter things*, are expell'd by *Stool*, or sometimes tending upwards, are voided at the *Mouth* or *Nostrils*. *Corallina* or the *Sea-moss* that grows upon *Coral* is very famous for its efficacy in destroying *Worms* and expelling them, being given in *Powder* mixt with *Wine*, *Milk*, or the extract of *Cassa*, to the quantity of half a *dram* to *Children* under 14 years of age, and to those who are elder to the quantity of a whole *dram*.

XV.
How the
qualities of
the Herbs
that Ani-
mals feed
upon, come
to be com-
municated
to their
Milk.

Nurses Milk oft partakes of the *Odor* and *Taste* of the Herbs they have eaten: And it is notorious that *Cows* according to the difference of the Herbs they feed upon, do give a different *Smell*, *Taste* and *Colour* to the *Butter* that is made of their *Milk*.

The Reason is, because the *Milk* is made immediately of the *Chyle*, and not out of the *Blood*, which hath been formerly the common opinion. For the *Chyle* is carried from the *Stomach* to the

Breasts, and by some particular passages is carried from the *Guts* to the *Receptacles* of *Milk*. This is confirmed by the daily practice of *Physicians*, who give *Purges* to *Nurses*, when their *Nurslings* stand in need of being *purged*, because the purging quality of the *Medicin* is communicated from the *Chyle* to the *Milk*; but not to the *Blood*, which takes a much longer circuit through the *windings* of the *Heart* and *Arteries*, and undergoing several changes, cannot possibly retain the *Cathartick Virtue* of the *Medicines*. For how can it be that, when a *Nurse* drinks *Milk* ting'd with *Saffron*, within half an hour after the *Milk* in her *Breasts* should be of the same *colour*, *smell*, and *Taste*, if *Milk* were made of the *Blood*, and not of the *Chyle*, which by some secret and short passages, is conveyed to the *Breasts*? All which is further confirm'd by that Leaf of *Succory* which a Surgeon took out of the *Breast* of a *Roman Matron*, and which she had eaten the night before.

CHAP. III.

Of the obvious, or known Qualities of Plants.

GREEN is the common colour belonging to *Plants*, not only to them that are yet young and flourishing, but also to some when they are old and withered.

It is evident from what hath been said before, that the nature of *Colours* depends on the various *Reflexion* of *Light*, and the various disposition of the *surfaces* of those *visible Bodies* upon which it falls. So that those *Bodies* are of different *Colours*, whose outward *particles* are variously posited, and reflect the *Beams* of *Light* to the *Eye*. Thus the *Green Colour* we find in growing *Plants*, proceeds from the copious *moisture* wherewith they abound, the *particles* whereof are so mixed with other foreign *particles*, that they reflect and refract the *Light* in the same manner as those *Bodies* do, which in *Rivers* or standing *waters* are turned into *Moss*. And thus according to the various mixture of this moisture with the *External matter*, a different degree of *Greenness* is observed in *Vegetables*. For some of them are of a most deep *Green*, and such as these abound most with *moisture*, but their *juice* is not so exactly percolated as that of some others. Others are of a more pale *Green*, that is, such whose *Leaves* are of longer standing, or whose *Fruits* are come to their full maturity. Because in process of time a great part of the *moisture* flies away, and the crude or raw *Juice* being digested by *heat*, arrives at perfect *Ripeness* and *Concoction*. Hence it is that the *Leaves* of *Plants* sometimes put on other *colours*, and become *Yellow* or *Red*.

And whereas *Fruits* do very much differ in their *colours*, *Pears* and *Apples* being whitish, *Plums* yellow, *Blue* or *Purple*, *Cherries* *Red* or *Black*; this proceeds only from the various percolation of their *Juices*, and the different texture of their *parts*. For it is apparent that the *Juice* in an *Apple* or *Pear* is first coagulated into *Froth*, which afterwards becomes a hard *Flesh*; whereas in *Apricocks*, *Figs*, *Cherries* and *Grapes*, the same *Juice* is turned into a much softer substance. And therefore no wonder

I. colour
Why Vege-
tables are
commonly
Green.

II.
Why the
Fruits of
Plants are
of various
colours.

wonder if from this different disposition of their particles, such different colours are produced in them.

III. The Root which lies hid in the ground, is commonly more tender than the other parts of the Plant, and for the most part of a white colour.

The Reason is, because the particles of the Juice, which by heat are agitated within the pores of the Roots, endeavour to get out, and accordingly in effect many of them do break their Prison and fly away. But being hindered by the Earth, that lies about them, from going further, they return to the Root again, where undergoing a 2d Concoction, they make the Root the more tender. And forasmuch as that moisture which imparts a Greenness to the Leaves, is by the warmth of the Earth changed into froth, this makes the Root to look white, because according to the multiplicity of its surfaces, it reflects various parts of Light. Hence it is common with Gardeners to cover some Plants with Mould or Sand, as Succory Endive, Cabbage, Leeks, &c. to make them tender, and to give them a white colour.

IV. Some Vegetables are much more odorous than others: For such as grow in Arabia, and other hot Climates, are of a stronger fragrantcy than others; as appears in Cinnamon, which keeps its odour for many years.

The Reason is, because the odoriferous Steams that proceed from Bodies, do consist of sulphurous or fat matter, which being attenuated by Heat, and reaching the mamillary processes of the Nostrils, doth affect them either softly and pleasantly, or harshly. And forasmuch as those Vegetables which grow in hotter Countries, are more exposed to the Rays of the Sun, which exhale the watry humours, the fat and sulphurous humour only remains, which furnisheth the matter of all Odours, and is the more readily conveyed to our Nostrils, as being disentangled from the encumbrances of the watry particles. Now that this fat and sulphurous matter, is that wherein the Odours of Bodies doth consist is evident from hence, because when this sulphurous matter is taken away by distillation, the odour or fragrantcy that is in that Body is taken away together with it, as appears in the Caput Mortuum, or remaining Dregs that are left in the Alembick after distillation which hath no scent at all. And therefore it is no wonder, that those Plants are of a stronger scent, whose fat and oleous particles are resolved by heat; and that those are of a weaker scent, and do less affect our Organs, which grow in moist and wet places. Because their Juice is not thoroughly digested for want of heat, and the abundance of moisture hinders the due concoction of the sulphurous matter, and keeps it from being dilated and rarefied. Hence it is that such Plants as these do smell more strongly when they are dry, than when moist and green, because then the odorous particles breath forth more freely, as being no longer drowned or entangled in moisture.

V. Fruits have not always the same smell, but change the same according to their several stations: For such as are near their perfect Ripeness, do smell more sweetly than those that are green and unripe.

The Reason is, because since odour consists in the dry and thin parts of Bodies, the same is made

the more pleasant, and doth more softly affect the Organ of smelling, by how much the matter of the said odorous Steams is more thin and better digested: Which certainly is then, when Fruits are arrived to the pitch of perfect maturity, and ready to be gathered. For then by reason of a long decoction the Juice is more purified, the parts digested, and their perfect percolation advanced. And when this happens, no wonder if copious steams proceed from Fruit at this time, and more pleasant smells than when they are only in their first tendency to maturity.

Almost all Fruits are distinguish'd by their Taste, as affecting the Tongue and Palat after a peculiar manner. Some are of a harsh taste, as Sloes; other of a smart or sharp taste, as Onions, Mustard, &c. some sweet, as Wheat; some sower, as Sorrel; some bitter, as Wormwood, Aloes, &c.

This difference of Taste in Vegetables, proceeds from the different texture of their particles whereof the Fruit consists, and which entering the Organ of the Taste, do affect the same. For these little Bodies, when they are mixed with the Spitile, have the power of moving the Tongue, and impressing several affections upon it. Wherefore the particles of such Bodies which draw the Tongue together, and make it rough and harsh, are said to be of a harsh or sower and adstringent taste as unripe Fruit. And such whose particles prick the Tongue, and divide it with the sense of a kind of dilating heat, are said to be of a sharp, smart and biting taste, as Pepper, Mustard, Arsmart, &c. Those which smooth the Tongue, and pleasantly affect, are called sweet, as Licorish, &c. Those which prick the Tongue, and affect it with a constringent sensation of cold, are called sharp and styptick, as Cypress Nuts, the Rind of Pomegranates. Such as impress a kind of dryness upon the Tongue, are called bitter, as Aloes, Coloquintida, the Lesser Centaury, Wormwood, &c. So that the whole difference of these Bodies consists only in this, that their particles are of a different magnitude, and vary also in their Figure, Motion, Hardness, Lightness and several other ways.

Thus we find by daily Experience, that when a Man hath tasted Vitriol before his taking a Pipe of Tobacco, the smoak will seem as sweet to him as Honey, and with a pleasant tickling will affect his Organ of Taste; because the styptick or adstringent saline particles that are in the Vitriol, being impregnated with the sulphureous particles evaporated from the Tobacco, do produce a sweet Taste.

Some Fruits do change their Tastes, so as that those which before were biting and bitter, become sweet and grateful; thus Garlick and Onions, being boiled in water, lose their Acrimony.

The Reason is, because the Taste of Fruits consists in their stiff and pricking saline particles. And therefore Garlick and Onions become sweet and pleasant when they are boil'd, because the fire opening their pores, makes way for the saline particles to exhale. Hence it is also, that all Fruits, as they ripen, grow sweeter; forasmuch as upon the evaporating of their moisture, their salt Armoniack and other volatil saline particles fly away, leaving these only behind them that procure a sweet Taste to the Fruits. And it is for the same reason

VI. The cause of the different Taste that is in Fruits.

VII. Why the smoak of Tobacco seems sweet after the tasting of Vitriol.

VIII. Why Garlick and Onions lose their bitterness by boiling.

reason that *Garlick* and *Onions*, being soaked in boiling water, acquire a milder Taste, viz. because the particles of Salt that were in them are dissolved by the water, and being intangled with it, do evaporate into the Air. Thus the Root of *Arum*, when new took up out of the Ground, is of an extream smart, biting and pungent Taste, but being dried, and especially being long kept so, becomes insipid, and consequently inefficacious and of little or no virtue.

CHAP. IV.

Of the Occult Qualities of Plants.

THE Occult Qualities of Plants, are generally such as belong to *Medicin*, and are discernible by Reason, rather than by the Senses. Amongst these we will first speak of the Purgative Virtue or Quality wherewith several Plants are endued, and by means whereof they expel excrementitious and corrupt humours out of the Body by siege. Thus *Rhubarb* and *Scammony* purge *Choler*; *Sena*, *Polypody of the Oak*, *Dodder of Thyme*, *Hellebor*, &c. *Black Choler* or *Melancholy*; *Carthamus* or *Wild Saffron*, *Agarick*, *Herb Mercury*, *Spurge*, and the several sorts of it, *Phlegm* and watry Humours; *Fumitory*, *Cassia Fistula*, *Prunes*, *Bugloss*, purge and cleanse the Blood from its dregginess.

The Opinion of the Antient Physicians was, that *Medicins* that are endued with a purgative virtue, exert the same by a likeness of substance to those Humours they attract and expel out of the Body. And therefore *GALEN* who made the purging virtue of *Simples* to consist in attraction, *Simpl. Lib. 3.* asserts a similitude between the substance that purgeth, and that which is purged: So that *Purging Medicins*, according to his Opinion, do pick out some particular humour, which they expel out of the Body, viz. some, *Choler*; others, *Phlegm*; some, *Melancholy*; &c. But I cannot be induced to comply with this opinion, seeing that daily experience teacheth that the *Melancholy Humour* which is tough and clammy, is expelled by *Cassia* and *Coloquintida*, which have no affinity at all, or likeness of substance with that Humour. So likewise the watry or ferous humours of Persons afflicted with the *Dropsie*, are evacuated by *Aloes* and *Rhubarb*, when yet there is no similitude between their substance and that of the Moisture they expel.

But if we examin this point more narrowly, we shall find that contraries are rather cured by contraries. For what Physician doth not know that the deterfive quality that is in *Wormwood* consists in its sulphureous Spirit; that the Roots of *Plantain* and *Bugloss* do thicken thin *Choler* by the clammy consistence of their Juices; that all the *Sorrels*, *Juice of Limons*, and all *Acids* do thin and cool the Blood, and allay its Fury, not with adust Sulphur, but with their acid and cold Spirits? Besides infinite other *Simples*, which either by softning or asswaging do purge those Humours with which they have no similitude at all.

Conclude we therefore, that *Purging Medicins* expel corrupt humours by fermentation in this manner: The Medicament as soon as it is

taken into the *Stomach*, doth there meet with a sharp humour, which flows from the *Heart* through the *Arteries*, whereby, as with an *Aqua-Fortis* it is dissolved: But forasmuch as it is of a different substance from the said Juice, and therefore doth not mingle with it without difficulty, the Juice by means of the *Medicin*, begins to swell and ferment; as we see that *Wine* doth, by reason of its *Sulphureous Lees*, or by the mixture of some *Heterogeneous Substance* with it. Afterwards this *Medicament* is carried to the *Lacteal Veins*, and from thence to the common *Receptacle* detected by *Pecquet*, and thence to the *Ductus Thoracicus* or *Breast-passage*, and so is conveyed into the left *Axillary Vein* where it is confounded with the Blood. But because by reason of the *Heterogeneousness* of its Parts it cannot be united with the Blood, therefore it joins it self with the *Choler*, *Phlegm*, or other Humour lurking in the Blood. And forasmuch as it is carried with the Blood throughout the whole Body, it doth in its passage twitch and prick the parts, whereupon they become contracted, and squeeze out the humours that were lodged in the Vessels belonging to the said parts. Now while all the parts of the Body do thus successively expel these humours, and they find no refuge for themselves in the Veins, they are driven towards the *Stomach* and *Guts*, which they irritate to expulsion, and so are evacuated with the common excrements of the Food. Thus according to the difference of the Plants, different Humours are expelled; as *Choler* by *Scammony*, *Phlegm* by *Coloquintida*, *Melancholy* by *Black Hellebor*; *Black Choler*, so called, by *Dodder of Thyme*, *Sweat* by *Sarsaparilla*, &c.

Some Vegetables excite Vomiting, and evacuate Humours by the Mouth; as the middle Bark of *Walnut-trees*, *Coloquintida*, *Broom Leaves*, *Nuxvomica*, &c.

The virtue of these Vegetables is not much unlike that of *Purging Medicaments*, save only in this, that their operation is more swift, by exciting a quicker Fermentation. Corrupt Humours therefore are expelled by *Vomit*, when the *Stomach* being vellicated or twitched by the particles of the Medicament, becomes so contracted and drawn together, that it can no longer contain the matter that is in it, and consequently drives forth the Humours that oppress it. And therefore it is dangerous to exhibit *Vomiting Medicaments* to those who are troubled with the *Pibisick* or *Consumption*, or that have strait Chests, lest the *Stomach* should not have room enough to display it self in vomiting, or by a too violent compression of its Fibres should occasion a dangerous Convulsion. This vomitive virtue is found in the *Herb Groundsel*; the Juice whereof being taken in Beer, or the decoction of it in Water with *Curans* or *Hony*, affords a gentle *Vomit*. So the Water of a certain Thistle called *Silybum*, being drunk causeth vomiting: And the Root of the *Herb Thapsia*, as well as the Juice or Decoction thereof, doth purge upwards and downwards with great violence, and therefore is not safe to be given inwardly.

Some Plants cure the Diseases and Grievs of some parts: Thus *Betony*, *Hyssop*, *Maiden-hair*, &c. are good for the Head; and particularly *Sweet Marjerom* do help the cold affections of the Head

efficiency by fermentation.

VI. Why the Odour of Herbs sometimes per- forms the same effect which the substance of the Herb taken doth produce.

IV. What is the cause of the Vomitive Virtue of some Plants.

VII. Why Cat- are so much delighted with Cat- mint.

VIII. Why a piece of Pumpkin being put into a Pot wherein Flesh is boiling, makes the same tender.

V. Of the different virtues that are in Plants.

Head and Brain, which way soever it be taken; the Powder of the dried *Herb* snuff up, provokes *Sneezing*, evacuates *Phlegm* and strengthens the *Brain*; and the same effect is caused by the Juice of the *Herb* snuff up. *Borrag*, *Angelica*, *Bugloss* and *Balm*, strengthen the *Heart*, and remove the Distempers of it: *Wormwood*, *Sage* and *Aniseed* are good for the *Stomach*. Thus *Endive* and *Succory* are appropriated to the *Liver*, and afford a most excellent Remedy to remove the Heat of the *Liver* or its obstructions, which way soever it be taken, whether the *Leaves* of them be eaten raw or boyled, or the *Juice*, distilled *Water* or Decoction of them; and therefore greatly commended in *Fevers*.

The Reason of all these manifold virtues is to be lookt for in the different texture of their parts. For seeing that the disposition of the parts of the *Head*, *Heart*, *Stomach* and *Liver* is different, they must consequently be cured by different Remedies. Now *Bodies*, according to their various Figures, produce also various effects. Thus subtil and thin *Bodies* are aperitive or opening; thick *Bodies*, incrassate; sharp and biting are absterfive, and cutting or inciding.

VI. Why the Odour of Herbs sometimes performs the same effect which the substance of the Herb taken doth produce.

There are some, who with the smell of *Herbs* or *Drugs*, are purged, much after the same manner as if they had taken a purging Medicament inwardly. Thus I knew an *English Gentleman* in *Flanders*, who when ever he passed by an *Apothecaries Shop*, was moved to go to Stool, as if he had taken a *Purge*.

The Reason of this was, because the particles flowing from the *Purgative Drugs* or *Medicins*, did so agitate the *Brain*, and consequently the *Nerves* of this Person, that thereby they put the *Humours* in the same motion, as might have been expected from a purging Medicin; viz. by the rushing of the *Spirits* against the *Fibres* of the *Stomach* and *Guts*.

VII. Why Cats are so much delighted with Catmint.

Cats take a very particular pleasure in *Catmint*, tumble themselves over it, and seem wonderfully pleased with the touching of it.

The Reason is, because *Catmint* consists of such particles as have a great sympathy and agreement with the *Brains* of *Cats*: For seeing that *Beasts* are not led by Reason or Judgment, but by a meer impulse of Nature, or rather by the disposition or make of their *Organs*, they cannot but be allured by those objects that present themselves to them; which could not be, except some steams did proceed from them, with the scent whereof they are affected. Wherefore we may conclude that in *Catmint* there is such a Texture of *Fibres*, as hath a great agreement and correspondence with that of the *Brains* of *Cats*.

VIII. Why a piece of Pompion being put into a Pot wherein Flesh is boyling, makes the same tender.

A piece of *Pompion* put into a *Pot* in which *Flesh* is boyling, doth make the same more tender than ordinary.

The Reason is, because the *Pompion* abounds with strong *Spirits*, and a sourish *Juice*: Now it is manifest that all sour things are endued with a resolving virtue, which daily experience shews us concerning *Vinegar*. And *PLINY* assures the same concerning sharp pointed *Docks*, viz. that being boyled with *Flesh*, it makes it more soft and tender; because its sharp and corroding quality doth dissolve the Texture of the *Fibres*.

The same virtue is by *Botanists* attributed to *Hippolapathum* or *Patience*, which renders the oldest and toughest *Flesh*, when boyled with it, tender and fit to be eaten. For this *Herb* being of a slippery and moist nature, it makes the oldest and toughest *Beef*, or any other *Meat*, soft and tender. And for this reason the use of it was very frequent amongst the *Antients*, because it renders the *Meats* boyled with it, easie to be concocted, and besides, makes the *Body* soluble.

IX. Why some Plants are of a deleterious quality, and kill living Creatures.

Some *Plants* are endued with a pernicious power of killing *Animals*. Thus the *Herb Napellus*, which is a kind of *Wolfsbane*, doth by its extream heat burn the *Body*, and scorch and consume the firmer parts of it.

This effect is also to be attributed to the figure and motion of *Plants*, by means whereof they exert their virtues, and perform those effects we are surpris'd at. For it is most consentaneous to reason, that the parts whereof *Poisons* consist, are very stiff, penetrating, hard, and armed with *Prickles*. In the same manner as we find by the *Microscope*, that *Nettles* are armed with an infinite number of prickles; wherefore such *Bodies* as these being fermented in the *Stomach*, and mingled with the various *Humours* therein contained, doth excite a very violent *Ebullition*, especially when it is conveyed out of the *Vena Cava* into the left *Ventricle* of the *Heart*, and from thence into the right. For its heat being here encreased, it breaks forth with extream violence, and rushing upon the inward parts, doth with its sharp points and prickles penetrate, corrode and tear their substance.

X. Again, there are other *Plants* which are of a contrary virtue, and which kill *Animals* by their coldness, as *Hemlock*, which kills *People*, or makes them go mad or senseless; and *Scammony* which doth so draw the *Wind-pipe* together, that it sometimes choaks and kills *Men*.

XI. The efficacy of these *Plants* consists in this, that they stop the circulation of the *Blood*, and suppress the Native Heat; for seeing that the motion of the *Blood* is smooth and easie, as passing through all the parts of the *Body* with an even Courte, when ever cold, or slowly moved *Bodies* do enter into the mass of it, they disturb and confound the motion thereof, and dull or diminish the heat of the *Plants*: And being through the *Veins* carried to the *Heart*, they cool it, and reduce it to a kind of lukewarmness. For whether the agitation of the particles of the *Poison*, be contrary to the motion of the *Blood*, or whether the slowness of their motion do destroy its heat, still the same effect will follow, if by their entering into the *Heart* a change is made, and the *Orifices* through which the *Blood* is conveyed thither, be never so little obstructed. For no other reason can be assigned why the eating of *Hemlock*, makes persons mad or senseless, but because the said *Herb* taken inwardly, causeth disorderly twitchings or vellications of the *Brain*, by which means the *Spirits* are hindered from their natural and due motion through the *Fibres* of it.

XII. Thus *Physicians* tell us, that when the *Air* is corrupted by noxious exhalations, the *Plague* and other *Epidemical Diseases* are produced; for the particles of the *Pestilential Steam* being taken in with the *Breath*, and insinuating themselves into the *Blood*, do confound the natural ranging of its parts.

particles: Even as the *Rennet* when mingled with *Milk*, and diffused through the substance thereof, doth so change the ranging of its parts, as to make a fixt *Body* of that which was fluid.

XIII. And probably it is for no other reason, that the Root of a certain Tree called *Baxana*, growing in a Kingdom belonging to the *Dominions* of the *Great Mogul*, doth immediately cause death to them that take it, by stirring up a sluggish drowsiness or heaviness over the whole *Body*; but because as soon as it enters into the *Blood*, it doth by its coldness allay the heat of the *Heart*, and by this means diminish the heat that is in the extrem parts of the *Body*, and afterwards by degrees cools the *Blood* that is in the *Veins* and *Arteries*, whereby soon after the *Heart* itself is seized and nummed. But what is most wonderful is that *Historians* tell us, that the *Fruit* of the said Tree is altogether harmless, and is safely eaten by the *Inhabitants*; the reason whereof probably is, because the *Fruit* is better concocted by the heat of the *Sun*, and the cold *Humours* discurr and exhaled.

XIV. Neither is *Hemlock* always hurtful to all living Creatures: For *Starlings*, if we may believe *GALLEN*, do commonly feed upon it, and without receiving the least hurt thereby. And some *Anatomists* tell us, that they have found the Crop of a *Bustard* full of *Hemlock Seeds*, which had only 4 or 5 grains of *Wheat* mingled amongst them. And the Poet *LUCRETIVS* adds,

Thus with cold *Hemlock* Goats we fatted see,
Tho' it to Man a present Poison be.

Wherefore it appears that *Hemlock* is not deadly to all *Animals*; seeing that the use of it inwardly is commended by Modern *Physicians* in the Swelling and Inflammation of the *Spleen*, as the Juice of it is an ingredient in *Splenick Plaisters* to soften the hard swellings thereof.

XV. A Mad Bull is tamed by tying a twig of the Wild Fig-tree to his Neck; and the same virtue is also attributed to the Herb *antheris*.

This may come from the Steam proceeding from that Plant, which being diffused through the Wild Bulls Brains, doth so affect the Nerves thereof, as to cast him into a stupidity or numness, whereby he loseth all his strength. The same is related by some concerning the *Lion*, that as soon as he is but toucht with the Herb *Adamantis*, he lies with his Mouth open upon his Back, as having quite forgot his wonted strength and fierceness.

XVI. Some Herbs are endued with a virtue against Poison, and therefore are called *Antidotal*, or *Alexipharmacal*. Thus *Purslain* cures the biting of *Serpents*; *Endive* that of *Spiders*. *Wine* resists the cold Poison of *Hemlock*. And besides these, *Marygolds*, *Carduus Benedictus*, *Angelica*, *Rue*, &c. do powerfully resist Poisons, and break the force of them.

The Reason is, because these Plants consist of such parts as have a great affinity with the particles of those poisons which they overcome, and therefore easily join with them; and by this means do by their interposition break the force of them, and change the ranging and figures of those Bodies, which without their conjunction, do fix and

coagulate the *Blood*. For hot things do easily discuss and overcome the violence and malignity of cold Poisons; and therefore the Publick Executioner adviseth *Crito*, that he should not suffer *Socrates* to dispute too earnestly, lest his *Body* should be too much heated. *SCALIGER* Exercit. 52. Moreover cold Plants also are found to be of use for the curing of cold Poisons, by drawing them out of the *Body*; because when the *Blood* is coagulated by cold, it is dissolved again by the supervening liquor, and its nimblest particles are put into motion again; and both of them being thus confounded together, are variously agitated, and at last thrust together out of the *Body*.

CHAP. V.

Of the Sympathy and Antipathy of Plants.

THE Female Palm-tree seems to delight in the nearness of the Male Palm, and becomes more fruitful by standing in its Neighbourhood; and therefore inclines her Top and Branches that way; and being removed farther from the Male Palm, languisheth, and sometimes withers and dies.

The Reason of this sympathy between both these sorts of Palm-trees, is a certain steam which proceeds from the Male Palm to the Female, which abounds with a seminal and fecundating virtue, and insinuating it self into the Female Plant, make her more flourishing and fruitful. For it seems that in this case it happens with the *Palud-tree*, as with *Hens*, which lay Eggs indeed without the Cocks Treading, but yet the said Eggs cannot be animated or become prolifick, tho' the Hen sit never so long Brooding upon them. So Herbs being endued with a vegetating virtue, as well as Animals, which propagate themselves by a moist Seed, do transfuse the generating virtue and vital spirit from one to another by mutual embraces, and this by a tacit consent of nature, and are cherished, animated, flourish, and produce Fruits and Seeds by a hidden and secret inspiration.

Cucumbers and Gourds have an antipathy against Oyl; so that when ever it is put to them, they seem to turn away from it.

The Reason is, because the Effluvia that proceed from Oyl, consist of such particles, as do with their sharp prickles and points run into them, and cause their Fibres thereby to be contracted, so as that they seem to avoid, or withdraw themselves from the Oyl.

The same Antipathy is found between the Ivy and the Vine, inasmuch that a Cup made of Ivy will not admit of Wine. For if we may believe *CATO*, if a Cup be made of Ivy, and be filled with Wine, if the same be mingled with Water, immediately the Wine will run out of the Cup. And it was probably for this cause that the Ivy-tree was consecrated to *Bacchus*, forasmuch as it resists Drunkenness, and removes pains of the Head, caused by too much drinking of Wine.

Cabbage is said to abhor the neighbourhood of the Vine: And *Rue* to be an Enemy to *Hemlock*.

I.
Why the Female Palm-tree delights in the Neighbourhood of the Male Palm.

II.
Why Cucumbers and Gourds have such an aversion from Oyl.

III.
Why the Ivy hath an Antipathy against a Vine.

IV.
Why Cabbage is said to be an Enemy to the Vine.

One

One *Plant* is said to be friendly or inimical to another, not by reason of any *Sympathy* or *Antipathy* that is between them: For such a concord or enmity is not to be found among *Plants*; but on the contrary when one *Plant* is nourished with the same kind of *Juice* that another is, their Neighbourhood becomes hurtful to one another, because when the one robs the other of his due *Aliment*. If two *Plants* are maintained by a different *Juice*, then they are said to *sympathize* together, as we flourisheth, when planted near to a *Fig-tree* because they draw a contrary *Aliment* from the *Ground*; the one of them taking in a moisture which gives it a *sweet taste*, and the other such as affords it a *bitter taste*. And it is for the same Reason that a *Rose-tree* which grows near *Garlick*, brings forth sweeter scented *Roses* than that which is in the neighbourhood of other *Plants*, because the noisome and offensive *Juice* being sucked in by the *Garlick*, the purer and more fragrant *Juice* is left for the *Rose*.

V. The *Live Plant*, called, to which the *Arabians* and *Perfians* give the name of *Suluc* or *Saluc*; and to which *Philosophers* have given the Title of *Chaste* or *Shamefaced*: whilst it is *Green* it be touched never so slightly with ones hand, or be never so little squeezed with ones finger, it presently starts back, and contracts it self; but no sooner is the hand of him that toucheth it withdrawn, but it returns again to its natural posture. And *THEOPHRASTUS* tells us, in the 4th Book of his *Histories*, Chap. 3. that there was a *Tree* growing about *Memphis* in *Egypt*, which to outward appearance was thorny and prickly, and its *Leaves* resembled *Fern*, the *Branches* whereof being touched, the *Leaves* immediately fall and wither, and afterwards recovering their strength, rise again and return to their former state, as is expressed in the *Figures*.

Figure 27.

HENRICUS REGIUS, in the 4th Book of his *Natural Philosophy*, endeavours to give a reason of this *Miracle*; supposing in the first place this *Plant* to be of a very tender and pliant substance, which upon the least touch is wounded and bruised. 2dly, That there are some inward *Nerves* or *Fibres* marked 1. 1. wider than other outward ones, signed 2. 2. by which means the *Stems* proceeding from the *Earth T*. are in more abundance sent up into the upper *Fibres* of the *Leaves b b*, than into the lower *c c*. For when a Hand toucheth the upper part of the *Leaves* about *d d* of the *Figure A*, the *Spirit* contained in those parts, are by the inward *Nerves I. I.* carried downwards, and consequently open the *Flap Doors* and *Pores* that are about 5 5, and pass out of the wide *Nerves* into the narrower 2 2. And forasmuch as they cannot go downwards, because they are hindered by the upward tending *Flappets 6 6*, they ascend, and in their ascent shut the *Flappets 4 4*, opening from the narrower *Nerves* to the wider, and thus necessarily pass to the inward *Muscles* or *Fibres c c*, and blowing them up, draw the *Leaves* downwards, as far as the *Joint* marked . . . reacheth, according to the *Situation* and *figure* expressed *Figure A* and *B*. But afterwards when those *Leaves* are bent or prest downwards, and that the Hand be removed again from the *Herb*, then the said *Stems* do move more copiously out of the *Earth T* through the inward and wi-

der *Nerves I. I.*, and the ascending *Flappets 3 3*, than through the outward and more narrow 2 2, into the *Stalk*, and therefore first shut the *Flappets* that are about 5 5, and that lead from the wider and inward *Nerves*, to the outward 2 2; and proceeding further, enter into the *Muscles* of the *Leaves b b*, and blowing them up, do somewhat lift up the *Leaves d d* that before were prest down; and by this their lifting up of the *Leaves* do press those *Stems* which are in great abundance in the lower *Muscles* of the *Leaves b b*; which being pressed, do open in the narrow *Nerves 2 2*, the *Flappets 4 4* that lead from the outward *Nerves* to the inward, and pass into the broader and more inward *Nerves I. I.*; and there forasmuch as by reason of the copious *exhalations* ascending from the *Earth T*, and shutting the *Flappets 5 5*, which lead towards the narrow *Nerves*, they can neither descend, nor pass sideways, they are by those copious *exhalations*, which continually ascend into those wider *nerves*, necessarily determined, to the upper *Muscles* of the *Leaves b b*; and entering into them, together with *Stems* that ascend out of the *Earth* through the broader *Nerves*, they lift up the upper parts *b b* of the *Leaves* that are filled with these copious *exhalations*, but emptied with respect to their inward parts *c c*, and so reduce them to the same situation they had before, and the same that is expressed in the *Figures*.

But this contraction of the *Leaves* may also be assigned to *Cold*. For the coldness of the *Finger* representeth the spreading motion of the *Juice* in the *Nerves*, and in a good measure stops the influence thereof; whereupon the *Fibres* do immediately contract or draw in themselves, and at the same time bend the *Leaves* downwards: After the same manner as we find that *Cold* doth condense and wrinkle the *Skin* of our *Body*, whereas on the contrary, *Heat* doth extend the same. And the *Lappes* of the *Leaves* are drawn inwardly together, because probably the upper *Fibres* of the *Nerves* are drier, and consequently are more readily and sooner contracted; and the lower *Fibres* softer, and therefore do more easily give way to be extended. Now that this contraction is caused by *Cold*, may be gathered from some *Flowers*, which shut themselves in the night, as *Marygolds*, *Succory* and *Woodbind Flowers*. So likewise we read of a *Plant*, the least *stalk* whereof, if it be wounded with a *Knife*, immediately the *Flowers* fall from it, because of the contraction or shrinking of the cut *Nerves* to which the *Flowers* are fastened.

Some *Historians* tell us of a *Tree* called *Pudifetana*, which cannot so much as endure the breath of *Man*.

The Reason of this may be, because the particles of the *exhalation* are so strongly driven against this *Plant*, that its tender *Nerves* are thereby dissolved, and their *Texture* disturbed. As we find that the tender *Bodies* of *Children* become sometimes infected by the *Breath* of an *Old Woman*.

Travellers who have visited the *Island* of *Japan*, do make mention of a certain *Tree*, which hath such a friendship with *Iron*, that if a *Branch* of it be lopt off, it may be joined and fastned to it again, by means of a *Nail* struck through it

VI. Another Explication of the contraction of Leaves of the Sensitive Plant.

VII. Why the Pudifetana Tree abhors the Breath of Man.

VIII. Of a Tree in Japan, that hath sympathy with Iron.

into the *Tree*, and flourish again as much as ever. Yea if the *Tree* begin to decline or wither, it presently recovers as soon as filings of *Iron* are laid to the *Roots* of it.

Supposing this Relation to be true, this effect does seem to be attributable to nothing else but to the indented particles of *Iron*, which do open the pores of the *Root*, and so cause the *Alimentary Juice* to pass up more freely into the *Stem* of the *Tree*. And forasmuch as some of these particles do continually break forth from the *Iron* of the *Nail* that is struck through the *Branch*, no wonder if by this means, the obstructions are taken away, and the ready passage of the *Juice* be furthered.

IX.
Why Maidenhair and Cabbage seem to abhor water.

Maidenhair and *Cabbage* seem to abhor water, and to keep it off from themselves. And therefore if they be dipt in water they do not grow wet, but are taken up out of the water as dry as when they were dipt in.

The Reason is, the great smoothness of their surface, which is such, that it will not suffer any water to stick to it. For water cannot stick to any Body, except its surface have some small roughness or wrinkles, wherein the liquor may stick and be intangled. Hence it is that all fat and greasie things can admit of no water to stick to them, because *Fat* hath a very smooth surface, and doth render those things smooth that are besmeared with it. Or this quality in *Maidenhair* and *Cabbage* whereby they reject water, may be attributed to a very thin Down that covers their *Leaves*, such as we see there is in some *Fruits*, which gather all the drops of water upon their points, and keep them rounded there, so that they cannot penetrate any deeper, nor wet them except after a long lying in water.

X.
Why Water-Mallows, Purslain and Herb-Mercury seem to have an Antipathy against Lead.

A Man that hath dipt his hand in the Juice of the *Root* of *Water-Mallows*, *Purslain* and *Herb-Mercury*, may put it into melted *Lead*, and receive no hurt thereby.

This proceeds from the natural coldness of these Juices, and also from the clammy thickness of them, which covers the hand as it were with skin, and hinders it from being touched by the melted *Lead*. To which may be added, that they leave also a great smoothness upon the skin, which makes the *Lead* immediately to glide from it, so that the heat of it hath not leisure to penetrate the pores of it.

XI.
How Dittany draws out any Iron Weapon out of a wound.

So great is the sympathy betwixt *Dittany* and *Iron*, that upon the touch of it *Iron Weapons* drop out of the *Wound* of any living *Creature*. According to what *TULLY* tells us in his 2d Book de *Natura Deorum*: It is reported that the *Goats* in *Crete*, when they are wounded with *Arrows*, do seek for the *Herb Dittany*, which they have no sooner tasted, but the *Arrows* drop out of their *Bodies*.

Some have supposed this effect to be caused by a kind of *Magnetical Virtue* in *Dittany*, whereby it attracts *Iron*; but daily experience hath convinced this conceit of falsity. For this *Herb* when applied to *Iron*, exerts no *Magnetical Virtue* at all upon it. Conclude we therefore rather, that *Iron Weapons* drop out of the *Body* upon the eating of this *Herb*, because it makes the *Wound* wider, and opens the *Orifice* by its agitation of the parts of it, so that by this means the *Iron* either drops out, or is easily pulled out with the least touch. To

which may also be added the force or impulse of irritated Nature, which being assisted with the particles of the *Herb*, or some *Effluvia* proceeding from it, doth endeavour to thrust out that which is hurtful to it.

Those that have lived in *Virginia* tell us, that a sort of *Wild Pennyroyal* grows there, which is so hateful to a *Serpent* called the *Rattle-Snake*, that if the bruised *Leaves* be but held to the *Nostril* of this *Serpent* for about half an hour, it infallibly kills it. And therefore this *Snake* is never found in those places where this *Herb* grows.

There are no *Plants* that have the power driving *Devils* away. For *Bodily Substance* cannot exert any activity upon *Spiritual* or *Immaterial* Ones. And tho' some *Herbs* are applied to persons possessed, in hope to yield them some relief, yet must not we conclude from thence, that they have any power against the *Devils* themselves for the reason above-mentioned.

CHAP. VI.

Of the Origina of Plants.

IT is believed that some *Plants* grow of themselves without *Seed*, such as *Asarabacca* which grows sometimes upon *Walls*; and a kind of *Maidenhair* which grows on the sides of *Wells* and near moist places. Besides, many other *Herbs* which of themselves sprout out of the mould that hath been deep dug out of the ground.

They who attribute the virtue of inferior things to the *Stars*, and suppose that nothing can be done upon earth, without the concurring help of the *Heavenly Influences*, refer the original of *Plants* to the *Sun*, or any of the other *Planets* or *Stars*, as making them the *Authors* of all *Sublunary Generations*. And therefore such as these are of the opinion of the *Cabalists* who precisely assert, That there is no *Herb* or *Plant* here below, which hath not his *Star* in the *Firmament*, which strikes with its *Rays*, and bids it grow. But having before treated of the power of the *Stars*, and taken it for granted that our *Modern Philosophers* are not so weak as to attribute all particular effects to general Causes, we must look out elsewhere for the Original of *Plants*.

Some are of opinion, that all *Plants* spring from the fortuitous meeting of some *Earthly particles*, as when the insensible parts of the *Earth* being agitated in the upper Crust of the *Ground* by the subtil matter do acquire such a figure, together with such a situation and motion, as is necessary for the first formation of the *Plant*: And from whence, as to the foundation, all the other parts afterwards are reared, whilst the *Nutritious Juice* mounting up through this first Rudiment of the *Plant*, doth dilate the parts, and assigns a certain figure to them. They suppose indeed that the Generation of *Plants* is somewhat Analogous to that of *Animals*, viz. when *Plants* do arise or spring from a *Seed* sown: Because the *Seed* in this case resembles the *Egg* of *Animals*, as consisting of a *Bud*, a *Shell*, *Membrans*, and a *Yolk*. Yet with this difference, that the distinction of *Sexes* is not requisite to the generation of a *Plant*, because every *Plant* gives forth its *Seed* in the *Fruct* it produceth; which *Seed* doth not stand in need

XII.

There is no such virtue in Plants whereby they can chase away Devils.

XIII.

Whether Plants grow without Seed.

I.

The opinion of the Cabalists.

II.

The opinion of some Philosophers.

III.

The opinion of some Philosophers.

of a *Womb* to receive and cherish it, since the *Fruit* it self supplies that place. But yet for all this they suppose also that *Plants* may be *Generated* without either *Root* or *Seed*.

IV. For they observe with the *Antients*, that *Herbs* grow on the top of the *Sea*, and that these are the product or effect of the coagulated *Sliminess* of the *Water*, wherein the heat of the *Fire* is most predominant, and the *Sea* moves more slowly than in other parts of it. Yea there are some who have made it their observation more than once, that *Herbs* have sprung out of *Snow* that hath been kept a long while, which *Herbs* they have found to be of a *bitter Taste*. Neither can this be any matter of so great wonder to us, when we find that *Worms*, not much unlike those which are generated in our *Bodies*, are sometimes generated out of *Snow*, as some ingenious persons in *Germany* have lately observed.

V. Others again have observed, that *Herbs* have sprung forth from *burnt* or *calcin'd Earth*, especially after it hath been watered with a copious *Shower*. Because by the power of *Heat*, the particles of *Bodies* are as it were let out of their prisons, and joining variously together, do form the *Rudiments* of *Plants*; which the moisture doth further unite and work together. Now that in this *Earth* the *Seeds* of *Vegetables* lie hid, may be gathered from this, that if after it is *burnt* it be exposed to the *Air* and *Rain* again, it brings forth divers *Vegetables*.

VI. *Historians* tell us, that a great *Wood* sprung up out of the ground in *Cyrene*, after the falling of great and copious *Showers*, which extended it self to many miles. And *THEOPHRASTUS* *Histor. Lib. 6. Cap. 3.* says that a famous *Tree* called *Lafer* (which *PLINY* reckons amongst one of the excellent gifts of *Nature*, as being of great use in many *Medicinal Compositions*, and strengthening concoction in *Old Men* and *Women*) sprang out of the *Earth* in those parts, after a shower of *Rain*, whereas before it had been there altogether unknown.

Some imagine that this great *Wood* and useful *Tree* did not spontaneously, or of themselves spring out of the ground, but from *Seeds* carried thither by the *Winds*. But they suppose there is no necessity to grant this, forasmuch as *THEOPHRASTUS* tells us, that the ground in *Crete* can scarcely be turn'd up, but that *Cypress Trees* do spring up from it, and this not from any foreign *Seeds* conveyed thither, but because the ground there abounds with particles, which, when exposed to the *Air* and agitation of the *Sun Beams*, do form the *Rudiments* of those *Trees*. And the reason, say they, why the same doth not happen in other ground, is because the particles of *Seed*, cannot be so mingled and grow together, as is necessary to form the first organization of those *Plants*. For it is a thing notorious beyond all dispute, that every ground is not proper to bring forth all manner of *Plants*; for we see that those *Plants* which grow in great abundance in both the *Indies*, *Brazil*, *Arabia*, &c. will not grow in *England* or *Flanders*, or other northern parts of the *World*. Yea in one and the same *Country* some *Plants* grow in one part, and not in the other of it, according to the peculiar quality and disposition of the ground. So that they suppose that *Woods* may

be generated, not only by the *Industry* of *Man*, or by *Seeds* carried by the *Winds*, but from particles found in the ground, which by heat may be so disposed, as to shoot up into different *Plants*.

Wherefore it cannot seem strange that on the *Dikes* that are cast up in the *Ile of Ely* for the draining of the *Fenny Grounds* such vast quantities of *Mustard Seed* should grow, tho' never any known in the memory of men to have grown there before. So likewise after the *Dreadful Fire* of *London* great quantities of the *Narrow Leav'd Neapolitan Hedge-Mustard* was known to grow in the *Ruins* of this *City*, according to the relation of many *Credible Authors*, whereas for many hundreds of years the ground had been built with *Houses*, nor ever any such *Herb* was known to grow there, so that it must be concluded, that either this *Herb* did grow of it self there, or that it grew up from *Seeds* that had so long been hid in the ground, which none will easily admit.

But all difficulty will be removed as to this point, if we consider how *Plants* grow upon *Walls*, the tops of *Houses* and *Rocks*: To which places it is not easie to be conceived how any *Seeds* should be conveyed; and therefore it seems most obvious to conclude, that they proceed from large and plentiful *Showers*, which leave some slimy matter upon the said *Walls* and *Rocks*, which being cherished and assisted by the *Sun's Prolifick Heat* doth bring forth *Herbs*. It cannot be doubted, but that many particles of the *Earth* do mingle themselves with the *Streams* that do continually ascend from it; which afterwards when the said *Streams* or vapors are turned into *Rain*, fall down again, and cleave to rough *Bodies*, and when the water is again rarefied into *vapor*, do remain behind upon the said *Bodies* in the form of *Slime* or *Mud*, out of which afterwards many *Plants* do bud.

But notwithstanding all these *Reasons* and *Experiments*, our modern *Philosophers* believe that all *Vegetables* are formally contained in their *Seeds*, and that they are not formed by apposition of parts as *Stones* and *Metals* are, but at once and all together like perfect *Animals*. They cannot imagine how the fortuitous concourse of divers particles can form that vast number of similar parts as well as *organical*, which enter the composition of every *Plant*. Neither can they any more conceive how the pores of the grain of *Seed* that is cast into the ground should be so disposed, as that the *Juices* which penetrate them, should of themselves range themselves into that order, wherein consists the form of each *Plant*. Wherefore they conclude that all *Plants* were formed together and at once, and that they are so comprised one in another, that the latter are only an uncasing or unfolding of that which was contained in the first *Plants*.

Accordingly we see that a *Bean* contains formally the *Root*, *Stalks* and *Leaves* of the other *Bean* that is to grow from it; which therefore makes it probable that this 2d *Bean* does again contain a 3d, and this 3d a 4th, and so on to an infinity. So that we are to consider the growing of *Plants* only as a repetition of *Generations* performed every year, by the production of new *Leaves*, *Flowers* and *Fruits*, whose *Branches* actually contain an infinity of others; and to conceive that of all the *Leaves*, *Flowers* and *Fruits* that are actually formed in the *Branches*, there be only

VII. *Hedge Mustard grows without Seed.*

VIII. *How Plants grow upon the tops of Houses and Rocks.*

IX. *All Plants proceed from Seeds.*

X. *This confirmed by the instance of a Bean.*

only a certain number that can be unfolded every year.

XI. MALPIGHIUS designing to make a trial whether *Earth*, without being sown with any *Seed*, could bring forth *Herbs of it self*, put some *Earth* which had been dug deep out of the ground into a *Glass Vessel*, and bound over it a manifold doubled piece of *Silk*, so as that the *Air* and *Water* might pass through it to the *Mould*, and yet keep off those small *Seeds* that are carried up and down in the *Air*; but he could never find that any *Herb* ever sprouted in the said *Glass*.

XII. So that we must conclude that the first *Plant* of every kind was at the beginning produced by *God*, when he divided the matter of the *World* into parts of that exact bigness and figure, as they were to be in order to their composing the *Buds* of each kind of *Plants*. But not that they were produced according to the before-mentioned opinion of some *Philosophers*, from the fortuitous concurrence of many principles, which so united themselves together, as to form such a *Plant*; for if this were so, we should see sometimes *Plants* of new kinds produced, which never hapning, we must conclude, that *God* is the Author of the first *Plants* of each kind.

XIII. *Plants* that are frequently cut, cropt or lopt, do grow the better, and live so much the longer.

The Reason is, because frequent *Amputation* doth renew the *Juice* of the *Plant*, by keeping it from spending it self too much in luxuriant and supernumerary *Branches*. So that *Plants* that are wont to live one year only, if they be not cut in time, when they are duly cropt, will outlive that time; such as *Lettice*, *Purslain*, *Cucumbers* and the like. And as to *Trees*, we find that such as are not used to be lopt, do never attain to the tallness of other *Trees* of the same kind, on which *Amputation* is celebrated.

XIV. *Plants* that grow in the *Philippine Islands* are indued with different qualities, and as they are planted or grow towards several quarters of the *World*, they are accordingly indued with various affections. For those *Leaves* which grow towards the *East* are good and healthful; whereas those which grow towards the *West* are poisonous and deleterious. So with us, those *Apples* that grow near those places where there is great store of *Cabbage*, yield a strong and stinking smell.

The Reason is, because some *Effluvia* do exhale either from the *Earth*, or some neighbouring *Plants*, which impart some noxious qualities to the *Leaves* and *Fruits* of the said *Trees* or *Plants*. For it is notorious, that poisonous *Trees* or *Herbs* do communicate their venom to *Bodies* that grow near them. Because the ascending vapors carry always somewhat of the same *Earth* along with them, from whence they ascend; and young and tender *Plants* that grow near to stinking or noxious, are easily affected and infected by them.

XV. Thus we see that the *Wine* that is made of the *Grapes* of a *Vine* that hath had *White Hellebor* or *Herb Mercury* grow near it, becomes purgative: And in like manner, that the *Fruits* of any *Tree* become *Narcotick*, *Venomous*, *Diuretick*, &c. if their *Roots* be moistned with such like *Juices*. Wherefore to make *Plumbs* purgative, it is a common thing to bore several holes in the *Trunk* of the *Trees*, and put into them the *Juice* of *Hellebor* or

Colloquintida, by which means their qualities are imparted to the *Tree*.

It is a matter of common Experience, for *Plants* to grow wild, and degenerate from what they were. Thus a *Fig-tree* degenerates into the *Wild Fig-tree*, *Barley* into *Oats*; besides many other such like *Transmutations*.

This degenerating of *Plants* proceeds either from the negligence of the *Husbandman*, the situation of the place, or the quantity of the Ambient *Air*. For *Plants* grow wild, except they be set in places that are fit and suitable to them, and that they be so cultivated as their Nature doth require. Which tho' it is evident in many *Plants*, yet in none more than in *Violets* set or sown for encrease, which if they be not every 3 years transplanted, do degenerate into a pitiful *Flower* without any scent at all.

The Reason of which deficiency is, because the *Rudiments* of *Plants* in their first original do require a certain determinate matter, out of which their texture and disposition of *Plants* must be produced. And forasmuch as such matter is not to be met with in all places, where the *Seed* is sown, it is no wonder if the *Plants* in such ground do degenerate and become changed into others. For this change is not made in the *Root*, but in the *Seed* it self, whilst it doth not find convenient and suitable matter, or when by reason of old age, having lost its vigor, it must necessarily change its nature. Hence skilful *Gardeners* are wont to make trial of the goodness of their *Seeds* by putting them into boiling water, which if they be lively and vigorous, will in an hours time begin to sprout.

Amongst the *Rules* that are given by the *Antients* for the setting of *Plants*, this is one; that care be had that the *Plants* removed from one place to another, be set so, as that their parts may answer to the same quarters of *Heaven*, as they did in their former station.

The Reason is, because when the aspect of *Trees* is changed from one quarter of the *Heaven* to another, the inward disposition of the parts is changed together with it, and the passages whereby the nourishment is conveyed, are altered, and acquire another situation. For if any will make the Experiment by cutting the stem of a *Tree* grown in an open *Field*, with a *Sitbe*, he will perceive several *Circles* that are broader towards the *South*, and narrower towards the *North*. Which cannot be ascribed to any other cause, but to the *Heat*, which proceeding more copiously from the *South*, doth more strongly agitate the particles of the *Tree*, and more extends the *Veins* of it, than that warmth which comes from the *North*. And tho' this difference be not to be found in *Brazile-wood*, all the *Circles* whereof are Concentrical, and at an equal distance from each other, the Reason is, because in the *Torrid Zone* *Trees* receive an equal degree of heat from the *North*, as from the *South*. Hence it is that from the position of these *Circles* some have taught how to find out the *Meridian*: And the more skilful *Gardeners* and *Husbandmen* enjoin transplanted *Trees* to be set with the same respect to the quarter of *Heaven*, which they had in their former position.

C H A P. VII.

Of the Nourishment of Plants.

I.
How the
Root grows
and is en-
creased.

AS soon as that part of the *Sprout* which is to constitute the *Root*, is become such, we perceive presently that it is nourished and encreased as to all *dimensions*, that is, in *Length*, *Breadth* and *Depth*.

The Reason is, because the *Juice* of the *Earth* passing through the thin *Skin*, doth some part of it enter into the *Bark*, and in part also into the *Woody Fibres*. Now that which enters into the *Fibres*, doth by little and little mount upwards, as well by reason of the agitation it hath received from the *Sun*, or from some *Fermentation*, as from the *circular motion* of the *Earth*; according to which every Body that is so moved, strives to withdraw from the Center of its Motion. Now proportionably as this new *Juice* mounts upwards, it must of necessity pass from the *Woody Fibres* into the *Bladders*, where meeting with the old *Juice*, it by commixtion therewith produceth a *Fermentation*; from which, as from all other *Fermentations* in *Chymistry*, certain *concretions* are produced, which at the same time do encrease the dimensions of the *Bladders* and of the *Woody Fibres*.

II.
Dunging of
the ground
conduceth
much to
their bear-
ing or
fruitfulness.

To the end that ground may be the more fit to bear *Plants*, it is *dunged* before the great *Rains* begin to fall. For the Barrenness of *Vines*, *Wheat* and other *Corn* is overcome by *Stercoration*.

The Reason is, because *Dung* abounds with *Salt*, which being dispersed through the Pores of the *Earth* doth allay the moisture and coldness of it, and promotes growth or *germination*. For the life of *Plants* consists in *heat* and *moisture*, whereof the one is the *Agent*, and the other the *Patient*; yet sometimes it may so happen, that *dunging* of ground may do more hurt than good, viz. when there is no moisture to rot the *Dung*, and dissolve the *saline parts* of it. Hence it is common with *Husbandmen* to *dung* their grounds at such a season, when they have reason to expect there will be copious *Rains* to dilute it, as before the beginning of *Spring*, or towards the latter end of *Autumn*, to the end that the moisture having dissolved the *Salt* that is in the *Dung*, it may be conveyed by this vehicle of the water to the inmost pores of the *Roots*. For otherwise the *Corn* that is sown will be in danger of being burnt by heat, in case the *Salt* be not dissolved, or that the surface of the ground be overmuch cumbered with abundance of *Dung*. And therefore it is *PLINY*'s observation, *Lib. 18. That Fields, if they be not dunged, are too chill and cold; and when over dunged, are burnt up.* For there is a great difference between the *dings* of several *Animals*; for *Pigeons Dung* is the hottest of all, and next to it *Sheeps Dung*, which two are only proper to recover those grounds that are child'd with over-much cold and crudity. *Hogs Dung* is of a sharp and biting nature, such as is found in *Onions*. But the *Dungs* that are more moderate, and of a middle nature between these, are *Horse Dung*, *Asses Dung* and *Cow Dung*.

III.
Dung con-
duceth to
the encrease
of Plants.

By this means the life of languishing, and almost dead and withered *Trees* is recovered and restored, viz. by laying *Dung* to the *Roots* of them.

Hence the *Grain* called *Panick*; which is so called from the *Paniculae* or *Beards* it is armed with, if it be laid to the lower part of the *Root*; it is known to be of good use to promote the growth of the *Tree*: For being of a clammy and spongy substance, it sucks in the moisture of the *Earth*, and so furnishing the *Root* with copious nourishment, it dilates and makes it grow.

In like manner some tell us, that the *Stones* of *Grapes*, laid in great quantities to the *Roots* of *Vines*, do greatly conduce to their thriving and encrease: Because these *Stones* are furnished with pores suitable to admit the *Juice*, which serves for nourishment to *Vines*, which after they have sucked good store of the said *Juice*, communicate the same to the *Roots* of the *Vine*.

Fallow Grounds, that is, such as are only tilled every other year, are more fruitful than such as are sown continually; and are the more fruitful, the longer they have been suffered to lie fallow, especially without soiling.

The Reason is, because by tilling, the pores of the *Earth* are opened, by which, as through so many, on purpose prepared passages, the *Juice* is carried upwards into the *Air*. Whereas in *fallow grounds*, the said pores are shut up, and there is no way for the *steams* to escape. And for the same reason it is, that *Husbandmen* burn the surface of the *Earth*, because when the *Stubble* is burnt after that the ground hath been reaped, the watry parts fly away, and the solid substance that remains is dissolved by the moisture of the *Earth*, which by its thickness promotes the fruitfulness of the ground. And therefore *VIRGIL* tells us in the First Book of his *Georgicks*,

From burning Barren Fields, oft plenty comes,
When brittle Stubble crackling Fire consumes;
Whether from this, new force and nourishment
The Earth receives; or else all Venom spent
By Fire, and forth superfluous moisture sweats.

A *Level Field* is more proper to nourish *Herbs* and *Plants*, than a *hanging ground*; for it is observed, that those which grow in this latter do very seldom arrive at their due magnitude.

For seeing that *Salt* doth greatly conduce to the nourishment of *Plants*, the same is easily dissolved in a *hanging ground*, upon the falling of *Rain*, and is carried downward, without any, or very little profit to the ground. Whereas a *plain* or *level ground*, besides that it keeps all the *Salt* that is laid upon it, for to improve it, receives the fatness which is conveyed to it, together with *Rain* from other places. Hence it is that some assure us, that *Sea-weed* being laid to the *Roots* of *Cabbage*, do promote their growth, which can be ascribed to nothing else, but to the *Salt* which abounds in the said *Sea-weed*, and therefore imparts fruitfulness to the ground.

Cucumbers become tender and delicious by steeping their *Seeds* in *Milk* before that they be sown. The Experiment might very probably be of use if applied to the *Seeds* of *Artichocks* and other *Plants*, for the taking away of their harshness and bitterness.

The cause of this change may be, that upon the steeping of the *Seeds* in *Milk*, the *Fibres* which

IV.

crease of
vines.

V.
Why Fields
that have
lain fallow,
are more
fruitful
than such
as are con-
tinually
sown.

VI.
Why Herbs
grow better
in a level
Field than
on hanging
ground.

VII.
Cucumbers
are made
tender by
steeping
their Seeds
in Milk.

are formed in the *Roots*, take upon them such a *Figure*, and such *Texture*, as to give way only to such *particles* which constitute *sweetness*, and to reject all other thicker *Juices*. Whence it is that those who endeavour to advance the smell of *Flowers*, and exhale it by *Art*, order the *Rose-trees* to be planted near *Garlick*, which draws to it self all the nasty stinking *Juices* of the place, leaving the *sweeter* and more refined to serve for nourishment to the *Rose-tree*.

VIII. Neither need we to fear lest the *sleeping* of *Seeds* should be any prejudice to the goodness of the *Fruit* by over-hastning its *Ripeness*; since that always depends upon the vigor and virtue of the *Seed*, which the hasty or slow ripening of it are not able to change. And therefore this *Experiment* may be extended to all *Grains*, *Seeds*, *Stones*, *Kernels*, *Roots*, or any other things that are committed to the ground.

IX. Some *Plants* grow more slowly, or swiftly than others: For *Willows*, *Vines*, *Gourds*, &c. encrease much in a very short space of time, and more especially *Gourds*, which grow to that bigness, that according to *P L I N Y*'s relation, they can scarcely be carried. Whereas on the contrary, the *Oak*, *Medlar*, and other such like, admit of very slow encreases.

The Reason of this difference is, because the nourishment of *Plants* depends on their *Juice*, which from the *Roots* is driven through the pores, as through so many little veins, which it fills to that degree, that they swell big with it, and are not able to contain all the particles of it. And forasmuch as the sides of the pores are too hard to be extended by the *Aliment*, therefore it is that their encrease also is very slow, and sometimes that they altogether cease from growing, according as it happens to *Old Trees*, which receive no encrease from the matter that comes to them, but continue at a stand. But *soft Bodies*, having pliant pores, and such as are easily penetrable, it is no wonder if the *Plants* that are so qualified are of swift and great encrease. Hence it is that *Gourds* grow to that vast bulk in the *East Indies*, that as *SCALIGER* saith, some of them are of 13 *Palms* breadth, and such as a *Porter* is not able to carry.

X. *Plants* are very vigorous when a *South Wind* blows, and advance more in growth than when other *Winds* bear sway.

For seeing that the *South Wind* is warm, and brings many hot *Exhalations* along with it from the *Torrid Zone*, it readily opens the pores of the *Plants*, and cauleth the nourishment to mount up more copiously out of the ground, and to be distributed through all their parts.

XI. On the contrary, *Trees* do not grow in the *Winter*, because the coldness of the *Season* fixeth and congeals the *Juices* in the pores of the *Earth*, and consequently deprives the *Trees* of their nourishment.

XII. Those *Trees* which delight in the warm *Sun*, such as the *Plumb Tree*, the *Fig Tree*, the *Vine*, the *Apricock*, and such like, are commonly set upon a *Bank* or *Wall*, facing the *South Sun*.

The Reason is, because a double convenience accrues to these *Trees* from this position or situation: The first is, that the warmth of the *Wall* caused by the reflexion of the *Beams* of the *South*

Sun, doth greatly cherish and promote the growth and fruitfulness of these *Trees*. The 2d is, that they keep off the shade: For when *Trees* grow round, that is, with their *Branches* spreading circularly, the upper *Branches* do shade the lower, but being spread against a *Wall*, this inconvenience is prevented.

The Famous *VAN HELMONT* put XIII. 200 pounds of *Earth*, dried in an *Oven*, into an *Earthen Pot*, and set in it the stem of a *Willow* of about 15 pound weight. After the time of 5 years he took up the *Willow*, and found it to weigh 165 pound, whereas the weight of the *Earth* was not above two ounces diminished, and had only been watered with *Rain-water*. And in another place of his *Writings* he tells us, that many *Fishes* live upon *water* alone, and particularly suppoeth the *Salmons* to do so.

This encrease does not proceed only from the substance of the *water*, but from the *Nitrous* and *Aerial Ferment*, which furnisheth *Plants* and other *Bodies* with their nourishment. For whenever a *Plant* wants this, it becomes altogether unfruitful. For we must not suppose that *water* is a simple *Body*, but consisting of many *Heterogeneous particles*, as may be easily proved from this, that *water* is subject to *putrefaction*, which it could not be in case it were simple, and devoid of all composition.

If an incision be made in a *Wild Tree*, and a *Graff* taken from a set *Tree* be *Ingraffed* into it, by this means the *Fruit* is meliorated, and of wild and harsh, becomes mild and delicious. And the same happens also, if the *Scion* be taken out of the same *Tree*, into which it is afterwards *Graffed*.

The Reason of this seems to be, because the *Fibres* of the *Ingraffed Scion* do not so perfectly correspond with the *Fibres* of the *Tree*; and the *Juice* which passeth from the latter, cannot freely enter into the former; because the ranging of the pores is changed, and so other ways must be prepared for the conveying of the alimentitious matter: So that by this means the *Aliment*, as it were, undergoes a 2d digestion in another *Stomach*, and the occurring *Juices* are wrought or elaborated after a new manner. Hence it is that the *Fruit* growing upon a *Garden Scion*, *grafted* on a *Wild Tree*, becomes meliorated; because the *Alimental Juice*, which ascends through the parts of the *Plant*, having been already digested in the first *Stomach*, is sent into the second to pass through a second *Concoction*. And if any body will take the pains to multiply the said incisions, and *graft* a second or a third *Scion* upon the first, he will find that by every insertion the *Fruit* will attain a higher degree of melioration, because the *Alimentary Matter*, passing through so many different *Strainers*, is the more exactly prepared, and higher exalted and purified. An Example whereof we have in the History of *CORRELIUS* a *Roman Knight*, who, when he at his *Country House*, near *Naples*, *ingrafted* upon a *Chestnut Tree* a *Scion*, taken from its own stock, it brought forth a *Chestnut*, much exceeding the common in goodness, and which afterwards were called from his name *Corellianæ* or *Corellian*; and when afterwards a *Freeman*, whom he had made his *Heir*, had *Ingraffed* the same a second time, it did not bring forth *Chest-*

nuts

nuts in that plenty as before, but much better than the *Corellian*.

XV. But the contrary happens when we cut off a Branch or Twig from a Grafted Tree, and put it into the ground.

The Reason is, because this Branch being put in the ground, and taking Root there, doth draw all its nourishment from thence only, which is prepared by one continual percolation or straining: And for this Reason brings forth less and worse Fruits than the grafted Tree whence it was taken; because in it there is a double concoction of the Alimential Juice, viz. in the Stem or Stock into which the Scion is grafted, and in the Scion it self; whereas in the Branch cut off from the graft, there is but one digestion or preparation of the Aliment.

CHAP. VIII.

Of the Germination, Sprouting or Budding of Vegetables.

I. How Germination is performed.

THE Germination of Vegetables is that whereby the Bark, Leaves or Branches do send forth Buds, Fruits and Seeds, by a propagation of their Fibres. And so in a like manner a Seed is said to Germinate or Sprout, when the outward shell of the Seed is burst open by the breaking out of the Bud which appears above ground.

II. Why Plants send forth their buds upwards.

It is natural to all Vegetables to send forth their Buds upwards, tho' they be sown in a hanging ground; whereas on the contrary, the Roots of Plants tend downwards, and are but seldom seen on the surface of the Earth.

It will not be difficult to give a reason of this, if we consider how the Germination or Sprouting of Vegetables is performed, and by what means the Seminal Virtue presseth through the surface of the ground. For seeing that Germination is nothing else but a kind of Dilatation of a Plant, caused by the entrance of the Juice, which makes it swell, distend it self, and to sprout or break forth upwards: And forasmuch as no Expansion can be without heat, it is evident that the Bud which breaks forth from a Plant, doth proceed from heat, by the impulse whereof it is also carried upwards. For the nature of heat is always to mount upwards, and to drive all the Bodies it meets with, that way. And the reason is the same with regard to those Vegetables which grow on a down-hill: For as fire that is kindled in a shelving or hanging place, doth not follow the declination or declivity of the place, but mounts up directly: So Plants that grow on the sides of Hills, do always tend upwards, as being directed and carried by the heat which always keeps that course. True it is, that for the same reason it seems that the Root also ought to mount upwards, forasmuch as it is likewise dilated by heat, and so it would without doubt, but that it is swayed downwards by its Aliment which is in the Earth, to which it tends. For as the flame of a Torch doth insensibly sink downwards, to feed upon the Wax, and to carry up the flame to the upper parts: So the heat which is contained within the Roots, tends to the lower parts of them, where it draws in that

nourishment, which it afterwards sends up to the Stem, Branches and Leaves, for their support and growth.

Watry and moist Fruits, as Pease, Cherries, Gooseberries, Currans and Strawberries are the first that are Ripe.

The reason is, because the watry Juices are always the first that mount upwards, forasmuch as their smooth and even figures make it easie for them to separate themselves from others: Seeing therefore that Pease, Cherries, &c. contain more of this watry Juice, and are more nourished by it, therefore they must needs be ripe before other Fruit.

All Vegetables that have round or bulbous Roots, that is, such as consist of Coats or coverings one above another, as Onions, Aloes, Herb Pennyworth, Saffron, Squills, Leeks, &c. do shoot and grow, tho' they be taken out of the ground, and hung up in the Air within doors.

The Reason is, because bulbous Plants do not suck their Aliment out of the Earth by the strings of their Roots, as other Vegetables do; but draw it in from above, viz. that Juice which lies hid in their Bodies, and those thick Coats wherewith they are covered; whence it comes to pass, that these Roots, being filled with moisture, and containing much alimentitious humours within their Membranes, whensoever the same is excited by heat, they begin to shoot forth. And that this is so, daily experience teacheth; for when bulbous Plants grow, their Roots are sensibly diminished, because the Juice, which swell'd them up before, becomes by degrees exhausted, and turns into Stalk and Seeds; as it is evident in Pennyroyal and Orpin, wherewith some Country People adorn their Chimneys, by tying them to little Lathes, on which they grow and continue green for a great while. But most of all is this visible in Houseleek, which will bring forth Leaves and Branches 2 or 3 years together, if its Root be only wrapt up in a Linnen Rag dipt in Oyl, and be renewed every half year.

It is observed concerning the American Aloes, with indented or saw-like Leaves, that every year some of its Leaves do wither, and as many grow in the stead of them, tho' it be not sprinkled with Oyl, but only wrapt up in a Red Cloath, and so hung up in a Kitchen.

The Reason is, because the alimentary Juice in this Plant does continually circulate from the Root to the Leaves, and from them again to the Root. For how else could it be, that the Root continuing undiminished, so much nourishment should be furnished for the production of new Leaves, except the said Juice were continually pulst forwards from the withered Leaves to the Root, in order to a new Production?

If the top of a Rose-tree, presently after its budding be cut off, it will bud, and bring forth Roses again, about the month of November following. Which sprouting doth not proceed exactly from the top that hath been cut, but from the shoots or twigs that grow near it.

The Reason is, because the Juice which is contained within the Plant, which otherwise would have gon to nourish the top of it, upon the cutting of it off, is conveyed to the Sprigs that grow about it, and from them produces Roses of a late growth.

III.

Why moist and watry Fruits are ripe soonest.

IV.

Why Onions sprout and grow tho' they be not set in the ground.

V.

Why some Leaves of the American Aloes fall off, and others grow in the stead of them.

VI.

How a Rose may be made to bud about November.

growth. And the same effect will be produced if you pluck the *Buds* of a *Rose*, as soon as they are first knotted. Yet it is probable that the budding of *Rose-trees* may be retarded, by tying a *Pack-thread*, or other *Cord* very strait about the *Rose-tree*, because this ligature, will hinder the *Juice* from mounting so soon, as otherways it would.

Some *Trees* have only *Branches* proceeding from the tops of them, as the *Fir*, *Pitch-tree*, *Cypress-tree*, and *Cedar*; whereas others shoot forth *Branches* from all parts of them.

The Reason of this different *Germination* of *Trees* is from the *pores*, by which the *Alimental Juice* passeth from the *Root* to the *Branches*; for if they be strait and perpendicular, the *Juice* is carried up along through them to the top, where the *Juice*, by reason of the great abundance of it, is forced to break forth, and to spread it self into *Branches*. To which also may be added, that the *Juice* which ascends in these *Trees* is fat and clammy. Whereas the *pores* of those *Trees* whose *Branches* proceed from all parts of their *Stems*, are more crooked and winding, by which means the *Juice* ever and anon breaks forth sideways. Or likewise, because their *Juice* is, not so ropy and glewy, as it is in *resiniferous* or *resin bearing Trees*: Wherefore as a great *Fire* or *Flame* which passeth up through a *Pipe*, with holes on the side of it like a *Recorder*, doth continually pass some of its parts through the said side holes: So the *Juice* in *Trees* being carried up through the *pores*, breaks forth by all the ways it finds open for it, and more especially through the tender *shoots*, the softness and tenderness whereof afford it a more easie passage.

VIII. *Why the Leaves of some Trees are always green.*
The *Leaves* of some *Trees* and *Plants* are always green, as the *Bay-tree*, the *Laurel*, *Cypress*, *Ivy*, *Fir*, *Box*, *Rosemary*, &c. whereas others towards the end of *Autumn* lose their greeness, and are spoiled of the Ornament of their *Leaves*.

The Reason of the perpetual verdure of some *Trees* and *Plants* is, because their *Leaves* consist of a more solid matter, and do abound with such hot *Juices*, that the *pores* through which they run, cannot be shut up by the cold of the *Air*. And for this reason it is, that in *Brazile* all the *Trees* enjoy this privilege: And that in *Egypt* about *Memphis*, according to the account *THEOPHRASTUS* gives us, the very *Vines* and *Fig-trees* themselves never shed their *Leaves*, whereas others do lose their *Leaves*, and continue without them all the *Winter*, because their *Leaves* are more soft and tender, and therefore cannot resist the rigor of the cold, which contracts and draws their *pores* together, and by this means hinders sufficient *Aliment* from being conveyed from the *Roots* to the *Leaves*, which for want thereof, wither and fall to the ground.

IX. *Why tender Shoots are not fit to be grafted.*
Soft and tender *Shoots* or *Twigs*, and whose sides are not yet sufficiently hardened, are not fit to make *Grafts* of.

The Reason is, because in *Grafting* the *Fibres* of the *Scion* must be suited with those of the *Stock*, that the nourishment which comes from the *Root*, may have its free passage to both. For their *Orifices* must so answer one another, that the nourishment may pass from the *fibres* of the *Stalk* into those of the *Scion*. Now very soft and tender *twigs*, because of the tender texture of their *fibres*,

are so bound up and straitened between their *Rinds*, that they cannot readily take in their *Aliment*, and therefore thrive but badly, or wither within a short time. For the *twig* that is to be grafted, must be of a years growth, to the end it may the better cleave to, and unite with the *Stock*. Thus on the contrary dry *twigs*, or which by reason of their Age or sapless, are also unfit for *grafting*, because they want moisture, by means whereof both their *Fibres* might be joined together, and become one *Plant*. As we see that dry and thirsty ground is *Barren*, and scarce able to quicken the *Seeds* that are committed to it.

Fruits when they are fully ripe, drop down from the *Trees* of themselves, and fall upon the ground.

The Reason is, because at that time, the lateral *fibres* of the *Fruits* do swell, and are no longer able to contain their *Aliment*; by which means it comes to pass, that that part of it which was used to ascend to the upper parts, finding no passage, runs downwards again, leaving the *stalk* by which it was fastned to the *Tree* dry and sapless. Hence it is that some *Fruits* fall down with their *stalks*, as *Apples*, *Pears*, &c. others without them, as *Plumbs*, *Apricocks*, *Peaches*, &c. according as the *Alimentary Matter* fails nearer to, or farther from the *Fruit*.

But the Reason why *Stags* cast their *Horns* every year, at a set season, doth not proceed, as some suppose, from the same cause now produced, but indeed from a quite contrary, viz. from an overgreat abundance of a volatile saline *Juice*, where-with *Stags* are filled at that time. For this matter continually flowing from all the parts of the *Body* of that *Animal*, and pusht upwards towards the *Head*, thrusts the old *Horns* out of their places; and being afterwards condensed by meeting with the cold *Air*, becomes turned into new *Horns*, and such as are more tender.

CHAP. IX.

Of the Decay and Death of Vegetables.

Plants pluckt up out of the *Ground* do wither; and tho' *Trees* that are cut down in the *Spring*, do seem to bud and grow, as long as they are suffered to lie upon the ground, yet they are no sooner taken from thence, but they by degrees wither and dye.

Plants pluckt out of the ground do not wither immediately, because the *Juice* doth not all on a suddain cease from flowing, neither are the *pores* so soon changed, but that the *Aliment* is still for some short time carried to their utmost *Fibres*. For *Vegetables* never die, till their *Juice* stagnates, and is no longer heated and agitated by the subtil matter. For upon the failing of heat all motion ceaseth, and consequently all *Germination* and *Nutrition* also, wherein the *Life* of *Plants* doth consist. And therefore *Plants* in the *Winter* season cannot properly be said to be dead; because, tho' they produce nothing, and there appears no sensible transmission of the *Alimental Juice*, yet it cannot be denied, but that it is still in them, because the self same dispositions remain in them, that are found in *Living Bodies*, and that their condition

X. *Why ripe Fruits fall from the Trees.*

XI. *Why ripe Stags Horns fall every year.*

I. *Why Plants dye when they are plucked up out of the ground.*

V. *Why some Winds are harmful to Plants.*

tion is very different from those Bodies that are withered and dead.

II. How it comes to pass that the Rose of Jerusalem after it is withered, grows green and flourisheth again.

Moreover, it happens sometimes that the parts of Plants, as their Leaves, Sprigs, &c. which have been shrivel'd and contracted by drought, are again, by the return of their Juice and Moisture, distended and displayed, as is evident in the Beards of Oats, and in the Plant called the Rose of Jerusalem; the Root whereof, when dry and withered, if it be put into luke warm water, immediately distends it self, and displays its Sprigs, and this by means of the moisture which insinuates it self into the pores of the said Sprigs, and so swells and extends them.

III. The Juice circulates through the whole Body of the Plant.

For it can no longer be questioned, but that the Juice hath its course or circulation in Plants, like as the Blood in Animals, as may be perceived more especially in Lettice, Bastard Saffron and the Greater Celandine, in which Plants the Juice never rests, but as soon as their outward Rind is taken away, runs forth continually as the Blood doth out of Animals when a Vein is opened. Besides, the Juice of Plants is not found in them dispers'd every where throughout their Bodies without any Vessels to contain it, seeing that pipes or passages are found in them, resembling the Veins of Animals. As may visibly be perceived in those Plants, whose Juice is White, Red or Yellow. The Principal Cause of which Circulation is, for that all here beneath, which partake of the Circular Motion of the Earth, strive to withdraw themselves from the Center of their Motion: For therefore it is that the Juice of the Earth, being entred into the pores of the Root, in the which it moves with the more ease than in the Air, endeavours to mount upwards, towards the higher parts of the Plants, and distributes it self to them, according to their several requirings, and that in such a manner, that the remaining crude Portion of the Juice, returns towards the Root, in order to receive there a new and further preparation.

IV. Why Oyl is an enemy to Plants.

Oyl is very hurtful to Plants, as being always destructive to them, when it reacheth their inward parts. And the same is observed by Chymists concerning Quicksilver, which is deleterious to Trees when ever it enters into the pith of them.

The Reason is, because Oyl by its fatness doth so obstruct the pores of the Plants, that the particles of the Alimentitious Juice cannot pass through them: Whereupon the Plants wither and die for want of due nourishment to support them. And Quicksilver is a poison to Plants, because by reason of its subtilty, it pierceth into their inward parts, dissolves the Texture of their Fibres, and introduceth a new disposition of their parts. And when this is done, the Alimental Juice can be no longer strained as it ought, and thereupon the Plant must needs fade and die.

V. Why some Winds are hurtful to Plants.

Trees sometimes wither upon the blowing of some Winds, and the young Shoots or Sprigs of them grow so dry and sapless, that they may be rub'd to powder with ones hand.

The Reason is, because these Winds abound with a nitrous or vitriolick Spirit, which invading the green and tender Shoots of Trees, do blast them with a consumptive infection, foras-

much as the tender strings or fibres which are like the nerves of the Leaves and Sprigs, become so compressed and drawn together by the cold blast of the Winds, that they can no longer take in the Aliment conveyed from the Root. By which means the Trees, being deprived of all their moisture, become dried up, and die.

The top of a Sprig or Shoot sometimes withers, when yet that part which is near to the Stem continues fresh and vigorous.

This may happen from several Causes; either from an obstruction of the pores, or from some knot, or from a dissolution of the twisting of the Fibres: For by any of these means the nourishment is hindered from ascending after its usual manner, and from distributing it self to all the parts: Whereupon when the moisture which was at the top of the Sprig is exhaled, and the way stoppt through which other should come to it, it must needs wither and die.

Trees do often wither and die by being bruised, slit, bor'd, or by some other wound.

The Reason is, because by confusion the order of the parts of a Tree is disturbed and confounded, and the passages obstructed, through which the nourishment passeth, and is conveyed to the further parts. Whence it comes to pass, that those parts which are above the confusion, do waste for want of nourishment, whilst those that are below it are choaked with too great abundance of it. In like manner Plants die also by splitting, or some other kind of wounds, because in this case, the Alimentary Matter ceaseth from passing through its pores, neither can it be distributed as it was before: And whereas some Trees, as the Pine, Fir and Turpentine, when they are wounded do thrive the better; this proceeds from the great abundance of their moisture, part whereof being evacuated by the wound, the Plants being rid of that which was their Burthen, bring forth fruits with more ease, and in greater abundance.

Some Plants perish by too much heat, especially those that are young and tender, which are not yet sufficiently armed against the injuries of the weather. Others are destroyed by cold, and being seised with the Frost, die.

The Reason is, because the life of Plants consists in the temperature of Heat and Moisture, as hath been before-mentioned; so that moisture cannot continue long in a Plant without a mixture of heat; nor heat without moisture. Wherefore when either of these doth predominate, and destroy its compeer or fellow, the Body must of necessity die, and be deprived of Life. Young and tender Plants therefore are much sooner than others destroyed, because the outward heat does easily penetrate their tender Bodies, and by putting their parts into too vehement an agitation, doth extract and consume the moisture, not only out of the Stem, but out of the Roots themselves: And forasmuch as the loss thereof cannot be restored from out of the Earth, because it is likewise parcht up with too much heat, the Plants must needs wither and die. Others again do perish by over-hard Frost, which by locking up and contracting the pores, drives away the heat; whereupon the motion of the Alimentary Juice ceaseth, so that the nutrition, and consequently

VI. Why the top of a Sprig or Shoot sometimes withers.

VII. How Trees come to die by being bruised or bored.

VIII. Why some Plants perish by Heat, and others by Cold.

the growth of the *Plants* must in time cease also, and all their *vital functions* be interrupted. And for the same reason it is, that *Plants* are often killed by *Winds*, which if they be very hot, do open and widen the *pores*, and exhaust the hidden *moisture*: Whereas when they are cold, they compress the *pores*, and by expelling the *beat*, do weaken and waste the natural strength and vigor of them.

IX.

Why Wild
Plants are
longer
liv'd than
those which
grow in
Gardens.

Wild Plants, and such as grow on *Mountains* and *Hilly Places*, are of longer continuance than those which are cultivated in *Gardens*.

The Reason whereof seems to be this, because the *Plants* which grow in *Gardens*, are frequently overcramp'd by the abundance of *Alimentary Juice*, which does extinguish, or at least weaken their natural *beat*. For since the design of *Gardening* is to bring forth goodly and early *Ripe Fruits*, the *Gardener* makes it his whole business to make his ground fat and fruitful; and is not at all concerned that his *Plants* be strong and long lasting, so they do but thrive and bring forth abundance of *Fruit*. Now it is certain, that the *pores* of *Trees* are widened by the too great abundance of the *Alimentary Matter*, and an easie way being thus made for the *vital moisture* to escape, the *beat* must needs vanish together with it. Another thing that shortens the *Life of Plants* is, because the *dung* which is made use of to improve them, lies round about them, and that not far from the *surface* of the *Earth*; and by this means it happens, that they do not strike down their *Roots* so deep in the

ground, as otherwise they would: Whereas the *Plants* that grow *wild* in the *Fields*, being surrounded with more hungry and dry *Earth*, where they meet with but little *moisture*, sink their *Roots* deeper into the *Earth*, to provide themselves a sufficiency of sustenance, and by this means grow much stronger, and more able to resist all outward injuries, and consequently endure longer. For it cannot be questioned, but that the *spreading* and *thickness* of the *Root* conduceth much to the lasting condition of *Plants*.

Hence it is that *Gardeners* observe, that those *Plants* die within a short time, that are watered with hot *water*: For tho' by this means their growth for the present seem to be promoted, and it makes their *Fruits* to be ripe the sooner; yet because the *Fibres* of the *Plants*, by this unaccustomed heat, are too much relaxated, and so take in too much *Moisture* or *Juice*, they are either quite choaked by the too copious affluence of the *Alimentary Juice*, or else their *pores* become obstructed by the bigness of the *particles* that come thronging in into them.

And as it is of ill consequence to *Plants*, if they be watered with hot *water*, so neither doth too cold *water* agree with them. And therefore skilful *Gardeners* take care to set the *Spring* or *Well-Water* they make use of for the watering of their *Plants*, in the *Sun*, that the coldness of it may be somewhat temper'd and alay'd, for fear otherwise it might be prejudicial to the growth and thriving of them.

The Eighth Part OF THE HISTORY OF NATURE. OF ANIMALS.

CHAP. I.

*Of Animals which are commonly supposed to
be of a Spontaneous Birth.*

I.
Whether
there are
any Ani-
mals pro-
duc'd with-
out Seed.

THERE is nothing more vul-
garly taken for granted among
Authors, than that certain *Ani-
mals*, particularly *Insects*, are ge-
nerated without *Seed*, as *Bugs*
and *Lice* out of *Human Excreti-
on* and *Filth*; *Book-worms* out of *Books*, *Wood-lice*
out of *Wood*, *Moths* out of *Garments*, and innu-
merable others, which, as they say, breed and
are produced without *Copulation* of different
Sexes.

Some *Physicians* who pretend to be the only
Inspectors into things of this nature, because they
discern not with their *Eyes*, nor can any way
comprehend the *Causes* which produce these *Ani-
mals*, call the formation of them *Æquivocal*, as if
they sprang from different *Principles*, and their
production had no manner of agreement with that
of others; whereas indeed their *Generations*, by
the same right as other *Generations*, are to be
called *Univocal*; since they are effected by the
same necessity, and no less than others, require a
prævious *Seed* and requisit *Dispositions* therein.
For whatsoever in Nature is produc'd, proceeds
from *Seed*, and nothing in the *Earth* is generated
by Chance, or contrary to the Course of Nature.
True it is, that that sort of *Seed* is chiefly inter-
nal, and not always appearing to the sight; but
that there is such a *Seed* latent in those *Bodies*, is
not to be denied, since we find that *Lice*, *Bugs*,
Maggots, &c. are curiously wrought and formed,
each in their kind, and exactly agree among them-
selves in similitude of parts. For there is nothing
wanting to their perfection; and they may be
said to be no less compleat as to their *internal*, than
external parts. For who can imagine, that so
great a variety of *Members*, so exact a *Form* of
each, so wonderful a proportion and contexture of
parts, should fortuitously, and by an accidental

Concourse of *Atoms* be produc'd, and that there
should not rather be some necessarily determined
Seed to bring them forth? For if we allow, for
Example, that *Daws* among *Birds*, or *Cats* among
Beasts, are produc'd of *Seed*, as being too elabo-
rately fram'd to be compos'd by an uncertain
Agent, why may not the same thing be judg'd of
other *Animals*, when as we may observe in them
a Structure no less exact and curious, and Parts
no less correspondent each to other?

But some *Philosophers* suppose, that *Bugs*, *Lice*,
Maggots, and such like *Animals* are generated,
while many *seminal particles*, as they call them,
being agitated by a subtle matter or heat, are so
disposed as to compose or constitute certain conve-
nient *Figures* and *Organs*. For this motion, as
they say, not rashly and by chance, but according
to the *Laws* of Nature, and its *Seminary Virtues*
proceed out of an aptly and well-disposed Matter,
and determinated Heat; whereby it comes to pass,
that the parts of the Matter so exagitated, not on-
ly conduce to the formation of the Heart and
Veins, and the union of them with the *Arteries*,
but also to compose the Principle of the Brain,
the *Sensory* and *Motory Organ* of the *Fibres*,
Nerves and *Spirits*, which things being first laid
as a foundation, a farther progress is made to the
forming of the perfect *Instruments*, those namely
which contribute and are inservient to *Sensation*
and the *Local Motion* of the Body.

To this production of *Animals* may be referred
that which HECTOR BOETIUS makes
mention of in his *History of Scotland*, namely,
that on the Sea-side in some parts of Scotland,
there is a sort of Bird ingendred of a certain Tree,
that is, of the Fruit of it falling off and dropping
into the Sea. The same thing or the like, he re-
ports to be on the Sea-coasts of the Hebrides Islands,
where such a strange kind of Production is said to
be brought about two manner of ways. The one
from *Ships*, or old *Planks* and pieces of *Timber*,
which being left upon the Shore, and there re-
maining some time, breed from their corruption
certain *Worms* or such like *Insects*, which discover-
ing

II.
Every Ani-
mal is en-
gendred of
Seed.

III.
Of the
breeding of
Ducks or
Geese from
Trees in
Scotland.

ing first *Feet*, then *Wings*, lastly *Plumes*, come at length to bear the similitude of *Ducks* or *Geese*, and like them take their flight up into the *Air*. The other is a *Hatching* as it were of certain little *Birds* out of *Excrescences* like *Snails*, *Cockles*, or some kind of *Shell* fish sticking to the *Sea-weed* that grows in those parts, which are therefore supposed to proceed from the *Fruits* of *Trees*, because they are chiefly hatcht about that time, in which the *Leaves* or *Fruits* of those *Trees* that grow by the *Sea-side* appear and drop into the *Sea*. And indeed if *Fruits* hanging on a *Tree* can breed *Worms*, *Maggots* and such like *Insects*, why may there not as well out of the same *Fruits* be bred such *Animals*, as like other *Birds* take wing and glide to and fro in the *Air*?

IV.
Fishes engendred of Dew.

I have been informed by Men of very good Credit, that if a *Hurdle* be plac'd over any *water*, whether a running *Stream* or standing *Pool*, and dewy *Turfs* be so laid upon it before *Sun-rising*, that the *Hearby-side* may be turned downward without shaking off too suddenly the drops of *Dew*, so many drops as afterwards upon the *Sun-rising*, and heating the *Turf* shall fall into the *water*, so many *Fishes* will be ingendred of them, and various, according to the diversity of the *Herbs* on which the drops of *Dew* fate.

Upon the truth hereof a certain Famous Man infers that from *Lakes*, *Rivers*, *Seas*, *Fishponds*, and all places in general, disposed to the ingendring of *Fish*, there are *Seeds* variously exhal'd, being conveyed through the *Air*, mixt and incorporated with the *Dew*, and falling upon the *Herbs*, are so cherish'd by the *Spirit* of them, and acquire such a disposition from them, that being receiv'd into the *water*, they are there form'd into these *Fishes*. In the same manner as from the *Dew* lying upon the *Leaves* of *Nightshade*, and warmed by the heat of the *Sun*, are ingendred *Worms*, as *SCALIGER* affirms; and as in *Chili*, a Province of *South America*, there grows a *Tree*, from whose *Leaves* small *Serpents* are said to fall.

V.
All Animals whatsoever are generated from the Egg.

Now, tho' it hath been from Antiquity to this day the general opinion, that divers *Animals*, particularly small *Insects* are produc'd only by corruption; It is of late plainly evinc'd to the contrary by many Experiences. For besides those which I have quoted in my *Institution of Philosophy* touching *Insects*, we see that *Butterflies* by *Copulation*, produce an infinite number of *Eggs*, from which are hatcht *Canker-worms* of all sorts. Whence we may conclude, that all those *Animals* which are thought to be spontaneously ingendred, which are found in *Cheeses*, *Fruits*, and other sorts of *Food*, proceed from real *Eggs*, or at least from something equivalent to the *Seed* that comes from *Females* after they have been impregnated by the Company of the *Males*.

VI.
How Serpents have been generated in a Mans Brain.

BUT *HOLLERIUS* in his 10th Book *De Morbis Internis*, Chap. 10. makes observation of a *Scorpion* bred in the *Brain* of a certain *Italian* by the frequent smelling of the Herb *Basil*. And *RAIMUNDUS* in his *Mercurius Italicus* affirms, that he found by experience, that the foresaid *Plant*, plac'd under a *Stone* in a moist place, within two days produc'd a *Scorpion*, which much at the same time, while he resided at *Siena*, a very rare and memorable accident confirmed. A cer-

tain Gentleman of *Siena*, wonderfully taken and delighted with the smell of this *Plant*, used frequently to snuff up into his *Nose* the powder thereof dried, but highly to his cost, for in a short time he died *Mad*; whereupon his *Skull* being open'd by a *Surgeon*, a *Scorpions Nest* was there found: And this might possibly be, in regard the *Scorpion*, being delighted with the smell of that *Plant*, creeps with a great desire to it, lodges in it, and haply feeds upon it, and may chance also to lay its *Eggs* in its *Leaves* and *Buds*: Whence it might easily happen, that the foresaid Gentleman might, together with the Powder snuff up into his *Nostrils* some of the *Scorpions Eggs*, which cherish'd by the heat of the *Head*, might well enough hatch young *Scorpions*.

So the *Ukrainians* are mightily infected, especially in a dry *Summer*, with swarms of *Locusts*, by reason these sorts of *Insects*, before they expire, leave each of them behind them 2 or 300 *Eggs* in *Autumn*, which afterwards by the next *Summers heat* are hatcht into *Locusts*, which unless they be swept away by the following *Rain*, or driven by the *Northberly Winds* into the *Euxin Sea*, spoil all the *Corn*, and inflict vast damages upon those *Provinces* through which they travail. Some there are, who, by diligent observation, have made this remark, that never any *Insects* are generated of the *Flesh* of *Beasts* or *Fish*, except they have been first *Fly-blown*, or tainted with the *Seed* of *Flies*; and consequently that *Vermination* in *Flesh* proceeds only from *Flies*, altogether like to those which afterwards breed in *Flesh*.

VIRGIL in his 4th Book of *Georgicks* affirms, that from a *Heifer* of two year old, having its *Nose* stop't, and being beaten to death, its *Bowels*, after it is killed, being spread over its whole *Skin*, *Bees* are generated, provided this be done about the beginning of the *Spring*, and before *Herbs* shoot forth into *Flowers*. This, (as we suppose) may very well be, in regard the *Heifers* about the beginning of the *Spring*, feed upon *Thyme* and *Cassia*, which soon after shooting forth into *Flowers*, contain little *Eggs*, which being agitated by heat and the subtil matter, are dilated, and at length are delivered of these little *Animals*. For what the common belief is of most men, is absolutely false, namely, that *Bees* are generated out of the corrupted *Carcases* of *Oxen*. However this seems more likely than that exterior Causes should be able to meet so opportunely, as to build or frame *Organs* of *Animals*, such, as whose *fabrick* or *structure* can be comprehended by no human understanding unless perhaps some *Seminary* and *Plastick Virtue* lie hid in the said *Bodies*, which being scarce credible, it seems a much greater probability, that all *Generation* is univocal, and that almost all *Animals* are procreated by others of the same kind.

And much after the same we may determin concerning *Animals* discovered in *water*, wherein *Pepper* hath for the space of three days been infused. For altho' they are too minute to be well discerned by our *Senses*, yet they are fram'd with so great and almost infinite variety of *Organs*, that they must needs be allowed to be the progeny of others of that kind, and most likely it is that their *Eggs* have lain hid in the *Pepper*.

VII.
Locusts bred of the Seed of Flies.

VIII.
Bees generated out of Heifers.

IX.
Animals discovered in a mixture of Pepper and Water.

Worms

X.
Worms bred
in Fruits.

Worms are generated in Fruits; and Flies which are so numerous in Summer, cannot be produc'd by any act of Generation, since the whole race of Flies being destroyed, there can be none surviving to produce others.

Worms are bred within the Pulps of Fruits, not spontaneously, as if there were nothing in the Fruit before, from whence they may be generated, but from a premised Seed, that is to say, while Bees or Flies, sitting upon Flowers, leave behind them certain little Eggs, which being intercepted within the Fruits, are disclosed by the urging heat, and turn into Worms. Thus Fruits and Herbs breed Worms, when they are exposed to the Air; and sometimes in one and the same Plant, divers sorts of Insects are to be seen: But if any Plant be inclosed within a Vessel, and the said Vessel be kept close stoppt, so that the Air can have no access, no Worms will there breed from any putrefaction; nor is Cheese capable of breeding Mites, if kept in a Glass Vial well stoppt and Hermetically sealed.

XI.
Flies are
generated
of other
Flies.

So Flies are not bred spontaneously, but by a premised copulation, and of Eggs laid, which being promiscuously dispers'd in the Earth, and afterwards cherish'd by vernal heat, are deliver'd of the respective Animal: For if PLINY may be credited, Flies, as also Ants, Beetles, Bees, Spiders, Wasps, and other such like Animals generate by commixture or copulation; and this is chiefly to be prov'd by this one Argument, namely, because some years, Flies, Locusts, &c. are more abundant than others, make greater waste and havock in the Fields, and more infest Mankind, which certainly can be from no other cause, but for that in a mild Winter they were preserv'd and not destroyed by the coldness or moisture of the Earth.

XII.
How Worms
bred in the
Maws of
Infants.

Wherefore by no means can we assent to those Peripatetick Physicians, who affirm that Maw-worms are bred in the Intestines out of putrefaction, by the means of Heat; as in like manner they assert of other Insects, that by the heat of the Sun they are produc'd out of Horses, Cows or other Animals Dung. But it may more probably be alledged, that the Maw-worms have their production from the little Eggs of Insects swallowed down by Children with their Meat. For our Meat cannot be so exactly preserved, but that it may by some way or other be contaminated by invisible Insects, which continually fly up and down in the Air. And whereas the meats swarming with those Eggs, are conveyed into the stomach; the said Eggs by this means remain entire, and being cherish'd by a gentle heat, are at length delivered of these Worms: And for a clear demonstration hereof it is to be observed, that Children during the time they suck, are never troubled with Worms, nor are they in the least subject to this Distemper, till they come to feed upon more solid meat; whereas before they immediately drew their nutriment from the Breasts, in which none of these little Eggs could harbour. But when they come to feed upon external nutriments, they are then more exposed to the breeding of Worms, because the fermentations in those nutriments are not powerful enough to destroy the Eggs.

XIII.
That some
Flies are
viviparous

ALDROVANDUS in his first Book of Insects affirms, that some Flies are viviparous or

capable of bringing forth living Flies: I took, saith he, when I was young, being entic'd by the specious form thereof, one of the bigger sort of Flies, streakt with several white Lines; which when I had kept some time in the hollow of my hand, I perceived at last proceeding from it, certain small white Worms crawling up and down. And tho' he speaks but of his catching one only Fly, which had Worms living and moving within her womb, yet it may easily be imagin'd, and inferred that the rest of that kind are also viviparous.

Some Animals become pregnant by the wind, as PLINY relates of Mares in Spain and Capadocia, in his Eighth Book, Chap. 42. It is certain, saith he, that in Portugal on the Banks of the River Tagus, near Lisbon, there are certain Mares, which turning their Face to the West-wind, when it blows, conceive thereby an Animal Spirit, which proceeds to a Birth, that is brought forth into the world with wonderful ease and expedition, but retains not life beyond the term of three years. This the Ancients gave credit to, but I fear, not upon so exact examination and enquiry, as a matter of this nature requires; since sure enough it is that Generation cannot be effected without the coition of Male and Female, unless perhaps that which they call Hippomanes, be taken for a Birth, that I say, which Mares, while they are exposed to the wind, emit. I have ask'd some Portugueses whether or no it were true which some Ancient Authors have delivered concerning the fruitfulness of the Portugal Mares, and whether any sort of Wind was so efficacious as to deserve to be termed a Father of Living Creatures. Of these persons, some professed themselves totally ignorant of the matter; others, whom the reading of Ancient Authors had incited to a more narrow search and enquiry into Antiquity said, that they had heard indeed that Mares sometimes bring forth certain mishapen and formless Masses, or lumps of Flesh, having nothing of resemblance with the shape of a Horse, or any other Animal: But this happens very rarely, and that too, only when they are high fed, and raging with desire of Copulation, are kept from the company of the Male. Whence we cannot but admire that PLINY, COLUMELLA, and other Accurate Writers of Natural Causes, should make mention of this strange sort of Geniture, which neither they themselves had observed, nor could warrant the truth thereof to the World by any sufficient Testimonies; except we compare this opinion of theirs concerning the fruitfulness of those Mares, and their celerity of Birth, with some conceits of Justine the Epitomizer.

Nor is it with less uncertainty, that AELIAN in his 2d Book of Animals, asserts the Conception of Vulturs by the Wind, and their exposing their hinder part to the North-wind, to be as it were trodden and impregnated by the said Wind, since among Vulturs there is known to be a Male and Female, by the conjunction whereof Generation is produc'd, according to the common direction of Nature. Moreover, their Neasts are discovered, and they are known to couple at set times of the year. Nor signifies it any thing to say, that some Animals lay Eggs, which from the Wind are called Hyenemions or Sub-ventaneous, that is to say, indeed Wind-trodden Eggs, as Hens, Partridges, &c.

XIV.
Whether
Mares may
be impreg-
nated by
the Wind.

XV.
Vulturs
falsely given
out to con-
ceive by the
Wind.

which before such time as they have experienc'd Coition, emit those *subventaneous Births*: Since these sorts of Eggs are barren, smaller and more liquid than those, which being produc'd by *Copulation*, are capable of fecundity. Nor can the liquor of them by any brooding of the *Hen* be brought to thicken, but still remains what it was at first.

XVI. In the *Braß Furnaces* in the *Isle of Cyprus*, where the *Stone Chalcites* being cast in, is many days a *burning*, there spring up on a sudden in the very midst of the *Fire*, certain little winged Animals, called *Pyraustæ*, somewhat bigger than great *Flies*; which nimbly run and frisk up and down in the *fire*. *ARISTOTLE* makes mention of them in the 5th Book of his *History of Animals*, Chap. 19.

These *Pyraustæ* breed not of the simple substance of the *fire*, but out of Eggs left by this kind of *Animal* in the *Stone Chalcites*; for I cannot but persuade myself, that this *Chalcites* in the *Mines* is condens'd out of a certain *Juice*, from which, as from a kind of *Vehicle*, certain Eggs, apt for the generating of these *Pyraustæ*, proceed out of some *Vegetable Body*; so that in fine the *Pyraustæ* themselves are procreated out of these Eggs, the fat humour being mixt to the *Metallick Matter*, and thereupon live unhurt in the *fire*. In regard such is the temper of the *Matter* whereof they consist as long to endure the *fire*, and like *Adiantum* to elude the strength of the flames. *St. AUGUSTIN* in the 21st Book of his *Teatise De Civitate Dei*, mentions also a sort of *Worms* found in *bubling Streams of Water*, so hot, as not to be touch'd without scalding.

XVII. *TORNIELLUS* in his Book of the World, takes notice of a light kind of *Wood*, and to all outward appearance combustible, said to be brought from the *Mountains of Java*, whereof a small portion hath been cut off with a *Knife*, and cast into a large *Coal Fire*, and not been consumed, nay, not so much as lighted, impaired or diminished; but being taken out, hath appeared as if it had never been cast into the *fire*.

XVIII. And altho' the same thing be vulgarly reported of the *Salamander*, yet I dare not maintain it as a compleat truth, since most certain it is, that at *Rome* a *Salamander* being cast into the *fire* by *Corrini*, a *Roman Knight*, immediately swell'd, and sent forth a fat thick matter which quench'd the *Coals*, and by repeated vomitings, endeavour'd to defend himself from the cruel *Ardours* of the *fire*.

XIX. *LEMNIUS* saw, as himself attests, *Mantles* Knit or Woven of a certain incombustible sort of *Flax* which yield not to the *fire*, and are invincible to the hottest flames; insomuch that if at any time these *Clothes* come to be sullied, or contract any thing of *Soil* or *Spots*, there is no need of *Soap* or *Lie* for the taking out of these *Spots*, but the *Garments* are thrown whole into a great *fire*, and immediately become all in a blaze as if bedawb'd with *Grease*; but being taken out, they are fresh, and cleansed of all their *Spots*. The same sort of *Plant* is said to grow in the *Desert* and *Sandy Parts* of *India*, whereof some *Stocks*, acquire from the condition of the *Soil*, and quality of the *Ambient Air*, such disposition as to be capable of being woven into *Linnen*.

CHAP. II.

Of Animals produc'd of Seed.

SOME Animals are thought to be of one Sex only, and to Generate and bring forth without the Male, as *ARISTOTLE* in the 11th Chapter of the 4th Book of his *Natural History*, relates of *Robets* and *Plaice* among *Fishes*; which when they are taken, are found to have Eggs. The same thing is affirmed of *Oysters*, and some other *Shell-fish*, that they are impregnated with their own proper Seed, and that they breed and bring forth their like without *Natural Coition*.

Those that stand up for *Aristotle* and right or wrong defend whatsoever hath been wrought by him, admit, without the least difficulty, this assertion of his, because he Judges so, Writes so, and will have it so: But we who prefer Truth before *Aristotle*, and think nothing fit to be received which is not consentaneous to Reason and Experience, reject his Assertion as *Fabulous*, as having conferred with Men of undoubted Credit and Reputation, who affirm that they have seen *Robets* without *Spawn*, and *Plaice*, *Male* and *Female*, in conjunction together. And indeed it is utterly repugnant to Reason, that any *Animal* should procreate by it self, and propagate its *Species* without the help of another. So that I am apt to believe that *Aristotle* delivered not this to be his Sentiment, as totally relying upon his own proper Judgment or Experience, but rather by suffering himself to be led aside by the Credit of those *Fishermen* whom he had hired to discover to him the Nature and Properties of *Fish*. The same may be said of *Oysters* and such like *Shell-fish*; since there are many who affirm that they have seen *Horn-fish* and *Purples* in Conjunction each with their kind: Nay, and that they have observed their Meeting at set times of the year to perform the said work of Generation.

Women that are maimed or deprived of one or more Limbs, sometimes bring forth Children affected with the like Mutilation, as that *Woman* mentioned by *GASSENDUS*, who having formerly brought forth many Children perfect and intire, afterwards when she had lost one of her Fingers, brought forth several Children, in like manner, deficient. *Sir KENELM DIGBY* gives us a Relation of a certain *Woman* whom he saw in *Barbary*, who having two Thumbs on her Left Hand, was attended by four Daughters, whom she brought forth thumb'd in like manner.

Ancient Physicians generally alledge one main cause of these and the like effects, namely the deflux of the Seed from all parts of the Body: Forasmuch as since the Blood is carried by a perpetual motion through the Body of the Animal, it is not to be doubted but that the subtil part thereof adapted to Generation, by passing through all its parts, is concocted by every one of them, and affected in a certain peculiar manner, so that it partakes of the qualities of each, and carries them along with it to the Heart, whereunto it tends; and where it is separated from another more gross part, and laid up in receptacles appointed by Nature. And this, say they, is the Seed which every Animal makes use of for the Generation of others like

V. How Excess breeds Addition of Parts happen.

VI. The Cause of Women's Barrenness.

like it self. So that if it chance that the *Animal* from which that *Spermatick Matter* is drawn, wants any *Limb* or *Member*, no *virtue* of the said *Member* will be in the *Blood*, and consequently the *Birth* will come forth *maimed*, or destitute of some part or parts. Or if any part or parts in the *Animal* exceed, as Sir *Kenelm* relates of the *African Woman*, or there be any exuberance or excrescence of *Flesh*, the same deformity will be also concomitant to the *Birth*, unless this redundancy be temper'd by the *Seed* of the other *Parent*, or the superfluity of the *Blood* be corrected.

III.
Defects,
Diseases
and Vices
of Parents
entail'd
upon their
Children.

And for the same cause they say it is, that they who are troubled with the *Gout*, *Epilepsie*, *Leprosie*, or any such like contagious *disease*, impart the same to their *Births*: Especially the *Mothers*, since they afford them *Aliment*, and together with the *Blood*, the habit of *Body*, as they likewise communicate the *manners* and *dispositions* of the *Mind*. Hence commonly it falls out that *lewd* and *drunken Women* bring forth *Children* of the same temper and like themselves entailing their *vices* on their *Offspring*.

IV.
How Chil-
dren come
to be mark'd
with their
Parents
defects.

But as in *Fruits* it may possibly be conjectur'd, that the *Buds* and *Efflorescences* have been form'd in their original exemplar from the beginning of the *world*; so the like is to be inferr'd in the production of all *Animals*; and tho' it may seem very difficult to comprehend how the *form* and *features* of *Parents* are imprinted in the *Births*; yet if we seriously consider it, we shall find it not so hard a matter to conceive as we think, that the *figure* of a *Body* so small, and so flexible as is that of an *Embryo*, may be diversly modified, whether it be by the *Bodies* which serve to extend and enlarge it, or by those which close or compress it, or by the *imagination* of the *Mother* which hath power to remove the *humours*, and consequently to cause them to flow towards some parts rather than others. For when they fail to bend their motion towards some parts of the *Infant*, then it is that the *Infant* is born with the Defects of the *maimed Parent*.

V.
How Exu-
berances or
Additions
of Parts
happen.

And on the contrary, if it happen that they have exuberances or more parts than belong to a compleat *Birth*, as two *Heads*, or the like; this addition of *parts* may be attributed to the meeting of two *Eggs* hitting together, or whose parts have been disordered, intermingled, or crush'd together through the motion of the *Humours*, several ways, by the *imagination* of the *Mother*.

VI.
The Cause
of Womens
Barrenness.

Some *Women* are undoubtedly *barren* and incapable of ever bringing forth *Children*, and the reason is evident from things already discours'd of in our *Institution* of *Philosophy*; namely, that every *Egg*, in its proper receptacle, that is, the *Womens Testicles* is rendred fruitful by the *Virile Contact*, that the *Egg* thus fecundated or fructified, increases daily more and more, and is at length shut up in the *Womb*, and is there, as it were, ripened with *heat*, till such time as it hath received all its *Lineaments*. So that *Women* are *Barren* when their *Eggs* are either intemperate, or hardened, or wrapt in a *Membran* too thick to be fermented by the touch of the *Virile* or *Male Seed*; or because their *Eggs* are too small or juiceless, so as to contain little or nothing in them, or else because their whole *Bodies* are intemperate or full of gross

humours, or are over fat, or because they are troubled with the *Whites*, or have their *Courses* too much. But of all others, the chief cause of *Sterility* is said to consist in the obstruction of the *Fallopian Tubes*, since if these chance to be obstructed, the *Seminal Spirit* cannot reach the *Ovary* to fructifie it.

Women, whom the Monthly benefit of Nature fails, are *barren* and void of all fecundity.

The Reason is, because at such a time the *Vessels* being obstructed, the passage is rendred incapable to transmit the Genital Air to the *Ovaryum*. Whereas *Women*, when their *Courses* begin, and more especially when newly over, are sooner impregnated and conceive, because the *Womb* is moist with a certain roscid *humour*, and more easily attracts and retains the *Seed*.

Women have not their *Courses* at the same time in all *Countries*. In very hot *Climats*, for the most part, the *Profluvium* begins in the 7th or 8th year: So the story goes of an *Indian Girl*, who was married at seven years old, and at eight brought forth a *Boy*. In temperate Regions at 12 or 14; in cold Regions seldom before the 16th or 18th year of Age: In persons very young these *Fluors* break not out, both in regard the *Blood* is for the most part taken up in the nutrition of the *Body*, as also because the *Blood* is not sharp enough to open easily the *Mouths* of the *Vessels*: In *Women* growing into years it ceases, in regard the *Blood* thickning for want of due fermentation, is not so fluid as in the strong and youthful.

She *Mules* are generally accounted barren and incapable to bring forth their like.

The Cause of this sterility in *Mules*, Modern *Physicians* attribute to the want of *Eggs* in the *Womb*. For *STENO*, who first discovered and made publick the *Ovary* in *Women*, affirms that *Mules* have indeed *Testicles*, but are destitute of *Eggs*, and therefore no wonder they are so barren, since they have not like other *Animals*, *Eggs* in those *Testicles*.

However some there are that question this Tradition, and assert that the *Mules* are not altogether barren, since there have been *Mules* known which have brought forth; particularly there was one of late in *Auvergn* that brought forth a young *Mule*. And *PLINY* quotes *Theophrastus* his Testimony, that *Mules* in *Cappadocia* bring forth not only those that are generated of a *He Ass* and *Mare*, but also such as are begot of *Mares*, and wild *Asses*, tho' this seldom happens by reason of the great difference of parts which constitute the *Womb* of a she *Ass*, and those which constitute that of a *Mare*; forasmuch as the *Asinine Birth* possesses those *Caruncles*, *Placents* and *Zones* which the *Equine Birth* is destitute of. Wherefore it must needs be, that whereas a *She Mule* partakes not of all those parts, she cannot but be barren, unless some extraordinary accident happen.

Overmuch effusion of *Seed* is very hurtful to the *Brain* and *Nerves*, and creates an extraordinary weakness in them, as those persons by experience find, that too much indulge to *Venery*.

HIPPOCRATES was of opinion, and to this day it is the belief of many *Physicians*, that the *Genital Humour* is derived from the *Brain* into the *Spermatick Vessels*, whereof when-ever there is any evacuation made, the *Brain* must of necessity

VII.

quent effu-
sion of Seed
hurtful to
the Brain.

necessity be weakned. But since there appears no peculiar Channels from the *Brain*, which can convey the foresaid *humour* to the *Spermatick Parts*, it is most consentaneous to reason, that this noble *humour* is generated out of the *mass* of *Blood*, or as others will have, out of the *Nutritious Juice* and *Animal Spirit* well compounded, whereof some part is no less diffused to the *Genitals* than to the *Brain*. But that the overmuch wastings of the *Genital Humour* should endamage and weaken the *Brain*, that arises from hence, namely because the *Blood* to repair the *spent Seed*, puts the *Brain* to the expence of its most subtil part to supply the *Spermatick Vessels* with a sufficient quantity of *Animal Spirits*. Nay, when the *Blood* out of its own substance cannot contribute sufficiently to the *Genitals*, it claims of the *Brain* a Grant of new matter formerly borrowed on purpose.

XI.
Children
generally
resemble
one or other
of their
Parents.

Children most commonly are like to one or other of their *Progenitors*, and sometimes resemble both. Some *Women* have the resemblance of the *Grand Father*, *Great Grand Father*, or some other of their *Ancestors*. As that *Græcian Woman*, mention'd by *PLINY*, being accused of *Adultery* because she had brought forth a *Black*, was acquitted and judged innocent when it appeared that she was but the fourth degree removed from an *Æthiopian* Ancestry.

It is a common opinion of ancient *Physicians*, that if the *Womans Seed* abound, the *Birth* becomes like the *Mother*; if the *Mans Seed* predominate, it is most like to the *Father*; but if there be an equal proportion on both sides, that then there is a resemblance to each party alike; and to this purpose and almost in the same terms *LACTANTIUS* expresses himself.

XII.
The Reason
of the re-
semblance of
Children to
their Pro-
genitors.

But I rather think, as I said a little before, comparing the *Germination* of *Plants* with the *Production* of *Animals*, that the resemblance of *Children* to *Parents*, is not caused by the exceeding quantity of *Seed*, either of the one or the other *Parent*, but rather because the *Seed* of the *Male*, making way into the *Pores* of the *Eggs*, opens them in such a manner, that they are more disposed to receive the matter whose *particles* resemble those of the *Male Seed* than to admit of others, by reason whereof the *particles*, which make up the composition of the *Infants Body*, rank themselves in such sort as those are rank'd which compose the *Fathers*; and this is the true cause of *Father* and *Sons* resembling each other. The same reason may be given of *Infants* being born with a resemblance to the *Grand Father*, or any other *Ancestor*, whom neither *Father* nor *Mother* ever knew. For it may easily be conceiv'd, that *Ancestors* may possibly have impress in their begotten *Off-spring* such sort of dispositions, that the parts of their *Seed* cause in the *particles* of the *Eggs* those particular structures which are proper to produce in the *Birth* a *Figure* modified rather one way than another.

XIII.
Whence it
is that some
Children
are born
Lame, o-
thers Gib-
bous.

But some will say, if *Infants* are thus inclosed, and as if it were fenc'd about in *Eggs*, how comes it that some are born *Lame*, others *Gibbous* or bunch backt?

This happens when the *Infant* is so streightned in the *Womb*, that all the parts cannot grow proportionably; whether it be that the *Womb* is too little, or because the parts of the *Birth* are

diversly affected by some exterior cause. For by this means the *Infant* must needs be out of order, that is, must have some *Member* greater or smaller, or otherwise dispos'd than the natural construction of the *Body* requires.

Hence it is that wise men oft beget *Changelings*, or *Children* of little or no understanding: Because having their *minds* imployed in subtil inventions, or some serious points of *Learning* or *Art*, they little mind the *Sports* of *Venus*, and are very slack and indifferent in the performances thereof. On the contrary, those that are eagerly bent upon the *Act* of *Generation*, for the most part beget *Children* of like *Affections*, *Manners*, *Studies* and *Inclinations* of *Mind*. For those *Children* in whom vigour of *Soul* and *Vital Spirit* is infused from the faculty of the *Seed*, cannot but be of the same *Disposition*, *Nature* and *Temperament* with their *Progenitors*.

The *Matrons* of *Holland* by looking earnestly upon a *Hare*, oft-times bring forth *Children* with the *Upper-Lip* divided, or as we commonly call them *Hare-Lipt*. In like manner, some have *Flat Noses*, *Wry Mouths*, *Blubber Lips*, and a habit of *Body*, all over deformed.

The Reason is, because *Women* in the time of their *conception* or going with *Child*, have many times their *Eyes*, *Thoughts* and *Fancies* strongly fixt upon some or other mishapen or ill favour'd sight: For such is the force of *Imagination*, that when a *Woman* Looks or Thinks upon any thing very earnestly, she commonly brings forth some thing very nearly resembling the thing so seen or thought on. So a certain *Woman* not forgotten in story, who having cast away all shame, while her *Husband* was absent, and prostituted her self to another person, brought forth a *Child* no way like to the *Gallant*, but the very Picture of her absent *Husband*: The cause whereof is Elegantly and Wittily described by Sir *Thomas More* in one of his *Epigrams*.

The like is related by *GALEN*, namely, that a certain *Woman* brought forth a *Child* not at all like the *Father*, who was naturally deformed in *Body*, and of an ill-favour'd Visage, but to a fair *Image* or *Picture* which her *Husband* had often desired her frequently to cast her *Eyes* upon. And *PORTÆUS* makes relation of another *Woman*, who delighting as it were by a natural propensity, to have frequently in her sight, and oftener in her mind a *Statue* of *Marble* representing a *Fat Boy*, brought forth a kind of *Man Child* Pale and Wan, and indeed wholly resembling the said *Statue*. Nor is this peculiar only to *Human Race*, but common also to *Brute Animals*, of which more in the following Chapter.

Whence it is that *Twins* are brought forth at one Birth.

Ancient *Physicians* were of opinion, that the *Womb* is distinguish'd into so many *Cavities* or *Cells*, divided by *Membrans* from one another as there are *Births* generated in the *Womb*; but the contrary is proved by experience. For the *Womb* hath in reality but one continued *Cavity*; and the truth of the matter is this, when several *Births*, at one time are generated in the *Womb*, they are contain'd each in their proper *Membrans*; so that if two, three or more *Births* are conceived, it is when the *Male Seed* hath been very spirituous, even to the im-

impregnation of so many Eggs, with the same fruitfulness through the *Fallopian Tubes*, as if there were but one, which being driven down to the bottom of the *Womb*, are there each of them fructified.

XVIII.
Whether
Issues dis-
pose to Bar-
renness.

It is a *Vulgar Maxim* among *Women*, and by some taken for a certain truth, especially here in *England*, that if a *Woman* have but one *Issue*, she is condemned to *Sterility* or *Barrenness*, and much more, if more. Therefore to married *Women* that are in expectation of *Childing*, this sort of application, tho' otherwise thought very conducive to health, is most strictly forbidden.

But of this Interdiction I have yet found no just reason alledged, only there are cited some stories of *Barren Women* with *Issues* about them; but it would not be difficult to produce relations of very many *Barren Women* without *Issues*, and of many *Fruitful ones* which have them.

CHAP. III.

Of Monsters.

I.
What a
Monster is.

THOSE we call *Monsters* are Natural Births, or Natural Living Creatures degenerating from the due and wonted disposition of their *Species*. Now they are said to degenerate if there happen any superfluous *Member*, or any necessary one be wanting, or any part be in a wrong place, or be of another kind than what it ought to be; so that those persons are said to be *Monstrous* who are either born without *Arms*, or with more than ought to be, or have them in a wrong place, as in the *Thighs*, or have the *Head* of a *Ram*, or other unhuman *Creature*, not to mention several other accidents of this nature.

II.
Of a Two-
headed
Twin Fac'd
and double-
breasted
Birth.

There goes a tradition of a *Boy*, born in the Reign of the Emperor *Theodosius* at *Emaus*, who from the *Navil* downward was perfect as others of his kind, but upwards was all double; *Head*, *Face* and *Breast*, had the use of his *Senses*, and of all his double parts by turns, while one eat and drank the other abstained, and with the like vicissitude while one slept, the other waked; while one sported, the other was serious; discovering hereby effects of a different *Mind* and *Temper*, and in this manner he lived near two years.

III.
A Child
born with-
out a Head.
Another
without
Feet, others
without
Hands or
Feet.

In 1504. in *Misnia*, a *Child* was born without a *Head*, his *Eyes* being placed in his *Breast*. Another in *Nebritz*, not far from the City *Wutz* was born without *Feet*. Others the *Roman History* mentions born without *Hands* and *Feet*.

IV.
A Monster
with one
Arm in the
Ear, and
another in
the Side.

In *Stetin* was born a *Monster* shaped as followeth, in the place of the *Head* there was an unformed *Mass* or *Lump*, rising and sinking like a *Sheeps Intrals*; in the place of one *Ear* stood out an *Arm*, where the *Face* should be, there was a tuft of *Hair* like a *Cats Fur*, and the *Spawn* of a *Pike Fish*, through the lower part whereof the *Eyes* cast a splendor like *Glasses*; the *Mouth* was contracted into a little hole, without *Lips*; there was something like a *Nose*, but wonderfully small; nor was there any appearance of a *Neck*: Another *Arm* stuck out from one side, but there was no sign either of *Back* or *Breast*, excepting that a little small *Line* seemed to supply the place of the *Backbone*; it was neither *Hermaphrodite*, nor of any *Sex*. There was also in the year 1516. another strange *Creature* born, which lived to be a *Man*,

having no other *Head* but what grew out from the *Navil*, yet it took in nourishment as freely as if it had been in its proper place.

In 1560. there was born at *Basil* a *Man-child* with a fierce and grim *Visage*, having indeed an indifferent well compacted *Body*, but *Head* and *Face* all hairy, and more resembling that of a *Dog*, *Cat* or *Ape*, than of a *Human Creature*. He liv'd no longer than about an hour and a half. Near *Lauffenburg*, a *Town* in *Germany*, on the Borders of *Switzerland*, a *Child* was born with a rough and frightful *Head*, and the *Feet* of a *Goose*.

Of all these strange Births various causes may be assigned: For in the first place, we may without offence believe that the first *Seed-plot* of *Monsters* as well as of perfect *Creatures*, was planted in the beginning, and that *Generation* only conduces to render them capable of a sensible growth; nor doth it avail to say, that *GOD* cannot be the Author of *Monsters*, for he would be so nevertheless, tho' the first *Seed-plot* of *Monsters* were not till after the beginning; and there is a ready answer, viz. That there is nothing in the *World* except *Immortality*, of which *GOD* is not the Author.

2dly, The cause of any *Monstrous* defect is either in the *Conception*, or the *Egg*, in which some passages are by accident obstructed, or some *Fibres* pluckt off; or in the *Womb*, when the *Placenta*, into which the *Male Stock* is ingrafted, hath suffered any defect; or in the decision of the *Conception*, or last efflorescence.

3dly, These *Monstrous Bodies* may possibly proceed from the streightness of the *Womb*, whence *HIPPOCRATES* compares an over-streight *Womb* to a stony place, which causes the *Tree* that springs up there, to become bent or dismembred; or to the narrow *Neck* of a *Vessel* which stifles the growth of the *Cucumber* when tender, and contracts and curtails it when growing to maturity.

4ly, The force of *Imagination* may produce a defect, or exorbitancy in the *Birth*, as we oft see *Warts* and *Spots* imprest upon the *Birth* by *Imagination*; and these *Spots* are not always the simple resemblances of *Cherries*, *Mulberries*, but also sometimes of *Entrails*, as *Liver*, *Heart*, &c. Now if this *Imagination* have such a power upon one part, why may it not have the like upon many, nay upon all?

Animals which bear *Twins*, sometimes bring forth *Monstrous Births*. So we see many times out of one and the same *Egg*, a double *Monster* produc'd, a *Chicken* with four *Wings* and as many *Feet*, and sometimes with two *Heads*. *Twins* oftentimes are born with their two *Bodies* joined together into one; as at *Constance*, near a place called *Abronium*, there were born two *Children*, *Male* and *Female*, with two *Heads*, four *Arms*, and as many *Feet*, that is, each of them had all their *Members* compleat, only they were joined together about the *Navil*.

The Reason seems to be, because altho' *Twins* in most *Animals* are wrapt up in the same *Membran*, called *Chorion*, yet each of the *Births* hath its proper *Membran*, called *Amnion*, and therein a separate *Conception*; yet sometimes it happens that these two *Membrans*, mix as it were into one, or at last mutually intersect each other, whence certainly arises a great confusion of parts, for this

V.

Imagination.

X.
How Twins
come to be
born with
Bodies join-
ed or fast-
ned to each
other.

the *Fibres* and the *Canals* have proper to themselves, viz. that they easily join into a Contexture; so there is not a total confusion of the Colliquaments, but only some commixture and compression which will cause the two *Twins*, thus united together, to have some parts in common; and the Colliquament, upon the consumption of one of the salient points, to turn into a duplicated *Animal*, and consequently some *Members* will prove superfluous. The same thing happens in *Fruits*, if they be crowded up in straight places before they arrive to their due magnitude, as hath been already hinted, tho' *Plants* seldom undergo this sort of failures and lapses of *Nature*, because they are more plain and simple, and the *Organs* of their *Body* are lesser and less exact; so that in their constitution they give *Generating Nature* less occasion to err. For it is very obvious to err in composing works of divers parts join'd each to other with most curious Artifice, as the *Members* of *Animals* are. Whence it appears, that *Mothers* consult very ill for themselves and *Children*, while they live idly and lazily at home, and incommode the *Child* within them, while they sit double or cross-leg'd at their *Needle-work*. Forasmuch as by this overmuch contraction, they bring *Children* into the *World* Bunch-Backt, Splay-Footed, Crooked or Awry, or some way or other Mithapen.

XI.
How Africa comes chiefly to abound in Monsters.

Sometimes also *Monsters* are produc'd from the various commixture of divers *Seeds*; that is, when the sorts of *Seeds* are taken in at several times one before, another after. Hence it is that *Africa* is generally said to abound in *Monsters*, because *Animals* of different kind resort from all parts of the *Country* to drink of what *Streams* of *Fresh Water* they can find, which are fewer than in any other quarter of the *World*; and so rencountering each other, they couple promiscuously together, and bring forth productions never intended by *Nature*.

XII.
How it may be known whether Monsters, having double parts, be two Animals, or but one.

The next thing to be considered is, whether *Monsters* that have double parts, can be said to be two *Animals* or one. To determine this the better, it is to be supposed, that the *Heart* is the principal part of every *Animal*; forasmuch as all other parts derive their original from it; so that if there be two *Hearts* in any *Animal*, it will necessarily follow that the *Animal* possessing those two *Hearts* is a double *Animal*. For as it is the principle of the *Operations* of the sensitive *Soul*, according to the *Internal Senses*, and in part according to the motions of the *Appetite*; so it is vulgarly said to be the principle of the *Vegetative* and sensitive *Soul*, according to the motions of the *Appetite*. Hereupon SENNERTUS infers, that that *Monstrous Birth* of *Emans* having two *Heads* and two *Hearts*, was to be accounted two *Men*: But that the other born in the year 1531, who had two *Heads*, and but only one *Heart* and lived to *Mans Estate*, was to be reckned no more than but one *Man*, which he proved by this Argument viz. that the two *Heads* perpetually testified their consent to the same actions, had the same appetite, the same hunger and thirst; spake in the same manner, had the same desire to accompany with their *Wife*, the same desire to exonerate *Nature*. But in the other who had two *Hearts*, there was not found the same conspiracy and consent of *Affections* and *desires*; what this would have at one time, the other affected at

another time; sometimes they agreed, sometimes they squabled.

Monstrous Births proceed not only from *Man-kind*, but also from other *Animals*; forasmuch as being equally endued with *Corporeal Imagination*, they may be as eagerly intent in the beholding of any *Object*, and by this means may induce various *Forms* upon their *Births*. So *Jacob* made a great part of his *Uncle Labans Flock* his own, by the ringstreaked and variously spotted *Rods* he cast before the *Ews* when they were ready to conceive: Thus we draw fine *Pictures* upon the *Wings* and *Tails* of divers sorts of *Birds*; thus we produce delicate breeds of *Dogs* and *Horses* curiously streakt and spotted; and who knows but that that wonderfully shapt *Monster* described by FINCELLIUS might be produced by this or some such like artifice; that *Monster*, I say, which being calv'd by a *Cow*, had the Feet of a *Calf*, a *Mans Head*, with both Ears also like a *Man*, and Hair of an indifferent length, a *Breast* also and *Teats* on them like a *Human Creature*. Nor must the *Turkey Hen* be past by, which had the *Body* of a *Peacock*, the *Crest* and *Dewlap* of a *Game Cock*, a *Voice* like that of the *Peacock*, and a noble display of *Colours* on the *Tail*; for such is the force and power of the imaginary, tho' corporeal *Faculty*, that when *Animals* behold any thing attentively, it makes so deep an impression in them, that they impart those impressions of various forms upon their *Births*.

XIII.
Monstrous Births in other Animals besides Mankind.

But there are more differences and varieties in *Man* than in other *Creatures*, by reason that swiftness of *Thought*, readiness of *Mind* and variety of *Fancy* and *Ingenuity* makes impressions of various forms, whereas other *Creatures*, have for the most part the same reception of *Images* which are produc'd from the variety of *Tracts* impress'd in the *Brain*, whereby it comes to pass, that a *Womans Imagination* induces a strange and borrowed *Form* and *Image*, no way like to the begetter, but totally differing from them.

XIV.
But most in Mankind.

Now upon serious reflection of all that hath been said on this *Subject*, there is nothing more odious and detestable to me, than to see wanton *Women* so excessively delight themselves with *Dogs* and *Apes*, as to carry them in their *Bosoms*, hug them, stroak them, and be continually handling and making much of them; since by this familiarity, and having these *Creatures* perpetually in their sight, the imperfect *Nature* of *Women* is apt to conceive in the *Mind* one or other strange form or feature, and so fix upon the *Birth* a *Face* like some of those *Animals* they converse with, or at least some way or other specially illfavoured. Yea, sometimes *Children* are brought into the world with odd kind of shap'd *Bodies*, Visages out of the common road of *Human Aspect*, distorted *Mouths* and *Cheeks*, inflate like the *Picture* of the *Northwind*, and all by the *Mothers* regards continually and intently fixt upon brutal and unwonted *Objects*.

XV.
Whence the deformity of some Bodies.

CHAP. IV.

Of the Birth of Animals.

I. Why Women bring forth but one Child at a Birth.

Women lie in commonly but of one Child, whereas other Creatures bring forth many of their kind at a Birth.

This is, because in those Animals there are divers Cells or Flethy Eminences, to which small Eggs are fastned, one to each: But it is not so with Women, for tho' the Virile Seed ascends in vapors to the Testicles through the Tubes of the Matrice; yet notwithstanding Women do not commonly conceive two Children, by reason that the Womb hath but one Cavity; and that for the accomplishing of Generation, it is not enough that it be receiv'd into Testicles, but it must also be received into the pores of the Eggs to cause them to ferment; nor can these pores receive it till after the Egg is brought to a certain point of maturity, to which commonly, in Women, they attain not to, but only one after another; as we see in the Ovaries of Hens, whence the Eggs for the most part are not unfastned but successively. We must therefore suppose that when Women bring forth two Children at once, it either proceeds from hence, namely that two Eggs fall at one and the same time into the Womb, and that there are two places for them to be fastned to, and for that the two Eggs have been in such sort formed in the first Creation as to be apt to fasten to the same Placenta.

II. Whether there be any sign to discover whether a Woman shall have Twins or not.

There are some who brag that by a certain sign or mark, they can easily guess whether a Big-bellied Woman shall have Twins or not. But their boast is vain and groundless, for of this matter there can be no certainty, rule or knowledge. It can neither be the big swelling of the Belly, which sometimes is greater in the bearing of a single Birth, than in that of Twins; nor the diversity of motions, which many times some have taken such strict observation of from an abortive Embryo only, especially by the slow motion thereof, as to believe that the Woman would certainly have had Twins, had she gone out her time. Nor an external Line dividing the Womb in the middle, which several Anatomists have, even from their own Wives, found experimentally to be a vain conceit: Nor the swelling of their Legs and Feet in the last Month, or Months of their going with Child, since they swell in that manner, even in the bearing of single Births: Nor lastly, the large distention of the Belly towards the Sides, which the various situation of a single Birth may be the cause of. Rebecca indeed from the extraordinary motion of two Embryos struggling one against the other, guess that she had Twins within her; but this might also be partly a Divine Instinct.

III. What the Cause is of Immaturation Birth, and to suffer an Efflux or Abortion before the due time appointed by Nature for their Delivery. Abortion, or the untimely Exclusion of a Birth, not yet perfected, happens according to the opinion of the Galenists, either from the overmuch abundance of Blood, by reason of the great afflux thereof to the Womb, more at that time than another; or else from the want of Blood in the Mother to nourish the Infant. But in my Judgment there are several Causes to be en-

quired into, as well relating to the Mother, as to the Birth. On the of the Birth, Abortion happens when the Uterine Glands are so infirm, that they are soon broken; or the Membrans so thin, as upon the least occasion to burst; upon which the humours breaking forth, the Birth decays. On the part of the Childing Woman, if she be of a weaker Nature than ordinary, and hath not strength sufficient for the bearing of such a burthen: Sometimes it happens from a sudden fright, or the noxious temperament of the Air. To which purpose AELIAN relates, that Women inhabiting the Southern Countries are more subject to Abortion than those that live more Northerly, because there the Limbs are more supple; and those parts which conduce to Childbearing are more loosened.

An Abortion may happen from the first moment of Conception to the beginning of the seventh Month; but it is most frequent about the end of the third: not but there have been examples thereof both before and after that time. Before the tenth Week after Conception, exclusions are scarcely taken for a real Abortion, because till after that time scarce any rudiment of a Birth appears; so that it is then rather accounted for a Mole. For unless the Birth appears in the body of the Placenta, it is not allowed to be a true Conception, and consequently the exclusion thereof cannot be said to be an Abortion.

The end of nine Months is the usual time of Infants coming into the world.

The Reason of this is, partly because of the overmuch Meconium of the Intestins made by the excrements, which is nothing else but the mixture of Phlegm, Choler and Pancreatick Juice, which because of overmuch delay, become oversharp, whence by a troublesom vellication of the Fibres of the Intestins, it causes an influx of the Animal Spirits into all parts, and so the Birth overmuch stirring it self by its calcitration or kicking, breaks the two Membrans, the Amnion and the Chorion, in which it is wrapt, and gathering it self round, shoots downward towards the internal Orifice of the Womb, which by dilating, it naturally makes its way into the world.

The Viper brings not forth but with the loss of Life, for on the third day shutting in her young ones into her Womb, having about twenty to bring forth, and having brought one a day for two or three days before, the rest impatient of their slow Birth, and halstning into the Light, bite through the Sides of their Dam, and thereby open a gap to their own Life and her death. Whence Mamuan;

The Viper wounded by the fatal bite
Of the young Vipers, dies to give them light.

This Tradition, from the Age of Herodotus to this very time, hath been received for an undoubted Truth, namely, that the Male Viper loses its Life in the midst of Copulation, by thrusting its Head into the Mouth of the Female, who through the height of pleasure bites it off: As also that the young ones not tarrying their time, make a speedier way by tearing the Womb, and gnawing through the Breast of the Dam. But the vanity of this assertion they find by experience, who preserve them in Glass Vessels for their use, in certain Medicinal

IV. When Abortion happens.

V. Why Infants are born at nine Months end.

VI. The Viper does not let out her young ones through her Sides.

Compositions. It may well enough be conjectur'd that this fancy took its original from hence, namely, because *Vipers* are brought forth fenc'd about with their *Membrans*, which in regard some of them break not till the third day after their being brought forth, and others free themselves of them in the *Womb*; hereupon some have taken the *Membran* for the *Womb*, and delivered in writing that the Brood of *Vipers* gnaw through the sides of the *Dam*, and by that corrosion cause her Death.

VII.
But the
Fish *Acus*.

But this is known for a certain, that the Belly of the Fish called *Acus*, in the midst of her breeding, cleaves into a gaping Aperture by reason of the multitude of young ones within her, which cleft is not effected by the corrosion or gnawing of the young Fry, but by the rupture of the Skin making a gap under the bottom of its Belly, by which, contrary to the custom of other Fish, its *Womb* is extended in time of breeding, and in which it lays up its *Spawn*. For *RONDELETIUS* upon his own experience attests, that as he was dissecting of one of this sort of Fish, he found abundance of *Spawn* in that very gap; and likewise that as he was inspecting into the said gap, he found in two other lesser ones, some *Spawn* newly hatch'd, and many Births just perfected; whereof some of the biggest moved, but others imperfect, whose Eyes and Mouths were only to be perceived. From all which it may be gathered, that the Fish *Acus* does not so much bring forth young ones, as exclude them out of that bursted Gap, and that the *Viper* suffers no damage by the production of her *Viperous Blood*.

VIII.
How it
comes that
Animals
have each
their set
season of
bringing
forth from
the time of
Copulation.

Animals observe each of them, their certain and determinate time in bringing forth. *Elephants* go go 2 years, *Mares* 11 Months, *Camels* 12 Months, *Cows* 10, *Sheep* 5, *Bitches* 9 Weeks. *Birds* also lay their *Eggs* at a set time from the *Seed* received. *Women* also have their ninth or tenth Month for their delivery, which if they exceed, the *Birth* is accounted either not Natural, or not Legitimate.

There is one common Cause of all these different *Seasons*, namely, for that the *Birth* as it grows bigger and bigger, being more and more unsatisfied with its nourishment, makes a stir and eagerly indeavours to enlarge its Commons, and provide it self with a more plentiful subsistence; as also for that being shut up in too narrow a compass, and freighted by the *Membrans* wherein it is wrapt, it shakes the Walls of its Prison to get free. And this is to be observed, not only in *Animals* of the bigger sort, and *viviparous* or live-bearing, but also in the *Oviparous* or Egg-bearing. For a *Chicken* shut up in its *Egg*, as soon as the *Yolk* upon which it hath lived is consumed, with the help of its *Dam*, the *Hen*, breaks the *Shell* and gets its liberty. Thus the *Egg*, after formation compleated, becomes so burdenson to the *Womb*, that being in a sort exasperated, indeavours to expel the said *Egg*, and to free it self from so troublesome a burthen.

IX.
Why Ani-
mals are
born with
their Head
downward.

All *Creatures*, if they are brought forth according to Nature, are carried inverse, and prone upon the Head, open the Mouth of the *Womb*. The Reason is, because that part of the *Body*, from the *Navel* upwards, to the *Head*, is more ponderous than that which from the *Navel* reaches

downward; and since heavy things tend to the lower parts, the *Head* of the *Infant* must of necessity be carried first to the *Orifice* of the *Womb*. As of two *Scales* of a *Ballance*, the heavier tends downward, and the other upward. And if at any time it happens otherwise, that *Birth* is said to be not Natural, but as it were perverting the course of Nature; as when it comes out with its *Feet* forward, or with one *Foot* stretcht out, another tending to one side; or when with one or both *Hands* it offers it self to the Mouth of the *Womb*.

Ancient *Physitians* are of opinion, that a *Septimestrian-Birth*, or a *Child* born in the seventh Month may live, but that an *Octimestrian* or Eight-month Birth is for the most part fatal.

The Cause hereof *HIPPOCRATES* attributes to the order of the seven *Planets*, that preside over *Human Affairs*, and have their domination or Government over them, each in their turn. So that according to his assertion, the first Month belongs to *Saturn*, the second to *Jupiter*, and so of the rest, till the dominion comes to *Mercury*, who is the lowest of the *Planets*; which Circuit being finish'd, it returns again to *Saturn*. But how comes *Hippocrates* to understand so well this power of the wandring *Stars*? Wherein is it that this great force of theirs consists? What Instruments guide them to the *Infant* wrapt up in his *Membrans*? But looking upon these things as the *Dreams* of a wise or rather industrious Person, I choose to adhere to *PLINY*, who affirms the contrary to have hapned in *Egypt*, in which Country he saith, there is nothing more frequent than for *Octimestrian Births* to live, and brings for example, *Cæsonia*, the Wife of the Emperor *Caius*, who came into World in the eighth Month. This account is confirmed by *CARDANUS*, bringing an instance of Cardinal *Sfondano* and others, who being born in the eighth Month, nevertheless lived to a very considerable Age. And what should hinder us from asserting, that Persons born in the eighth Month are more long liv'd than others; since it is a great Argument of vigor that they anticipate the ordinary course of Nature, and as it were take it in dudgeon to be shut up longer in a Prison, unless the blame be laid upon the *Mothers* weakness, and the *Birth* be accelerated by an overmuch irritation of the *Womb*.

It is delivered by some *Physitians*, as well Ancient as Modern, that there are *Births* of eleven Months: *PLINY* makes relation in his seventh Book, Chap. 5. of a *Woman* who was brought to Bed in her thirteenth Month; and *AVICENNA* writes of another that was delivered in her tenth Month.

This *Computation* may possibly have hapned from the roguery of some *Women*, and the simplicity of others in misreckning their time: Roguery when a *Woman* having no *Children* at her *Husbands* death, may for enjoyment of his *Inheritance*, and *Personal Estate*, accompany with another Person, and have a *Child* by him within 11, 12, 13, or 14 Months, and to lay the getting of it to her deceased *Husband*; which kind of Villany is so common, that all the World over in all *Judicial Courts* ring of it. And this is the reason that these late kind of Births are seldom heard of except in such sort of *Widows*, but very rarely in

X.
Why In-
fants born
in the 7th
Month live,
and not
those born
in the 8th.

XI.
How In-
fants are
said to be
born in the
12th or
13th
Month.

in those *Women* whose *Husbands* live, and constantly Bed with them. But as to the misreckning, *Women* generally compute the beginning of their *Conception* from the first stoppage of their *Courses*, whereas it may possibly fall out, that for some other cause they may stop two or three Months before *Conception*; so that if a *Woman* begins the computation of her being with *Child*, the very first time of their *Stoppage*, she must needs be in an error, and by reason thereof it will be thought that the *Infant* came into the World on the 11th or 12 Month, when indeed it was born after the wonted manner; at the end of the 9th Month.

XII. A Great Birth, when Mature, for the most part kicks, and gathering it self up in a heap, breaks the *Membrans* in which 'tis wrapt.

This Kicking proceeds from a necessity of refreshment or respiration; for the heat of the *Embryo* is small at the beginning, and setting it self at first to shoot out like a small sparkle, it hath then no need of refreshment, but augmentation; but as the bulk encreases by little and little, so also the *Actions* and *Motions* of the Birth encrease. But at length the heat is so encreased, that then it chiefly wants ventilation and refrigeration, which not being found, the Birth begins by little and little to be more and more disturbed, and by reason of that disturbance and anxiety, to stir and kick at length so much the more strongly, and by that strong motion to incite the *Uterine Vapors* to a violent Effervescence or boiling, and thereby to endeavour to make its passage out into a freer Air.

XIII. *Women's Breasts* immediately after their delivery, swell and abound with *Milk*, but especially on the 3d, 4th or 5th day.

That is, because *Childbed Women* the three or four first days after delivery, seldom bend their Minds intently upon any business, or serious affairs, and thereupon having but very little appetite, they eat and drink less than usual, and breed less *Chyle*; but in the following days they eat more, and the *Infant* begins to cry more, and then they presently begin to think of *Nutriments* for the *Child*, and desire to quiet it from crying. From which affection the passages being loosened by a determinate influx of *Animal Spirits*, which before were carried to the *Womb*, the *Chylie Juice* is then converted to the *Breasts*.

XIV. And this their strong intent and frequent rumination about their *Milk*, and the suckling of their Young Ones, may possibly cause the *Chyle* to be the better conveyed to the *Breasts*: Which most evidently appears from what *SANTORELLUS* relates of a *Man*, who after the death of his *Wife*, not being able to hire a *Nurse*, one time above the rest, to still the *Child*, when it cried, took it to his *Breast*, and gave it the *Dug*, doubtless with great desire of satisfying its Appetite with *Milk*: and by this iterated application, together with an earnest intention of Mind, and the *Child's* sucking of the *Teat* from time to time, the *Chyliferous Passages* were opened, and the *Paps* afforded plenty enough of *Milk* for the *Child's* nourishment. Thus *Imagination*, and great apprehension of Danger, sometimes causes a *Man* to tremble, to be in a cold sweat, to fall into a swoon and the like.

Infants that suck the *Milk* of a *Woman* with *Child*, become sick and weakly, and many times contract dangerous *Diseases*, as we see in too many, who by reason of the *Nurses* avarice, get a sickly habit, which shortens their days, and never ends but with their Lives.

The Reason is, because the sweetest and grossest portion of the *Alimentary Liquor* is attracted by the Birth, and nothing but what is ferous and tainted with excrementitious depravity is carried up to the *Paps*. For tho' the said *Paps*, as *HIPPOCRATES* affirms, are rendred so much the larger, by how much they attract any thing of *Fat* from the *Belly*; yet in regard before *Childbirth*, the passages are too narrow for the fatter and sweeter parts of the *Milk* to pass through; therefore nothing but what is ferous and most hurtful to the *Infant*, can get up to the *Paps*.

A *Woman*, within the verge of our memory, upon the sight of the *Naked Arm* of a lusty well-flesh'd *Man*, longed to eat some of it; and the *Honest Man* in pity to her Condition, and to satisfy her extravagant Appetite, permitted her to bite thereof: But upon her second longing he thought it too much to sacrifice his *Arm* to her ill-govern'd Appetite, and made bold to deny her; whereupon the unhappy *Woman*, who doubtless could not help her irregular desire, overcome with trouble, fell in Labour.

Of this there can be no other Reason, than for that the *Womans Heart*, having contracted a deep sorrow, the *vital Spirits* were diminish'd, and the *Humours* design'd for the nourishment of the *Child*, averted another way, and not conveyed as at other times to the *Womb*. So that the *Infant* destitute of that *Aliment*, wherewith the *Mother* would have had it satisfied, languish'd and at length died. For the Passages and Conveyances by which sustenance used to be conducted into the *Womb*, being shut, the *Infant* must be destitute of *Nutriments*, and so deprived of *Life*.

A certain *Woman* in France, being stabb'd with a *Dagger*, an *Embryo* was taken out of her *Body*, mark'd with as many livid spots as she had received stabs, and in the very same parts of the *Body*.

The Reason is, because the *Embryo*, carried in the *Mothers Womb*, makes up but one *Body* with the *Mother*; and as it is nourish'd with the same sort of *Aliment*, so it is vegetated with the same *Spirits* according to all its parts. Wherefore no wonder if so tender a *Body* as that of the *Embryo* is subject to the same accidents as the *Body* of the *Mother* is subject; and any *Mark* or *Brand* whatsoever is the more easily imprest upon it, in regard the *Animal Spirits*, which convey the conceived *Image*, are directed by the *Mother*, whilst she touches any part of the *Child's Body*, and as it were marks it out.

CHAP. V.

Of Hunger and Thirst.

ALL sorts of *Animals* are some way or other, or at some time or other pinch'd with hunger; and if we should except the *Chamelion*, which is said neither to eat nor drink, there are at least none besides which feel not a rellication of the

7 K

XV. *Children* sucking the *Breasts* of a *Woman* with *Child*, contract *Diseases*.

XVI. The occasion of a *Womans* bringing forth a dead *Child*.

XVII. How the marks of a *Woman* stabb'd with a *Dagger* were imprest upon the *Child* in the *Womb*.

I. How all *Animals* at one time or other come to be afflicted with hunger and thirst.

Stomach, thirst.

Stomach, and have not sometimes dry and juiceless *Jaws*.

II.
That the
Chameleon
lives not
upon the
Air alone.

Before we come to discuss the Reason of this Affection in *Animals*, it will not be amiss to premise something concerning the falsity of this Old Tradition, viz. that *Chameleons* live only by the *Air*, since it is well known by experience, that they greedily receive as for a great delicacy a sort of little *Worms* pick'd out of *Meal-troughs*, and that they make use of a *Proboscis* instead of a *Tongue*, which they manage like a *Dart*, with such incredible speed, as not to be discerned by the *Eye* of *Man*.

III.
Whence
Hunger in
Animals
proceeds.

The Reason of that trouble and pain caused by *Hunger*, is the great plenty of a certain *Acid Liquor* flowing into the *Stomach*, which *Liquor* being conveyed from the *Heart* through the *Arteries*, insinuates it self among the particles of the chew'd *Meats*, and by diluting them, composes the *Chyle*. But when this humour finds nothing of *Meat* in the *Stomach* to be diluted, it exerts all its force into the *Membranules*, whereof the *Stomach* consists, and agitates the *Nerves*, whose Extremities adhere to the said *Membranules*, in such sort as is required to the causing of the sense of *Hunger*: Whence no wonder if the *Stomach* being empty, and the *Meats* consumed by the *Native Heat*, *Hunger* succeeds with a gnawing of the *Belly* which attends it. In like manner, all *Creatures* are affected with a desire of quenching their *Thirst* by *Drink*, whilst the serous part of the *Blood*, which is accustomed to take its course to the *Stomach* and *Throat*, under the species of *water*, thereby to moisten those parts, sometimes also repairs thither in *Vapor*, and so dries the *Throat* and the *Vind-pipe*, and at the same time moves the *Nerves* in such a manner as is required to excite a desire of *drinking*.

IV.
Why great
drinkers of
Wine and
Strong Li-
quors are
little Ea-
ters.

Hence those that are great *Drinkers* of *Wine*, *Brandy*, or any kind of *Strong Liquors*, more or less lose their *Appetite* to *Meat*; in regard the said *Wine* or *Brandy*, being full of *Volatile Salt*, cause the ferment of the *Stomach* to be either too *volatile*, so as that over-running the most subtle pores thereof, it leaves the *Stomach* destitute of all Incitement or Provocation, which produces *Hunger*, or at least takes away that correspondence that ought to be between the *Salt* and that *Acid Ferment* which is required in the *Stomach* to excite *Appetite*.

V.
How Spar-
rows come
to be so
voracious.

VAN HELMONT is of opinion, that *Sparrows* are therefore so very voracious and desirous of *Meat*, as having much of acidity in the *Throat*, and the *Stomach* irritated with some pungent *Liquor*. Hence the most dry and juiceless *Meats* are commonly eaten with some or other *Acid Liquor* or Pungent Sauce, as *Vinegar*, *Limon-juice*, *Pepper*, *Olives*, *Capers*, *Mustard*, &c. to stir up an *Appetite*, so far as they are capable of helping the foresaid vellication of the *Acid Juice* by their own proper acidity. But all kind of *Fat Meats*, *Broths*, or *Fat Soops* soon satiate hunger, by glutting the *Stomach*, in regard the foresaid acidity of the *Vellicant Juice*, being as it were drowned in those sort of *Glutinous Bodies*, gives not that provocation before-mentioned to the *Stomach*.

VI.
For the
heat of the
Stomach.

By this we may easily see into the error of Ancient *Physicians*, who attribute the *Concoction* of *Meats* to the heat of the *Stomach*; and imagined

that the alteration of them was the effect of some extraordinary situation. Forasmuch as if we should take some certain *Bones* of a *Sheep* or other *Animal*, and cast some of them into a *Kettle* of *water* seething over a great *Fire*, and throw the rest to a *Dog* to be devoured; it will appear plainly to the *Eye*, that those in the *water*, tho' boiling never so fiercely for some hours, have suffered no diminution, but those eaten by the *Dog* will be found upon the dissection of his *Stomach* three or four hours after, almost wholly converted into *Chyle*; whereas it would happen quite contrary, were the *Concoction* of *Meats* performed by heat alone, since no *Man* can make any doubt, but that the heat of the *Kettle* vastly exceeds that of the *Dogs Stomach*.

but the Acid
Juice per-
forms the
Concoction
of Meats.

Meat conveyed into the *Stomach*, and converted into *Chyle*, turns white like *Milk*.

VII.
How it is
that Meat
received
into the
Stomach,
turns white.

This whiteness of the *Chyle* is effected, not by any assimilating faculty, as *Physicians* have all along, and still do commonly fancy, but by an action wholly *mechanick*; for as we see in an *Apothecaries Shop*, that many times *Fat* and *Oily Ingredients*, mixt with *Watry*, turn of a whitish Colour: So likewise in our *Stomach*, the Effence of the *Aliments* extracted, seems to us of an *Oily* or *Fatty Substance*, as the *drink* resembles *water*. So that no wonder, if from the mixture of these two, there ariseth a whitish and *Milk-like Colour*, which is the reason that the *Chyle* is always white. And as in the mixture of *Oil* and *Water*, a little *Sugar*, which is a species of *Salt*, is required to make them mix the more easily; so also in what we generally take in for sustenance, a great deal of *Salt* is supposed to be.

Or to speak more like a *Chymist*, it may be said that this Colour proceeds from a *Sulphureous Matter*: That is, it arises from *Sulphureous* dissolved together with *Saline Particles*, mixt with an *Acid Ferment*; for we find by daily experience, that if an *Acid Humour* be infused into a liquor impregnated with *Salt* or *Sulphur*, a white Colour is hereby immediately produced. As appears in the *Spirit of Hart's-horn*, or *Soat*, imbibing a sufficient quantity of *Volatile Salt*, which being incorporated with an *Acid Liquor*, obtains a whitish Colour, and very near resemblance of *Milk*.

Of *Persons* that lie sick of a *Fever*, those are most difficultly cured who are great *Eaters*, especially those, who by virtue of their distemper, become more voracious than before. Hence *Physicians* observe, that those *Fevers* are more lasting, by which Mens *Appetites* are increased, but those which excite *Thirst*, shorter.

VIII.
Persons sick
of a Fever
are the
more diffi-
culty cu-
red if great
Eaters.

The Reason is, because thirsty people are more easily satisfied by the taking down of *Liquor*, which breathing out of the *Body* by *Sweat*, leaves nothing behind to nourish the *Fever*: But those whose *Fever* is inflamed by an *Acid* and *Salt Humour*, as being over-greedy of *Meat*, load and surcharge the *Stomach*, and so nourish the *Disease*. The appetite of *Meats* is irregular, and affects us not always in the same manner.

Some are so excessively oppressed with *Thirst*, that all they can drink is not able to quench it.

IX.
How it
comes that
some are
tormented
with un-
quenchable
Thirst.

The Cause of this excessive *Thirst* in the Mouth of Sick *Persons* is obvious; namely, when the *Salivary Vessels* are so obstructed, that they cannot discharge their moisture into the Mouth; where *Thirst*.

whereupon the *Mouth* being excessively dry, and parch'd, excessive *thirst* must needs follow. Nor can it be removed, how much *Liquor* soever is pour'd in, so long as that obstruction of the *vessels* lasts.

Another Cause of *Thirst* is, when *Moisture* only is wanting in the *Blood*; but this *Thirst* may easily be expelled by a large draught of *Drink*, by reason that in this case the *vessels* are open enough. Now when the *vessels* are obstructed, to remove that obstruction, opening *Gargarisms* are to be used, that is, such as are compos'd of *Lapis Prunella*, and other *Nitrous Medicaments*.

It oft happens that persons who are very well in *health*, eat indifferently, and with little or no appetite, and can remain a long time fasting without any pain or trouble. Roger Bacon makes mention of a certain *Maid* that eat nothing for the space of twenty years; as also of a *French Priest*, who in the time of Pope *Nicolas* the 5th, lived two years without any manner of *Meat* or *Drink*.

The want of *Appetite* may proceed from several Causes, sometimes from Obstructions, that is, when the *Acid Liquor* that provokes *Hunger*, is obstructed, and denied all access to the *Ventricle* or *Stomach*: Sometimes from cold and glutinous *Humours*, by which its vigor is weakned and hindered from exercising any power upon the *Membranules*: Sometimes from the corrupt temperament of the *Blood*, whereby the foresaid *Juice* impelled from the *Arteries* into the *Stomach*, degenerates and becomes of a different nature from what it uses to be; or because the *Juice* or *Ferment* of the *Stomach* hath been thrown out by *purgatives*; whence the *Nervous Fibrils* are no longer provoked; or because the *Heat* or *Flame* (as *Physicians* call it) of the *Heart*, is agitated but with a gentle motion, and thereupon consumes but a small quantity of *Blood*; as we see commonly in *Maids* troubled with the *Green Sickness*, who being taken with an *Anorexia* or want of *Appetite*, have wholly abstained from all sorts of *Meats* for a considerable time, and without much falling away of the *Body*.

For I cannot assent to those who will have it, that *Hunger* proceeds from a *Liquor* flowing out of the *Milt*, since there is a short *Ligature* of the *Venous Vessel* between the *Stomach* and the *Milt*, which by its intumescence or rising up in a living *Animal*, hinders any thing from passing out of the *Milt* into the *Stomach*, as appears from those *Valvulae* which are in the said *Venous Vessel*; being so disposed, that tho' any thing may have a passage from the *Stomach* into the *Milt*, yet from the *Milt* through any *Veins* into the *Stomach* it cannot pass.

As to that *English Girl*, mentioned by Roger Bacon, who eat nothing for the space of twenty years, it will prove a very difficult task to make out clearly the Cause of so long and continued an abstinence from *Meat* and *Drink*, unless it be allowed, that from an extraordinary moistness of the *Brain*, a certain thin and pituitous matter flow'd down from the *Head* into the *Stomach*, which might possibly turn to *Nourishment* in the *Body*, as we see in *Dormice* and several other *Animals*, namely, *Bears* and *Brocks*, that pass whole *Winters*, and receive no sustenance from without, but

are nourish'd only by their inward *Fat*. It may also be asserted, that the *Vital Flame*, and as *Philosophers* vulgarly call it, *innate heat* in the aforesaid *Green Sickness Girl*, moved slowly, and consumed but a small quantity of that *Blood* which turns to *Nourishment* in the *Body*.

Hunger and *Appetite* is many times abated, and sometimes expelled by the taking of *Tobacco*, as we see frequently among *Soldiers* and *Seamen*, who upon the taking of a *Pipe* of *Tobacco*, are often very well refresh'd, and their *Hunger* satisfied.

The Reason hereof seems to be, that in the common sort of *Tobacco*, being strong and full body'd, there is much *Opium*, which keeps the *Blood* from being over *Acid*, and restrains the *Spirits* from flying away in too great a quantity: For herein *Hunger* and *Appetite* chiefly consist, that the *Acid Humours* vellicate the *Nerves* of the *Stomach*; which *Acidity*, if it be drown'd and stiff'd in the *Viscosity* of the *Tobacco*, the appetite and desire of *Meat* must of necessity cease; and if by reason of the said *Viscosity*, the *Acidity* of the whole mass of *Blood* be blunted and impair'd, consequently the fewer *Volatil Spirits* must be left; the loss whereof will be attended by debility of *Body*, and at length by death it self.

Some there are who are scarce ever satisfied with *Eating*, but are still ravening after more *Meat*; and such are they who are said to be affected with a *Canine Hunger* or *Appetite*. FRISCUS Lib. Cap. 7. makes mention of a *Woman* of a great Age, who was not able to live a moment longer than she was eating. The Emperor *Maximus*, surnamed the *Thracian*, who succeeded *Alexander* the Son of *Mammæa*, had for his daily allowance a prodigious quantity of *Meat* and *Drink*.

This extraordinary *Voracity* may proceed from two Causes, first by reason of the *Acid Juice* in the *Stomach*, so excessively abounding, that tho' *Food* be never so fast cram'd in, yet it remains so acid and pungent, that it still corrodes the *Stomach*; and continues a violent *Vellication*; and since the *Meat* in the *Stomach* is thereupon not dissolv'd in such a manner as it ought, the *Mucilage* thereof hapning for the most part to be corrupted, comes back at his *Mouth*, and is cast off as unprofitable and superfluous *Aliment*. 2dly, This unreasonable desire of *Meat* may proceed from *Worms* which swarm in the *Belly*, and cease not to gnaw and feed upon it any longer than they are fed themselves with fresh supply of *Nutrient*. And to this purpose there goes a story of a certain *Woman*, who having voided a *Worm* of twelve inches long, return'd to her wonted moderation in eating; and likewise of another that did the same after she had voided 100 little *Worms*.

There are some, who, for several days together, feel no *Hunger*, and remain fasting without any disturbance of *Mind*.

The occasion of this is, because that *Liquor* which affects the *Membranules* with its acidity, is too dilute or weak to be capable of vellicating the *Stomach*, or because at that time it may possibly be separated from the purity of the *Blood*, or pass away into *Sweat*, either by insensible *transpiration*, or by *urine*. And this confirms the story of a certain *Man*, who being shut up under ground, and not able to get out for the space of three weeks, kept himself alive all that time by drinking his

XIII.
Hunger expelled by the taking of Tobacco.

XIV.
Some are always hungry.

XV.
How it comes to pass that some persons can live a long time without Hunger or Appetite.

X.
How it comes that sometimes Persons, well in health, have little or no appetite to their Meat.

XI.
Hunger proceeds not from any liquor in the Milt.

XII.
How a Maid could live several years without Meat or Drink.

own water: For whilst he was so imprisoned, his Blood was less diminished by insensible transpiration, than when he breathed in the free Air above ground.

XVI.
How it
comes that
Women
with Child
covet the
eating of
odd sorts
of Meats.

Women with Child, especially the first three Months, when they begin to be subject to their Breeding Qualms, delight to feed upon things of a strange Nature, and unfit for Human Food. Some delight in Tan'd Hides or Leather; some can eat Shreds of Woollen or Linnen; others Chalk, Tobacco Pipes, Cinders, or the like.

The Reason of this strange deprav'd Appetite is deduc'd from the Reason of Hunger it self; for when the Liquor which proceeds from the mass of Blood, continually takes its course through the extremities of the Arteries into the Stomach, it preys upon it, as hath been said, for want of Food, by agitating more vehemently than usual, the Filaments of its Nerves. But if the said Humour be of that Nature as to exert its ability rather upon some meats than others, after the same manner as Aquafortis more easily dissolves Metal than Wax; it thereupon affects the Nerves of the Stomach with some singular quality or other. Whence it comes to pass that the Soul inclines to some sorts of Meat rather than others, and at such time as aforesaid, most vehemently covets, what at another time it would loath.

XVII.
Why some
that are
great eat-
ers, never-
theless
are spare
and lean.

Some Persons, tho' they eat much, yet are never the fatter, but always thin and lean: Others on the contrary, eating but little, grow very fat and corpulent.

The Reason is, because some people consist of a Fibrous Blood, and their Fibres are of a very soft and pliable contexture; so that by the accession of new Fibres, their Flesh must needs become inflate and loosened into a fat consistence. Whereas those that are lean have drier Fibres, and which consist of a harder contexture; which being incapable of access or addition, cannot be augmented or dilated.

Another Reason is this, because too great quantity of Meats devoured, cannot well be fermented or attenuated; whereupon there arises a thick and viscous Chyle, which being conveyed to the Lacteal Veins, and by reason of its thickness not being able to pass, is forced to stop, and this stoppage produces obstructions, which hinder the Chyle from passing freely to the Blood. So that no wonder if some great Eaters are frequently leaner than those of a sparer and more slender Diet.

XVIII.
Why after
Meat some
feel more
cold than
before.

It is a common observation, that many persons are more cold than ordinary after Meat.

The followers of GALEN alledge for a reason, that the heat draws inward, and returns toward the Heart; but we rather assert, that the true reason of this cold is, because the cruder part of the Chyle transmitted from the Stomach and Intestines through the Lacteal Vessels to the Blood, diminishes in some sort the rarefaction thereof in the Heart, and hinders the Blood from being carried with such a force as it was wont, to the solid parts; whereupon the Vapors arising from thence into those parts, meet some stop, and thereby the Fibrils suffer a tremour of the parts less than usual, and herein consists the reason of the Cold.

CHAP. VI.

Of the Motion of the Heart, and Circulation of the Blood.

Physicians observe, that Respiration is hindered by Laughter, and if it be excessive, that then the Motion of the Heart, and Circulation of the Blood is stop'd.

The Reason is, because in Laughter the Diaphragma or Midriff seems to be driven by the Muscles of the lowermost Ventricle, which press the Entrails upon it, upwards as far as the Cavity of the Breast, and with a tremulous progress to be relax'd or loosened, as it were to expel the Air by parts, for the forming of a Laughter within the Larynx, whereby it comes to pass, that adhering to to the very Pericardium, it drives up the heart, and its Basis close to its Vessels, as well where it uses to take in the Blood, as where it lets it out: So that the Doors, as it were, of the Heart being shut up, the Circulation of the Blood is for a time intermitted, as plainly appears from a swelling of all the Veins in the Neck, Face and Forehead. That this is the real Cause, may certainly be hence collected, namely, because in long fits of Laughter, especially in young Children, they look black in the Face, from the over abundance of Blood, because of the stoppage of its course, and even Death it self sometimes puts an end to these over-gamesom Frolicks.

Some things accelerate the Motion of the Blood, as a Fit of a Fever or Ague, and an over-large draught of strong Wine.

The Reason hereof in Fevers is, not because the Blood, with an excessive ebullition, flies up into the Aorta, but because its aestuation and sense of heat, hurtful to the Ventricles of the Heart, being transmitted to the Cerebellum or hinder part of the Head, provokes the Spirits to accelerate its motion sooner or later, as occasion requires. Partly also because some parts of the Blood thus roused and carried into the Brain, exagitate the Spirits there abiding, and raise them as it were into a mutiny; so that those parts that fly up into the Brain from high drinking of Wine or other strong Liquors, stir up the Inhabitants of the said Brain into the like tumults.

A Heart taken from the Body in some Animals, leaps and discovers a sensible motion; nay, and sometimes, tho' dissected and cut into small pieces, it does not presently cease from motion, but beats for some time after, especially in Fishes, whose Hearts move longer than those of any Terrestrial Animal. But how can it be that a Mans Heart can borrow its pulsation from the Soul, when-as the Soul is indivisible, and hath not parts of its own, separate from the Body. We may better attribute this Motion, as well in Man, as in other Creatures, to the Blood contained within the Fibres, which Motion in the Heart is oft-times discerned by the Eye, or may be supposed to lurk, or lie hid within the Fibres of the Heart. For a very small portion of Blood flowing from one part of the Heart to the other, being a little hotter, suffices for the effecting of this Pulsation. For by how much the less the quantity of any Liquor is, so much the more easily it rarefies, and is dilated. And as some Members of our Body so much the more easily repeat

I.
How
Laughter
comes to
hinder the
Motion of
the Blood.

II.
How an
Ague-fit, or
large
draught of
Wine accel-
erates the
motion of
the Blood.

III.
How it is
that the
Heart of
some Fishes,
severed
from the
Body,
moves, and
sometimes
tho' cut in
pieces.

repeat any *motion*, by how much the more frequently they have exercised it before: So the *Heart*, in regard it hath been accustomed to the *Diastole* and *Systole*, from the first moment of its *formation*, may be impelled by the smallest force imaginable to continue it. Whereupon since some remnants of the *Blood* are dispersed in the *Hearts* taken out of the *Body*, it comes to pass, that upon their being dilated by *beat*, the *Hearts* for some time beat, and by turns rise and sink.

IV. This is more particularly discern'd in the *Hearts* of *Eels* dislevered from their *Bodies*, in which *Hearts* some *pulsation* still remains for a time, that is, because the *Spirit* of those *Eels*, implanted in their *Hearts*, is by a small heat easily raised into *Act*, and thereby *acts* upon the *Blood*, inhering in the substance, and by dilating it in some measure, contracts the *Fibres*, after which that dilated matter being a little dispersed, the said *Fibres* are again loosened. And this appears not only in *intire Hearts*, but also in the *Hearts* of some *Animals* dissected into pieces, and that in every several *particle*, as in each whereof such a dilatation happens about the dissected *Fibres*.

V. Upon the thrusting of any *solid Body* into an *Artery* to stop the course of the *Blood*, immediately the motion of the *Artery* ceases; nay, if a *Silver Pipe* or *Quill* be put into the incision of an *Artery*, and the *Artery* be bound about with a *Fillet* thereupon, the same effect will immediately follow, altho' the *Blood* pass through it.

The Reason of the first Experiment is plain, because the *pulse* of the *Arteries* is made by the *Blood*, rarefied by turns, and flowing into the *Arteries*, that is to say, whilst the *blood* of the great *Artery*, possessing the place of that next the *Heart*, thrusts forward and agitates all the rest of the *blood* contained in that *Artery*, and its *Branches*. But a thick *Body* being thrust into the *Artery*, the course of the *blood* is stopp'd; and that portion of *blood* entering the *Aorta*, is not able to thrust forward the other parts contained therein. As to the 2d Experiment, there must be a distinction to explain it aright. For either the *Pipe*, thrust into the *Artery*, is of such a thickness as to fill the whole capacity of the *Artery*, and thereby to be so join'd to its internal superficies, as that it may not be able to overtop the *blood*, and to have so narrow a cavity within, as that it cannot without great difficulty be penetrated by the *blood*. In this case it is evident, that the *Pipe*, tho' free from any sort of bending, will stop the Motion of the *Artery*. Or else the *Pipe* thrust into the *Artery*, is of that Cavity as to afford a free passage to the *blood*; and then whether it be bound with a *Fillet* or not, it will no way hinder the *pulsation* of the *Artery*.

VI. The *Blood* hath a quicker course in the upper parts of the *Body*, than in the lower.

The Reason is, because in the upper part it flows easily into the *Heart* without help, (for the most part) of any thing else; but not in the lower part, except by the impulse of the *Arterious Blood*, and sometimes by reason of the contraction of the *Muscles* it exerciseth, it is not without difficulty driven upward. And therefore of necessity the *Circulation* thereof must be quicker in the upper parts.

VII. The *Veins* have no *Pulse*, notwithstanding they are no less full of *blood* than the *Arteries*, and as well convey into the *Heart*, the *blood* returning from the whole *Body*.

The Reason is, because the extremities of the *Veins*, by which the *blood* enters, are narrower than their *Channels* into which it flows, whereby it comes to pass, that by passing from a narrower place into a broader, it loses a great part of its force and vigor: Whence tho' it may fill the *Veins* with a continual afflux, and make them swell, yet it cannot agitate them with continual subsults, so as to be sufficient for the effecting of a sensible pulsation.

If a *Mans Arm* be so bound, that all the *Veins* which tend thither, (by reason of the pressure of binding) are so obstructed that the *blood* is denied all farther access to them; that *Arm* in a short space will swell and be puffed up to a high degree; but afterwards if the *ligature* be not loosened it will dry up and wither.

The *Veins* being bound, the *Arm* swells and is puffed up beyond its usual pitch, because the *blood* flows from the *Arteries* into those *Veins*, and not finding a passage, cannot but inflate them, and increase their bulk; but by little and little this tumor is diminished, and the *Veins* grow flaccid, because the *blood*, stagnating in the *Veins* so bound up, becomes in a short time more gross; and by reason the *Ligature* presses the *Veins* too long, not only the *Branches* of the *Veins* are obstructed, but also the passages of the *Arteries* are also shut up, and hindered from any farther transmitting the *blood* into the *Veins*. Whence the serous part of the *blood* therein contained, evaporating by insensible *transpiration*, the *Arm* must needs fall from its swelling, dry up and wither.

We find by experience, that during the *pulsation* of the *Heart*, sometimes all the *Arteries* eat, even to the utmost extremities of them, and sometimes that they do not all beat.

When the *pulsations* of the *Heart* are very great and perceptible, then the *Arteries* are perceived to beat sensibly; but when the *Pulses* are small and languid, then there is perceived no sensible motion in the extremities of them. Whence HARVEY upon very good ground and consideration, observes as followeth; *The impulse of the Heart*, saith he, *is diminished as it were in all its parts, at every division of an Artery; so that at the last division, the Arteries in a manner becoming Capillary, are like to the Veins, not only to their structure and tunicles, but also in their rest, and cessation from beating, since they have no sensible Pulse, or at least not always, except when the Heart beats very vehemently, and the Artery that attends is over-much dilated.* And this is the Reason why we sometimes feel a *Pulse* at the *Fingers ends*, and sometimes not; and from hence Dr. HARVEY commonly made his indication of a *Fever* in *Children*, when he sensibly perceived a *pulsation* at their *Fingers Ends*.

Women, when they arrive to a certain Age, have a flux of *blood* every Month.

The Cause of this *Profluvium*, some attribute to a *Nitrous Salt* which excites a fermentation in the *blood*: Whence the *Orifices* of those *Tubuli* which reach to the *Womb*, being dilated by an effervescence, or as it were boiling of the *blood*, draw the said *blood*, and as freely refund it back again. But when the *blood* flows without any stop, the *Ferment* reinforcing, dries it up, much after the same manner, as *water* gushing forth, casts out

VIII. The *Veins* being bound, the *Arm* swells, and with continual *Ligature* dries up.

IX. During the *pulsation* of the *Heart*, all the *Arteries* do not always beat.

X. Whence Women have their Monthly *Fluores*.

the Nitre which it washes out of the Earth. Then the Womb being reduc'd to its former state, the same Ferment is rais'd in the same manner as formerly, and if not hindred, being collected together in the same space of time, and in a like quantity, and advanced to a like exaltation, produces a new Fermentation in the Womb.

XI. *Why sometimes dying Persons live for a time without any circulation of the Blood.* Persons at the point of Death, oft-times live a considerable while without any circulation of the blood. This is most intelligible to Anatomists, who in their dissection of Bodies, often find the Vena Cava empty, and wholly destitute of all Sanguineous Liquor.

This may well enough be, by reason of the contraction of those vessels which serve for the transmitting of the blood. For tho' the blood of a dying Person is first refrigerated in the lesser Veins, and farthest distant from the Heart, and then thickned for want of heat; and thereupon the wonted motion of the blood passing out of the Arteries into the Veins is stopt; yet the Vena Cava may nevertheless be able to contain something of the hot and fluid blood; which by contracting it self, serves for a fomentation to the Heart, in the same manner as a Hogs-bladder, blown up and distended by the Air, the Mouth being taken off from the Ureter, expels by a spontaneous contraction, and drives forth part of the said Air. Forasmuch as the Life of the Dying Person is no other way ended, but upon the ceasing of the circulation of the blood: Since all the vital sustenance contained in the Vena Cava is consumed, and the Vena Cava dispossessed of the blood.

XII. *Why in strangled Persons the Arteries are found to be void of Blood.* Hence it comes to pass, that in strangled Persons or Animals, the Arteries are wholly destitute of blood, when as at the same time the Veins are filled. For when the motion of the Lungs begins to fail, and the motion of the Heart still continues vigorous, the blood is forcibly ejected out of the left Ventricle of the Heart into the Arteries, and yet at the same time no new blood flows out of the Lungs into the said Ventricle of the Heart. Hence in a short time the Arteries become empty, a great argument nevertheless that at every pulsation or beat, the blood flows plentifully from the Heart into the Arteries: Whence upon the binding of the Aorta near the Heart, the Carotides or Arteries in the Throat seem empty, not the Veins; whence it appears, that the blood flows not out of the Veins into the Arteries, but rather out of the Arteries into the Veins.

XIII. *Why Surgeons tie the Arm in Blood-letting.* Surgeons when they let blood, bind the Arm in different streight, above the place where they design their incision, to the end the Veins may swell the more, and the blood issue out more freely.

The Reason is plain to those that admit the circulation of the blood in Human Bodies; forasmuch as a gentle binding cannot hinder the blood which is in the Arm from returning to the Heart through the Veins, nor new blood from being always impelled by the motion of the Heart out of the Arteries into the Veins. For the Arteries are placed beneath the Veins, and their skin is harder than to be compressed or bent by any slight ligature or pressure; besides that, the blood proceeding from the Heart, strives with greater force to advance through the Arteries towards the Hand, than to return from thence to the Heart through the Veins.

This may be proved by another Experiment: For if upon the swelling of the Veins, for example of the Hand, the blood be pressed by the Finger towards the Branches, the Vein towards the Branches swells, the Trunk in the mean time falling, which immediately upon the drawing back of the Finger, rises and becomes inflate; that is, because the motion of the blood inclines from the Branches towards the Trunk, which while it is hindred by the apposition of the Finger, the Trunk must of necessity grow flaccid, and the Branches swell: Whence, when-ever it happens, as in a Plurisie, that the passages, for the conveyance of the blood through the whole Body, are streightned, the Person is in danger, unless immediate Phlebotomy be applied, by which the pores of the Intercoastal Capillaries are at length opened, and the blood regains its accustomed passage.

Some Animals having their Heart cut out, still move, as Lizards, Eels, and the like. I have seen a Frog, which having its Heart taken out, remained some time alive.

The Reason possibly may be, because motion in Animals is effected by means of the subtiler parts of their blood which pass from the Heart to the Brain through the Magna Arteria or great Artery. But when there is a great abundance of those subtiler particles in the ventricles of the Brain, it happens that the Frog remains alive for some time. Since no doubt but new Spirits have flowed from the blood contained in the Arteries: But if the Head be cut off all motion thereof immediately ceases, because then no more Spirits can pass from the Arteries into the Muscles. So that if any parts of these Animals still move after the Head is cut off, it proceeds from the Spirits only, which yet a while adhere to the Muscles, as is to be seen in the Tails of Lizards cut off; and in Pidgeons, who having their Heads pluck'd off, still move their Wings and Feet for a good while, in regard the Animal Spirits are still fluttering in those inferiour parts, and by those aforesaid intermediate Canals, tend from one Muscle to another, until at length they are dissipated, and after that their motion wholly ceases.

CHAP. VII.

Of the Actions of Animals.

THE Badger *Ajachtlay* or *Tatus* in Brasil, lies with his Face upward in rainy weather, and takes in the water by a large passage into the Belly between the Ribs, that looks like a little Pool, and so continues after the shower is over, sometimes for a whole day together, or till such time as the thirsting Hart coming near by chance, sets his Mouth to the Imagined Pool to drink, which the said Badger perceiving, catches hold of the poor Beasts Mouth and Nose, and never lets it go, till tired with struggling it loses its Life together with its wasted Spirits.

The Fox is a very crafty Creature, who sometimes counterfeits himself dead, and lies without all sense of motion, till the inveigled Geese and Hens approach so near that they are easily snapt and devoured by him.

Many hereupon attribute Reason, however imperfect, and as they call it *Umbratile*, to Brute Beasts,

XIV. *An Experiment proving the motion of the Blood.*

XV. *How Animals live some time after their Heart is pluckt out.*

III. *There are affections in Brutes, but not reason.*

IV. *How Brutes come to have a memory.*

V. *Whether the Dogs make any rational choice in following their Game.*

VI. *How Dogs know their Masters.*

Beasts, by which they manage their *actions* and effect their *designs*, with a semblance of *Cogitation*. And to this Opinion they are induc'd by their being indued with *Tongue, Ears, Eyes*, and other *Organs of Sense*: From whence they conclude, that they have a perception like to that of ours. For since in our way of *Sensation, Perception*, or *Cogitation* is included, they will have it that the like sort of *Cogitation* is also to be attributed to them. But these men seem not sufficiently instructed in the nature of *Cogitation*, when they assign it to *Brute Animals*: Forasmuch as those effects of sensibility mentioned, are proper as well to the *Body* as to the *Mind*. Otherwise all other *Animals* might be asserted to be equally indowed with *Intellect* and *Will*, and must of necessity be judged, not only *equal*, but even *superiour* to *Mankind*; since we find that they comprehend objects at one view, and attain to what they design the very first time they attempt it; a thing scarcely to be allowed, even to the wisest of *Men*, who make their conclusions and results, not without long *Discourse, Study* and *Cogitation*, which these *Creatures* at once, and by a simple apprehension attain to.

III. I acknowledge indeed certain *affections* in them, by which they are impelled to the performance of their *actions*, but not *Cogitation*, and the *modes* of *thinking* proceeding from it. So the *Badger* lying on his Back in the open *Air*, to retain the *Water* which the *Rain* had poured into his *Belly*, as it were into a *Trough*, and being wakened by the approach of the *Hart* to *drink*, is led by instinct to catch hold of his *Mouth*, by the closing and shutting together of its strong Coat of *Mail*, to get possession of his *Prey*; and afterwards calling to mind the said accident, he might from time to time, as often as *hunger* urg'd, make use of the same stratagem for the getting of new *provision*. All which things might very well be effected, without the help of *Reason, Design* or *premeditation*, but only by the disposition of the parts of the *Body*, and the frame or structure of the *Organs*.

IV. *Brutes* indeed have a *memory*, not by virtue of a *Rational Soul* or *Mind*, of which they are destitute, but of motions formerly received by tracts heretofore impressed by the sense upon the *Brain*, which *motions* are presented again singly to the common *Sensorium*.

V. *Dogs* oftentimes having lost the *Scent*, are at a stand, and if it happen that there are several *ways* or *paths*, for example three, having by the *smell* try'd two, they fall into the third without any demur, not in the least doubting, but certainly assured that the *Deer* or *Fox* hath taken that

This *Action*, which seems to carry some semblance of *Reason* in it, is only the work of a *Corporeal Organ*. For the *Dogs*, while they pursue the *Deer* with extraordinary earnestness, it may possibly happen, that they may make but a slight search in the first *Path*, and then leaving that way betake themselves to the search of the others, but finding therein no tract of the *Beast*, may lastly return again to the first, wherein the *Scent* being recovered, and all demur set aside, they follow the track, and at length catch the *Beast*.

VI. *Dogs* in a mixt Company of men, keep close to and follow their own *Masters*, as knowing and distinguishing them from other *Men*.

Of this there can be no other reason given, than because from divers persons different exhalations arise, which the *Dogs* discerning, are affected with none so much as those which exhale from their *Master*, as being longer accustomed to them. For these *particles* exhaling from the *Body* of the *Master*, so affect the *Fibrils* of the *Nerves* that are extended into the *Dogs* *Nose*; that thereupon there follows such a concurrence of the *Animal Spirits* into the *Muscles* of the *Dog*, as disposes him to fawn upon his *Master*.

VII. *Camels*, that delight very much in *Musick*, are oft-times taught to *dance*: Some have been seen to keep exact *Time* and *Order* in their *movements* at the sound of a *Drum*, sometimes in a round, sometimes meeting, sometimes falling off.

Their manner of Institution in this faculty was thus. When they were yet young and tender jointed, they were shut up in a Hot House, whose Pavement was on purpose heated; then just before the Door there was a *Tabour* or *Drum* beat, mean while the *Beasts* not well-induring the heat of the *Floor*, lifted up sometimes one *Leg*, sometimes another, and by such a continual *motion*, were forced to bestir themselves. This *exercise* being thus continued for divers *Months*, they were so accustomed to it, that when-ever they came in publick, and were brought forth into the open *Air*, at the sound of a *Drum*, on purpose beat, they lifted up their *Legs* according as they had been accustomed, but with a *motion* somewhat more regular than what they had been used to, as being now more unforced, and so framed a compleat *Dance* in exact *time* and *measure*.

VIII. A *Hen*, when she calls her *Chickens, Clucks*, when she warns them to flight by reason of the *Kite*, she holds it out longer and advances it louder, when taken she vehemently, and, as it were, repeats a sobbing tone: When she laies an *Egg*, she *Exalts* or *Cackles*; when she hatches her *Eggs* to produce the *Chickens*, she utters a rougher, thicker and slender tone, than when she calls them to her; when she broods over her *Chickens*, she uses a lower and more depressed voice, and different from all the rest.

This diversity of *sounds* which is observed in *Hens* and other *Animals*, proceeds from their various *affections* or *passions* which move them and alter the disposition of their *Body*. For whereas the *Voice* is produced by the emission of the *Breath* out of the *Mouth*, through the *Aspera Arteria*. It is apparent that according to the various disposition of the *Instruments* which conduce to the forming of the *Voice*; peculiar *Voices* or *Sounds* must needs arise. And since according to the different *passions* wherewith they are moved, the *Organs* obtain a different disposition: Hence it comes to pass that *Animals* utter different *Voices*, and signify by various *Tones* their trouble or delight; which *Sounds* being conveyed to *Animals*, either of the same or different kinds, variously affect them. So the *Howling* of a *Baboon*, toles the rest of that kind, tho' remote from him, and calls them to his Aid. So a *Hog*, when he is set upon by *Dogs*, by his loud *grunting* and *crying* out, calls the neighbouring *Hogs* to come and help him. So a *Hen* by its different *pipations*, signifies its various passions, according to the various disposition of the *Vocal Organs*, which the predominant *passion* produces

from other Men.

VII.

How Camels are taught to Dance.

VIII.

Whence proceeds the diversity of tones in Hens.

duces in its Heart. So that whoever will penetrate into the Nature of Brute Animals, and dive into their most hidden affections, may easily and without labour discover the reason of their several Cries and Vociferations, and unfold by what motion of the Heart they are impelled; as I have more at large made out in my Dissertation of the want of Sense and Knowledge in Brutes.

IX.
The reason
of the Craft
used by
Hares to
avoid the
Dogs.

Hares, the better to elude the quick Scent of the pursuing Dogs, confound their Tracks, by shifting and traversing from one course to another, and most especially they avoid shrubby and brambly Places, lest by rubbing off their Hairs against them, they should afford the stronger Scent to the Hounds as they pass by. Sometimes they betake themselves to Hedges, where they lie and skulk; sometimes they run into the midst of a flock of Sheep, that so the scent of their Bodies may be drown'd and lost by the overpowering scent of so many other Bodies: Nay if they are overmuch pressed by the Dogs, they come back the same way again, or by a huge leap bounce into their Cave or Lodging.

All these tricks which are ascribed by some to the Craft and Policy of the Hare, are only the effects of their Fear. For what can be more obvious to Hares, when the Hounds pursue, than to have recourse to places of retreat, and by their shelter to preserve themselves from their Enemy? When there are no Woods to fly to, haply Herds of Deer or Flocks of Sheep present themselves to Eye; thither then immediately they run, and intermingle themselves for refuge, till by the cry of the Hounds they find themselves freed for the present, and so continue their flight homewards; or if they take their flight, as soon as the Dogs are in pursuit, it is to be imputed to their fear. By which the Spirits of the Brain being agitated, will not suffer them to sit down in quiet, and neglect the imminent danger. As we see in persons tired and wearied, who not having an immediate opportunity of resting, are forced still to keep moving a little, by reason of the commotion of the Spirits, which haply is the cause that Hares by reiterated Vaultings, leap to and fro, and springing high in the Air, recover their abodes: Nor can there be any other reason given why tired Hares make so many windings and turnings, oft-times repeating the same Tracks over again; but because hurried with overmuch fear, they become affected with great distraction; and are thereby diverted from their first intended course, unless the Hounds in their close pursuit are so inevitably hard upon them, as to force them back into their first Path.

X.
How Birds
with such
Art and
Order build
their Nests,
and bring
up their
Young Ones.

Birds are indued with wonderful ingenuity in the bringing up of their Young; for presently after Copulation, their main business is to build their Nests; they pick up Moss, Chaff, Straws, Feathers, &c. with which they build their Nests round; and having laid their Eggs, they sit upon them, hatch their Young, and in a short time teach them to fly.

All these things may be effected without the help of Reason, for it is certainly natural and innate to Birds to couple at certain set times, and to this they are impelled, either by the Season of the year, or by the Meats upon which they feed: Likewise certain it is, that Eggs are produced from Copulation, which being shut up in the Belly of

the Female, cannot but be burthensome to the bearer of them; as soon as they are arrived to any magnitude, whereby it comes to pass, that desiring to unburthen themselves of them, they choose a place fitting wherein to lay them, and underlay it with the softest things they can procure, and which are especially grateful at that time by reason of the weight of the Eggs; and all this by no other conduct of Reason than Cats and Dogs make use of, when upon the approaching time of their Whelping or Kittenning, they seek out a place commodious for the bringing forth of their Litter. The Eggs being laid, they sit upon them, by reason of a certain contexture of the Fibres at that time whereby they are disposed hereunto, as we see in Hens, which at a certain time of the year; sit cowering on the ground, as if they were sitting over their Eggs, when as indeed there are none under them; which plainly shews, that at that season they are affected with a certain indisposition which brooding eases and removes. Whence it appears that all these things are not effected by Ratiocination or Cognition, but by the motion only of the Spirits, and the disposition of the other parts of the Body. In like manner as artificial Fountains, Clocks and such like Automata, wrought by Human Ingenuity, which perform many things that cause wonder, and all by the orderly structure of their parts only.

The Castor or Beaver, an Amphibious Animal in Virginia, thus fortifies it self against the force of the approaching Winter; they choose a place upon a declining ground near a Rivers side, against which with great Industry and Labour, raising a kind of Bulwark with Turf, Boughs of Trees and the like, they stop the course of the water, and make a little Lake or Pool; and about the Head thereof they choose a little rising Hill-lock whereon to build a Cottage or little House; on the topmost part whereof they leave an open Portal for the Air, here they lay up Boughs cut from Trees, on which they feed; moreover digging Mines under the water to pass to and fro, when and where they please, they bid defiance to all the Hunters Arts.

And all this may be performed both by Beavers and other Creatures without the help of Council or Rational Cognition, but by a certain blind impulse of Nature; for if Cognition be allowed of in these Creatures, it may as well be allowed of in a Vine, which as if it foresaw its inability to sustain its future burthen, hath recourse to the Elm, which it catches hold on for a Prop to bear the load of those heavy Clusters it must hereafter bring forth, and winds about it with its wreathed tendrels, as with so many grasping Hands: Or as in the Stomach either of Man or Beast, wherein the Aliment is so digested, as if by foresight and design there were made a distinction between the profitable and unprofitable Juice, and a distribution ordered accordingly, part being sent out to the intestines, part to the Heart, thence to be conveyed to the Limbs and Head, according to the several occasions and necessities of each part. And certainly since the forementioned Animals, build their Habitations, and manage all other affairs by the same impulse; it is a great argument that this proceeds from Nature, that is, from

XI.
How the
Castor
builds its
Cottage.

XII.
That there
is no more
of Cogitation
in
Brutes than
in a Vine,
or in the
Stomach.

from the disposition of the *Organs*, rather than from any rational *Cognition*.

XIII.
How the
Remora
puts a stop
to Ships in
the Sea.

The *Remora* retards a *Ship* under *Sail*, and stops its *Course*. An instance whereof we have of a *Ship* of *Francis, Cardinal of Turon*, sailing from *France*, and stop'd in its mid course, from the Relation of *Petro Melata of Bononia*.

This so great force of the *Remora* baffles the subtle apprehension of all the *Philosophers* I ever yet read of, who frankly acknowledging the slenderness of their understanding, profess themselves wholly ignorant of the cause of this so stupendous a matter, and have nothing but that *Asylum* of *Asses* to have recourse to, their *Occult Quality* forsooth: Nor is it without Reason that they are at this loss; for indeed it must be a very difficult thing to be resolv'd of the Reason of a thing that never was. For if the Writings of Authors that make mention of the *Remora* be seriously considered; it will plainly appear that what they delivered concerning it, depends not upon their own Testimony or Opinion, but is taken upon trust from others. Whence *ARISTOTLE* in his 2d Book of *Natural History*, having delivered all he had to say concerning the Nature and Qualities of this Creature, adds at last, as some relate, *PLINY* writes in his 9th Book; This Creature sticking to the Keel, the Ship is supposed to move the slower: And *Plutarch* in his *Symposia*, Some, saith he, there were who laugh at this tradition of the *Remora*, as an Idle and Fabulous Story. And many others there are, too long here to recount, who believe the Story of this Fish to be but the subject of an Idle Fiction imposed upon the credulity of Mankind.

But that *Ships* have been hindred on a suddain from Sailing is not denied. Must therefore a little Footless Fish, which according to *Aristotle*, is but a kind of *Murex* or *Purple Fish*, and like to a *Snail*, effect so great a wonder? Why may we not as well impute it to a suddain Ebb of the *Sea*; such as in the Bay of *Sicily* divers have had experience of, by which *Ships* in their full career of *Sail* have on a suddain been retarded and rendred wholly destitute of Motion? Who knows not that very vehement gusts of *Wind* sometimes break forth in a moment from the bottom of the *Sea*, and with a vast force drive against the *Stream*? Do not such accidents as these suffice to retard *Ships* under *Sail*, without the help of a poor despicable little Fish? Doubtless they do, and I cannot but positively look upon them as the real cause of the *Ships* immobility. Besides if the *Remora* be able of it self to act such a wonderful thing, why may it not as well do the same being received into the *Ship*? Since it is reported of it, that it hath been by the *Mariners* taken sticking to the *Rudder*, and brought into the *Ship*. Which was the very observation of the Emperour *Cajus*, who sailing from *Astura* to *Antium*, when a *Remora* that was said to have stuck to his *Gally*, was taken and brought into it, wondred why it could not then as well do the same thing, and transfuse its virtue as well within as without.

XIV.
How Brute
Animals
come to pre-
sage ab-
solute
Weather.

Brute Animals foretel Winds, Fair Weather, Rain, &c. Hedgehogs drawing in their Quills, are a great sign of Stormy Weather; Halcyons betaking themselves to their Neests, betoken a Fair Season: All tame Fowl, as Ducks, Geese, Game-

Cocks, &c. give certain presages of change of Weather.

This faculty they have from a perfect disposition of their *Organs*. For since there are in the *Air* certain prognosticks of future Weather, Brute Animals by reason of that vigour of some Senses more than others, with which they are indued, more easily presage those Seasons than Men, whose Imaginations are taken up with variety of Objects, and whose common Senses are not altogether so sharp as those of Beasts. However they cannot properly be said to foretell any more than Warts on a Mans Toes, or Limbs out of joint can be said to be indued with prescience, or the knowledge of future things.

Whatsoever Dislocation, Fracture or Solution of Parts happens to be in any Member of the Body, portends by a greater pain at that time than any other, a Stormy or Wet Season; but especially that Venereal Distemper, that with a far more exceeding pain attends persons of a lewd and incontinent course of Life: Forasmuch as these Men, when the Northern Winds begin to blow, are sooner assaulted with those pains, in regard at that time their Nerves are intended and their Muscles grow stiff, and are cruelly tormented with those vitiated humours that are rivetted in the Members; for in these parts chiefly lurks the said Distemper, which influenc'd by the Season, exercises a kind of butchery in the inmost recess of the Body. By the same sensibility of Weather, Frogs Croaking more than usually; Swine routing in a bundle of Hay; Cows and Oxen holding up their Snouts to the Sky, and snuffing, presage Rain from the humidity of the Air.

C H A P. VIII.

Of the Aversion and Affection of Animals.

THE Basilisk hath that kind of pernicious Venom, that it is said to destroy a Serpent, tho never so great, by breathing upon it: Nay, if credit may be given to Historians about this matter, if it espy any Man approaching to its Cave, it kills him with its looks.

I cannot easily persuade my self that the Basilisk can prove so mischievous to Mankind with its Eyes only; for how should it come by so fatal a malignity in its Looks? With what a vast force must Rays be darted from his Eyes, to pierce quite through the whole Body of Man, and destroy him even at a distance? But I am rather apt to believe, if what is reported of the Basilisks fatal presence be true, that the killing stroke he gives, proceeds not so much from Spirits darted from his Eyes, as from the pestiferous blast of Breath blown out of his Mouth. Since it is certain, that he causes Trees and Shrubs to wither and die; breaks Stones, blasts Herbs, and that not by contact only, but parches and burns them up by his Breath. Hence all other kinds of Serpents dread and shun his poison, and fly him as a Common Enemy of all Creatures: And as such a one *Lucan* describes him in his 9th Book, where among other things of him he saith,

Lord Paramount he reigns of th' empty Sand,
And from him drives all Creatures near at hand.

XV.
How Mens
Bodies pre-
sage Storms
and wet
Weather.

I.
Whether
the Basilisk
be mischie-
vous in its
looks.

II.
The same is
done by
Dragons.

Well therefore may such a destructive Breath as this, blown out of his pernicious Mouth, and lighting upon any Man as he chanceth to pass by, penetrate through his whole Substance, by its subtil and virulent quality, and by inverting the contexture of the *Fibres*, so afflict him, as to render him less capable of performing the Offices of Life. The same is related of *Dragons* in the time of *Philip*, King of *Macedon*, for that the Soldiers passing through two Mountains, fell dead as they marched.

The Reason, as *Socrates* reported was, that by his prospective Glass he discerned two *Dragons*, one upon each Mountain, breathing forth their *Venemous Breath* one against the other: By the power whereof whatsoever went between escaped not Death: For this story we have the authority of *Libanius De Origine Rerum*.

III.
Of the Be-
numing
Fish.

There goes a Story of a *Fish* in the Island called *Cayenne*, not much unlike a larger sort of *Eel*, which by touching the utmost end of the *Fingers*, or the very Staff or Stick held in the Hand, strikes a numbness through the whole *Arm*, and the parts near about it, accompany'd with a kind of *Scotomy* or heavy dimness of Sight. It is also related of this *Fish*, that to make a prey of other *Fishes*, and prepare them for his *Tooth*, he strikes them with the extremity of his *Tail*, and so benumbs them into an irresistence. This Mischief is to be imputed to the virulency of those *Breathings*, *Evaporations* and *Effluvia* which proceed from these *Creatures*; much like those that steam from *Aqua-Fortis*, *Quicksilver*, and such like sort of *Minerals*.

IV.
Why the
Lion
dreads the
Voice of the
Cock. The
Elephant
that of the
Sow.

So great is the *Antipathy* between the *Cock* and the *Lion*, that the noise of his *Crowing*, or the very fluttering of his *Wings* strikes a terror into the *Lion*. The *Elephant* starts at the grunting of a *Sow*, and tho' the strongest of all *Beasts*, trembles when he hears that noise.

This *Aversion* in both these *Creatures* proceeds from such a Contexture of the *Organs*, as that the noises of the *Cocks* *Crowing*, and the *Sows* grunting, being conveyed to them, pierce their *Bodies* with a sort of *Vellication*, and as it were rend them a sunder with a kind of sharp smiting violence; insonmuch that being received into their *Ears*, they open the Pores of the *Brain*, not only into the *Muscles*, that serve for the moving of the *Members*, but also into those *Fibres* of the *Heart* that conduce to the exciting of *Fear*. Who knows not that the grating noise of a *Sow* is very harsh and ungrateful to the *Ear*? In fine, therefore it is that a *Lion* trembles at the *Crowing* of a *Cock*; and an *Elephant* is affrighted at the *Grunting* of a *Sow*, because their *Organs* are so disposed, that they cannot receive in those sounds without great trouble and offence.

V.
How it
comes to
pass that
Elephants
cannot en-
dure the
sight of any
thing that
appears
Red.

To the same cause we may refer that which is related in the *History* of the *Macchabees*, namely that *Elephants* laden with *Wooden Towers* full of *Armed Men*, at the sight of ruddy colour'd *Grapes* or *Mulberries*, were so exasperated thereby, that they could not forbear rushing into the midst of the *Enemy*, without regard either to their own or their *Charges* danger; and all upon this occasion, that *Elephants* have their *Eyes* so disposed as to be ill affected with *Red*, or any Colour inclining thereunto; and by certain Rays flowing

from such a Body, to have those passages of the *Brain* dilated, which open those *Fibres* of the *Heart* that conduce to the exciting of *Rage* and *Fury*.

A *Camel* and a *Horse* have great aversion to each other, so that these two *Creatures* can by no means be brought to live together without extraordinary dissention and hostility. The *Weasel* abhors the *Toad*, and comes not near it, but with great reluctance. The *Mouse* flies the *Cat* as its mortal *Enemy*. The *Pheasant* designs against the *Hart*, and to do him a mischief sits upon his Back, twitches up his Hair by the Roots and pecks his *Flesh* with its Bill.

The *Peripateticks* express all these Enmities and Aversions by no other name than that of *Antipathy*, thinking they have discharged themselves very well, and given a sufficient explication, when they tell us, that it is a certain natural hatred between one *Animal* and another, by which they fly and abhor each others sight. But who is there so ignorant as not to understand that we are not one jot the wiser by this Answer? That there is a dissention and hatred in several *Creatures* one with another; but how this enmity arises, or in what motives it is founded, certainly it can be no otherwise than from some *passion* transmitted into the *Brain*, through the external *Senses* by the help of the *Nerves*. For such is the disposition of the *Brain*, and such the contexture of the *Fibres* in *Animals*, that from such a species proceeding from without, such an affection must needs arise, no otherwise than as Heat hardens some *Bodies*, and softens and melts others. And hence it is that the smell of a *Camel* so disturbs the *Brain* of a *Horse*, that it renders him wholly unfit for service in the *War*. The *evaporations* only of *Effluvia* from a *Horse*, hath such a power over an *Elephant*, as to drive it into a frantick rage, which effect can certainly be Imputed to nothing but such or such a disposition of the *Organs*, or contexture of the *Fibres*. And much after the same manner it is that a *Blood-Colour* disorders an *Elephant*: The smell of a *Panther* attracts *Apes*, and Fear seizes a *Lion* at the sight of a *Cock*.

Blood is said to gush out of a Wound, tho' bound up, upon the approach of the Person that gave it; and the *Lawyers* of some Countries take it for more than a half proof of *Murder*, when in the presence of any suspected, the *Body* of a slain Person begins to fall a bleeding afresh.

Lemnius in his 2d Book Of the *Occult Miracles of Nature*, assigns no other Cause to this Effect but *Imagination* only. So great, saith he, and powerful is the force of hidden Nature, and so strong is *Imagination*, that so long as any spark of Life is left, and the slain Body not quite cold, the Blood may possibly gush out afresh, and boil by means of the *Cholers* retained heat. Others refer it to the *Antipathy* that is between the Carcase and the *Murderer*, as if there were still remaining some struggling of the *Spirits*, somewhat like to that which struck the horror at the time of the *Murder*. But these *Examples* carry little weight with me who look upon the thing as dubious; and if I may take the boldness to contradict so many *Affertors* of this accident, altogether false: Forasmuch as I my self have seen the Dead Body bleed at the Nose and Mouth after three

VI.

VIII.
Why some
Infants
have an
aversion to
Oil.

three or four days, when the *Murderer* hath not been present, nay, not living. Besides, I presume there has scarce been any one heard of that could confidently attest upon *Oath* the truth of the thing, but rather relied upon the credit of *Relaters* or authority of *Writers*.

But let it be granted sometimes to happen, that in the presence of the *Murderer*, a *Murdered Body* may fall a *bleeding*; must therefore the Presence of the *Murderer* be immediately concluded from this accident of the *Bodies bleeding*, or at least a suspicion thereof be implied? Why may not the said accident of *bleeding* be rather imputed to *Natural Causes*, a thing indeed scarcely to be avoided, if all things which commonly happen about these *Dead Bodies* be well examined. The *Body* is carried into a *Room* where there is generally a great confluence of *Spectators*. By the breath then of so many *Men* the *Air* must needs be heated, and the *Blood*, tho' cold, be excited by this warmth, and consequently some small quantity of it may break forth out of the *Nose* or *Mouth*. From all which may be concluded how weak a testimony this *bleeding* is, and how slight those determinations are which *Judges* have made about the presence of the *Murderer*, unless we assert with *PLATO* that the *Souls* of *Persons murdered* persecute those by whom they have been deprived of *Life*.

*Thy Ghost ile ever haunt, where e're it is ;
Thy Soul, Bad Man, shall dearly pay for this.*

Virg. 4. Aeneid.

VIII. *Beasts* have a notable aversion to the *Killers* of their *Kind*, and to the utmost of their ability prosecute them: I have wondred, when being some time in the *Country*, I have observed all the *Swine*, and even the very *Pigs* of a certain *Village* grunting out their *Clamours* against one *Passenger* particularly more than others, and as it were preparing to set upon him; and asking the reason hereof, was told that this person was a *Butcher*, employ'd in the killing of all the *Hogs* and *Pigs* of the said *Country Town*.

XI. This *Aversion* of the *Swine* might very well be caused by the *smell* of the slain *Hogs*, or of some of the *blood* that stuck upon the *Butchers Cloaths*, which being corrupted and debased from its natural temperament, offended their *Sense*, and begat a certain *horror* in them. For it is not to be doubted but that the degeneration of any thing from its natural temperament, makes an ungrateful impression upon *Animals*, especially if it be from those of the same kind, and hurts and offends them much more than if it proceeded from those of a different kind.

IX. If the *Bodies* of certain *Insects*, especially of the *Silkworm*, *Grasshopper*, *Bee*, *Locust* or *Wasp* were so besmeared with *Hony* or *Oil*, that the black specks, running along their *Bodies*, were all covered, they would presently die, nor could they by any *Art* possibly be recalled to *Life*.

The Reason is, as *Malpighius* very well observes, because *Insects* have not only *Lungs* as other *Creatures*, but are so abounding with that sort of *Bowel*, that every Section of them is furnished with double *Lungs*: Nay, those *blackish Holes* are as it were so many gaps, which lead to

so many rough *Arteries* which convey the *Air* into the *Heart*, *Spinal Marrow* and other *Internal parts*; so that no wonder if upon the stopping up of their *Orifices*, the said *Insects* or little *Animals* perish and die for want of *respiration*.

CHAP. IX.

Of Sleep and Waking.

I. *Infants* and *Children* soon fall asleep, and being in a sound *Nap*, sleep long and are not easily wakened.

Children are very much abounding with moisture, with the thickness whereof the *Pores* of the *Choroidal Contexture*, and the *Arteries* called *Carotides* are somewhat streightly closed and shut, and consequently afford not a very free passage to the *Animal Spirits*. For as we see sometimes the *Sails* of *Ships* slack and lank, when there blows but a gentle gale of *Wind*, not strong enough to stretch and expand them; so when there is not so great a plenty of *Animal Spirits* proceeding from the *Heart* as to fill the *Marrow* of the *Brain*, and to keep all its passages open, *Sleep* must needs arise. Since then in *Children* and *Infants*, *Humours* very much abound, the Motion of the *Animal Spirits* is by the resort of them to the *Brain*, much diminish'd, and the *Pores* of the *Brain* apt to be obstructed.

Hence it comes to pass, that they who have a more than ordinary *Cold* and *Moist Brain*, as persons of a decrepit Age generally have, soon fall a *sleep*. On the contrary, those that are of a more *dry* and *hot temperament*, pass many times whole *Nights* without *sleep*, and being vigorous and in the prime of their *Age*, are satisfied with a smaller portion of *sleep* than *Children* or old *People*.

We *Sleep* sooner lying down than in any other posture, and sooner by a *Fire* than elsewhere.

That we sooner *sleep* lying than otherwise, is because our *Heart* is then parallel with the *Horizon*; whence it comes to pass, that the *Blood* proceeding from the *sinister Ventricle* of the *Heart*, passes to and fro with an equal force, which, when we stand or sit, it cannot do, for then the more subtle part of the *Blood* only ascends; so that in regard the grosser part is conveyed to the *Head* through the two *Carotides*, and the two *Vertebral Arteries*, consequently the fewer *Spirits* are from thence generated; the want whereof causes an inclination to *Sleep*. But that we sooner than ordinary *sleep* by the *Fire*, is because the *Pores* of our *Body* are much enlarged by the fiery particles, so that our *Body* becomes like a coarse *Sieve* or *Cullender*, by reason whereof the *Animal Spirits* take their flight the faster; thus the *Body* tired and debilitated, drops at last into a sweet *sleep*.

It is vulgarly affirmed that the *smoking* of *Tobacco* both induces *sleep* and drives it away; and that it both excites and expels *Hunger* and *Thirst*.

The Reason is, because the *Animal Spirits* being stroak'd, and as it were led into a *Dance* by this sort of *Fume*, grow absolutely deaf to all troublesome accidents; nay, whatsoever of difficulty lies upon them to be done or suffered by them, they

I. Why Infants are most chiefly addicted to sleep.

II. Who they are that soonest fall asleep.

III. Why we fall sooner asleep sitting by a Fire, than in another place.

IV. How Tobacco taking, both procures and drives away sleep.

they go through with ease and undisturbed: Wherefore to *Soldiers* and *Mariners* the use of *Tobacco* is a thing not only of advantage, but almost of necessity, forasmuch as it renders them undaunted and fearless, and ready to undergo all dangers, patient of *Hunger*, *Cold* and *Labour*; as gently raising and exalting, and as it were tickling the *Animal Spirits* to quick and expansive motions, and is a recreation to them, no less than the carousing of full *Glasses* of *Wine* to others.

V. *Poppy*, *Saffron*, *Mandrakes*, and the like stuporifics, benumb and lay asleep those that take them.

The Reason seems to be, because *Plants* of this Nature are full of a very Uliginous or Clammy sort of *Juice*, with which the *Pores* of the *Choroidal Contexture*, being stopped, are disabled from conveying to the *Brain* the *Spirits* proceeding from the *Heart*. For as some *Plants* are obstructive to the *Spleen*, others to the *Liver*, and hinder them from performing their usual office; so the *Poppy*, *Mandrake*, *Saffron*, &c. have a sensible power of obstructing the said *Contexture*, and causing fewer *Spirits* to be transmitted from the *Heart* to the *Brain*. For all *Somniferous* or sleeping things, whether outwardly applied, or taken inwardly, infuse a certain moistning all over the *Body*, and so induce a *Refrigeration* or *Cooling*, by which the abundance of *Spirits* is diminished, or their motion retarded. By the like Reason, those who are troubled with a *Catarrh* or *Rheum*, are apt to fall asleep, and to be oppressed with a kind of stupidity or heaviness, by reason of the abundance of *Humour* which lies about the *Fountains* of the *Nerves* and stops their passages.

VI. *Balneo's* generally cause sleep in those that use them.

This they do, not so much from the immediate virtue of *Bathing*, but so far as they communicate to the *Humours* circulating through the *Pores* certain sweet particles proceeding from those emollient *Herbs* infused in the *Bath*, whereby it comes to pass, that the *Blood* is somewhat restrained, and disturbed in its over-violent Career, so as that it drives not into the *Brain* with so much vehemence as before, nor is there so great a quantity of *Spirits* to be discerned, from the want whereof sleep arises.

VII. Certain *Diseases*, as the *Lithargy* and others, create in the Patient an excessive drowsiness, and at length plunge him into a deep sleep.

And this by reason that the proximate cause of this affection is the obstruction of the *Pores* of the *Brain*, proceeding from a gross *Humour*, and the want of *Animal Spirits* immerst in the overflowing stagnation of *Humour*, by which means those affected with this *Distemper*, must needs be apt to fall asleep. And such a sleep it is, that it may be accounted not only the Chain and Fetter of all the exterior *Senses*, but also the Oblivion of all things. Wherefore those that have taken in the *Infection* of the *Plague*, if they are of a sleepy Constitution, and give themselves up to repose, become the more deeply infected, and Nature is the less able to resist the *Contagion*. Moreover, those that have drunk *Poisoned Potions*, if upon the drinking of them they are overtaken with sleep, they suffer in a higher degree, and the *Poison* the sooner reaches their *Vitals*. Because too much

evaporation oppresses the *Natural Faculties* and renders them dull, heavy and incapable of overcoming the *Evil*.

The wakeful *Cock* certainly shakes off Sleep about *Midnight*; Whence MANTUAN,

*The Bird that's sacred to the Sun's bright Ray,
Bids Night adieu, salutes th' approaching day.*

Cicero in his 2d Book of *Divination* judges DEMOCRITUS to have most excellently explain'd the reason why *Cocks* Crow before Day, as follows, *The Meat being gone off from the Stomach, and dispers'd into the whole Body, the Cock, saith he, in the silence of the Night, having digested his Meat, and being satisfied with rest, to express his content, lifts up his Crowing Voice, and displays his Gay Wings.* But with this opinion of *Democritus* I am no way satisfied. Because if the *Cock* rowles from sleep, and Crows after *Midnight*, by reason of the digestion of his *Meat*, it should follow from thence, that afterwards he would no more indulge to rest; but this Experience contradicts. Besides, he Crows as well at *Noon*, being full, as also after treading of the *Hen*; so that this Reason might better be given, namely, that the *Sun* having past the *Nights Meridian*, and now steering towards the *Morning*, agitates and drives before him a cold *Nocturnal Gale*, by the shuddering approach whereof the *Cock* being roused out of his sleep, flutters with his *Wings* and sets a *Crowing*.

Or why may we not affirm, that certain times are allotted to all *Creatures* for sleep, and this particularly to the *Cock*, at which by an innate motion it wakes, and having its *Spirits* in agitation, sets a *Crowing*, and by his *Crowing* testifies his wakefulness? For why may not the *Spirits* of the *Cock*, as well as of a *Goose*, or any other Bird of that Nature, inclosed in the *Brain*, excited either by its own abundance, or by some external murmuring noise, so open those passages in which the said *Spirits* use to have their course from the *Brain* to the proper *Organs* of the *Senses*, as from the Center to the Circumference, as by a concurrence made to move the *Nerves* attendant to the foresaid motions?

Soon after *Dinner* or *Supper* we are more apt to fall asleep than at other times. Whence many have taken up a custom of setting themselves to sleep after *Meat*, to which Custom Nature seems to invite, and few can put it off without much reluctance.

The Reason is to be derived from the very concoction of the *Meats*; for when at that time a cruder *Chyle* from the *Stomach* and the *Intestines* is mingled with the *Blood*, and hinders the rarefaction thereof, it must needs follow that the *Brain*, by the loss of *Spirits*, is refrigerated at that time, and so contracts a certain sleepy disposition, so that the *Spirits* which remain are scarce sufficient to keep the passages of the *Nerves* open and tite: Hence we find by experience, that the external parts of the *Body* are after *Meat* refrigerated, so that the *Head* hangs down, and the *Eye-brows* fall, if we do not rouse and set upon some serious affair, and find work for the *Animal Spirits*.

VIII. Why the *Cock* wakes at *Midnight*.

IX. Why we are most apt to be sleepy after *Meals*.

Sleep

The. or. serie. copious. from. a. of. the. that. u. follow. way. and. the. our. oth.

X. Sleep is not so easily broke off by Day as by Night, as we find by experience in the Spring and Summer, in which, by reason of the Sun's light coming in at the Chamber Window, we are more difficultly rous'd from Sleep than in the Winter when the Sun is at a distance, and we are surrounded with Mist and Darknes.

This proceeds not from Light, as from the efficient Cause; as if Light were indued with a faculty of procuring Sleep; but only by accident, forasmuch as our Eyes, being weak, and smitten with sudden cold, are apt to wink, and at last to close and be quite shut: For when we open our Eyes, the Light comes upon them, and smites them, and they not knowing how to send back the Rays, are offended and disturbed to be so smitten by them, shut down the Eye-lids again, and betake themselves immediately to a renovation of Sleep and Repose. Hence it comes to pass that waking at broad day, and opening our Eyes, we feel a kind of force and pain in so doing; in regard the Light smites not the Retine Tunicle by degrees, but all on a sudden.

When we are asleep, we are more apt than at other times to be cold in the extreme parts of our Body, but hot within.

This most probably proceeds from hence, namely, for that the Blood not being at that time agitated by any passion, or any violent exercise, flows so quietly that it hath not force enough to convey any heat to the extremities of the Body, whence they become cold, at least in those persons whose Lungs are in a good temper: But for those that are troubled with bad humours, or are Asthmatick, they cannot indure to lie covered, by reason that the heat which they bring upon themselves by being covered, very much augments their inward heat.

XI. Those that lie not at ease, by reason of the Sheets not lying smooth under them, or the hardness of the Bed, or a necessity of making Water; are very often interrupted in their Sleep, and forc'd to lie awake a long time.

The Reason is, because the Animal Spirits which are bred during Sleep, and continually repair'd by the motion of the Blood through the Heart, can have such a plentiful confluence, as that having thereby the power of opening the Orifices of the Nerves, they fill them in such a manner as is necessary to extricate their Filaments, and give occasion to the Soul to perceive those Objects; For whatsoever gives disturbance to any sense, and interrupts the usual rate of motion, is an absolute Enemy to all Repose.

XII. We find by experience, that when we are very attentive in Reading or Studying presently after Dinner or Supper, we are apt to fall asleep, but not in the least when we are present at the acting of a Comedy, or the sight of any thing that moves to Laughter.

The Reason is, because any studious attention, or serious exercise of Mind, draws the Blood more copiously toward the Head, and gathers it together from all parts of the Body towards the very midst of the Brain. By which means it comes to pass, that upon the Blood penetrating the Brain there follows a great recourse of Nervous Juice that way, by which the Spirits are presently obstructed, and their intermediate places taken; but it falls out otherwise, when after Dinner we repair to a

Comedie, because then the Animal Spirits being diffused with pleasure, distend and enlarge the Brain; so as that the passages being streightned by that inflation, stop the course of the Soporiferous Humour, and hinders it from forcing into the Brain.

Coffee is said very much to keep away sleep, and procures an extraordinary disposition to wakefulness, and an unwearied exercise of the Animal Faculty; forasmuch as upon the drinking of this Liquor any one may sit late at night for the carrying on of any Studious Contemplative or Wakeful business.

This effect in my Judgment may very well be imputed to those adust particles of the Coffee, which mingling first with the Blood, then with the Nervous Juice, keep by their agility and restlessness the pores of the Brain open, and the Spirits having now shaken off all Curb or Bridle, are prick'd as it were with Goads and Stimulations to the longer and more continued performance of their Offices. In like manner the Cause of a very wakeful temper may be imputed to a torrid and Melancholick Blood which supplies the exterior Brain with such a sort of Nervous Juice as is parch'd and fill'd with adust particles, and is neither fit to remain longer within the pores of the Brain, nor kindly to receive and contain the Animal Spirits.

XIV. This kind of Drink, tho' of very common use, and in some cases very wholesom and medicinable, yet at other times, and in other cases it may be hurtful and unwholesom; and this not only Reason, but also common Observation tells us; forasmuch as excessive drinkers of Coffee are very often Lean and Paralytick, and many times unapt for Generation. In regard, since the Blood, by the frequent and excessive use thereof, becomes in a great measure acid and adust, it is consequently the less apt and capable to nourish.

XV. In Children Sleep is procur'd by the motion of Libration, so called, or rocking in a Cradle. The Reason is, because this rocking to and again stirs the Humours of the Brain; by the access of which Humours to the Brain and Origin of the Nerves, Obstructions are created: As when any sort of Liquor is injected with a force upon whatsoever Object is capable to receive it, it sinks in the deeper, especially if the Body into which it enters be tender and soft, as the Brain of Children most certainly is.

XVI. Some wake constantly at set hours. This comes to pass, partly by reason of daily custom, and partly because at certain set hours those men have sufficient plenty of Animal Spirits to puff up the Tubes of the Nerves, and also the Muscles; as appears in those that are more hungry at some times than others: Of which there can be no other reason given, than because by that set time the Blood has made several circulations through the Heart, and by that means hath obtained such a due degree of acidity, as is requisite for the exciting of Hunger in the Stomach.

As for the time allotted for Sleep. That which the Schola Salernitana hath decreed in this point, is most generally received.

Seven hours in Sleep the Eyes to hold, Is long enough for Young and Old.

XIV. How Coffee happens to drive away sleep.

XV. In what the excess of Coffee is hurtful.

XVI. How it is that Children are rock'd asleep by the motion of Libration.

XVII. How some duly come to wake at set hours.

XVIII. How many hours are to be allotted for sleep.

But in this matter a certain set time cannot be appointed to all alike, but rather the different *temperament* of this or that *person* is to be consulted. For to those whose *Blood* is more thin and subtile, as the *Spaniards*, *Italians* and *French*, a shorter time of *Sleep* is sufficient; for example, the space of five *hours* or thereabout, which would be too short for those that have their *Blood* more gross and viscous, for such *Blood* should be allowed time to pass often through the *Heart* before it can be made thin enough to afford matter for the generating of *Spirits*.

CHAP. X.

Of the Diseases, and Death of Animals.

I.
What the Cause of Diseases is in Animals.

THERE are no *Creatures* whatsoever totally exempted from *Diseases*, but according to their different *temperament* are affected with some or other *Bodily Distempers*. Some are troubled with a *Shaking* or *Trembling* of their *Limbs*; others are in a manner choak'd up with an *Inflammation* of the *Jaws*, commonly called a *Quinsie*; others are afflicted with the rising of the *Lights*, &c.

The Reason is plain, because *Sanity* or *Health* is a certain disposition of the *Body*, by which it is rendered capable to perform its *Offices*. So that when-ever the *temperaments* of the parts chance to be altered, or its *Organs* to be intercepted, the *Order* or *Course* of *Nature* being hereby inverted, the *Creature* must needs be deprived of *Health*, as falling from its primitive *State* of *Body*. So the *tremour* or *shaking* of the *Limbs* proceeds from a debility of the *Nerves*, or some depraved affection which haply some foregoing *Convulsion* had left behind it; or by reason of some *frigid Humour*, which insinuating through the hidden passages, impells the *Members* to this motion. So the *Quinsie* in such sort streightens and shuts up the *Jaws* of some persons, that they are hardly able to breathe, much less to swallow any thing, by reason the *Inflammation* or malignant *Humour* so wholly takes possession of the *Nerves*, that they are rendered in a manner incapable of *motion*, and scarce sufficient for the opening of the *Jaws*: So the rising of the *Lights* is incident to those whose *Stomach* is obstructed by certain *humours*. For since the *Blood* is strained through the *Liver*, it may very well so happen, that that which is transmitted from the *Milk* through the *Splenick Vessel*, or flows from the *Mesentery* is corrupted and shuts up the *pores* through which it is to pass. In like manner we may inquire into the reason of any other *Disease* which is incident to *Animals*, ever perverting or disturbing their *actions*, and hindring their *faculties* from performing freely the *offices* of *Life*.

II.
Whence it is that the pain of the Teeth is so sharp and vehement.

The pain of the *Teeth* is a most acute and sensible pain. It is not to be imagined, that the *Teeth* have any sense of *pain*, since they are all *Bone* and solid. But this *pain* vulgarly ascribed to the *Teeth*, proceeds from those *Nerves* which terminate at their *Roots*, and the pain is the greater, First, because those *Nerves* being of a very short extent, so much the sooner transmit the impressed motion to the common *sensorium*. 2dly, Because they hap-

pen to be overmuch stretcht, whereupon that action of the *Internal Object* is the more lively propagated. As we may observe in *Musical Chords*, that those which are stretcht to the highest pitch, give the acutest or highest sound. 3dly, Because they go right forward without any deviation, by which means the impressed motion is carried the more easily to the inmost parts of the *Brain*, as appears in the difference between a *Rope* drawn out into a strait *Line*, and another laid crooked or winding. But this most acute pain of the *Teeth* usually ceases upon drawing out of the *Tooth*, in regard by this means the over-much tension of the *Nerves* is remov'd, by reason whereof the impressed motion cannot continue to be transmitted so vivaciously to the *sensorie*.

Hereupon it is that *Infants* die through the excessive pain of *Teeth*, which when they begin to breed, they by the violence of their crying so excessively shake the *Brain*, and the *Membrans* covering it, which are very soft and tender, that all the natural *faculties* of the *Infant* are exceedingly disturbed and out of order, whereupon the *Milk* and *Blood* become corrupt, and the *Spirits* bred of them, contract an acrimony, which entering into the *Nerves* through the *Muscles* excite them more than ordinary, and cause *Convulsive Fits*, of which they oft die, because the efforts they make, cause the *blood* to flow in such abundance into the cavities of the *Heart*, that they become too inflat, and cannot give it a free course, and continue that *circulation* which is necessary for *Life*.

The *Small Pox* and *Measels* are incident to all persons, and most especially when they are *Children*, but if not then, yet at least at some time or other of their *Life*.

This is because they brought into the world some impure *particles* which lie skulking here and there in some lurking places of the solid parts, and which in process of time are drawn forth from thence by a ferment or peculiar matter of the first *Element* introduc'd by *fermentations*, and are pour'd upon the mass of *blood* in which they excite a violent motion, until at length they are cast out through the *pores*, and appear upon the superficies like little small *Vesicles* or *Bladders*. Those that have but few *feculencies* stagnating in the *Body*, are for the most part but lightly invested with them; those that have none of these *feculencies*, are never troubled with this *Distemper* during their whole *Life*, but there are very few that escape. Those that once have them very much, seldom have them again, which is a great sign that the place which gave harbour to the *Peccant Matter*, is totally clear'd and empty'd thereof. But those who, who having in their *Bodies* a plentiful stock of this said matter, yet have put forth but few, are in much danger of being infected with them a second time, if not a third. These *Distempers* are epidemical, and sweep away yearly, especially out of all great *Towns* and *Cities*.

Many feel great pains returning yearly at some set time, especially such as proceed from old *Wounds*, or some acute *Distempers*, which, tho cured, yet leave a remembrance behind them.

The Reason seems to be this, because in the scars which those *Wounds* have left, the *pores* are very much altered,

III.
Why some Infants die with breeding Teeth.

IV.
Why the Small Pox and Measels are so common.

V.
Whence it happens that some feel greater pains at one time than another.

altered, both as to their *Magnitude* and *Figure*, and wholly different from the *pores* of the rest of the *Body*. When therefore any change of *Air* or *Season* is at hand, another *Aether* usually approaches our *Earth* than before, which rushing into the *pores* of our *Body*, easily passes them all, those only excepted which are in the *Scar* of the *Wound*, in regard they have a perfectly different *Figure* from any of the rest; whereupon the said *Aether* must needs make a more forcible entrance into the intorted *pores* of the *Scar*, and consequently excite a *Vellitation* and *Sense* of *Pain*.

VI. The *Distemper*, commonly called the *French Disease*, had its beginning among the *French* at the *siege* of *Naples*, being till then unknown to all but the *Canibals* of *India*.

The Cause of this so foul and poisonous a *Mur- rain*, the *French* ascribe to certain *Mariners*, who coming from *Mauritania* to the said *Siege* to vend their *Merchandise*, sold instead of the *Sea Hogs* the *Flesh* of *Men* newly killed, salted and barrelled up. Which sort of *Meat* the *Soldiers* feeding very much on, contracted this *Disease*, which afterwards spread very much by *Contagion*, and infected those *Women* with whom they had to do. Nor is this Reason of the *French* any way dissonant from truth, since certain it is that the *Canibals* who feed upon *Mens Flesh*, are greatly punished with this *Disease*. And *History* testifies, that the *Indians*, when first discovered, were known to have this *Venerical Distemper* frequently among them. Because the *Eating* of *Human Flesh* begets foul and fulsome *Vapours*, by which the *Head* being wrought upon is *Vitiated*, and the texture of the *Fibres* of the *Brain* corrupted.

VII. Persons in a *Fever* are wont to lie all night as if they were sound asleep, when in the mean time they have not one minutes rest, but lie muttering to themselves, and in a very restless condition.

The Cause is to be sought from the *pores* or *tracts* in the *Brain*, by which the *Animal Spirits* are conveyed to the *Brain*, which are very much obstructed by a certain gross matter which proceeds from the mass of *Blood*, in regard the *Spirits* being at that time not allowed their wonted dilatation, a heaviness to *Sleep* seems just falling upon them; but by reason of certain acid or aculeated *Corpuscles* adhering to the said *Spirits* which put them into motion, It happens that some of them break the way, tho' barricadoed or shut up, and stumble upon each other by an oblique course. Whereupon so great an agitation of them, tho' confused, by reason of the divaricated obstacles, cannot but disturb the quiet and cessation of the *Animal Function*.

VIII. In a *Palsie* the parts being loosened, pine away, and by little and little consume, till at last scarce any thing is left but *Skin* and *Bone*; altho' the *Blood* at the same time have a free and plentiful course, and circulates after its wonted manner through the whole *Body*.

The Reason hereof must be supposed to be, for that in this *Disease* the *Nerves* are ill-affected, and cannot perform their office, for the *Blood* is not, as some of the *Ancients* believed, an adequate nourishment of the parts of the *Body*, but a certain *Juice* transfused to them from the *Brain*, and the *Medulla Spinalis*, by the mediation of the *Nerves*.

So that since in *Paralyticks* or those troubled with the *Palsie*, the *Nerves* are obstructed, and can no longer supply nourishment; no wonder if in that *Disease* the parts of the *Body* dry and wither, and the fleshy substance falls away. Hence it comes to pass, that those who have *spongy* and *moist pores*, by reason of their reception of their greater plenty of *Alimentary Juice*, grow fat: But those on the other side are apt to be lean who abound with *Blood*; yet by reason of overmuch heat, have their passages straight, and their *Nerves* not wide enough for the drawing in of *Juice*.

The *Elephantiasis*, or vulgar *Leprosie*, as also that which is called *Stomacacoe* and *Scelorybe*, are now much more mild and gentle than in former Ages, in which persons were wonderfully tormented and felt intolerable pains.

The Reason is, either because the rigor of the *Distemper* is much taken off by powerful *Medicaments* now better known than formerly, or because Nature accustomed to those *Distempers*, hath induc'd such a *Callosity*, that they seem now more tolerable than of old, and so much the more tolerable by how much they have been the longer indured. The Reason whereof may possibly be, because the *Ardour* and *Ebullition* of the *Distemper* is diminish'd. Or else Nature accustomed to a pain of so long continuance, ceases any longer to struggle so much with it, as being now familiar, and as it were domestick: Or Lastly, Being nourished even by those corrupt *humours* is the less offended by them. For even as those nasty sorts of *Fellowes* that empty *Houses* of *Office*, and cleanse *Sinks* and *Common Sewers*, are made by long custom unsensible of the filthy *Smell*: So those that are diseased, for examples sake with the *French Pox*, after they are used to it, as if they had lost their *Sense*, are no longer sensible of the defects of the *Body*, and debilities of *Nature*; by reason that *Nature* and the *Disease* grow at last to be of a party and agree together, and the *Humours*, of the one are mixt with the *Humours* of the other.

When *Night* comes, *pains* increase, and are exasperated to a greater height.

The Reason is, for that the *Humours*, quiet before under covertures and bindings, are mov'd and stir'd up, so that those *Acid Particles* formerly imprisoned, take thenceforth an occasion to *Vellitate*, more than before the *Nervous Fibrils* of those parts in which they are fixt. Whence there must necessarily follow a notable aggravation of *pain*; as appears in those who are distempred with the *Venerical Disease*.

Some *Fevers* (or rather *Agues*, for so they are commonly called in *English*) begin with *cold*, in such sort, that not only the extrem parts of the *Body* are seized with *cold*, but with a certain kind of *Action* of *Horror*, the whole *Body* trembles and shakes.

The Reason is, because *Fevers* proceed from a certain *Humour* falling into the *Mesentery*, or some other part of the *Body*, which *Humour* flowing through the *Veins*, and by that means mixing it self with the *Blood*, is at length conveyed therewith, to the *Heart*, which gives an obstacle to the *Blood* from being heated there, and dilated as before, and conveys that heat which it borrows from the *Heart* to other parts of the *Body*. Whereupon

IX.

Why Pain
increases at
Night.

XI.
Why some
sort of Fevers
begin
with Cold.

a cer-

a certain tremour must needs arise; and the *Febricitant* or *Fever-fetted* Persons be taken with a sudden shaking of the *Members*: Which yet never happens, but at the beginning of a *Fit*. For as *Green Wood* thrown upon a *Fire* puts it out, or at least opposes, and resists its heat, but being once kindled, sends forth a fiercer flame than any other *Wood*: So after that the said *Vitiated Humour* hath been for some time mixt with the *Blood*, it grows hot at length, and is dilated in the *Heart* more than the *Blood* it self. And this causes the return of the *Fit*, which lasts so long, till the said corrupted matter is exhaled and reduced to the natural constitution of the *Blood*.

XII. *Fevers*, which are so very incident to *Mankind*, afflict not the *Body* always after the same manner. For some affect with a continual burning or violent heat; others *intermit*; some return more suddenly, some more leasurably, and some anticipate and come before their usual time.

The difference of all these *Fevers*, arises from the *Morbifick Matter* which creates the *Fit*. For tho' that *Matter* in the former *Fit* hath been all purg'd away, yet there still remains some fewel or depraved disposition in that place wherein the *Humour* was first vitiated. Whence it comes to pass, that that which succeeds there anew, is first coagulated, then corrupted, and after some certain time growing to maturity, flows toward the *Heart*, in the same manner as the former, and creates the same symptoms. Whereupon, if the *Morbifick Humour* which succeeds into the same place wherein the former was corrupted, wants the maturation of three days, before it mix with the *Blood*, it produces a *Quartan Fever* or *Ague*; if it stand in need of two only, a *Tertian*: But when the said matter applies to the *Heart* with a continual onset, and vellicates or twitches it without ceasing, it induces a *Quotidian*, or continual distemper. Lastly, If the *Blood* be so vitiated, that between the time wherein the last drop of the depraved *Humour* flowed out, and that wherein the first drop of the new gathered *Humour* began to take its course, it cannot be purified, the *Fever* renues with a more ardent inflammation than ever.

XIII. Besides all these several kinds of *Fevers*, *Physicians* observe that a *Fever* sometimes proceeds merely from a previous pain.

The Reason of all this we shall soon understand, when we consider that pain hence arises, namely, for that the *Fibres* of the *Parts* incur danger of Rupture or breaking, if not Rupture it self. Whence sensation of pain arises in the *Mind*, which is followed by an immoderate influx of the *Spirits* into all the *Nervous Tribe*; since therefore many little Branches of the *Nerves* are implanted into the *Arteries*, and feel the said inordinate influx of *Spirits*; hence it comes to pass, that the *Arteries* are hurtfully smitten and battered, and that the *Blood* contained in them is wonderfully streightened and pent in, and its mixture confounded and disturbed. And hence it is that the *Fever* arises.

XIV. After a fit of the *Fever* we feel a pain all over the *Body*.

Because since the *Feverish Heat* which uses to succeed the shakings and cold fit, depends merely upon this, namely, that the *Blood* by means of

this admixture of the *Febrile Matter*, rises into a preternatural and vehement heat and ebullition, as moist and green Sticks of Wood laid upon a *Fire*, do not very easily catch, and burn into a blaze, but when they have once taken, cast a most ardent heat above all the rest of the fewel: Hence it is that by this great effervescence of *Blood* within the *Heart*, the particles thereof are more subtiliz'd, and as if abundance of *Salt* were mixt with it, the said *Blood* makes an irruption into the *Fibres* of the solid parts, and by corroding them, creates that pain which so afflicts us after the *Fit*.

The like dissertation we may make concerning the periodical accesses of the *Head-ach*, which are daily, by reason of the *Morbifick Matter* rising and boiling up to a height at a set time. But so far varying as to be either before or after *Meat*, according as the offices of *Digestion* and *Distribution* of the *Aliments* are sooner or later performed.

Those that are sick of a *Fever*, and oppress with an excessive and unwonted Heat, *Leanness* and *Consumption* attend them.

The Reason is, because the particles of the *Blood*, or *Nutritious Juice* which are for the nourishment of the *Body*, and ought to make some stay in the *Members*, to which they take their course, are more hastily moved and agitated, than to be able to make their due stay, and afford their due nourishment, but either are thrown off by those *Members* in a nature of *Sweat*, or pass away by insensible *Transpiration*; whence the *Body* must needs be exhausted and become thin and lean for want of nourishment: Just as *Plants* are dried up and wither, when by the overmuch heat of the *Sun*, the *Juice* assigned for their nourishment is too quickly strained within their pores, and without making that stay there which is required, passes away and drops off.

Some there are that pretend to know all *Diseases* by *Urines*, as commonly your *Quacks* and *Mountibanks*, and some reputed *Physicians* are not ashamed to undertake the same thing; nay they go so far as to make us believe, that they can tell the *Diseases* of each part of the *Body* by the *Urin*, and whether it be the water of a *Young Man* or an *Old*, of a *Man* or a *Woman*, of a *Woman* with *Child*, or not with *Child*. But these things I look upon as trifles, for how can it be resolved from the *Urin*, whether the *Eye* akes, or the *Nose*, or the *Ear*? Whence the *Head-ach* arises? Whether there lie any obstructions there undiscovered? whether there be any *Distemper* in the *Arms*; whence its pain comes? For that all these things are impossible, both Reason and Experience testify. I confess indeed that something may be conjectured from *Urines*, but it can be nothing but what is very general. So if *Matter* be voided together with the *Urin*, we may conclude that there is some part *Ulcerated*, but what part that is, who can resolve? For we see that *Matter* is voided when the *Lungs* or *Bowels* are *Ulcerated*; and tho' the *Urin* passes through these *Ultimate Parts*; yet it is a difficult thing to resolve whether it proceeds from the *Reins* or from the *Bladder*. This is certainly found by experience, that *Physicians* are very often deceived in this matter. Our judgment therefore of *Diseases*, especially of those parts

XV. The Head-ach hath also its accesses at a certain time.

XVII. Whether Diseases can be known by the Urin.

The Ninth Part OF THE HISTORY OF NATURE. MAN.

CHAP. I.

Of the Sense of Touching, or Feeling.

I.
The Skin
partakes
more of the
Sense of
Touching,
than all
other parts
of the Body.

ALTHO' the Sense of Touching is spread all over the Body of Man, yet it is generally allowed that the Skin partakes more of this Sense than all the other parts, and the reason is, because the Nervous Fibres which are spread almost through all parts of the Body, run through the Skin in a particular manner, and in effect, the whole construction thereof is particular: For besides, that it is form'd of Nervous Fibres which are interwoven one with another, there spring from among these Fibres, certain small threads disposed into the form of Pyramids, and are Nervous Eminences, covered with a Cuticle or Upper Skin, under which is discover'd an Oily Humour, which keeps them always very supple. Whence it must needs follow, that the immediate Organ of Touch is no other than the Nervous Fibres extended all over through the Skin.

But this Sense of Touching or Feeling is chiefly predominant in the hand, as MALPIGHIOUS confirms, who observed by a Microscope, that in the hollow of the hand, and the extremities of the Fingers, there were certain elevated wrinkles spirally drawn, in which were hidden those Nervous Bodies that serve for the act of Touching.

II.
Of a Woman, who after the cutting off of her Leg, complained of great pains she felt.

A Certain Noble Woman in Dauphiny had one of her Legs, newly affected with a Gangreen, cut off, but with such Art and Industry, that she had not the least suspicion thereof, being deceived by a Wooden Leg which the Surgeons brought along with them, wrapt up in a Cloth; but some considerable time after the amputation, she complained of very sharp prickings and shootings, not only in her Leg, but down to her very Toes ends. Nor did she cease complaining after the matter discovered, but still asserted that she felt pain in her Leg.

The cause hereof can be no other than this, namely, that such is the constitution of our Body,

that no part thereof can in the least be stirred by any other remote part, but it may also after the same manner be moved by intermediate parts, altho' the remoter conduce not at all to the motion: For who ever draws the last part of the given Rope A B C D, the first part A, will be moved in the same manner as it might be moved if it were drawn by one of the intermediates B or C, the last part D remaining unmoved; so when the Noble Woman felt the pain of the Joints of her Leg and Foot, the reason hereof was, because the Nerves which first descended to the Foot from the Brain, and were then terminated in the Thigh near the Knee, were there moved in the same manner as they were to have been moved before in the Foot, upon the sense of this or that Toe aking to be imprest upon the Soul residing in the Brain: Hence an Argument may be brought against the Aristotelians, who will have the Soul to be actually present in each part of the Body; for were it so, how could the Soul of this Lady judge her pain to be in her Leg, which was cut off, or in her Toes, when it was indeed in her surviving Thigh?

Thus it happens in us many times that when we lean longer than ordinary upon our Elbow, we feel a numbness in the Little Finger, so that the Nerve which is deduc'd from the Brain to that Finger being compressed more than it can indure, moves the common Sensorium with the like affection, as if it were prest in the said Finger.

When any one, on a suddain, and having his Mind intent upon other things, is touch'd by any one, he is seized by a suddain trembling or horror.

The cause seems to be, upon an apprehension that by the said suddain stroke some mischief is design'd against him, whereupon he recollects himself, and indeavours to decline it. For then the Animal Spirits are suddainly stirred up, and tend in greater plenty to the Brain than that they can possibly be derived thence in order into the Muscles. For that which comes to the Soul by the Senses, affects it more, than that which is represented

III.
How the Sense of Touching may be deceived.

IV.
Why any one touch'd on a suddain, hath a horror upon him.

sented to it by reason, tho' for the most part it comes short in truth and reality: Whence in regard by that unexpected *contact*, there is but a slight impression made in the Body, and he finds the mischief which he apprehended coming upon him, to be nothing but a vain apprehension, he returns immediately to himself, and after a little time lays aside all horror.

V. Hence it comes to pass, that when we *touch* or tickle our selves with our own *hand*, we are not so shaken or smitten with *horror*, because therein is no surprise, but we act at pleasure, and consequently following our own way and method, we are not touch'd with that apprehension of *evil*, which is the principal cause of the said *Horror*.

VI. *Titillation* is chiefly raised in the *Soles* of the *Feet*, which delighting the Patient by a grateful *Pruriency* or *Itching* affects him with a sensibility of *Pleasure*.

Titillation is produc'd when the *Nerves* terminating in the *Skin* of the whole *Body*, are agitated more vehemently than ordinary. Yet so as that there follows thence nothing of *hurt*; or when the *Filaments* which are carried from the *Brain* to the other remoter parts of the *Body*, are drawn with the like force, so as they be not broken, nor divided from the *Members* to which they adhere; which *Titillation* or *Itching* is chiefly perceived in the *Soles* of the *Feet*, by reason of the tension of the *Skin* which is impell'd by a light contact, and transmits motion to the *Nerves*, the *Organs* of the *Senses*: Or else, when through the unwontedness of the way of promoting the agitation of the *Spirits*, new force accreus to them. So a *Feather* or *Bulrush* lightly running over the *Lips* or *Cheeks*, causes a *titillation* there, by reason of the thinness of the *Skin*, and the seldomness of any contact hapning in those parts: Whereas if things harder than those aforesaid are applied, or the parts are more frequently touch'd the *Titillation* ceases; nor are those parts affected in any unwonted manner. But the pleasure which proceeds from *Titillation* hence arises, viz. because the *Objects* excite a certain motion in the *Nerves* which might possibly hurt them, unless they had strength enough to resist it; or unless that *Body* were well disposed, which causes such an impression in the *Brain*, which being instituted by *Nature*, to contest this good disposition and strength, represents it to the *Soul*, as a Good that belongs to it, so far as it is joined with the *Body*.

VII. In persons affected with the *Elephantiasis* or *Leprosie*, and in some that are craz'd in their *Brain*, and are, as they are commonly term'd, besides themselves, the sense of *Touching* is wholly taken away, tho' the *Locomotive Faculty* remains entire: For we often see *Madmen* go barefooted, and lie almost naked on the ground, their *Skin* being so benumb'd and senseless, that they hardly feel the incisions of a *Knife*, or the running of *Pins* or *Needles* into their *Flesh*.

This Case, tho' it be very difficult to unfold, by reason the *Nerves* convey both the *Instincts* of *Motions*, and the impressions of *Sensibles* to the *Brain*; yet it may be affirmed, that not the same *Fibres*, which attend upon *Motion*, are inservient to the *Sense*. For the *Musculous* and *Tendinous* *Fibres* execute the motive power, but the *Membraneous* receive the sensible *Species*, and convey

it to the *Brain*: So that it may possibly be, that the *Hurt* or haply the *Loss* of the *Sense* of *Feeling* may be caused by reason of some harm inflicted upon the exterior *Members*; as namely, when their *Fibres* are overlaid by some gross matter, or condens'd by excess of *cold*. On the contrary in the *Palsey*, it falls out that the *Sense*, and not the *Motion* is hindred, in regard that not the same *Fibres* that are the *Organs* of *Sense* are the *Organs* of *Motion*.

The *Skin* being pulled off from any part of the *Body*, *Objects* are the more acutely felt.

This happens, because, tho' the *Cuticle* or upper *Skin* be interspers'd with *Filaments*, by which the affection is transmitted to the *Brain*, yet it contains many insensible *Fibres*, which like *Dead Flesh* are not affected by any *Object*. In so much that they may be taken off with a *Penknife* without any *Pain* or *Sense*: Or at least it may be made out that they are harder than to admit of any *Impression*. For the *Interior* *Fibres* which compose the *Flesh*, being more tender and *nervous*, are therefore the more apt to admit even of the least affection, and consequently are the more sharply prick'd with the asperity of a *Body*.

He who leans or puts a stress long upon any part of the *Body*, makes it stupid and numb'd, or, according to the vulgar expression, *asleep*; as hath been already intimated.

The Reason is, because by the said compression the *Spirits* are stopp'd, and all access to them obstructed; whence it comes to pass that when that part of the *Body* is relax'd, there is felt a little pricking, trouble or pain, by reason of the *Spirits* being at length agitated afresh, and repeating their interrupted motion.

It is vulgarly affirmed, that *Females* in the *Summer*, and *Males* in the *Winter* are most desirous of *Copulation*.

The Reason is, because the *Bodies* of the *Males* being more hot and dry, the *Summer* hath more power by exhalation to dissipate the *Animal Spirits*; whereas the *Winters* *Frost* condenses more, and preserves them intire: For in *cold* and *moist* *Bodies*, such as are those of *Females*, the *Summers* heat cherishes, and calls forth the *Spirits*, when as *Winters* cold blunts and repels them.

Of all *Animals* whatsoever, *Man* excels in the faculty of *Feeling*, and more distinctly perceives the first qualities of things, and other qualities relating to *Touch* in general, as *Humidity*, *Siccity*, *Hardness*, *Gravity*, and the like.

This Prerogative we commonly attribute to the *Spider*, who (as the *Boar* surpasses in *Hearing*, the *Ape* in *Tasting*, the *Vultur* in *Smelling*) is generally believed to be the more quick and vigorous in the faculty of *Feeling*; but this vigorous sense of *Touch* is upon no other account ascribed to the *Spider* than upon its quick perception of *motion*, when sitting in the midst of its *Web*, it perceives the *Fly* lighting upon the most remote part thereof, which is not in the least to be wondred at, since all the *Lines* are equal which are derived from the *Center*; so that lying in ambush in the middle, and holding the extremities of the *Threads* with its *Feet*, it easily deprehends all things which are transacted about it: But *Man* surmounts in the Prerogative of *Feeling* above all *Creatures*, by reason of the excellent temperament of his *Skin*, and

sirous of Co-
pulation.

XI.
Man excels
other Ani-
mals in
Feeling.

and the subtle contexture of *Fibres* in which he excels all other *Animals*. His most excellent Faculty of *Touching*, is most chiefly discerned in the hollow of his *Hand*, and the extremities of his *Toes*, because that in those parts the *Filaments* of the *Nerves* are very slender, and moved with small ado. Whence it happens, that, as it were by instinct of Nature, when we go about to grope out any thing by *Feeling*, we reach out our *Hand*, but chiefly make use of the extremities of our *Fingers*.

XII. The Sense of *Touching* in some Men is so admirable, that it mightily helps the want of *Sight* in them, as appears most evidently in that renowned Organist of *Falcombourg*, who by his *Touch* alone, not only knew how to play most elegantly, but also could distinguish *Coins* and *Colours* of all sorts from each other; nay, and to very great advantage plaid at *Cards* with other persons, especially if he dealt the *Cards*, since he could easily understand by the *Pulps* of his *Fingers* what sort of *Cards* they were which he dealt to his Partners.

Of this thing there can be no other cause assigned, than because all persons, like the said Organist, deprived of their *Sight*, are by consequence no longer distracted by the multiplicity of external *Objects*, which hinder us from keeping our thoughts fixt upon any particular thing, so that by daily exercise, and a most accurate attention of all circumstances, it must needs of necessity be that *Blind Men* must in the Sense of *Touching*, for examples sake, as in the rest of the Senses, of which they are not deprived, excel all other Men.

XIII. *Touching* sometimes causes the *Object* to seem to be felt double, when as indeed it is but single: For the *Globe G*, being touch'd with the two *Fingers* laid a cross *D* and *A*, feels like two.

Figure 28.

The Reason is, because while these *Fingers* keep themselves thus crossed, the *Muscles* endeavour to deduce *A* into *C*, and *D* into *F*: Whence it happens that the parts of the *Brain*, out of which the *Nerves*, inservient to these *Muscles*, derive their original, are disposed in such a manner as is requisite for the said *Fingers* to be, viz. *A* into *B*, and *D* into *E*, and consequently that the two *Globules H* and *I*, must seem to touch each other. For when we lay the *Middle Finger A*, for example sake, upon the *Fore Finger B*, then the part of the said *Fore Finger B*, which being next to the *Thumb F*, is disposed together with the said *Thumb*, to lay hold upon any thing, and the part of the *Middle Finger A*, which joined to the *Ring Finger H*, is apt, together with the said *Ring Finger*, to catch hold on any thing, are not very capable, both at the same time, to grasp the said *Globe*. And the *Mind* then seated in the *Glandule*, perceives the *Globe*, not as single but double, and as it were placed in two places; and from the different Motion of the *Nerves* hath an apprehension of two *Globes*, not one.

XIV. By the same Reason, or not much unlike, when we hold up one *Eye* with our *Finger*, and behold any thing with dissevered *Rays*, we cannot but perceive it as double: Forasmuch as the superior *Rays* of one *Eye*, are ever wont to act with the superior *Rays* of the other; as likewise the Middle with the Middle, the Inferior with the Inferior, and to conspire together to the perception of one

and the same thing, as it were to make a report that it is indeed but one and the same. But if the *Eyes* chance by any means whatsoever, to be so distorted, that the *Right Rays* of one *Eye* agree not with the *Left Rays* of the other; or the Superior *Rays* of one with the Inferior of the other, all single *Objects* whatsoever are look'd upon as divers. As in a *Concave Glass*, the *Flame* of a *Candle* appears double, by reason that from the *Left Side* of the said *Glass*, the *Rays* are reflected into the *Right Eye*, and from the *Right Side* into the *Left Eye*.

CHAP. II.

Of Taste.

THE same sort of *Meat* doth not always please. For that which is gratefully receiv'd by the *Hungry Stomach*, becomes unpleasant and unsavoury to the same *Stomach* well satisfied; and the same *Drink* which delights the *Thirsty*, becomes loathsome to those that are fill'd with *Drink*.

The Reason is, because all *Savoury Things* impress an affection in the *Organ* of *Taste*, according to the Contexture and disposition wherewith it is imbued: So the *Tongue* over-dry, or void of Moisture, perceives little or no taste in any thing; and so on the contrary, a *Tongue* which is turgid or swelling with too much Moisture, and hath its pores stop't up with liquid Bodies, cannot be affected with any *Savour*. Since therefore the disposition of the *Tongue*, in a person fasting, and in a Person full, is quite different; hence it comes to pass, that the same sort of *Meat* or *Drink* is not always in the same manner received in its little chinks and small pores, and consequently induces a different affection therein. This may possibly arise from a Mutation of *Temperament*, whilst the *Spittle*, proceeding from the *Stomach*, according to the qualities of the *Humour* wherewith the *Stomach* is repleated, mingles it self with the particles of the *Meat* in the *Mouth*, and promotes their acting.

This very Experiment alone is sufficient plainly to discover how grossly the *Peripateticks* are deceived when they affirm, that the savor in *savoury Bodies* does every way agree with the sentiment we have thereof. Since were it according to their opinion, it would follow, that the same Man could not at several times have a different taste of the same sort of *Meat*, which is contrary to experience.

It may also happen, that from the various situation of the *Nerves* conducing to *Taste*, all sense of *Taste* may be taken away, according to the mention made by REALDUS COLUMBUS, of one *Lazarus*, vulgarly Sirnamed the *Glass-devourer*, who not distinguishing in any thing bitter from sweet, fresh from salt, used to devour *Stones*, *Glasses*, *Charcoals*, *Fish* drawn alive out of a *Fish-pond*. Of which Monster of Nature, when after his death, a Dissection was appointed by a Person of Curiosity inquisitive into the Cause of so uncouth a thing: It was found that the sixth Conjugation of the *Nerves*, which was ordained by Nature, for *Tastes* sake in other Men, in this *Glass-devourer* reached neither to the *Palate*, nor

I. Why the same sort of Meat is not always alike grateful to us.

II. The Gross Error of the Peripateticks about Savours.

III. How it is that in touching, the Object seems to be double.

IV. How things appear double.

to the Tongue, but turned back to the hinder part of the Head.

IV. They that are troubled with the Jaundise, think all sorts of Meat they taste to be bitter, and imbued with a quality noxious to them.

This mistake proceeds from the Choler which is diffused through the Tongue, for such a sort of bitterness, mingled with the Spitte, infects the Meats, and imbues and depraves the Organ of Taste with its bitterness: So that these laterick Persons are not so much deceived about the Affection imprinted (for they do really taste that which is bitter, and the Organ is certainly ill affected) as about its Cause, since they look upon the said Savor as received from the Meat, when as indeed it is to be imputed to the humour only. For some without any Meats, seem to themselves to taste a certain Savor, in regard this humour sliding into the Tongue or Jaw, vitiates and corrupts their Temperament. The same thing happens in the Touch, as when any one fancies he feels the force of heat, and thinks Fire to be applied to his Body, when indeed Fire is far enough off from it, and only a deficient humour, either a tension of parts alone, or a tumor with it impresses such an affection, as Flame the Instruments of Pain, were it present, would impress.

V. The Tongue is the chief Indicator of any Disease, and by whatsoever Infirmary we are oppressed, 'tis thither we have recourse for all the Signs and Discoveries thereof. In so much, that it hath been always the custom of all Physicians, the first thing they do, to bid the Patient hold out his Tongue.

The Reason is, because the Tongue being the tenderest of all parts of the Body, is most easily wrought upon; for since it is of a Spongy Nature, and abounding with Blood, it is soon seized with the force of a Disease, or infected by vitiated Blood, by both which being ill affected, no wonder if it soon discover the alterations of the Body, and reveal with what infirmities it is assaulted; sometimes it looks Red, sometimes Yellow; and when its plexure is singular, it is subject only to a singular affection.

VI. They that take a Crust of Bread with a draught of Wine, for Breakfast, seem in a manner to feel certain prickles in the innermost recess of the Tongue.

Because the Meal of which the Bread is made, is for the most part kneaded with Ferment and Salt, the latter whereof still imparts something of Acrimony: For the parts immingled are rendered more sharp, than those that are more solute and loose, and adhere to it with a lesser tie. Whence New Bread pleases more, and is more grateful to the Organ of Taste, in regard the particles thereof being less interwoven, are better chewed by the Spitte, and more gently move and affect the innermost tract of the Palate.

VII. They that have not the faculty of perceiving Savors, must in all likelihood be deprived also of the sense of Smelling, as is many times observed in a Distemper called the Peste, where the sense of Smelling being taken away, that of Taste also fails.

The Cause of this Consequence depends upon the Corpuscles which are inservient to both Senses; forasmuch as they are the same, and differ in nothing but their various Expansion. For the sense

of Smelling proceeds from particles of Emanations flying in the Air, which being mixt with the Air we breathe, are conveyed to the Nose. But the particles which conduce to Taste are indeed less subtle, and are to be imbibed by some humour; that they may smite the Organ of the Tongue; yet they are really the same, and are only distinguished in this, viz. that being diluted with humour, they cause Savor, and being exhaled and transmitted through the Air, they cause Odor.

Many who have an aversion to certain sorts of Meats; for example, to Old Cheese, or the like, when they happen to taste of the same unawares, certainly contract a great loathing, and immediately, if possibly, vomit it up; but if they cannot, presently fall sick, or find themselves very much indisposed.

The Reason is no other than that the said Meats, either by their Odor or Vapor inflict damage upon those Fibres or pores of the Nerves: For while they ill affect the Nerves infested into the Ventricle, they first cause a tremour of the Lips or Nauseation; and if the said Vellication of the Nerves continue, there will at length follow a Vomiting, which Nauseation ever precedes; nor is the said Nausea any thing else than the tremulous Motion of the innermost Membran investing the Mouth, which proceeds even from the vellication of the Ventricle, as to which Tunicles, that of the Mouth is continuous.

It may also be otherwise said, that the privation of Taste induces the failure of another Sense, viz. Smell; by reason that both Sensories being planted near each other, are apt to be both together overwhelmed and glutted by the same serous matter squeezed out of the Blood. In as much as the tubulated Membrans of the Nostrils, and the structure of the Tongue it self consist of a very rare, and as it were spongy composition: Wherefore the pores of either Organ, and the passages from the Serous floating matter are apt to be overflowed, and the sensible Fibres in both at the same time to be obstructed; to which may be added, that whereas the Nostrils and Tongue ought to be supplied with a continual moisture; both of them as they most grievously, and more than other parts, undergo a deflux of superabundant Serum, so both are equally obnoxious to the same mischief upon any slight cause.

Sick Persons, and those that are of a Crasse Body, reject all sweet things, and are only delighted with what is acid and sharp.

The Reason why these sickly people have such an aversion to all Meats that are sweet, is because of the vitiated Blood, and the malignant quality of the Morbifick Humour, which being for the most part Choler, breaks into the Tongue, as being a very tender place, and causes innumerable obstructions, hindring a just perception of the Meats that are presented. Hence it is that sharp Meats please the Sick, in regard the Tongue is covered with a certain Uliginous tegument, so that sweet things cannot enter and pass through it; whereas Acids affect in another manner, as consisting of long and inflexible parts. Nor is it for any other cause that Beasts covet Salt, and are very much taken with the eating thereof, because their Tongue is scabrous and rough, and overlaid with a certain Crust.

VIII. When Nauseation comes, or a vomiting up of certain Meats.

IX. Why upon defect of Taste, defect of Smell should follow.

X. Why sick Persons have an aversion to Meats that are sweet.

XI.
Sweet
Meats hin-
der others
from being
relish'd.

Who ever hath a relish of sweet things, hath not a right relish of other Meats of a more accurate taste.

Because all Esculent or Eatable Things are no otherwise tasted, but so far as the Tongue induces and insinuates within the pores certain Savoury Corpuscles reduced and made small by manducation or Chewing. But whereas sweet things are viscous or clammy, and for the most part obstruct the passages of the Tongue, they hinder the supervenient savoury particles from being carried into, and affecting the Sensorium. Wherefore the better to restore again the faculty of Tasting, we use to feed upon sharp or salt things, to the end that they may loosen the passages of the Tongue, and wear away, and take off the inherent Viscosities.

XII.
How it is
that Spittle
is excited
at the sight
of things
grateful to
the Palate.

Spittle at the sight of things grateful, and with which we are chiefly delighted, increases and fills the Mouth.

This happens by reason those sorts of Meat, which before are apprehended to be grateful to us, now again excite an Appetite in the Soul to receive them. Whence it comes to pass, that the Soul being intent upon this alone, sends more copious Spirits into the Glandules of the Mouth, so that they being so much the more compressed, the Spittle at the sight of those grateful appearances is squeezed out in greater abundance.

CHAP. III.

Of the Sense of Smelling.

I.
Man is the
dullest of
all Animals
in the sense
of Smelling.

Of all Animals, Man is thought to be that of the grossest Smell, and who the most slowly takes in the Emanations flowing from Bodies.

The Reason is fetch'd from the Constitution of the Brain it self, which being spongy, and abounding with much moisture, blunts the edge of smell, and is the less affected by the said Emanations. Hence those that are troubled with a Catarrh or excessive deflux of Humour, many times have no smell, in regard the pituitous Humour blocks up the Nostrils and the Cribriformous or Sieve-formed Bone, to which the Emanations flowing, clot together, and are in a manner choak'd up. So likewise little or no smell is perceived under water, in regard the moisture takes in the exhaled Corpuscles, and obstructs their diffusion.

II.
They who
have large
Nostrils
smell best.

They who have broad and open Nostrils, and in whom the spongy passages of the said Bone are from their Birth dilated, admit more easily and strongly all Odours or Smells.

The Reason is, because a greater abundance of Emanations is conveyed through those Cavities to the Brain, which being gathered therein, and with mutual application aiming at the Nerves of the Brain, impress the greater affection. In a manner not much different from that whereby the Air inspired through a broad and well purged Ear, enters more copiously the Auditory Passage, or whereby the smoke ascends more easily through a wide Chimney than through a narrower.

III.
The Ox,
Goat, and
the like,

Hence in dissections, we see in a Goat, Ox, Sheep, and other such like Animals, that feed upon Grass and Herbs, that the Mammillary Pro-

cesses are larger than in Carnivorous or Flesh-eating Animals, because they have more need of an exquisite Organ of Smell to distinguish divers sorts of Herbs, and to select the more agreeable from the more noxious. For the same reason Brute Animals are indued with far larger Olfactory Nerves than Man, by reason that they discern their food by no other guide than smell alone; whereas Man, as one indued with Reason, knows many things by Reason and discourse, and is led not so much by smell as by seeing and tasting, to the choice of his Diet.

Those things which are grateful in smell to some, are to others ungrateful.

The Reason lies in the diversity of the pores in the Olfactory Nerves of this or that Person; so some are highly delighted with the smell of Roses, while others reject them, in regard the Volatile Particles exhaling from Roses, have such a Figure that they can easily, and without any trouble pass through the pores of some, but not without great difficulty and violence the pores of others; whence in these there arises a notable aversion of the rose smell, in the others a wonderful delight therein. So Men without any disgust or trouble accept the smell of Musk or Civet, which at the same time to Women generally is odious and pernicious. Nay it causes in them Hysterick Passions, whereof there can be no other reason but this, viz. that the Volatile Particles of the Civet or Musk cannot so easily and freely pass the pores of a Womans Body as of a Mans, whence Women are most refresh'd by the odour of the most ill-scented things, as Asa-fetida, and such like smells, which Men can hardly endure.

A Man that stinks, as they say, above ground, is not sensible of the ill-scented Vapour proceeding from him.

The Reason is, because the Organ of smelling is so disposed, that the inbreathed smell cannot be perceived but according as it falls upon adverse Fibres; for there are in the Nostrils certain Vavules, or little Caverns, whose Mouth towards the extremity of the Nose is most open, and consequently the sense of smelling is only effected, when the Breath emitted from without arrives at the Nostrils, and falls upon the adverse Fibres: But when the foresaid Vavules lie not open to the exspirated Breath (that is to say, because it falls not upon the adverse Fibres) it comes to pass that the Organ of smell is not touch'd, and consequently no affection follows.

Those that long hold any perfumed thing to the Nose, or live for any considerable time in a place full of perfumes, are at last sensible of no Odour at all.

This happens because the Emanations or Breathings from Bodies perpetually, exhale forth, and are successively conveyed through the Air to the Nostrils, which when they arrive to, they do not immediately return back, but stick there some time, and so fill the Appendices or Suburbs, if I may so call them, of the Brain, that those which follow after cannot penetrate them and make a fresh assault upon the Sensorium. This appears plain by those that lay among their Cloaths Civet or Musk Bags, or powder their Hair with Jessamin or other sweet Powders. Forasmuch as after some time, they cease to have any Odour of them, and

excel other
Creatures
in smell.

IV.
Those things
which are
grateful in
smell to one,
are very
ungrateful
to another.

V.
A Man that
stinks is not
sensible of
his own
stink.

VI.
Continual
Odour or
Perfume
ceaseth to
be smelt.

as if they were no longer respiring, are not in the least affected with any *Scent* of these *exspirations*. So that those who love to *smell* to *Flowers*, or to enjoy the *Flagrancy* of any place, hold them by turns to their *Nose*, and go and come several times to the place, to the end that the *particles* of *Flowers* or *Spices* may have time allowed them to depart from the *Organ* of *smelling*, and way be made for those that come after.

VII. Sometimes it happens that a *Woman* with *Child* miscarries upon an ill *smell*. I knew one who *smelling* the *Snuff* of a *Candle* blown out, fell thereupon in *Labour*, and brought forth an *abortive Child*, when near her time, and that not without great danger of her *Life*.

The Reason is, because ill *Odours* grate and perplex as they pass by, and so compress the *Organ* of *smelling*, that such a sort of *motion* being transmitted to the *Brain*, affects also the *Fibres* of the *Womb*, which are connected with the *Fibres* of the *Birth*, and induces such a disposition, that the *Birth* forcing the *Umbilical Vessels*, breaks forth, and makes its passage out. On the contrary a grateful *Odour* refreshes and comforts the *Gravid Person*, and renews her strength, which suffers from the grievous and *fætid Vapours* wherewith she is chiefly at that time infected, and therefore must needs be relieved by a *sweet Odour*, as it were by a *tenifying* or *emulgent draught*, unless by chance the *Womb* labours with an *overcorrupt Humour*, and swells with *Crudities*.

VIII. *Smells* are less scented in *Winter* than in *Summer*, and hence it is that *Hounds* follow the *Game* better in *Summer* than in the *Winter*. Of this there can be no other reason than that the *Heat* which prevails in *Summer* dilates or widens the *pores* of all *Bodies*, which causes the *Vapours* the more easily to be diffused and spread through the ambient *Air*; whereas the cold by condensation compresses the *pores* and hinders the *particles* of *Bodies* from being resolv'd, and turn'd into *Vapour*; almost in the same manner as *Smoke*, which being excited by the *heat* of the *Fire*, is extended; but being invironed by *Frost*, is contracted, and ascends in slender *Columns* through the *Frigid Air*. Altho' it may also be said that *Summer* is more apt and disposed for the receiving of *Odours* than *Winter*, because in *Winter* the *pores* of the *Body* are contracted, and less of *Vapour* is educed out of them; whereas in *Summer* all *Odours* are too much dissipated by reason of the *heat* of the *Air*, and by the over-abundance of them, the *Organ* of *smelling* is disturbed and disordered.

IX. Those who have *flat Noses* send forth for the most part a very unsavoury *Breath*, whence proceed the many *scoffs* of *Poets* upon *Flat-Nosed People*, in which their *stinking Breath* is brought upon the *Stage*. The Reason is, because the *pores* through which the *Humour* flowing from the *Brain* to the *Nostrils* passes, are obstructed, or at least are too narrow for it to run freely through them, so that by gathering and clodding there, it corrupts and putrifies. To which also may be added, that *Flat-Nosed Persons* have for the most part vitiated *Lungs*, in regard that since the *Air* cannot pass through so short a passage or winding of the *Nostrils*, so as to be well purged, the *Brain* and *Lungs* must needs be infected, and thereby cause a *stinking Breath*.

Those who excel in *Wit*, are dull of *smell*, and sometimes totally lose that faculty.

The Reason is, because those are most *Ingenious*, whose *Brains* are best purged, that is, exonerated of all their superfluous and excrementitious pituitous *humour*, from which the *Brain* being freed, is rendered the more prompt to execute those *works* which depend upon the faculty of *Wit*. But they who have a *deflux* of *Flegm* or *Spittle* distilling down to the *Nostrils*, must certainly of necessity become yet more dull of *scent*, in regard the *Flegm* obstructs the *Nostrils*, drives away the supervening *Odours*, and blunts their *Edge*.

CHAP. IV.

Of Hearing.

WE are quicker of *Hearing* by *Night* than by *Day*.

The Reason is, because in the *Night* the *Air* is still and quiet, and not troubled with any loud noises or sounds, which in the *Day* hinder us from hearing another's *Voice* at any distance, in regard it presently meets with various undulations of *Air* raised from external sounds, into which immediately it transfers its *motion*, so that the *Voice* becomes as it were stifled in the *Air*.

Speech among *Men* is various, by reason that some *Men* in *speaking* utter a great and manly sound, others an indifferent, and others a shrill and effeminate voice.

The Reason is, because in some the *Aspera Arteria* is more ample or large, and so puts forth a grave or big sound; but they whose *Aspera Arteria* is of a mean or middle size, send out a *Voice* or *Tone* somewhat sweeter, and as it were mixt of a grave and shrill *Tone* together. Lastly, they who have it narrow and streight, utter a *Tone* yet more shrill and also soft, such as is for the most part that of *Women*.

Those that have their *Ears* cut off, relate that they confusedly take in all sounds; so they seem to hear upon all occasions some inarticulate sound or other, as the chirping of a *Grasshopper*, the murmur of a *flowing Stream*, or the like.

The Reason is, because the exterior *Ears* are hollowed and enlarged, so that the moved *Air* by passing through the *turnings* and *windings*, is gathered and made intense. For the *Air* enters so much the more copiously into the *Auditory Passage*, as coming from an ampler space, it falls into the *streights*. So that *Deaf People* oft-times supply the defect of that *Sense* by holding their *Hand* hollowed, or a *Horn* to their *Ear*; for as the sound is enlarged in winding Cavities, and enters the *Ears* with the greater force; so *Animals* that have moveable *Ears*, at the hearing of any noise, prick them up that the sound may enter in more copious and direct: Therefore the *Ears* being cut off, the sound falls directly into the *Auditory Passage*, which causes the failure of that determination which ought to be, and which happens but at the instant of the said *Illapse*. And thereupon the sound comes to them no other way, than if it proceeded from various parts, as it happens in the instances before-mentioned.

IV. *A Tune plaid on the Pipe is more sweet and charms the Organ of the Ear, more than if plaid on a Harp.* The Reason is, because the sound of a Pipe is more continuous and less disjointed, than that of a Harp. For in regard we are delighted with modulation, and take greater pleasure to hear proportionate Movements; we are most taken with those which keep a certain Tenour, and smite the Soul with repeated strokes. To this may be added, that the sound of a Pipe is as the Voice performed with respiration, and consequently the Notes are the more easily mixt one with another. For the Harp produces a certain asperity, and howsoever struck creates harshness to the Ear.

V. *Those that are smitten with the sting of a Tarantula, are said to be cured by Musick; in so much that let a Musician be brought to the Person so smitten, and let him sing by him to his Lute or Harp, and the Patient shall rise from his Couch as he were wakened out of his sleep, and shall so exercise his Feet for some hours by his frequent Dancing, that all the poison shall effectually evaporate by sweat out of his Body.*

The Reason of this so wonderful effect, is to be attributed to the motion caused by the Musical Instrument, by which the Drum of the Ear, and afterwards the Brain being smitten, by their help, also the Arteries, Nerves and Muscles are excited; so that upon the excellent and well-followed performance on the Harp, the Patient to free himself from the Tarantula's poisonous stroke, falls a dancing with all his might; and by this means not only hinders the force of the Venom from spreading farther, but also by the continual agitation of his Body expels and breaths it out by sweat, in regard the playing on the Harp so far stirs up a motion in the Nerves, as to dissipate the force of the Venom which possesses the Arteries.

VI. *But if it happens at any time that some are not cured by dancing, (for it hath been found by experience, that persons stung by the Tarantula have danced thirty or forty years without cure.) It is because the Sting possessing the Arteries, Nerves and the Spirits, contained in them, hath been more tenacious and viscous, than to be capable of exhaling and being rarefied.*

VII. *It hath been known that persons of vitiated Ears, and almost deprived of the sense of Hearing, have by a very loud sound (for example of Drums and Trumpets) been brought to that pass as to receive the words of people speaking to them, and to give answers to their Interrogations.*

This happens from the Drum plac'd in the recess of the Ear, which being loosened, admits of no affection from the soft impulse of sound, but upon the din of a very great noise, acquires its due tension; so as commodiously enough to perform its office; and thus the Cause is made plain why a certain Deaf Man of Orleans living near a great Steeple of Bells could easily hear the words of those that stood talking with him, so long as the several Bells were ringing; but upon the ceasing of that noise, he fell back to his wonted deafness, and could no longer hold discourse with those about him. So a certain young Nobleman born near Oxford, plainly heard the words of

those that were near him while he passed through London-streets in a Chair, or any loud Noise was made about him, by reason that upon a notable concussion of the Air, the tympanum was reduc'd to its due tension, and acquir'd its turgescence.

When the Breath is kept in, we receive so much the more easily and plainly the approaching sound; whence in hearkning earnestly to any sounds which come from afar off, we commonly keep our Breath.

The Reason is, because all expiration is a motion *ad extra*, as my Lord Verulam calls it, rather repelling than attracting the sound; so upon whatsoever thing we are most industriously bent, and labour with most vehement intension, we stop and keep in our Breath; for a catching with a difficulty at any flying sound is but a certain sort of laborious work.

It happens frequently, especially in a confused multitude of sounds and words, that we presently hear the speeches of some certain Person; but those of another Man, tho' speaking at the same time, we are not sensible of, till some time after.

The Reason is, because the sound or voice of one Man taken in with that of another, is not altogether at the same moment of time, conveyed to the common sensorium, but one after another enters the Ear. Whence it is probable in such a case, that the first sound, one winding of the Ear alone being gained, is thereupon sooner transmitted from the first Branch of the Auditory Nerve to the common Organ; but the later as it were sensible, because it cannot be transferred together at the same time in the same Nerve, making therefore another circuit through the second winding, it is at length removed from the second Branch of the Auditory Nerve, and consequently succeeding the former, is later taken in.

Let any one be plac'd in a Chamber, and he shall more clearly and distinctly hear the words which are delivered from without, than were he plac'd without, he could hear them, being utter'd in the Chamber.

This comes to pass, because the sound diffus'd through the Air, is reflected by interposed Bodies, as sufficiently appears from an Echo; for in regard there are many solid Bodies within the Chamber, as Walls, Planks, Tables, &c. which drive back the emitted words, it happens that the sound becomes the stronger, and more forcibly smites the Ear, than in the free Air, where those obstacles are not to be met with, from whence sounds result. Hence it is that he who speaks from any high place is better heard by him who is beneath, than on the contrary he that speaks from a low place is heard by one above; because more Bodies occur from which the voice may be reflected, whilst it tends downwards, than whilst it flies up, and wanders through the Air.

The sound of a Bell happens sometimes to be heard in such a manner, that it seems to proceed not from the place where it is, or whence it really proceeded, but from the opposite part.

This fallacy proceeds from the reverberation of sound, which coming last to the Ear, seems therefore to proceed from that place from whence it was reflected: For as by the reflection of Rays, a thing appears not where it is, but in that place whence the Rays are last derived: So a Bell or any other

VIII. How it comes to pass that by keeping in the Breath, we hear the more plainly.

IX. We hear not all Sounds with like suddenness.

XIV. How it is that two unequal sounds are equally quick.

X. Words pronounced without, are better heard from within a Chamber, than on the contrary.

XI. Why the sound of a Bell is not always heard from the place where it is.

XV. How it is that the water hear not.

other *sonorous Body* is judged to be in that place where the *sound* came last to the *Ears*: For a *sound* reflected by an *oblique Line*, arrives at the opposite part. In like manner a *Bell* being rung from the *Northward*, if the *Chamber Window* where we are, open to the *South*, we seem to hear the *sound* from the *Southward*: So if a *Beggan*, as we are sitting in a *Chair* or *Sedan*, make his *Speech* on that side the *Chair* where the *Glass Window* is up, he will seem to be on the other side where the *Window* is open or let down.

XII.
Whence it
is that a
kind of
murmuring
sound is
heard upon
stopping the
Ears.

If any one stop both *Ears*, or either of them very well, he will nevertheless hear a certain tremulous and murmuring *sound*.

The Reason is, because of the agitation of the *Air* included in the *Ears*: For in regard there is a continual efflux of very much *Breath* from the *Ears*, if upon a stoppage applied, the said efflux be barricadoed or shut up, the *Air* pent in within the Cavities of the *Ears*, and impatient of its narrow confinement, drives and forces into the *tympanum*, from which vehemence of agitation a certain *murmuring noise* must needs arise, and affect the *Ears* in such sort, as if it proceeded from some *sonorous object*. Which that it is so, is from hence sufficiently evident, namely that a vehement *external noise* being raised, that *internal humming sound* is suppressed, and that indeed for no other reason but because a new agitation inwardly induced, directs the tumultuating *Air*, and forms it into *Rays*.

XIII.
How it is
that two
unequal
sounds are
equally
quick.

We oftentimes equally soon, at one and the same distance hear two unequal *sounds*.

This so happens, for that the agitation of the *Air* which makes the *noise*, hath always an equal swiftness at the same distance, tho' it is made with a greater or lesser effort, so that the *noise* of a *sonorous Body* extends it self with the same swiftness at one and the same distance, altho' the *Body* be smitten with an unequal force: For a greater force may indeed contribute to the making of a greater *sound*, but not in the least to the making it to be of a farther extent.

XIV.
Why sound
cannot be
heard un-
der water.

That famous *Diver* in *France*, wrapt up in his own *Machine*, which takes not away *Hearing* from any one so long as he continues above *water*, affirms that when he was about ten *fathom* under *water* in the *Ocean*, not far from *Diep*, he heard not the least report of those *Guns* which the *Ship* was obliged to discharge as it sailed out of the *Port*.

The Reason is, because *sound* cannot be procreated, except in a moveable *Object*; so that if that *Medium* through which it is to be transmitted, cannot conceive any *tremour*, or resist the *tremour* of other *Bodies*, it can produce no *sound*. Wherefore since the bulk of the *Water* is so great that it cannot be agitated by the moved *Air*, and resists its *tremours*: No wonder if the *noise* produced above the *waters* reach not so far as the bottom; for as we find by experience, that a *Stone* falling into a *River* from a high place, makes no noise when it come to the bottom, tho' it hit against other *Stones*: So an exterior *sound* cannot so penetrate the extraordinary height of the *Waters* as to be received by it; and so they who swim upon their *Backs*, scarce hear any thing so long as they have their *Ears* immerst, and lie beneath the surface of the *Water*.

XV.
Fishes in
the water
hear not.

Whence it is evidently made out, that all *Fishes* are deaf, or void of *hearing*, except those of grand

bulk, as the *Whale*, *Dolphin*, the *Phocas* or *Seal*, *Calf*, which raising their *Heads* above *Water* both take in *sounds*, and utter a voice from their *Mouth*.

The Reason why other *Fishes* seem to be deaf, or void of *hearing*, is because they are wholly *mute*; for there seems to be that correspondence between the *Voice* and the *Ear*, that those very *Animals* which want *Voice*, the same also are destitute of *Hearing*, by which at the same time the *word* and the *thing* signified thereby are apprehended. Now if it be objected that *Fishes* decline the *noise* of the *Oars*, and that the *Fishermen* commonly beware of the tottering of their *Boat*, or of making a *noise* with their *Nets*, when they beset the *Shoal*: I answer, that all this is, left upon the motion of the *Water* stirred up by the force of the *Oar*, or the overmuch tottering of the *Kessel*, the *Fish* should apprehend the said *motion*, either by *touch* or *sight*. For we may observe in a *Fish-pond*, that the *Pikes* and other sorts of *Fish* swimming therein, are terrified by no sort of *noise*, *murmur* or *sound*, but upon the least unusual agitation or motion made in the *Water*, they immediately fly and shift their places, and if being called to *Meat* they sometimes come; this comes to pass, either because they are mov'd at the *sight* of the *Person* calling, or because the *Water* is moved by the lowdness of the *Voice*.

CHAP. V.

Of Sight.

AS we go about to look upon any *thing*, both *Eyes* tend to the beholding of the said *Object* with one and the same *motion*, while in the mean time each of them hath its *Muscles* distinct, and proper to its self.

I.
Why the
Eyes move
both toge-
ther.

The Reason hereof proceeds from the *Mind*, which when it sets its self intently to behold any thing, it is not to be imagined that one *Eye* is bent upon the beholding of that thing, and that the other is employed upon another *Object*; for by that means there would be a *confusion* of the *Rays*; and of the perception in the common *sensorium*. But both *Eyes* must necessarily be directed at the same time, to the same *Object*: And to this end the *Spirits* are always disposed to the service of those *Muscles* which are capable of converting both *Eyes* to this one *place*, and not to those which serve to draw either *Eye* one way, and another another; for the *Mind* is always bent upon seeing one *thing*; and tho' it often designs to have the *sight* of many *things*, yet to take the better view of each, it takes it in a certain order, and views them one after another; which may quickly be done, if the things to be seen are near enough and big enough to be easily and soon beheld.

Who ever looks upon a *Flea* near at hand, and extends his *sight* to a *Horse* or other *Animal* of like magnitude at a very great distance, they will appear equal, and offer themselves to view under the same magnitude.

II.
How a Flea
and a Horse
may both
seem to be
of the same
magnitude.

This is evident from *Opticks*, by which it is thus made out, namely that the faculty of seeing, or rather the *Soul* residing in the *Brain*, apprehends *Objects* to be greater or lesser, according

as they were represented to the sight under a greater or lesser angle. So that when as a Flea being seen very near at hand, and a Horse at a remote distance, seem both under the same angle, they are look'd upon by the Soul as equal: For it is evident that an Object is there fore apprehended greater, because it impresses a greater affection upon the Retin Tunicle or Optick Nerve, and lesser so far as the lesser proportion of the Organ is affected. Hence it is that the farther a thing recedes from us, so much the lesser it appears; and by how much the nearer it approaches us, so much the bigger it shews, in regard the Object, by how much the farther it is removed from us, appears with so much the acuter and smaller angle, and impresses the lesser affection. The Reason of all this is, because while the Object recedes and withdraws it self by little and little from the Eyes, it is not only diminished as to its circumference, but as to all the parts which are turned towards the Eye, because tho' it always remits its Rays in like manner from each point, yet most of them according to the rate of their retess and elongation, slip beside the Eye, and are elsewhere disposed.

III. In like manner those things which are seen afar off, tho' they are square and angular, yet they seem round in regard the distance of the angles cuts off the excursions and asperities; so we receive Convexes as they were plain, because all inequality of parts, by reason of so great an interval totally disappears. Hence the Sun and all the Stars appear to our sight not convex but plain; for tho' their middle parts are nearer to our Eyes than the extreme, yet that difference is but very small, if compared with so great a distance.

IV. An Image of any one beheld in a Looking Glass, appears as much beyond it, as the Spectator Stands on this side it.

The Reason is, because the Spectator beholds his Face in the Glass, not as fix'd therein, but as sliding from him; and consequently the matter is to be considered, as if the Spectator were from the Looking Glass behind himself; whence it comes to pass, that the same distance is repeatedly apprehended by a reciprocal comparison: And because this reflexion causeth no necessity of the Spectators being transferred into the place of the Looking Glass, or altering his situation to be converted again into himself, it comes to pass, that after the Axis which is directed from the Spectator to the Glass, he immediately receives an Axis which tends from the Glass to the Spectator; and because of the unalterableness of the situation, hath both for the same continued Right Line, whose middle is from the Spectator to the Glass, the other half from the Glass to the Image beyond the Glass; where the Spectator represents from whence he comes.

V. An Object which appears too confused, as being too near the sight, may distinctly enough be seen, if any one behold it through a little hole made with a Pin or Needle in a Card or piece of Writing Paper. The Reason is, because the Eye then receiving a lesser quantity of Rays from every point of the Object, every one of them describes its Image alone in a very narrow space; and so they which proceed from the two Neighbouring

Points, scarce make any confusion in their Actings.

VI. Urinators or Divers see Objects confusedly in the bottom of the Waters, except they make use of very Convex Glasses.

The Reason is, because the Rays of Light are not sensibly broken when they pass from the water into the aqueous or watery humour of the Eye; and so those that proceed from the same point are not again compelled by falling into the Retin Tunicle, which may be gained by the use of very Convex Glasses.

VII. Things presented to the sight, by how much the farther they are distant, so much the higher they appear; and on the contrary high things so much the lower.

The Reason is, because things near at hand emit those Rays which smite the superiour parts of the Eye, or Retin Tunicle; whereas things remote send forth those Rays which arrive at the inferior region of the Eye; and when the Objects in the Retin Tunicle are form'd with an inverted situation, those must needs seem more deprest and low, these more sublime. On the contrary it happens, when we convert the sight of the Eye to things plac'd on high; for then those things which are at a greater distance seem lower, in so much that the utmost bound of Heaven appears as it were continous to the Horizon. Forasmuch as that part of the Heaven which is our Vertical point, affects the lowest part of the Eye, and the other parts emit Rays, for much the more sublime by how much the more remote they are; hence that appears the suprem of all, and the rest are so much the more sublime, by how much the nearer they approach to the Vertex; and so much the more deprest and low, by how much the farther they recede from it.

Objects sometimes by the contraction of the Pupil or Apple of the Eye are hidden to the sight, as if any one should direct his sight to some remarkable Star, for example, Venus or Jove, and by some Art should contract the Pupil of the Eye, the Star at first seem will by degrees disappear, and at length totally fly the sight.

The Reason of this is drawn from part of the said Pupil, which according to the rate of the said contraction or dilatation, causes the Object to be seen, or to fly the sight. For since upon the contraction of the Pupil it receives fewer Rays under a smaller angle, it causes the Object to appear less, and consequently if they are so few as to be comprehended in an insensible angle, they will no way affect the Retin Tunicle, so far as is required to Vision; and as that affection is not perceived, so neither will the Object which ought to be perceived by the mediation thereof, be any farther deprehended. For it conduces to the rendring of that affection insensible, that in the contraction of the Pupil, the Crystallin Humour be somewhat relaxt; whence it comes to pass, that the bottom of the Retin Tunicle goes back so little, and becomes more weak by the incidence of the Elapsed Rays; which two things are sufficient to make the Object, at the contraction of the Pupil, to disappear, and what was seen before, to become afterwards invisible. Hence

VI. Those that dive into the water, see Objects only confusedly.

VII. How low Objects seem to come to seem high, and high to seem low.

VIII. Objects ceasing to be seen when the Pupil is contracted.

VX. Hence

IX. Hence it is that the *Stars* appear lesser by *Day* than by *Night*, when our *Hemisphere* is overlaid with *darkness*, namely by reason of the *Pupil* in the *light*, and the expansion of it when it is *dark*. For it is certain, that the *Pupil*, when ever *light* takes place, is rendered more narrow, and consequently that fewer *Rays* from a *flame* of *Fire* enter the *Eye*, and that a lesser portion of the *Retin Tunicle* is affected; but the *Air* being overspread with *darkness*, it plainly appears that the *Pupil* is dilated, and consequently that many more *Rays* arrive at the *Eye*, and that a greater portion of the *Retin Tunicle* being affected, a greater species also of the *Object* is produc'd therein. Hence also it comes to pass, that the magnitude of the *Stars* seems in the *Evening* to increase, and so in the *Morning* to decrease; by reason that the *Pupil* in the *Evening* Season is by little and little dilated, and in the *Morning* by little and little contracted, and by this means the *Retin Tunicle* is ever less and less affected. So the *flame* of a *Candle*, if by *Day* it be beheld a hundred paces off, it appears very small, but upon the coming on of the *Evening*, it began to grow bigger, till *Night* at length increased it to the appearance of a considerable *Torch*.

X. It is reported of *STRABO*, that he was of so sharp and quick an *Eyesight*, that he could discern *Fleets* setting *Sail* from out of *Lilybaeum*, a Port of the *Carthaginians*, at the distance of above a hundred miles: Moreover, *LOPEZ*, a *Spaniard* at *Gades*, is related to have been able to discern from the top of the *Mountain Calpe* on the *European* side, to the opposite *Shore* of *Africa*, over the whole *Bay* between, which by the Testimony of *Cleonardus* in his *Epistle* to *Jacob Laboc*, is in a *Calm Sea* no less than three or four hours *sail*, and that so distinctly, that he could relate many things he saw there done.

This so wonderful a sharpness of sight depends mainly upon a double disposition of the *Parts* so indued, first from the docility of the *ChrySTALLIN Humour*, and the easie use of the *Ciliary Processes*; namely, whilst according to the different incidence of *Rays* reflected from the *Objects*, the *ChrySTALLIN Humour* is in such a manner adapted and disposed as an exact projection requires. 2dly, It is necessary that the *Capillaments* of the *Retin Tunicle* be so exquisitely disposed, as to receive the least affection. Because altho' those things which we behold with our *Eyes* cannot be discerned, but so far as in some sort they differ in colour, yet a distinct perception of Colours proceeds not only in this, that all the *Rays* proceeding from all points of *Bodies* meet in the bottom of the *Eye*, in so many other *Rays*, or thereabout; but also from the multitude of the *Capillaments* of the *Optick Nerve*, whose extremities are contain'd in that space which the *Image* in the bottom of the *Eye* possesses. Whence no doubt is to be made but *STRABO* and that *Spaniard* *LOPEZ* enjoy'd so accurate a contexture of the *Retin Tunicle*, and had so docile a *ChrySTALLIN Humour*, that they were able to contemplate *Objects* more distinctly than others, and have a prospect of them at so vast a distance.

From this very cause it happens, that some *Men*, like *Owls*, see even in the darkest *Night*, as it is related of the *Emperour NERO* and others, namely, that they have most slender and very moveable *Fibres*, of which their *Optick Nerves* are framed; so that that little *Light* which remains in the most obscure *Nights*, suffices to affect their *Fibres*, and to excite the sense of seeing in them.

If a *Stick* fired at the end be swiftly whirl'd about, there will appear to our sight the *Image* of a *fiery Circle*, tho' the *Stick* be not in all points of the *Circle*.

The Reason hereof is, because the *Stick* makes an impression in those parts of the *Retin Tunicle* which are circularly disposed; so as that the foreparts being agitated by the celerity of the motion, still retain something of its impression, whilst it agitates the last parts. For this motion is not at one and the same individual time, but in divers successions of Moments, so swiftly performed, that the *Vibration* of *Fire* impress'd upon the *Eye*, remains in the first parts of the *Retin Tunicle*, when the *Stick* hath declined to the other parts of the *Circle*. When no wonder if the *Rays* entering the *Eye* by the *Pupil*, oft-times effect at once a sensation of *Greenness*, *Redness*, *Blackness*, *Whiteness*, and other Colours; because the *Rays* modified by divers Colours, in divers successions of Motions following each other with incredible swiftness, hit upon the *Retin Tunicle*, and leave a little while their agitation, till other *Rays* presently entering the *Pupil*, impart in their turn their motion, and there leave it some time with others.

Those that have a *Cataract* couc'd, discern but obscurely all visible *Objects*; whereupon that they may the more clearly and distinctly see them, they make use of *Convex Glasses*.

To make this the more clear and evident, we must observe, that a *Cataract* is not any *Skin* (as hath been long believed) growing between the *ChrySTALLIN Humour* and the *Vitreous Tunicle*, which may be taken off by a *Needle*, and drawn down to the inferiour part of the *Eye*, but that it is the *ChrySTALLIN Humour* it self, which in tract of time grows flaccid and weak, and is separated from the *Ciliary processes*, as an *Acorn* when ripe, is easily separated from its *Cup*, forasmuch as it is removed with little or no trouble, and deprest to the very bottom of the *Vitreous* or *Glassy Humour*, a small part, in the mean time, of the said *Vitreous Humour* succeeding in its place. The *Cataract* therefore being thus taken away, the *ChrySTALLIN Humour* also must of necessity be taken away, or at least be rendered more plain, or less convex, whereby it comes to pass that the *Rays* proceeding from all points of the *Object*, are not sufficiently broken or made bending, so as to be united in the *Retin*, when they arrive there: Whence the *Vision* or act of *Sight* must needs be confus'd. To which infirmity the *ChrySTALLIN Convexity* only gives relief, as causing the *Rays* which before were divergent to become convergent, and to enter the *Eye* with such a disposition.

Upon sight of the *Sun*, or any other *Glaring Light*, we seem to behold various Colours.

XI. How it is that some Men see by Night.

XII. How a Body appears where it is not.

XV.

XIII. How it is that they who have a Cataract conceit, see obscurely.

IXV.

IXV.

XIV.

Divers Colours appear upon sight of the Sun.

The

The Reason is, because such is the nature of our *Mind*, as by virtue of the *motions* that occur in that part of the *Brain* whence the tender *Filaments* of the *Optick Nerves* proceed, to be capable of having a *Sense* of *Colour*; whereupon in regard the *Agitation* by which, after the *Eyes* shut, the *Capillaments* of the *Optick Nerve* still palpitate, and as it were tremble, is not strong enough to render the *Light* so bright, as that was from whence it came, it represents *Colours* less intense, and as it were dilute; but that these *Colours* are produced from motion, may from hence be easily concluded, namely that growing pale by little and little, they are changed, and passing mutually into each other, vanish by degrees.

XV. The top of a *Mountain* reaching far beyond the visible *Horizon*, appears to us as joined with it, together with the *Hill* it self, and the *Sun* when it rises or sets seems to adhere to, and be united with the said *Horizon*.
How it comes that the top of a Mountain far distant seems contiguous to the Horizon.

The Reason of this appearance is, because things appear at no distance from us, when the *Rays* cohere, and without the interposition of other *Bodies* apply to our *Eyes*; as it happens in the forementioned case: Forasmuch as tho' there is a vast distance between the *Sun* and the *Horizon*, and many *Bodies* are contain'd therein, yet because none of those *Rays* arrive at us, but only from the *Sun* and the *Horizon*, it happens that they seem among themselves contiguous and cohering. For the distance of the *Horizon* is no other ways known by us, than from the diversity of *Bodies* interpos'd between us and them; whence if those intermediate spaces should happen to be obstructed, and nothing of them could possibly be transmitted to us, we must needs judge those things which we see afar off, to be contiguous and separated by no interval. Wherefore G A S S E N D U S thinks that *Dogs* bark at the *Moon*, because they apprehend it to rise near the *House* top, and so to be very little more distant than the *House* it self, and not much bigger than that part of the *House* comprehended by it.

XVI. So if we behold many *Ditches*, the sides of them plainly appear to us as not much distant from each other, because they are represented to us by *Rays* from the *Eye*, to which many also that slide from the bottom, mingling themselves, are carried upward; but if we behold those *Ditches* *Horizontally*, or from a low place, their sides seem to us to have no distance at all, because no *Rays* proceeding from the bottom, reach the *Eye*, and those which proceed from the sides, stick as they arrive.
Ditches from a low place appear joined together.

XVII. *Drunken Men* see every Object double, which VIRGIL asserts also of *Mad Men*. 4 *Æneid*.
Why Drunken Men see double.

This proceeds from the dark and malignant *Vapours*, either flowing from the *Wine*, or stirred up by the malignity of the *Distemper*, which while they pervert the situation of the *Optick Nerves*, they make such a percussion of the *Brain* at the same time, as if the *Rays* exhaling from the Objects; proceeded from detorted *Eyes*: Whence those that by *Nature*, or any chance or accident, have their *Eyes* drawn awry, see all things double.

We find by daily experience, that standing in the dark, we plainly see things put in a light place, but not on the contrary, from a light place things set in the dark.

The Reason is, because the *Rays* of *Light* may be directed to the *Eye*, being in a misty or dark place, that some of them may make their way into the said obscure place, if the passage be open enough, and the *Light* gliding through it into the *Pupil* of the *Beholder*, arrive as far as the *Retin Tunicle*. But he who is in the midst of the *Light*, cannot apprehend those things which are in an obscure place, because from thence no *Rays* proceed, which either directly or by reflection can touch the *Retin Tunicle*; unless by chance the *darkness* be some way or other intermingled, and remit some *Rays* of *Light*; for then nothing would hinder, but that a few *Rays* reflect from things would sensibly affect the *Eye*, and represent some sort of *Image* of things.

The *Hyperboreans* or *Inhabitants* of the most Northern Countries, have generally bad *Eyes*, and are dim-sighted.

The Reason is, because they are perpetually conversant in *Snow*, which above all things reflects back the *Light*, by reason whereof their *Eyes* must needs be strain'd, or because their *Retin Tunicle*, hardened by the external brightness, is less capable of expressing, or entertaining an affection necessary for *Sight*. When as we see that the *Crystallin Humour* becomes congealed with cold, and attains to such a rigidity or stiffness, that it can neither be bent, nor contracted, nor unfolded.

A Cannon Bullet, or any dark Body, passing with incredible swiftness through a whited Wall, becomes altogether imperceptible.

The Reason is, because the dark Body, as likewise that so rapidly moved, making no impression upon the *Eyes*, so lightly, at that time, interrupts the reflection of the *Rays* of *Light* from the Wall, that the *Eye*, for that small interval of time, preserves the commotion which those *Rays* immediately before produc'd. The contrary whereof we find by experience in a *Firebrand* whirl'd round, in regard the *Brand* impresses its force upon the parts of the *Retin Tunicle* formed into a round, because then the rapidity of the motion causes the part first moved to keep yet a little while that impression which the *Brand* makes upon the last.

Those that have prominent or Goggle Eyes, as the *Myopes* or *Purblind People*, see not Objects distinctly at any great distance.

The Reason is, because the *Rays* of *Light* driven and refracted upon the prominent *Eyes*, meet sooner than they can arrive at the bottom of the *Eye*; Forasmuch as they represent the *Image*, not in the *Retin Tunicle*, but on this side; namely in the *Vitreous Humour*. Wherefore Goggle-eyed Persons are wont to make use of *Prospective Glasses*, because by them the *Rays* are divided, and do not so soon concur and meet together.

An Object in a plain Glass appears just as big as it is, but in a *Convex*, less; and in a *Concave*, greater.

The Reason is, because a plain Glass remits towards the *Eye* all the *Rays* from each direct point of the Object, and thereby every thing must needs be Glasses.

XVIII. Why we see from the dark, things set in the light.

XIX. The Hyperboreans have generally very weak Eyes.

XX. Bodies moved with a rapid swiftness are not perceived.

XXI. Why Goggle-eyed Persons cannot see clearly at any great distance.

XXII. The Object is varied according as it is represented in divers Glasses.

be represented just as big as it is. Whereas the *Convex*, by reason of the obliquity of the incidence, diversly disperses this way and that way a great part of the *Rays*; whence it is that few of them are directed into the *Sensorium*; and on the contrary, the *Concave* not only remits to the *Eye* the *Rays* which are reflected from the *plain*, but also very many more, which come from the little devexitated regions of *particles*, and those of *points* also elsewhere obverted. Whence it comes to pass, that the *Figure* is increas'd, and exceeds in magnitude the represented *Object*.

XXIII.
Why some
Men see
nothing, but
at some cer-
tain di-
stance.

Some *Men* perceive not *Objects*, except at some certain distance, in so much that either very near, or very far off, they see but confusedly.

The Cause hereof is chiefly custom, as when *Men* use themselves to look at such a distance; for the *Muscles* which are disposed to the immutation of *Figure*, are rendered as it were stupid, and unapt for their wonted functions; not otherwise than the rest of the *Muscles* of the *Body* become unuseful for the motion of the *Members*, after they have stood long unmoved. To which may be added, that the *Membranes* which contain the three *Humours* of the *Eye*, may possibly have become so hard, as not to be so flexible as formerly.

XXIV.
How a
Blindman
saw a lit-
tle, by com-
pressing his
Eye.

A certain *Young Man* being blind, while he prest either *Eye* towards his *Nose* with his *Finger*, could see a little, otherwise nothing at all.

Possibly this might be, because by the said compressing of the *Eye*, he inverted the convexity of the *Crystallin* or *Uveous Humour*; whence followed a change of the Projection, and consequently another Affection. In like manner as when holding to our *Eyes* a *Leaf* of a *Book* printed in a very small *Character*, we keep one *Eye* shut, and prest the other down with two *Fingers*, we shall fancy the *Letters* to be increased, and become bigger.

XXV.
Why the
whole Sun
cannot be
seen in an
Optick Tube.

The whole *Discus* of the *Sun* cannot be seen by the help of an *Optick Tube*, tho' the whole *Image* be projected upon an opposite sheet of *Paper*.

The Cause hereof is, by reason that the *Optick Tube*, in respect of its Cavity, divides the many *Rays*, and suffers them not to fall into the *Eye*; whereas all the *Rays* of the *Sun* fall upon the *Paper*, and form therein a far more large *Effigies* of the *Sun*.

XXVI.
Vision is
made much
more di-
stinct, by a
hole made
by a Needle
in a Card
or Paper.

An *Object* which appears confused, as being too near the *Eye*, may be seen distinctly enough at the same distance, by any one through a hole made with a *Needle* in a thin *Card* or piece of *Writing Paper*.

The Reason is, because the *Eye*, then receiving a lesser quantity of *Rays* from every point of the *Object*, each of them forms its *Image*, even in a very narrow space; so that those which proceed from the two Neighbouring points scarcely confound their actions.

XXVII.
How a
Stone at
the bottom
of a Vessel
comes to be
seen by the
pouring in
of Water.

If any one putting a *Stone* or *Counter* into a *Vessel*, so place it, that he can no longer discern it, yet by pouring *water* into the *Vessel*, directing his *Eye* precisely to the same place, he will see the *Counter* or *Pebble* sticking at the bottom of the *Vessel*, tho' it did not appear there before.

To this there can be assigned no other Cause, than that the *Rays* reflected before from the *Counter*, there being then no sort of *Body* interposed between, were directly sent into the *Air*, and by consequence smote nothing but the *Forefront*, and neighbouring parts of the *Eye*: But upon the infusion of the *Water*, the *Beams* passing through it, are refracted, and so applying towards the *Eye*, render the *Stone* visible and conspicuous thereunto. Thus we see in the refraction of the *Rays* made in the *Horizon*, the *Sun* being 34 minutes high or thereabouts, appears much higher to us, than it would appear, if those *Vapours* were absent, through which the *Rays* of *Light* are transmitted, and consequently being half a degree and 30 minutes diameter, it may be all seen, tho' depressed and wholly underneath the *Diameter*.

Things appear bigger than they really are, through a *Convex Crystall Round*: As we find by experience in old *Men*, who being not able to discern *Letters*, tho' near at hand, help their sight in reading, by using the *Convex Glasses* of a pair of *Spectacles*: As also in those that make use of *Microscope Glasses*, for the viewing and discerning of the *Hairs* of a *Flea*, and even the minutest and smallest *Bodies* imaginable.

The Reason is, because in a *Convex Glass* plac'd between the visible *Objects* and the *Eye*, the *Rays* which before came short, and hardly reach'd the *Ball* of the *Eye*, are forc'd into the *Pupil*, so that the *Eye* receives the *Rays* from the *particles* of the *Objects* formerly hid; and since the *Rays* before join'd with them are separated from those interposed, and many *particles* seen from each part, they must needs be thereby enlarged, and represent the whole bigger. For when the angle is increased, the visible *Object* coming next in view, by reason of the great divarication of the *Rays* entering cross-ways the *Pupil* of the *Eye* toward the *Retin Tunicle*, must needs form a great *Image* in the bottom of the *Eye*.

Hence it comes to pass, that through a *Telescope* or *Optick Tube*, we see things at a good distance, in their full magnitude, and discern them very distinctly. For this advantage a *Telescope* brings, that it causes the visible *Object*, by reason of the great *Pupil* of the *Tube* to be discerned with more *Rays*, and by reason of the convexity of the utmost *Glass* gathering the *Rays* under a greater angle of Vision. Moreover the divarication becomes great, of those *Rays*, which entering cross-ways the *Pupil* or utmost extremity of the *Tube*, towards the *Retin Tunicle* of the *Eye*, cause a large *Image* of the visible *Object* to be described in the bottom of the *Eye*.

The *Object* appears singular, or but one, tho' transmitted to the *Brain* through both *Eyes*; and tho' the *Optick Nerves* meet not in conjunction, as appeared in the dissection of a certain *Young Man*, in which *VE S A L I U S* found them to be separate or divided.

The Reason of the simplicity of *Objects* is referred to the *Conarion* or *Pineal Glandule*, situate in the midst of the *Brain*, in which the two *Images*, which proceed from the two *Eyes*, are united before they arrive at the *Soul*. For there is no other part in the *Brain* which is not double. For as for the *Cerebellum*, except in superficies and name, it is not one: Nay, it is manifest that its

ter.

XXX.
Why from
two Eyes
any Object
appears
singular.

Vermiformous or Worm-formed *Process*, and the Marrow of the *Spina Dorsi* consists of four parts; two whereof proceed from the two *Medieties* of the *Brain*; the other two from the two *Medieties* of the *Cerebel*: But the transparent *Septum*, or Fence which separates the two foremost *Ventricles* is also double, and consequently that *Pineal Glandule* only is single, in which the *Species* proceeding from both *Eyes* may meet, before they are conveyed to the *Soul*.

XXXI.
Why the
Picture of
a Man
seems to
look upon
all Persons
in the
Room.

A Painted Person seems to cast an Eye upon every part round about him, and as it were to look upon every one in the Room particularly.

The Reason hereof is, that the Eye of the Picture is in plain, and consequently the Rays may be brought from all its points to the Eye of the Beholder. But the Eye of the Living Person being of a Convex Figure, and a great part of it hid, it is not able to send out its Rays every way, as we find apparent in Carved Images, whose Eyes being exerted or sticking out, and shapt into a certain Curvity or Convexity, cannot emit the Rays every way.

CHAP. VI.

Of Imagination.

I.
Whence
arises the
diversity of
Wit and
Imagina-
tion.

ALMOST all Men differ some way or other in Wit, and Imagination.

This chiefly proceeds from the various Conformation, Figure and Magnitude of the Brain, Texture of parts, substance and motion of Animal Spirits. For all these things very greatly conduce to the quickness or slowness of Wit and Imagination. Forasmuch as if the bulk of the Brain be either lesser or bigger than is fit, the Wit will either be precipitate or slow; either because the Spirits themselves have not a passage free and open enough, or because the equal motion of them is put out of order through the default of the Figure; or perhaps because in a larger bulk the Contexture of the minute parts is coarser, or there is some other more occult Cause, which represents the Images of things distorted or ill delineated.

II.
Whence
proceeds
the vari-
ous Inclina-
tions of
Men, some
to one Art
or Science,
some to
another.

Whence according to the various degrees of Imagination, Men are variously carried by a certain innate Inclination, some to the Mathematical Arts, others to Eloquence and Poetry, others to the Art of Medicine, that is, the Practice; for the Speculation thereof, which comprehends the Principles and Rules of Medicine more properly relates to the Intellect or Understanding; as the Practick Part of it which examines all the Indications and Circumstances of a Disease, and takes opportunities of healing, belongs chiefly to the Imagination: Whence it happens that the most learned and acute Physicians are not always the most happy in curing of Diseases. The same thing is for the most part observable in other Sciences: For those Men who are the most Learned and Skillful in the Law, are judged the least fit for other Civil Employments.

III.
Many
things oc-
cur to our
Imagina-
tion, which
never of-

Many things, through our inadvertency, occur, which before were never offered to our Senses, nor left any Vestigium of themselves; as when, for Example, we conceive in our Imagination a Hippocentaur, and other Chimæras, which never

presented themselves to our Eyes, such as we form'd them in our Fancy.

But tho' perchance those things which we conceive in our Imagination, were not before in our Senses, as to their Composition; nevertheless it cannot be doubted, but that the parts of which they were constituted, have at some time or other entred the Brain; or if haply not by themselves, yet by some other thing which had a great affinity with them. For if a Horse and a Man, for example, be represented to our Eyes, and the Species of both be imprest upon the Organ of Imagination, we easily compound them together, and conceive a Hippocentaur or Animal, consisting of Man and Horse. In like manner we may determin of the vestigia of other Objects, by the sight whereof we form many things which before fell not under our Senses.

They who, not being so accustomed, pass over high Bridges, or from a high Tower cast their Eyes upon the ground, are commonly taken with a Vertigo, and fancy all visible Objects to turn round.

This proceeds from Imagination, which apprehends danger from the situation or posture of the Body, and dreads the hapning of any mischief to it, whence being very cautious how it transmits the Spirits into the Nerves, and how to direct them more securely, it recalls them into the Medullium or inmost part of the Brain, and so perverts them from their accustomed afflux and Irradiation; and while it indeavours to direct them into better order, overmuch sollicitude compels them into a certain confusion and irregular motion. And for this very Reason it is, that bold Persons, and Men in Drink, in regard they take little care of the Regimen or Government of the Animal Spirits, suffer no such Vertigo.

Some Men seized with a Disease, especially those in a Fever, fancy they do or suffer many things which indeed they do not: For I have known one in a Tertian Ague often complaining that he was grievously afflicted with a wound in his Shoulder, when at the same time he had in reality no wound at all.

This happens by reason that the Species which are imprest by the course of the Spirits, or raised by means of the Vestigia of the Memory are equally vivacious, and indued with no less strength than those which proceed from the Senses. For when at that time the Animal Spirits are agitated above what health requires, they concur with the Vestigia of the memory to the creation of other Species, which represent all things to us as being without us, and present to our Senses. It also happens sometimes in a Disease, that Objects make no impression with which the Mind can compare those Species, which the memory, or the force of the Spirits there ingender.

Thus it is probable that Witches, buried in a deep sleep, imagine they see Places far remote, Towns, Cities, Palaces, Troops of Men and Women, &c. and being awake describe them to a tittle, as if they had seen them with their Eyes. Which doubtless is done by the help of the Devil, who represents the Ideas of those things to their Imagination, and so strongly imprints it in them, that they make no manner of doubt but that they were present at those sorts of Shows.

VII.
What the
cause is of
marks im-
printed in
Births.

Some Marks or Characters are imprinted in Births by the force of the Mothers Imagination; this appears in Mothers that long for any thing: For upon their touching of the Cheek, or any other part of the Body, the thing so earnestly coveted, for example, a Cherry, Grape, or whatever else it be, is commonly imprest in the same member. And FORESTUS makes mention of a certain Noble Woman, who, whilst she was with Child, having broke her Arm, brought forth a Male Child with a broken Arm.

The Reason hereof is, that the Image of the Cherry or Grape imprinted in the Brain of the Parent, is conveyed by the motion of the Spirits to the Infant, by reason that the same disposition which inheres in the Mothers Brain, and moves in her the desire of the said Fruit, passes also into the Brain of the Infant, corresponding to the part affected: Whence the Mother touching her self in that part, in the time of her longing, produces there the effect of her Imagination. Because the Mother thus touching her self, there comes presently into her mind, the figure of the Image to be imprinted on the Birth; from whence a motion of some kind of shame, and also fear arises; without both which no mark is ever imprinted in the Bodies of any Infants. So also for the other Instance: For since every one of the Infants members is answerable to every one of the Parents, and the Fibres and Humours of both are continuous, no wonder if the Male Child of the foresaid Noble Woman was born with a Broken Arm, and the same remedies being applied to the Arms of both Mother and Infant, both were separately cured.

VIII.
The power-
ful force of
Imagination.

To the same cause may be referred what happened to an Apothecaries Wife at Bononia, who being with Child, and seeing through a Window in a Neighbours House, Snakes flea'd, and hung to dry in the Air, brought forth a Child with a Snakes Head: So another Woman in Sicily, according to the Testimony of ALDROVANDUS, observing a Lobster or Sea-Crab taken by a Fisherman, and being taken with an earnest longing for it, brought forth, together with the Birth, a Lobster altogether like what she had seen and long'd for.

IX.
A Party-
Colour'd
Child
born of a
white Wo-
man.

Hereunto may be added another History, quoted by JOHANNES SWAMMERDAMUS in his Treatise entitled, *Uteri Muliebris Fabrica*, In which the force of Imagination in a Woman with Child is clearly demonstrated. A certain Woman of Utrecht being with Child, and going to a Shop to furnish her self with some things for her Domestick Use, upon her first entrance, sees a Negro, at which sight being affrighted, she went home, thinking no other but that she should bring forth a perfect Black. But at last recollecting her self, she borrows a remedy against this strong Imagination, from another equally strong, perswading her self that all the Blackness in her Imagination might be wash'd off with hot water; in order whereunto she kindles a Fire, heats a Skillet of Water, and washes her self all over from Head to Foot. What follows? The time of her Delivery arrives, the Child is born, hath all his Teeth entire, and appears a perfect White, those places excepted to which in the Mother, while she wash'd her self, the water reach'd not;

such as in the Hands and Feet, the Interstices or innermost parts of the Fingers and Toes, and some other parts of the Body, where there appeared manifest signs of blackness and black Spots.

PERSINA an Ethiopian Queen, beholding, in the midst of Copulation, the Picture of a White Child, brought forth a perfect White; and on the contrary, another Queen an European, on the like occasion, brought forth a Negro Child.

This some Physicians attribute to the Seed, which according to its various quality, induces various forms: So that if it be Yellowish, they will have it to produce a Ruddy Colour, if Cineritious or Ashes-like, a Brown Colour; if whitish, a White.

Which Opinion, tho' it be common, yet in this matter, Imagination must claim the principal part. Because in regard the Nerves, through which the courses of the Spirits are incessantly carried, are extended from the Brain into all parts of the Body; the force of Imagination, especially if it be a little more strong than ordinary, by operating upon the Bowels, and exciting the motions of the Humours, may very well induce a Black or White, or any other Colour. So Jacob's Sheep, according to the different aspect of the Rods set before them, brought forth their Young of a various Colour.

By the certainty of this conclusion, HIPPOCRATES cleared a Woman that lay under suspicion of Adultery, upon bringing forth a Child utterly unlike her Husband; finding that it was very like a Picture which hanging up in her Bed-Chamber, the said Woman look'd upon very fleetly in the time of Coition. For the same Reason is to be excused that Lady of the Noble Family of the Ursini, who brought forth a Male Child like a Hairy Bear, because all the while she was big, she had very frequently before her Eyes, and consequently in her mind the Pourtraitures of Bears, which are the Arms of the Ursini.

Wherefore I judge nothing more blame-worthy among a sort of light and wanton Women, than the great delight they take in Whelps, young Apes and Monkeys, taking them up in their Arms, hugging, stroaking, and continually handling them, since by this frequent having them in their Laps and Sight, they habituate their Imagination to know not what strange and deformed Ideas, and so often bring forth a Birth that hath something of an odd, ill favoured sort of Meen in its Countenance. Wherefore I cannot but look upon it as very convenient that those sort of Dogs, vulgarly called Camusii, should be sent away; that the sight of them may not prejudice bigbellied Women, and be the occasion of deformed Births.

Such a kind of madness possesses the Minds of some Men, and so perverts their judgment, that in their discourse they have always one thing by the end, and neither give attention nor answer to the words of other Men. I saw a Phrenetick at Paris, who for a whole day together repeated the same words over and over again; and if by chance he was interrupted by any one, he would stare upon the Person so speaking to him, as it were intending to answer him word by word, but no sooner had the said Person done speaking to him, but he was at the same Story as before.

In such sort of Men it falls out, that so great a perturbation possesses the Animal Spirits, as to suffer the impression of other words to adhere to the

the *Glandule*, but a very little space, whereby it comes to pass, that the first *Image* of things by which it is detain'd, immediately returning, they (as having forgotten the words last said) are not able to give any answer to them, but only conformably to those things which impel the *Glandule*, and are at that time represented to their *Mind*. For I am apt to think that these sort of *Men* are not troubled with a *Phrensie*, but only so long as their *Soul* has no command over the motions of the *Glandule*; or because the *Animal Spirits* are in such commotion, and are carried above it with so unequal a course, that they flatter it without measure, and raise upon it innumerable *Species*, which presently flow out and slip away. Or else, because the course of the *Spirits* imbues the *Glandule* with some *Vestigia* of *Memory* so tenaciously, that the same *Image* is always represented from which the *Soul* is not able to disengage it self.

XIV.
How it comes to pass that sometimes we are not sensible of things present.

In like manner some *Persons* are not sensible even of those very things which their *Organs* perform, as it happens when the *Soul* is wholly taken up or diverted by any *Strong thought*, by reason that the *Animal Spirits* flow in so great a quantity through the tract upon which this thought depends, that those which remain are no longer able to supply the tract, which the Object present, endeavours to impress. For which Reason it is, that those who are seiz'd with any acute pain, cannot possibly fix their thoughts upon any other thing but that.

XV.
Some Men are carried by their distemper to fancy themselves Kings.

Some imagine their *Nose* to be of so great a bulk, as not to be passable through any *Door*: Others believe themselves to be *Kings*, as that *Spanish Servant* whereof *JOHANNES HUARTEUS* makes mention, who verily believing himself to be a *King*, made many grave and wise Discourses concerning *Government*. *MONTEFANUS* speaks of some who fancied the surface of the *World* to be made of *Fine Glass*, and that *Serpents* lay lurking every where underneath the said *Glass*; upon which conceit he kept his *Bed*, thinking himself there safe as in an *Island*, and that if he should stir out of it, he should break the *Glass* and so fall upon the *Serpents*.

XIX

The Reason of this extravagance may be drawn from what hath been said; for whilst by any tenacious disposition of the *Spirits*, and certain firm tracks of the *Memory*, the *Glandule* is converted to that part of the *Brain* where the pores are opened; by the opening whereof the *Species* of *King*, *Serpent*, *Glass*, &c. may be revok'd, or else is form'd at that very time; the *Soul* beholding such a *Species*, considers it self as joined to that very *King*, *Serpent*, *Glass*, &c. which are represented by the said *Species*, and as it were a *Composition*, making together with it one whole. I knew one at *London*, who took upon him to be *Archbishop of Canterbury*, so created by the *King*, and undoubtedly ordained to succeed the present *Incumbent* in that *See*, when as at the same time in all other things he seem'd to be a person sufficiently discreet and serious, and labouring under no other *Phrensie*; for he carefully minded his own affairs, spent his time seriously and wisely, and providently behaved himself in executing the *Impley* he was engag'd in: All which I suppose may well enough be if the agitation of the *Spirits*

XIX

by which the *Glandule* was formerly governed, ceases at that time, so long as nothing comes in its way that can renew those pristine motions, until the *Fit* returns, and a new access comes upon the persons affected as it were upon those that are subject to a *feverish Distemper*.

A certain *Person*, when by chance fell into a *Well*, where there were abundance of *Spawn* of *Frogs*, and taking into his *Body*, by the fall, some of the *Well-water*, he afterwards took a deep conceit, of his having young *Frogs* in his *Belly*, that he could not be otherwise perswaded for many years; in so much that for seven years together, he betook himself to the study of *Physick*, meerly for the finding out of a *Remedy* for this supposed *Distemper*; moreover he travelled into *Italy*, *France* and *Germany* to consult the *Physicians* of those *Parts* concerning the said affair, still fancying that the rumbling of his *Guts* was the *Croaking* of *Frogs*, nor was he otherwise cur'd at last but by deception; forasmuch as a *Physician*, acting above others by policy, conveyed live *Frogs* into his *Excrement*, and so made him believe that he had voided them by *Stool*. And all this while, setting aside the recourse of this *Imagination*, if it did recur, in all other things he acted very prudently, and made not the least discovery of any extravagancy: Which might be, because the *Animal Spirits* ceased sometimes to flow through that tract of his *Imagination* where the extravagance was impress'd, as being diverted by some other occasions; so that he appeared discreet enough till such time, as upon the renewing of the cause, the access of his whimsical *Fit* returned, that is to say, till such time as some cause had disposed the *Animal Spirits* to the same course.

XVI.
Of one that imagined he had Frogs in his Guts.

CHAPTER VII.

Of Memory.

AS Men differ in *Wit* and force of *Imagination*, so also in *Memory*. For some there are who presently get a thing by heart, and as soon forget it: Others get it soon, and firmly retain it: Others are slow in getting a thing into their *Memory*, yet when once gotten they do not easily lose it. Lastly there are who slowly learn a thing, but forget it soon.

I.
How it comes to pass that Men differ in Memory.

As to the first sort, they are *Men* who have nervous *Fibrils* sufficiently thin and flexible, so that they easily receive the Impressions of the Objects, so that their *memory* soon gets hold of any thing; but then on the other side their *Brain* is too moist and diffused, so that the *Vestigia* of what they had gotten are quickly effac'd, and consequently they forget those things they had learn'd just before. As to those who suddenly get a thing, and also long retain it, they have a *Brain* most excellently well tempered, neither too moist, nor too dry, so that consequently the *Fibrils* are wonderfully flexible, and thereupon the *Vestigia* or tracks themselves, are not, as in the former case, so soon effaced; and these *Men* are of all others of the happiest temper. As to those that slowly learn any thing, but long retain it, they have thicker, stiffer and less flexible *Fibrils*, whence they difficultly receive the

the *Vestigia* of the *Objects*; but withall they have a *Brain* sufficiently temperate, in so much that the *Vestigia* being there once imprest, they remain there a long time; so that those sort of *Men* cannot easily forget a thing which their *memory* hath acquired. And as to those who quickly drop or let go what they have slowly acquired, It is to be imputed to this, that the *Fibrils* of their *Nerves* are thicker and less flexil, and their *Brain* likewise intemperate, at least either too moist or too dry; and these sort of *Men* are of all others, of the most unhappy temper.

II.
Why Infants are deficient in Memory.

Children and *Infants* are less indued with *memory*, and sooner forget those things which they have learn'd, than those who are more advanc'd in years, or have arriv'd to their middle Age.

The Reason is, because the *Memory* depends upon certain *Vestigia* or *Tracts* in the *Brain*, after that the *Species* of any thing hath been imprest upon it. Whence if it happens that any parts of the *Brain* are changed by accretion or diminution, those *Vestigia* must needs be all of them disturbed, and some of them vanish. But whereas *Children* are continually growing, and something of new substance always added to them, the *Pleits* in the *Brain* form'd by the transcourse of the *Animal Spirits* are easily perverted and lose their pristin Order; as the *Pleits* or *Folds* in *Paper* are easily effaced if any of them be worn, or any new substance be super-induc'd: To this may be added, that the *Brain* of *Children* is too soft and moist to retain tenaciously any thing committed to it. For tho' it easily receives things, yet it retains not any distinction of them one from another, being like nothing so much as *Mud* tempered with a great deal of *Water*.

III.
The Memory very prompt in Young Men.

The contrary happens in *Young Men*, who having a *Brain* very well tempered, that is, neither too moist nor too dry; have also their *Fibrils* more subtil and flexil; and hence it is that the impressions of *Objects* are more easily received in their *Brain*, and longer conserved; and hence it is that *Infants* are much more capable of new habits than those of riper years, by reason that having the *Nerves*, *Muscles* and the *Brain* more tender, the *Animal Spirits* might the more easily form their passages: Whence it comes to pass, that *Infants* endeavouring and labouring to speak, get, in time, so great a facility of expressing themselves, that they pronounce their words with an incredible swiftness.

IV.

Some easily learn the things they hear.

Some *Persons* learn *Tunes* with little or no trouble, and afterwards without any study or labour of the *Brain*, express them, so as to make true and exact *Harmony*.

This so happens by reason that the *Animal Spirits* acting within the *Brain* from the distinct accents of the *harmony* heard, are disposed into peculiar divisions, according to which, when they flow into the process of the *Auditory Nerve*, like *Automata*, as it were spontaneously, and by a certain succession of *species* they easily express the *Tunes* of the *Voice*, or *Instrument* which they had taken in with their *Ears*. So *Musicians*, tho' intent upon other affairs, yet nevertheless can so guide their *Fingers* to find out the *Musical Stops* formerly taught them, that they touch the *Instrument* plaid on with wonderful skill, dexterity and sweetness.

The *Smoke* of *Tobacco* getting up into the *Brain*, weakens the *Memory*, and causeth stupidity and dulness, an excellent example whereof we have had in a *Person* of extraordinary Learning and Ingenuity, and once endowed with an excellent *Memory*.

And this might very well happen from the *Corpuscles* of the fume suck'd in, which entering the *Brain*, obstructed those *Vestigia* which represent the *Images* of *Things*, and consequently rendred them incapable of recalling any thing to *Mind*. Yet the said *Fume* being exhaled and drawn out, he recovered his former faculty, and called to mind many things which he had formerly known; much after the Nature of an *Apoplexy*, by which the *Blood* being effused out of its *Vessels* into the substance of the *Brain*, utterly obliterates the *Idea* of all things formerly known, no *Vestigia* of them remaining in the *Brain*.

Old Men, when they arrive to their decrepit Age, are almost totally devided of their *Memory*, and scarcely remember any thing which they did but a little before. Yet at the same time remember the *Actions* of their *Youth*, retaining them firmly in *memory*.

The Reason why *Memory* decays in *Old Men* is, because of the over-dryness of the *Brain*. For dry things cannot be easily wrought upon, so as to be able to receive impression; or if they do admit of an entrance or impression, they soon return to their pristin state, and recover their former dispositions. But *Old Men* retain those things which they have received into their *Memory* a long time since, because the parts of the *Brain* are hardened, and its pores in which the *Spirits* formerly ran up and down, have acquired a certain facility of opening themselves in the same manner at the presence of any object upon the *Spirits* repaireing to them. Hence it is, that they highly extol the times past, because they have a remembrance of things done heretofore; but presently forget late actions and occurrences.

Some *Persons* willing to supply this natural defect of the *Memory*, have invented a way of *Artificial Memory*; as thus, having hired a *Chamber*, they hang upon the Walls thereof several *Pictures*, to each of which they apply their *Cogitations*, and afterwards when they have sufficiently exercised themselves in uniting certain thoughts with certain figures, they make use of this their *Artificial Memory*, as they grow older and older, thus habituating themselves to recall this or that thing again into their *Memory*, according as they contemplate this or that *Picture*. For they cannot look on the said *Picture*, but presently there is excited in them that very thought which they had formerly join'd with the said *Picture*: For those things which are once joined in the *Mind*, remain joined there for ever.

Hence if any thing that we knew before slip out of the *memory*, and we call it afterwards to mind, that thing also presently occurs which was joined with it. So that if any particular *Man* comes into our remembrance, we also call to mind the injury we have received, if we have received any from him.

The Reason is, because when the *Vestigia* of the *Memory* have brought the *Image* of any thing upon the *Glandule*, the *Spirits* in like manner return-

V.
The Memory of a certain Learned Man, hurt by taking Tobacco.

VI.
Old Men, tho' they easily forget what they did but a little before, yet firmly remember all the actions of their Youth.

VII.
How Artificial Memory may be obtain'd.

VIII.
Why we cannot remember one thing without another to which it was join'd.

returning through the same pores, bring back also another Species to which the former was joined; whereby it comes to pass, that the Spirits flowing into the same Muscles, dispose our Body to put forth the same actions again, which it put forth upon occasion of the Object which first excited them, and this by experience we find to happen not only in Man, but also in Beasts; for if we receive with a good Cudgel, a Dog ready to fly upon us, and so put him to flight, the said Dog, if we afterwards meet him, tho' without any Weapon, will as soon avoid us, as if armed; because by the means of the blows wherewith he was formerly entertain'd, the course of the Spirits which our aspect excites, becomes joined with that course which the Spirits produc'd. So that those two ways meeting in the Brain, and being confus'd into one, it matters not which of them opens to effect the motion of the Muscles, and excite the said actions.

IX. Those Things which we revolve in our Mind in the Morning, we both more easily commit to memory, and more firmly retain, than whatsoever we think on the remaining part of the day.

The Reason is, because at that time the Brain is free, and not yet hindred by any Vestigia of things; for as in Paper a multitude of Pleits, and in the Air a great number of sounds brings confusion; so in the Brain the delineation of many things disturbs the Vestigia, and suffers them not to repose in their due places, nor to be perceived according to their proper nature. For the Sense being intent upon many things, is so much the more distracted and lessened, by how much the more it is employ'd in contemplating several distinct things. Add hereunto, that the Brain in the Morning is less hindred with Vapours, in regard the concoction of Meats being now finish'd, the Fibres thereupon are the more expedite, both for quickning the motions of the Brain, and putting on a new affection.

X. We find always by experience, that we better remember those things which we have seen by a Corporal View, than what we have apprehended by the Eyes of Imagination; forasmuch as the Nerves which are the Organs of Sense, more invigorate the Brain, and impress in it deeper Vestigia or tracts than the Animal Spirits do which open the Vestigia of Imagination, and consequently we must of necessity more distinctly remember things seen, than things imagined; and for this reason it is that we know better the distribution of the Veins in the Liver upon the sight of one dissection of that part, than by reading it often times in a Book of Anatomy.

XI. A Fit of Sickness or Distemper sometimes takes away all Memory, and so weakens that faculty, that they who before were indowed with an excellent Memory, after the said Disease scarcely remember any thing. PLINY makes mention of one, who falling from a high place, totally forgot, during the remainder of his Life, the Names of his Parents, Friends and Kinsfolks. And MESSALA CORVINUS after a great fit of Sickness forgot not only the Names of his Relations and Domesticks, but even his own Name also. Moreover a certain Student of MARSEILLES, after a wound received, so utterly

lost his Memory, that he was forced to learn all over again, the first Rudiments of the Arts and Sciences.

The Reason is to be taken from the force of the Distemper or Blow given to the Head; which changes the disposition of the Brain, and perverts the pores formed by the means of the Spirits. Whence it comes to pass, that the Vestigia are expunged, or the contexture of the Fibres left in such a state, as renders it less apt for the foresaid Function. For as Liquor spilt upon Paper, washes out all its pleits or folds so utterly, that when the Paper is dry there are left no signs of them; so it may come to pass that the Mercurial Humour may so far prevail as to take away all the Pleits of the Brain, so that no Vestigia of them may remain which the Sick Man knew before. On the contrary, it may possibly happen, that they who before had a dull and heavy Memory, may from the same causes acquire a happy and lively one. As is related of PEPE CLEMENT the Sixth, having so happy a Memory, that whatsoever he read he made absolutely his own, and never forgot it. The Cause of which Faculty PETRARCH ascribes to him from a wound given him in his Head, by which doubtless some Obstructions were dissolved, and the passages of the Brain opened, whereby a commodious way was made for the Spirits to pass to and fro. Another Person is mentioned by FULGOSUS, Lib. 1. Cap. 6. in the Reign of the Emperor Friderick the Sixth, who after breathing of a Vein, keeping his Memory intire in all other things, forgot to Read and Write as utterly as if he had never learnt either; But a year after, being let blood again, he recovered his knowledge of Reading and Writing, and became as it were a new Man.

In like manner it happens, that they who in Youth are brisk and active, when Age comes on, grow heavy and slow, and have little or no appearance of their former Wit and Ingenuity. Which proceeds either from the Blood vitiated, or from the Obstructions of the Brain, or from that Nervous Liquor, which being, according to the Modern Physicians, the Vehicle of the Animal Spirits, after too much Agitation or Evaporation grows flat. Hence oversoon ripe Wits which make such a clutter before their usual time, are not of long continuance, but in a short time decay and languish. Since such is the state of Nature, that those things which are best tempered, and to last a long time, are ripened by little and little, and as it were by degrees; so Summer Fruits soon decay, because the active principles of which they consist, quickly evaporate.

CHAP. VIII.

Of Slumbers and Dreams.

Slumbers or reposes of Sleep are for the most part interrupted, and but seldom hold out continued.

This hence proceeds, namely, because the Spirits being diversly agitated, and finding the Vestigia of various impressions, direct their course through such pores, rather than others. For the Animal

Spirits

XII. Why very soon ripe Wits soon decay.

1. How Sleep comes to be interrupted.

Spirits running through the Pleits of the *Brain*, render the *series* of them in a manner inflate, and according to their various agitation, either move them with one single *motion*, or skip from one to the other. Hence if it happen, that the *Spirits*, leaving one *series* of the *Vestigia*, skip first into one, then another, and so forward, various *Imaginations* must of necessity arise, which hang together by no connexion one with another; and yet they are all of a Company, tho' with some small interruption. Whence A R I S T O T L E compares such *Impressions*, as are formed by *Sleep* in the *Brain*, to *Frogs* made of *Cork*, which being stuf with *Salt*, are plunged into the *Water*, where as soon as the *Salt* is melted, they seem to struggle alternately, and without observing any Order, rise up to the surface of the *Water*.

II. Whether there be any that never Dream.

A R I S T O T L E in his Book of *Dreams*, Chapter the last, makes mention of some who are look'd upon as *Persons* that never *Dream'd*; such a one P L U T A R C H mentions *Cleon* in his time to have been: And I my self was familiarly acquainted with a Doctor of *Physick* at *London*, who protested often times to me, that he never had any apprehension of any thing in a *Dream*.

Altho' such sort of *Men* never remember that they *dream'd* of any thing, yet nevertheless they cannot be said to have been totally free from *Dreams*, for the *Soul* never wholly ceaseth from *Cogitation*; and whatsoever *Body* is laid asleep, that loses not its *Essence* which is constituted in *Cogitation*. So that because those sort of *Men* remember not that they had any *Nocturnal Cogitations*, it doth not therefore follow that they had none, since it many times happens to us not only to forget our *Dreams*, but even those *thoughts* which we had *waking*, altho' in the mean time we may be sufficiently assured that we saw in *Imagination*, or distinctly perceived something in our *Dream*: So *Cleon*, and those other *Persons* mentioned by *Aristotle*, were not free from *Dreams*, but forgetful of those things whose species were obliterated by reason of the quality of their temperament.

III. How the Night Mare comes upon those that are asleep.

Some in their *Sleep* fancy such a load or weight lying upon them, as if some *Demon* lay heavy upon their *Breast*, and hindred the freeness of their *Breathing*. Hence this sort of suppression which the *Latins* call *Incubus*, is named by the *Greeks*, *Ephialtes* or *Insultor*, we call it in *English*, the *Night Mare*.

The Cause of this *Nocturnal Asthma* proceeds from the *Animal Spirits* being denied their influx into the *Nerves* and *Muscles* designed for the *Organs* of *Respiration*; for if in *Sleep* the *Animal Spirits* have not their free Influx into their *Muscles*, the like motion is induc'd; whence the *Soul* in such an affection judges according to Custom, as if some weight were incumbent, and hindred the motion of the *Diaphragma* or *Midriff*. Add hereunto that those things which come into our *Imagination*, when asleep or in a *Dream*, more strongly affect the *Brain* than those which are conveyed into it by the *Senses* when awake. So while we indulge to *Sleep*, if *Spittle* abound in the *Mouth*, it follows that we seem to chew some certain *Meats*, and to mash them with much Iteration, which never happens to us when we are awake. The same distemper may be caused when any

thick *Vapour* fills the *Womb*, which by reason of its thickness cannot evaporate, but by an excited *heat* distends that part; whereupon the *Diaphragma* or *Midriff* is pressed, and therefore cannot be so commodiously drawn down, especially in the midst of *Sleep*, wherein by reason of the lesser influx of *Animal Spirits* it becomes less vehemently inflate, and is prest downward.

So the *Genital Humour* growing turgid in the *Spermatick Vessels*, and agitating them with a certain irritation procures unchast *Dreams*; for the more gross and undigestible sort of *meats* being taken at *Supper*, in regard they surcharge and lie heavy upon the *Stomach*, cause disturbances and frightful *Phantasies* in the *Sleep*.

It is usual with some persons to rise out of *Bed* at *Midnight*, and have recourse to those places and do those actions, which awake they would not dare to venture on; some hurry up and down, and without any help or assistance climb up *Trees*, and get up to *House-tops*. H O R S T I U S makes mention of a certain *Nobleman*, who climbing up a *High Tower*, and ransacking the *Birds* *Nests* there, got down again by the help of a *Rope*.

Physicians are of opinion that these things proceed from turgid *Blood*, and an Effervescence of the *Spirits*, which being carried into the fear of the *Mind*, agitate those *Instruments* of *Motion*, and impel them to perform those effects; whence it comes to pass, that the *Body* by the impulse of the *Animal Spirits* is wrapp'd up in *Imagination*, and by vertue thereof is incited to such actions: But I am of opinion, that all these things would signifie nothing without the help of *Imagination* which in a manner alone performs and brings to pass all these difficult things. For *Imagination* is not only incited by *External Objects*, but also by those things which are represented in *Sleep*, whence being agitated by the reserved *Species* of things, it both excites extraordinary motions, and impels to the performance of those things which strike both admiration and astonishment into the *Beholders*.

It is reported of G A L E N, that sometimes he walk'd almost a whole furlong in his *Sleep*; and of a *Servant* of *Pericles*, that he used frequently in his *Sleep* to walk upon the *House-top*. Others make mention of a *Schoolmaster*, who, in his *Sleep*, not only was wont to teach his *Scholars*, but went one time armed to kill a *Colleague* of his by whom he had been sharply reprov'd, of which when he wak'd he remembered not any thing. Moreover, some persons of undoubted credit have delivered a relation of two *Young Men*, whereof one tho' wholly ignorant of the Art of *Swimming*, yet used to rise in his *Sleep*, repair to the water and *Swim*; the other was also a *Nightwalker*, who one time above the rest, went down into his *Masters Kitchen*, and there in presence, and to the admiration of some of the *Servants*, not yet gone to *Bed*, spitted the *Brooms* like joints of *Meat*, and laid them to the *Fire*; thus he bestirred himself, till at last waking, and being ashamed of what he had done he sneak'd away to *Bed* as fast as he could. And all these things proceeded from the height of *Imagination*, and the persons deeply fixing their *Minds*, each of them upon the things they acted, whereby the passages through which the *Animal Spirits*, first entred, remained so wide and open, that the same *Spirits* at length insinuated

IV. The Cause of unchast Dreams.

V. How it comes to pass that some rise out of their Bed, and walk in their Sleep.

VI. An Example brought of Galen and others.

ated themselves, and the Soul by their motion became affected in like manner.

VII.

Dreams are usually of those things which were thought on in that Day.

In Dreams the same employments and actions run in our Minds, upon which we were intent and busied the day before.

The Reason is, because the parts of the Brain, which have formerly been shatter'd by the acting of an Inferior Object, are more easily moved by the Animal Spirits, than those which have always remained quiet; whence when the Vestigia of those things which we have first imagined, are discovered and remain after a sort laid open, the Spirits running slightly over them, bring back those Images of the Soul which it impress upon it when awake. Wherefore unless the Body be indisposed and disturbed by noxious Humours, no other Cogitations can be offered to the Mind than those which possess it waking.

V.

How it happens that some in their Sleep let go their water.

Some persons in their sleep emit their Urin, and as if they were standing against a Wall, or holding a Chamberpot in their hands make water.

VIII.

How it happens that some in their Sleep let go their water.

This never happens but when the Bladder swells with fulness, and is extended beyond its usual extension, because then the vellication of the Sphincter so opens the pores in the interior superficies of the Ventricle of the Brain, that the Spirits running to and fro above the Glandule, take their course toward those Nerves which are inservient to the emitting of the Urin, and thereby procure such a motion, that not only the appetite of making water is produc'd, but also the Image of the Wall or Chamberpot is presented, which they that thus dream were wont to make use of upon this occasion.

C H A P. IX.

Of the External Passions.

I.

Sanguine Persons are chiefly prone to Laughter.

MEN of a jolly Temper and sanguine Complexion, upon any the slightest occasion, burst forth into Laughter, nor are they, when any one else Laughs able to contain themselves, or when any matter of sport or merriment comes into their Mind.

This sort of Passion in Men of this Constitution arises from the moveableness of the Fibres which are stirred up, and as it were frisk at the occurrence of any sportive Object, by which affection drawn through the Diaphragma or Midriff a certain change of the Countenance with a sonorous and inarticulate Voice is created. For herein consists the reason of Laughter; that the Blood passing from the right Cavity of the Heart through the Vena Arteriosa suddenly, and with a repeated shaking, puffs up the Lungs, and causes the Air which they contain, to be compelled to break forth forcibly through the Aspera Arteria, in which it forms the Inarticulate and Sonorous Voice, and as well the Lungs by being inflate, as this Air by going out impel all the Muscles of the Diaphragma, Breast and Throat, by which means they move those Muscles of the Countenance that have any connexion with them. Wherefore no wonder if many times persons of great Sense and Ingenuity cannot contain themselves, tho' using their utmost means to repress the said Motions.

By the impulse of Nature it is that Animals are carried to Vener, or as it were forc'd by a certain violent inclination to a conjunction with their like, for the propagation of their Species.

This Inclination of Animals hence arises, namely, because at their fit Age the Seed increast in the Vessels appropriate to Generation, and the reception of the said Seed upon some access of heat from the afflux of the Spirits, provokes Concupiscence, which in Males from the sight of the Female, and on the contrary in Females from the presence of the Male, by a vehement agitation of the Animal Spirits, impels Animals by a certain amorous rage to a Mutual Conjunction, with which they are inflamed, much after the same manner as a rapid Fire shut up in a close Fornace.

There sometimes happens to one a Laughter against his Will, even in excess of pain, or else at the point of death; and such a kind of Laughter is called Canine or Sardonic.

Old Women impute this sort of Laughter in Infants to a sign of Joy, when indeed it is nothing but a Convulsion of the Muscles of the Face, which is very often attended by Epileptick Fits. So likewise among Gladiators and such sort of Combatants it is a most certain sign of instant death; forasmuch as it denotes that the Animal Spirits are no longer under the Government of the Mind, but in a tumultuary manner rush sometimes upon these, sometimes upon those Nerves, and so that the Link of the Mind with the Body is almost broken.

When any one is struck with horror, his Hair (as it were) stands on end. Because when the Blood, by reason of the said astonishment, withdraws to the Bowels, the external parts of the Body, especially the Skin, are contracted; nor can it be but that by the contraction of the Skin, the pores also are comprest, and thereupon the Hairs start up. Because the pores of the Body are like Repositories in which the Hairs are disposed, which according to their different situation, obtains a various position. The same effect is stirred up in other Animals by the motion of some affection or other; as for example, Anger in a Dog, fear in a Hen, whose Feathers rise up again, if the Enemy be at hand ready to seize her.

In some it is observed, that after Meat, from the fulness of their Stomach they fetch deep sighs, and draw their Breath from the very bottom of their Breast, like persons affected with some languishing distemper.

This I judge proceeds from a motion which Nature makes use of, the sooner to transmit the juice of the Meats through the Heart, to the end the Stomach may the more speedily be relieved by them. For sighs by agitating the Lungs, cause the Blood which is contained therein to flow the more speedily through the Arteria Venosa into the left Ventricle of the Heart, and thus the new Blood created of the Meats juice flowing from the Stomach, the Lacteal Veins and Heart, as far as the Lungs may the more easily be admitted into it.

In some Persons affected with Sadness, the Appetite being quite taken away, all sorts of Meat become loathsome to them. On the other side, others languishing with sorrow, covet Meat with a more sharp and greedy propensity,

II.

Whence arises the Impulse of Animals to Vener.

III.

Whence arises the Sardonic Laughter.

IV.

How it comes to pass the Mens Hairs stand on end who are struck with horror.

V.

Some after a full Meal fetch deep Sighs.

VI.

Why of sad Persons, some covet Meat, others refuse it.

The

The difference arises from the different original of these two sorts of *Sadness*. The original of the first, which affects some from their very Birth, is from hence, namely, because they took not in nourishment enough, but were kept short of such an allowance of *Meat* as might satisfy the appetite. Of the Second sort, that the nourishment they first took was grievous and hurtful to them, and thereupon the motion of the *Spirits* in them which takes away the desire of *Meat*, remain'd join'd with *Sadness*. For such is the *Conjunction* of *Body* and *Soul*, that these very *Cogitations* which have accompanied any motions of the *Body* from the very first entrance into life, continue to accompany them.

VII. Some fall into *swooning fits* upon their being seized with excess of joy, as for example, that *Woman* mentioned by VALERIUS MAXIMUS, who at the sight of her *Son*, whom she thought to have been long since slain in *Battel*, fell immediately dead. I have heard of a certain *Merchants Wife* in *England*, whose *Husband*, taking a voyage into the *East-Indies*, was by some Friends reported to be dead, that when after three years she heard that he was returned, and even just at the very doors to enter, she running hastily to meet and embrace him, fell down dead on the *Threshold* at her *Husbands Feet*.

The cause of this I judge to be, for that the said excessive, sudden and unwonted joy, by opening the orifices of the *Heart*, forces the *Blood* of the *Veins* to enter with such violence, and in such abundance into the *Heart*, that it could not be there dilated and rarefied soon enough to remove those *valvules* which close the *Orifices* of the said *Veins*, whereby it came to pass that the *Fire* in the *Heart* was suffocated, and the *Life* which consists in the motion thereof perisht.

VIII. It happens very often, that upon the yawning of one Person, the rest of the Company fall a yawning or gaping also.

Oscitation or Yawning is nothing but the deduction or parting asunder of the lower *Jaw* from the upper, which deduction proceeds from some sharp particles there sticking and gently vellicating the *Fibrils* of the *Nerves*, whereby the *Spirits* have a more copious influx towards those *Muscles* of the *Mouth*, and so produce the said motion. But that upon one Persons Yawning, others should do the like, it proceeds from no other cause but this, namely, that the said deduction of the *Jaws* so disposes the *Animal Spirits*, that they rush towards that part, and so excite an Oscitation or Yawning together, much after the same manner as two *Musical Chords* or *Strings*, which being screw'd up and tun'd to the same note, so sympathise together, that when one being struck sends forth a sound, the other at the same time, though not struck, sends forth the same.

IX. A *Lipothymie* or *Swooning away* through failure of the *Spirits*, oftentimes proceeds from great grief.

The original of a *Lipothymie* is when the *Animal Spirits*, be it for what cause it will, are carried impetuously through the *Nerves* to the *Heart*, and contract its *Ventricles* at that very time when they ought to be dilated by the *Blood* entering in; whence it comes to pass, that the fermentation of

the *Blood* is hindred, and consequently that the *Blood* within the very *Ventricles* of the *Heart* cannot be sufficiently rarefied, nor strongly enough thrust out into the great *Arterie* adjoining; whence it is that this *Lipothymie* proceeds from great grief, in regard the whole contexture of the *Nerves* is thereby shattered, and consequently the *Arteries* themselves that receive the *Ramules* or little *Branches* of the *Nerves* are also shattered, whereupon the *Blood* contained in the *Arteria Magna* or Great *Artery* is forc'd upward towards the left *Ventricle* of the *Heart*, and thereby hinders the *Blood* contained therein from being able to pass. This is the true cause of the *Lipothymie* or *Swooning Distemper*.

Those that are sad and dejected of Mind, are very prone and apt to shed *Tears*, especially if the heaviness of *Heart* be not very excessive, and any sense of *Love* attends it.

The Reason is, because tho' from all parts of the *Body*, *Vapours* exhale, yet there is no part which sends forth more than the two *Eyes*, both in respect of the magnitude of the *Optick Nerves*, as also the multitude of the little *Veins* through which the said *Vapours* tend thither. But, whereas *Sadness* by cooling the *Blood*, contracts the passages of the *Eyes*, and keeps back the agitation of *Vapours*: *Sadness* alone is not sufficient to draw forth *tears*, unless there be also an accession of *Love*, which is an occasion of discharging the *Blood* towards the *Heart*, and of increasing the quantity of *Vapours*: Whence it is observable that the *Sad* do not shed *tears* continually, but only by *Intervals*, whilst the *Object* they love recurs to their *Mind*, and is represented anew to their *Imagination*. The *Ancients* have allowed this expression of *Grief* even to *Brute Animals*. *Horses*, saith *PLINY*, bewail the loss of their *Masters*, and weep for want of them; and concerning the *Horse* of slain *Pallas*, *Virgil* thus writes.

The War-Horse *Ethon*, spurning now aside
His Warlike Trappings, Ornaments of Pride,
Weeps as he goes; and for resentment sour,
Down from his Cheeks the great drops trickling
(pour.

A loud Outcry is oftentimes adjoined to Weeping, especially in *Children* and *Women*, who, tho' they are both prone to *Laughter*, yet send forth louder and shriller Crys in Weeping than in *Laughter*.

These *Shrieks* are produc'd when the *Lungs* are in a moment puff'd up by the abundance of *Blood* entering into them, which expels from thence the *Air* that filled them, which *Air* being transmitted through the *Throat*, produces those howlings and crys which accompany weeping. But because the *Nerves* that are inservient to the dilating or contracting the *Organs* of the voice to render the said *Voice* more acute or gracile, are joined with those, which in time of joy open the *Orifices* of the *Heart*, and in *Sadness* contract them: Hence it comes to pass, that these *Organs* are at that time dilated or contracted. Hereupon in weeping the *Brows* are contracted and depressed, the contrary whereof we find in *Laughter*.

X.
How it comes to pass that Persons affected with Sadness or Grief, are apt to shed Tears.

XI.
How it comes to pass that those who weep, not only shed Tears, but also send forth loud Shrieks and Out-crys.

XII.
Why Lovers
so often sigh.

Lovers commonly fetch deep sighs, and as an argument of their solitude and grief, pant and draw their *Breath* thick from the bottom of their *Breast*.

The Reason is, because in *Love* the *Imagination* of *Hope* or *Joy* opens the orifice of the *Arteria Venosa*, which *Sadness* had before contracted. Wherefore when that small quantity of *Blood* which remained in the *Lungs*, is in a moment conveyed through this *Vena Arteriosa*, into the left *Cavity* of the *Heart*, and is impelled thither, by a desire of obtaining that *Joy*, where at the same time all the *Muscles* of the *Midriff* and *Breast* are agitated; it comes thence to pass, that the *Air* is very quickly impelled through the *Mouth* into the *Lungs* to possess that place which is forsaken by the said *Blood*.

XIII.
How it comes
that the
Sad have
not always
in their
Countenance
the
same Colour

The *Sad* carry not always the same Countenance; for sometimes they look *Pale*, other times are of a *Ruddy Colour*.

Sadness inclines to *Paleness*, when by contracting the *Orifices* of the *Heart* it causes the *Blood* to flow more slowly into the *Veins*, and as being made colder and thicker, to possess less place; whereby it comes to pass, that betaking it self into the broader *Veins*, and those nearest the *Heart* only, it forsakes the remoter, whereof the most conspicuous are those in the *Face*: And by this means the *Lover* is rendered the more *Pallid* and *Macilent*. But when the *Sad* look *Red*, and discover a certain *Ardour* in their *Countenance*: It is not so much to be imputed to *Sadness* as to other *Affections* which are joined to this *Passion*, namely, *Love* or *Desire*, or possibly sometimes *Hatred* it self. Forasmuch as these *Passions* moving and heating the *Blood* which proceeds from the *Liver*, *Entrails*, and other interior *Parts*, and impelling it first to the *Heart*, thence through the *Aorta* to the *Veins* of the *Face*, cause the said *Face* to look *Red* and *High Colour'd*.

CHAP. X.

Of some Persons Natural Inclinations and Aversions.

I.
How it comes to
pass, that
of two
Gamesters
we favour
one more
than the
other.

IF by chance we fall into the Company of two *Gamesters* equally unknown to us; We by I know not what *Instinct* of *Nature* are apt to favour one more than another: And so likewise if we see two *Persons* playing at *Tennis*, we with success to some one of them rather than the other.

The *Peripateticks* impute the Cause of these *Natural Inclinations* and *Aversions* to that which they call *Sympathy* and *Antipathy*; which obscure and insignificant Terms, serve only for one main end, namely, for a Cloak to cover our *Ignorance* under the umbrage of a few large striding and big swelling words. We therefore assert, that this *Inclination* whereby we favour one *Party* rather than another; if this propension continues no longer than the *Game* lasts, proceeds from hence, viz. that our *Will* which flies all *Indifference*, and affects to be concerned about some or other *Object*, takes an occasion to join it self to some *Party*, altho' the *Soul* be induc'd by no apparent Reason, more to favour one than the other, or to wish success on

any particular side, but only suffers it self to be drawn over towards that *Dice-thrower*, or *Tennis-player*, who at that time most sweetly soothes his *Brain* according to the tenour of its disposition. But if this *Affection* survives the *Game*, and after the *Match* ended remains still fixed in his *Heart*, it proceeds from the *Vestigia* or tracts of the *Inclinations*, the original whereof I have shewn in my *Institution of Philosophy*, Part 9. Cap. 14.

But if we remember not the agreement or similitude which the *Objects* we love or reject at present, have with those which we formerly had a love or aversion for, it is because the first *Passions* out of which the Second proceeded, were mightily confused, as being the very first *Passions* of our *Imagination*, or at least such as we no way ever considered with attention, and were of the number of those whose *Object* we loved or hated, without any trial or weighing of Reasons, or *Animadversion* of what might be worthy in them of *Love* or *Hatred*. Wherefore the Second also are partakers of the same obscurity and confusion as the First; and we are very often forc'd to say with the Poet,

I love thee not Labidius, say no more;
I love thee not, but cannot tell wherefore.

There is scarce a *Country* or *Province*, in which there are not many persons who have not an extraordinary aversion to *Cheese*, of whom some there are, who not only have a great abhorrence from the eating of it, but also cannot without much trouble and offence behold the sight of it.

The Cause of this *Aversion*, Sir KENELM DIGBY judges to be, for that *Children* many times are suckled by *Nurses* with *Child*, and in whose *Breasts* consequently by reason of a new conception the *Milk* is curdled, which may possibly offend the weak *Stomach* of the *Infant*. For without doubt a very great alteration must needs be made in the *Milk*, by reason of the *Nurses* pregnancy; and the *Milk* thus corrupted being suck'd in by the *Infant*, degenerates in his *Stomach* into a vitious curdle of *Cheese* grievously distasteful to the *Childs* weak *Stomach*; whereupon this aversion sticks upon it as a lasting brand during the *Parties* whole life. So a certain *Lawyer* in *London*, going to sup up a *Rear Egg*, and chancing unawares to swallow the *Embryo* of a *Chicken*, entertained from that time forth such an aversion for *Eggs*, that upon no occasion, nor by any persuasion of *Physicians*, could ever be brought to eat any more *Eggs*. This cause for nauseating of *Cheese* in many, I can well enough allow, but that all who suck coagulated *Milk* should for this cause only have this aversion I can never admit, when as we daily see a vast number of *Women*, especially of the common and meaner sort so fruitful, that they bring *Children* every year, whom they suckle at the time of their being with *Child*, and never wean them till they are near their time. So that if all the *Children* who have suck'd the *Milk* of *Big-bellied Women*, should be initiated in this aversion for *Cheese*, and increase it with their *Age*, how vast would their number be? And in how short a time would *Cheese* grow cheap?

Where-

II.
Why we should so
favour,
when no-
thing oc-
curs that
should im-
pel us to it.

III.
Whence it
is that ma-
ny have an
aversion to
Cheese.

IV.
Sir Kenelm
Digby's
Opinion.

V.
A more probable Opinion.

Wherefore my Opinion is, that there may be another cause of this *Aversion*, either their *Mothers Longing*, or greedy desire of certain *Meats*, which when they cannot be obtained, the *Infants* soon after born, abhor and loath them, or else because *Cheese*, especially *Old Cheese* abounding with *Volatile Salt*, and many other putrid particles, might possibly raise such a confusion of particles in the *Blood*, that great inconveniences might thereupon arise, especially to *Infants*. What wonder therefore, that this effect should be continued in *Adult* or full grown *Persons*? So far as that the very smell of *Cheese* cannot be indured by many. Nay, though it be fraudulently mixt with other *Meats*, and administered to the Party not knowing the cheat; nevertheless it will either cause a violent Vomiting, or if that happen not, many inconveniences and disturbances will thence arise.

VI.
How it comes to pass that some are so impatiently affected with the stink of a Candle carelessly put out.

A certain Nobleman of England, of my particular acquaintance, had so great an abhorrence of the fuming snuff of a Tallow Candle put out, that if by chance it hapned at any time through the negligence of the Servants to be carelessly blown out, and not covered with an Extinguisher, he was so disturbed with the smell thereof, that he became all of a sweat, and was discerned to tremble every Joint of him.

This could not happen to him upon any other account, than because this Organ of Smelling was so attempered according to the insensible particles, that the more subtile particles of the said Fumous Vapour begat in his Nose an ungrateful motion, that is to say, a most abominable smell, much in the same manner as Smoak falling into the Eyes provokes to Tears, and pricks and wellicates the Tongue in self.

VII.
How it happens that some mightily abhor the sight of a Cat, or such like Animal.

Some Persons can by no means indure the sight of certain Animals; nay, are highly disturbed if they happen to be in the same place where they are, tho' not seen; particularly some have such an aversion for the presence of a Cat, that at the sight thereof they fall into a Swoon.

This may very well be, for that when they were yet *Infants*, and in their tender years, they were hurt by a Dog, Cat, or some other noxious and hostile Animal, tho' perhaps retaining no memory of the Wound inflicted, and consequently they may experiment in themselves, at the first sight of the Animal, the same commotions as well of Body as of Mind, with which heretofore they were affected, either upon the foresaid occasion, or else because their Mothers when they bore them in the Womb, were affrighted at the sight of the said Animals; or lastly, because their temperament of Blood and Spirits is such, that the Evaporation continually exhaling from the Body of the Cat, and transmitted by respiration, coagulates, fixes, and after an unwonted manner exaggerates the Blood and Spirits with which it is intermixt. Whence no wonder they undergo so great a perturbation, and sometimes fall into a Swoon. If other Men have the fortune not to be taken with these Passions, it is because they are of a different temperament, and are not affected with the

exhalation of the Cat, evaporated by the circumambient Air.

Upon the same ground we must suppose that OLIVER CARAFFA abhorred the smell of *Roses*, when every year in *Rose* time he was forced to withdraw from Rome, and live recluse among the Gardens in the Quirinal, Guards being set at his Gates to hinder any of his Friends and Visitants from carrying in a Rose with them. In like manner a certain English Lady, mentioned by Sir KENELM DIGBY had such an abhorrence to the smell of *Roses*, that when one of her acquaintance put a Rose upon her Knee when she was asleep, to try whether she had so great an Antipathy to that Flower as was reported; there grew Pimples immediately upon the Place.

VIII.
How it comes to pass that some abhor the smell of Roses.

The Original Cause hereof might be from a strong scent in the Mothers Womb, or in the Cradle, or haply some other place, tho' totally forgotten; by which the temperament of the Brain hath been hurt, and the Mind affected with trouble and disturbance. And these or the like affections as well of the Body as of Mind, may easily be allowed, tho' a long time after, to survive, in the Parties, the Original Cause. To which we may add, that in regard the Fibres of the Sensory or Organ of Smelling are according to the diversity of Men, diversly configured: It thence comes to pass, that things of any Odour or Smell, affect not all persons alike, since that some Objects, as being indured with rough and pungent Effluvioms, are by some accounted sordid and odious, which very things to others that have notable strong and tough Fibres in that Sensory, are sweet and grateful. I know a great Lady that takes much delight in the smell of stinking Flesh, and admires the fuming Snuff of a Candle new put out.

IX.
The Reason of this Aversion.

A Gentlewoman in Oxford hated a Wasp to that degree, that in the hot Summer Months, when Wasps fly frequently about in Houses, she used to keep her self close shut up in a Chamber, not daring to stir out into a Dining Room, or any such like large or open place, till such time as she had news from those that she durst give credit to, that this sort of Insect was destroyed, or at least was no longer seen.

X.
Of one who abhorred a Wasp.

This Aversion probably hapned to her from some mischief or incommodity she had received from this kind of Animal: As they who having drunk for a Medicin some kind of bitter Potion, take such a distast from thence forward at it, that they will not indure to taste, nor even to behold, nay not so much as to look upon any thing that is like it. Likewise there goes a Report of a French Nobleman, who had such an Antipathy to Garlick, that he could not taste the least Crumb of it without Vomiting; and after he had with good satisfaction made an end of a Mels of Broth, into which, for his sake, no Garlick was put, yet when one of the Company, to play the Wag with him, told him there was a little Garlick shred in it to give it a relish, he vomited up both the Broth, and all that he had eaten besides.

XI.
How it
comes to
pass that
Men have
various
Natural
Inclinati-
ons.

All Persons by Nature are incited to certain Passions, some to one, and some to another; some are prone to *Anger*, and fly into *Rage* upon every slight occasion; others are of a disposition that inclines them to *Sadness*; others are addicted to *Joy*, *Fear* and the like.

The diversity of these Passions proceeds from the contexture of the *Fibres*, and the different *habitude* of the *Humours*. Forasmuch as *Choler* incites to *Anger*, *Melancholy* to *Sadness*; *Blood* bounding to *Joy*. In regard *Choler* vellicates

the *Fibres*; *Melancholy* compresses them; *Blood* dilates them; *Phlegm* obstructs them. Which effects we find certain both *sleeping* and *waking*. Those in whom *Choler* abounds, think of nothing but *Firebrands*, *Burnings*, *Fights* and *Brawls*. The *Sanguine* mind *Dancing*, *Musick*, *Laughter*, *Sport*, and all that tend to *Lasciviousness*. The *Phlegmatick* Fancy watry Places, and overflowings of *Rivers*; and so of the rest according as they abound in *Humours*, or have their *Spirits* disturbed.

ADVERTISEMENT.

THERE are some things taken notice of in this HISTORY of NATURE, which probably may seem impossible to some; But the Author Mr. LEGRAND is ready to justify the same, as well from Authentick Authors, as from Natural Causes, to such as shall be dissatisfied therein. And the same being Printed in all the Latin Impressions, and so well received, there is little room left for any real Dispute.

A

To the Honoured

Sir Henry Hobart

O F

Blickling in Norfolk, Knight and Baronet.

Sir,

THE Authors Opinion in relation to
BRUTE ANIMALS, as discoursed of in this
ensuing Tract, being an Opinion not
commonly received; requires the Protection and Pa-
tronage of some Person, Eminent for his Learning,
and one whose high Reputation may defend the
Opinion against the cavelling Critick, and
wrangling Disputant. For this Reason, Sir, 'tis
that I have selected You from amidst the number of
those Ingenious Persons, I have the honour of know-
ing, as reasonably believing, You who are allowed by
all that are so happy to be acquainted with You, to
be excelling in the ingenious performance of Learn-
ing, may, by Your favouring that Opinion, if not
totally recommend it as an uncontroverted Position, yet
stamp it so, as to make it currant with the Ingeni-
ous: For which Kindness and Generosity I might
blush, should I not gratefully make my acknowledg-
ment; assuring You that none would more willingly
serve You to the height of his Power, than,

Sir,

Your most Humble and Devoted Servant,

Richard Blome.

THE THIRD PART.

A

DISSERTATION

Of the want of

SENSE

AND

KNOWLEDGE

IN

BRUTES.

I. What it is that moves some Philosophers to believe that Beasts have knowledge.

SO far hath the Opinion concerning the Knowledge of BRUTE ANIMALS prevailed amongst Men, and so infixt hath it been in their Minds, that they who dare think otherwise, and refuse to patronise a Cause which to them appears so clear, can hardly escape the censure of Folly and Temerity. In this Opinion almost all Philosophers agree, and whether induc'd by the industry and vivacity of Sense, which they observe some Beasts to be induc'd with, or fancying that they see some Idea's of Reason in them, they make no scruple to attribute Knowledge and Ratiocination to them, and pronounce them capable of those perceptions and apprehensions, which in reality distinguish human kind from all other Creatures, not being able to imagine how without the help of Reason, BRUTE ANIMALS should bring such wonderful things to pass, and discover in their actions such a world of Ingenuity; as for example, how BEES, if void of Knowledge, should build so Geometrically their sexangular Cells, and fill them so exactly at their certain times with Honey. What, say they, can these Creatures Act so regularly, Consult so deliberately, make Choice so prudently of their Kings and Captains, and send out so seasonably their Scouts to watch and bring in a supply of Provisions, and not at the same time give an evident proof of a Rational Knowledge; since in all these Performances they cannot be supposed to be carried on by a blind and unaccountable impulse of Nature. For what impulse of Nature or Corporal Energy can be capable to inspire a meer living and moving Machine with Sense, and apprehension enough to constitute a King, obey his Commands, give him their presence, attendance and assistance upon all occasions? How comes that band of Soldiers appointed for his Gard? How

comes it that one more than another performs this *Satellitory Office*? Is it likely that by meer chance Serjeants and Officers should be chosen for his preservation, and sometimes to bear him up, when weary, upon their Shoulders? If destitute of Reason, they are totally ignorant of what they do in all these performances: Yet let us further inquire how the Living of them should carry out their Dead, and after the manner of Mourners accompany their Exequies? Certainly it must needs be very absurd, not to attribute to Reason so many plain signs and evidences of Reason, and after the discovery of such effects, not to find out the latent Cause.

No less discoveries the SPIDERS make of their Industry and Ingenuity in the curious weaving of their Webs, and hanging them loose in Doors and open Passages, wherein is likewise observable the manner of their lying in wait for Flies: For why should they place their selves to lie upon the watch rather in the center than in the extremities of the Web, but that they are sensible of the equality of the Lines drawn from the Center; and like skillful Fowlers understand that the Net is more easily drawn in that place. Moreover, if we well observe the ingenuity of certain other Animals, we shall find in them no weaker evidences of Ratiocination, than in those already mentioned. What providential care and forecast is to be seen in the GEESSE of Cilicia, who conscious to themselves of their garrulous Nature when they pass the Mountain Taurus, for fear of the Eagles, take each a Pebble Stone in their Bills, by which means they are forc'd to silence, and do not give notice to the Enemy of their coming. Moreover, who can but admire the Industry and Art of the ANTS, who build their Cities with so much design and regularity, that the

II. The industry of Spiders, implies a supposal of Reason, latent in them.

several Offices in them, may easily be discerned, some for holding their *Assemblies*, some for laying up their *Provisions* against the following year, and some for the *burying* their *Dead*. *Aldrovandus* was an Eye-witness of a City of a *Quadrangular* form, four foot broad, in which the *Ants* were seen to run to and fro through their several *Paths* in great diligence, as it were about their earnest *affairs*. It was exactly drawn in straight *Lines* and *Angles*, and the length thereof was just divided in the midst by a straight Path of a *Fingers* depth and breadth, through which ran three other ways directly, intersecting it at equal distance one from the other, and of the same depth and breadth. In the extrem *Angles* of these ways, as it were at so many *Streets ends*, their *Eggs* were laid up together in heaps. In another part of the City were *Granaries* filled up with *Grains* of *Wheat*, so full that the *Paths* were strewn with the overplus, but else all the ways were kept very clean: Lastly, one only Gate there was at the end of the *Cities* length which looked toward the *West*.

These and the like things reported of these *Animals*, do more than enough evince the *Natural Knowledge* they are endued with, and are sufficient to force a Confession from the most *Refractory*.

III. By these Reasons the *Ancients* were induced to believe the *Souls* of *Brutes* were *incorporeal*, and no way differing from those by which the *Bodies* of *Men* are *animated*; or if there were any difference between them, that it did not consist in the *Essence*, but was caused by certain *accidents*; or by the several degrees of *perfection*. Hence that passage in *GALEN* about the beginning of his *Exhortations*: *Whether those Animals, which are commonly called Brutes, be totally void of Reason, is not yet sufficiently made out to us; for tho' perhaps they have not that Reason common with us, which is called Enuntiation or Vocal Expression, yet they have that Reason common with us which belongs to the Soul, that is, a Reason capable of Affections, tho' some more, some less.*

IV. Very much inclinable to this Opinion were *Plato* and *Pythagoras*, by the Testimony of *Laertius*; and *Thales*, by that of *Plutarch*; and almost all those who gloried in the Learning and Authority of those great *Philosophers*: Forasmuch as supposing that there is one *Universal Soul*, by which *Plants* have their *Vegetation*, *Brutes* their *Nourishment*, and *Men* their *Form* and *Understanding*: They thence infer, that the *Souls* as well of *Brutes* as *Men*, are parts of this *General Soul*, and that they all arise and spring from the manifold division thereof.

Upon the confidence of this Opinion, *Thales* took the boldness to affirm, that all things are full of *Divinity*; consequently that there is no *Body* existent, which hath not its particular *Dæmon*; and so compriseth in it self something of *Divine*. Blinded also by this conceit, the *Disciples* of *PLATO* asserted that the *Souls* both of *Men*, and all other *Creatures* are equally *mortal* and void of all *corruption*: For since they are active and move themselves by their own proper *Force*, they cannot by any *external Agent* be urged to *Rest*, for that must of necessity perpetually exist which depends not upon another, and bor-

rows not the permanency of its duration from any.

But this Opinion hath long since grown out of date, and is reckned by the *Fathers* among *Plato's* *Childish Fictions*, so that there is no necessity of encountering them with *Arguments*: Let it suffice to take notice what enormous absurdities must needs arise from the admitting of this Opinion, and what confusion in Nature would follow: For if the *Souls* of *Beasts* be *eternal* and invested with *immortality*, what distinction will there be between *Men* and other *Animals*? Doth the same felicity attend them as us? However, not to be over solicitous about the beatitude of *Beasts*, let us at least examine where those *Souls* are disposed, which have been existent from the beginning of the *World*; what *Places* are allotted for them? Whether they have any peculiar *Elysian Fields* assigned them to wander and exspatiate in? What is become of all the *Gnats* and *Flies* with which the *Egyptians* were heretofore disturbed? What was their business after *Death*? And to what end were they kept? Or what advantage accrewed from their *Death*; when it must be confessed by all *Men*, that *God* governs all things by his wonderful *Wisdom*, and directs all *Creatures* to a certain end. All these things considered, it is most contentaneous to Reason, that the *Souls* of *Brutes* return to the *Earth* from whence they had their first beginning, and cease to *live*, when they cease to be among us.

But not to wander too far in the very entrance of this *Discourse*, let us come to the purpose, and examine whether *Animals* are indued with a *Real Knowledge*, or can judge or reason of things that are without them; which that we may the more easily compass, it will be worth our while in the First Part of this *Discourse* to inquire, First, what the *Soul* is, and what sort of *Soul* is proper to *Brute Animals*. Next what *Knowledge* is, and wherein the formal Reason thereof consists. Lastly whether *Beasts* perceive, and what Principle guides them in all their *Actions*.

To begin with that which in the first place was proposed, it will be of great consequence to know what the *Soul* is, and what is imported by that *Vulgar Name*; for when *Men* first imposed *Names* upon things, before they well understood their *Natures*, and enquir'd into the Properties of each distinct one from the other, it followed of consequence, that the name of *Soul* was indifferently attributed to all *Living Creatures*; and as well *Plants* and *Trees*, as *Men*, and all other *Living Creatures* were said to be indued with *Souls*. But in this affair no *Man* erred more than *Aristotle*; forasmuch as going to define the *Soul* in general Terms, this cunning *Philosopher* took great care that he might not be carpt at by *Posterity*, and thereupon brought forth such a definition of a *Soul* as might be applied almost to all things, and so serve as a common *Plaister* for the healing of all *Sores*. For in his Second Book *De Anima*, going about to explain the *Essence* of the *Soul*, he defines it thus. *A Perfection or Act of a Natural Organick Body, potentially endued with Life.* But how wild a definition this is, may be hence collected, namely, for that *Divines*, *Physicians*, and others, do all make use of it alike, and in so doing, appropriate it to things of a quite different Nature.

V. This Opinion of theirs admitted, there will be no difference between Brutes and Men.

VI. The Order of things to be said in the First Part of this Dissertation

VII. Aristotles definition of a Soul, vain and frivolous.

And are also affirmed by them to be parts of the Universal Soul of the World.

Nature. For *Theologists* and *Interpreters* of *Holy Writ* assert, that the *Soul* of *Brutes* is the *Blood* or *Spirit* exhaling from the *Blood*. To make this good, *Aristotle* is presently at hand, and suggests that the *Blood* is the *Act* of a *Natural Organick Body*, having *Life* potentially. The *Physicians* are pleased to make the *Soul* a temperament of the *Body*, and a harmony of the *Humours* which abound therein. This according to *Aristotle* must be that *Act* of an *Organick Body* which hath *Life* potentially in it. Antient *Philosophers* maintain that the *Air* is the *Soul*, taken in at the *Mouth*, cooled in the *Lungs*, and diffused into the *Body*; this comes up in conclusion with *Aristotle's* definition of a *Soul*, since he also defines *Air* to be the perfection of a *Natural Body*, potentially indued with *Life*. Others suppose the *Soul* to consist in *heat*, or at least that it is a *subtile Spirit*, which gives *sense* and *motion* to the *Body*; this *Aristotle* doth not wholly gainsay, yet withall obstinately maintains that this sort of *heat* or *Spirit* is nothing else but the *Act* of a *Natural Organick Body*, having *Life* potentially in it, so that whatsoever shall be alledged, or fancied concerning the *Soul*, tho' never so obscure, must be comprehended under this definition, and will challenge to it self both the *Genus* and *Difference*.

VIII.
May ob-
scure, and
explaining
nothing di-
stinctly.

But tho' this definition did not dilate it self so far, and were only confined to certain things, yet were it not fit to be retained among *Philosophers*; for what is there in it, that ought not to be rejected, it containing in it no absolute attribute which can any way explicate the *essence* of a *Soul*; nor do things only respectively and generally predicated, and which may be mixt, and as it were link'd with other things, produce any more than a confused *Knowledge*. Besides, what is there distinct, that can be made intelligible to us by the word *Act*, no more indeed than if any one should define *Light* to be the *Act* of a *Lucid Body*, or *Heat* the *Act* of a *Calid Body*; which definitions are so far from rendring us any whit more wise than before, that they serve only to involve us in an inextricable *Labyrinth*, and by a strange ambages of words render that obscure which was far more clear of it self. In so much that *HERMOLAUS BARBARUS*, a Learned Man, and for his great *Wit* and *Parts* very eminent among those of his Profession, when he had ambitiously sought, and at length obtained a Meeting with a *Demon*, is said to have requested of him no greater matter than to be resolved in the signification of the word *Actus*, in the foresaid definition of *Aristotle*, that so he might approve himself a worthy *Disciple* of so great a *Philosopher*. These things I have the rather added to make it appear what obscurity the Notion of *Soul* would incur, by being divided into *Vegetative*, *Sensitive* and *Rational*; and how little of *Light* is to be gained from those who make a vast confusion, by comprehending under one and the same distinction, things very different and remote in their own Nature.

IX. To proceed therefore more accurately as to the
There are
only two
sorts of
things, Ma-
terial and
Spiritual.
Soul of Beasts, and to the *Knowledge* they are indued with; we are to suppose from the Institution of *Philosophy*, that there are in Nature only two sorts of things; one *Intellectual* or *Thinking*, the other *Material* or *Corporeal*. Under the first are

comprehended *MINDS* and *SPIRITS*; under the latter all *BODIES*, which are vulgarly named *Natural*. Nothing can gainsay, but that *Man* is partaker of both *Natures*, and possesseth at once both *Cogitation* and *Extension*: Forasmuch as *Man* is not a thing simple and of one kind, but composite, and as it were a *Medium*, including both extremes; so that it is evident that *Brute Animals* are of a different *Nature* from *Man*, and no way indued with *Mind* or *Spirit*; forasmuch as all things which *Beasts* contain, are to be referred to a *Material Principle*, and have nothing of affinity with *Men*, except what refers to *Body*. We must therefore inquire what *Principle* it is in *Beasts*, by which they are not only Nourish'd, Grow, Breathe, are Moved, &c. but also by which they operate and perform those wonderful things in which they seem not only to come near the *Wit* and *Subtily* of *Men*, but even to exceed them.

GASSENDUS an eminent *Philosopher* amongst the *Moderns*, and so much the more praise-worthy, for that he hath refined and given new light to the *Opinions* of the *Antients*, imagines the *Sensitive Soul* of *Brutes*, (and a more than *Sensitive Soul* no *Man* that I know will allow them) to be a sort of *Flame* or *Species* of most subtile *Fire* which infuses *Life* into the *Animal*, and actuates and performs all its parts; so that the *Animal* lives so long as this little *Flame* continues in vigor, and dies when it is extinguished. For tho' this *Fire* be a *Body*, yet in respect of its subtility, it may be reckoned immaterial, if compared to the rest of the *Corporeal Mass*, and may justly for that Reason obtain the name of *Anima* or *Soul*; and the *Animal* thereupon be rightly said to consist of *Body* and *Soul*. Wherefore if the *Essence* of a *Brute* consists in this, that its parts are subtile and continuous, and are agitated by a quick motion, and there be also a continual succession of some parts into the room of others destroyed; in like manner the *Fire* or *Flame* wherewith *Beasts* are animated, is a *Congeries* and contexture of most subtile *Atoms*, which are stirred up by a quick motion, and by a continual generation of some, and departure of others, always preserve and maintain the same *Essence*: For into what other principle is the *heat* of the *Body* to be referred but to the *Internal Fire*? Whence comes its motion? How shall the *Organs* of the *Senses* receive the impressions of *Objects*, unless they be cherish'd by *heat*? And whence that *heat*, but from the *Soul*, which performs and executes all the functions of the said *Animal*; for tho' it may well enough be said that the *Soul* may rather be kept from *heat*, than *heat* from the *Soul*; yet it is manifest that *heat* depends upon motion, and is not existent in the *Body*, but for that action of an internal Principle; so that it must necessarily come to this, that there is a *Material Anima*, as GASSENDUS expresses it, to produce *heat*, give motion to the *Members*, and perform other *Acts* of the *Animal*.

Not much differing in Opinion is *Honoratus Fabri* in his Second Book *de Homine*, where he concludes, That the *Soul* of *Brutes* is indeed a *Fire*, but pure and free from the mixture of other Elements; to the asserting whereof he is chiefly induc'd, because *Fire* vegetates; and there is most

tus Fabri.

virtue (as experience tells us) where there is most *heat*, and where that stronger Element prevails. For whereas in other *simple Bodies* there is no footstep of *action* to be discerned, and *Fire* only is powerful by its productive *virtue*, Reason evinceth, saith *Fabri*, *That if any Element be armed with the force of Sense, it must be allowed rather to Fire, than to any of the rest*: Not that *Fire* absolutely taken is invested with such a power as to supply the place of a *Sensitive Soul*, but so far as it is constituted in such a frame of the *Organ*, such a disposition of *Parts*, such a Conduct, Communion and Texture of the *Fibres*.

XII.
Cartesius
his Opinion
that the
Soul of
Brutes is
the Blood.

The most illustrious *CARTESIUS*, who hath refined *Philosophy*, and purged it from all its folly and obscurity, and teacheth nothing but what is highly consonant to Reason, supposes the *Souls* of *Brutes* to be nothing else but the *Blood*, and that there is no occasion of a *Sensitive Soul* for the performance of their operations, and the production of the faculty of *moving*, and being *sensible*; for this most Sagacious Person, when he considered the *Blood* to be a *fluid Body*, and that the more subtle part thereof is carried by a continual circuit from the *Arteries* into the *Brain*, thence into the *Nerves* and *Muscles*, doubted not to assert that the *Blood* heated in the *Heart*, and attenuated into *Spirit*, constitutes the *Soul* of *Brutes*; and that from its motion alone, their various *motions* do proceed. This *Opinion* several places of *Holy Writ* seem to favour, and vindicate from the pertinacie of certain *Detractors*, who will needs take upon them, that it paves a way to *Atheists*, and gives them encouragement to think the same of *Men*, and consequently to divorce the *Rational Soul* from the *Human Body*; when as indeed so great is the distinction between the *Souls* of *Men* and other *Animals*, and so great the difference between the operations of the one and the other, that it can hardly be doubted, even by the most stupid of all *Mankind*, but that they arise from different *Principles*.

XIII.
The Life of
Animals
consists in
the continual
motion of the
Blood.

Be it granted then, that the *Life* of *Animals* consists in the incessant *motion* of the *Blood*, which beginning its course from the right *Ventricle* of the *Heart*, passes through the *Vena Arteriosa* into the *Lungs*, whence flowing into the left *Ventricle* of the *Heart*, it passeth into the *Aorta* or great *Artery*, whose Branches are dispers'd through the whole *Body*, and being joined to the Branches of the *Vena Cava*, convey the same *Blood* again into right side of the *Heart*; so that the *Blood* heated in the *Heart*, and converted into *Spirits*, obtains the name of *Vegetative* and *Sensitive Soul* in *Animals*, and is the immediate and principal *Organ* of all *Actions*, as may be apparently discovered in certain *Animals*; for examples, in *Flies*, *Serpents*, *Scorpions*, *Frogs*, &c. which through the extremity of cold in the *Winter*, lie void of *sense* and *motion*; and for the time in all appearance, totally deprived of *Life*, that is, while the *Blood* ceases to be in agitation, and the *generation* of *Spirits* is for the present *stopt*; which *Animals*, when the *Genial Spring*, as *Mantuan* expresseth it, gives new *primordia* to things, the *motion* of the *Blood* being renewed by *heat*, are again raised to *Life*, and resume their long intermitted *functions*. The same thing may be seen in *Men* who are *hanged* or *drowned*, forasmuch as in a very short time they

expire, by reason that the *Blood* stagnates for want of *respiration*, there being no passages open from the right *Ventricle* of the *Heart* into the left. The *Blood* therefore must needs be the principal part of *Animals*, from whence the native *Heat* and *Spirits* flow, and from which to those that are born, *Life* first begins, and to those that *Die*, last ends.

Altho' in explaining the *functions* of *Beasts*, we make no mention of their *Soul*; yet at the same time we deny them not *Life* nor *Sentiment*, provided always that by *Life* and *Sentiment* of *Animals*, no other thing is to be understood, but the *heat* of their *Blood*, and the particular *motions* of their *Organs* of *Sense* which depend thereupon: Nor is this more unreasonable, than to attribute to *Beasts* a *Soul*, which should be really distinct from the *Body*, and which nevertheless cannot subsist without the *Body*, it being the same thing as to say, that the *Soul* of a *Beast* is at one and the same time a *Substance* and a *Mode*; a *Substance* by supposition, and a *Mode* as having need of a subject for its existence.

Now it being made out, that the *Blood* overflowing the whole *Body*, and having by iterated turns a continual orbicular rotation to the *Heart*, from whence it had its first source, is the real *Soul* of *Brutes*, we must pass on to the Second Foundation, as it may be called, namely, what we are to apprehend by that which is commonly called their *Cognition* or *Knowledge*, what it is that constitutes their *Ingenuity*, and into what species chiefly it is to be distributed. The *Idea* of *Cognition* is so manifest, that there is scarce any thing which occurs to our *Mind*, which is more certainly known; and if by chance any persons in the explaining thereof have erred, I conceive the occasion thereof hath been, for that they have by their crabbed *Terms*, rendered that obscure, which of it self was sufficiently plain; and were minded, as they say, to hold a *Torch* to the *Sun*: For in this very thing, I find that all *Philosophers* have very oftentimes made great mistakes, namely, in endeavouring by *Logical Definitions* to explicate the most ordinary and simple matters, tho' in their own Nature intelligible; and by certain circumlocutions of *words* to go about to render those things perspicuous, which voluntarily offer themselves to our *understanding*; for what Object can present it self more clearly to us than *Cognition*, when as, if I perceive any thing, I seem to have its *Image* or *Idea* before me, and to behold it as it were present, with the *Eyes* of my *Mind*. For tho' perchance I be doubtful of all things existing in Nature, and may call in question what I touch with my *Hands*, see with my *Eyes*, hear with my *Ears*, smell with my *Nose*, or taste with my *Tongue*; yet all this I cannot choose but *think*, and my very dubitation is a certain *thinking*, which I cannot but be sensible of.

Wherefore by the name of *Cognition* we are to understand all that which so proceeds from us, that we are immediately conscious to our selves thereof. So that to *think* or *know*, is nothing else but to have a perception of those things which are in us. But to make the matter more plain by an *Example*, How doth any one know that he is indued with a faculty of *Understanding*, *Willing*, *Affirming* or *Denying*? but because he experi-

ness.

riments in himself this sort of *Faculty*, and is conscious to himself of such a power so long as he exerciseth it. But this is not to be understood of *Reflex Cognition* only, that is to say, by which any one perceives or observes that he hath observed any thing, but also of any primary *Perception* or *Intellection* whatsoever, by which he gives attention to any thing. Whence it follows, that if one have not a *consciousness* to himself of those things which he acts or suffers, he experiments in himself no knowledge of them, and thereupon may be said to be destitute of *Sense* and *Cognition*, properly so called: For how can the *Sense* of *Action* or *Passion* be attributed to him, if he knows not that he *Acts* or *Suffers*? Hence it comes to pass, that if *Men* attentively fix'd upon any thing are so taken up in contemplation, that they perceive not a *Torch* lighted before their *Eyes*, they cannot indeed be said to have any sense or perception of those things. And therefore that they may be said to be *sensible*, to *perceive*, *judge*, *affirm*, *deny*, &c. they must needs be knowing of those things which they are sensible of, *perceive*, *judge*, &c.

XVII. *Cognition is divided into four kinds.* All *Cogitations* which include *Consciousness*, are most especially two fold, *Actions* and *Passions*. All species of *Perceptions* or *Cognitions*, which are found in us, or which proceed from the power we have of perceiving or knowing, are called *Passions*; and all such *Operations* are divided into four kinds, the first is *Intellect*, by which the *Mind* without the help of any *Corporeal Species* perceives all manner of *Objects*, as well immaterial as material: The second is *Sense*, as well that which is external, as internal: The third is *Imagination*, containing under it common *Sense*; forasmuch as they are both actuated by the same *Organ*, and are employed about the same *Objects*: The fourth is *Memory* or *Reminiscence*, being that faculty by which we deprehend that we had formerly the same *Cogitation*. Those *Cogitations* which are called *Actions*, are all our *Wills*, because we find them to proceed directly from our *Soul*, of which alone they seem to depend; and to these are to be referred all our *Judgments*, *Inclinations*, *Appetites*, and all the *Motions* of our *Will*, which always accompany the power of our *Willing* and determining.

XVIII. *How Corporeal Matter differs from Immaterial and Incorporeal.* These things being thus explained, as far as the brevity of our Subject would permit, and premised as the foundation of our *Discourse*; We come now to examin whether the *Cognition* above-mentioned and defined be to be attributed to *Brute Animals*, or to speak in more express Terms, whether *Beasts* perceive, are *sensible*, *imagin*, *remember*, &c. and whether they imitate *Men* in these *Operations*, so far as to carry in them any semblance of *Reason*; which to make out the more clearly, we are to call to mind, that the Nature of *Corporeal Matter* consists precisely in this, that it contains *Longitude*, *Latitude* and *Profundity*, or that it is a *Matter Extensive*; for to consist of these three dimensions, is no other thing than to be extended, and to be extended is no other than to be capable of those three *properties*: To *Body* or *Matter* the *Spiritual Part* is diametrically opposite, whose Nature consists in *Cognition*, and which admits of no dimension, either *Longitude*, *Latitude* or *Profundity*; for all that is known to be in a *Spiritual Essence* is, that it is a *thinking thing*, that is, *Per-*

ceiving, *Affirming*, *Denying*, *Willing*, *Nilling*, &c. All which are understood without any *Idea* of *Extension*, and have no affinity with *Divisibility*, *Figure*, *Situation*, or any other *Affections* of the *Body*; and thence we must conclude, that *Cogitation* is an *Attribute* of a *Substance* containing no *Extension*; and on the contrary that *Extension* is an *Attribute* of a *Substance* admitting of no *Cogitation*: For those two *Idea's* are utterly different, and represent to our *Mind* nothing that is any way alike. What conduces more to the evidence of one thing being distinguish'd from another, than that one may be conceived without the other? For if we rightly infer that those *Bodies* which are not *square*, may be of *Spherical Figure*, and that those which are least capable of *motion*, are *square*, since *Imagination* can soon distinguish *quadrature* from *rotundity*, and ascertain that it is the nature of a *square Body*, to be least apt for *motion*; may not the same Reason serve to conclude, that there may be certain *Substances* void of *Extension*, because the *Idea* which we form to our selves of *Extension*, differs from the notion of *Cogitation*? Forasmuch as to establish a difference between two things, it sufficeth that one may be distinctly perceived without the other.

From this Principle then being granted, it is most clearly to be inferred, that *Brute Animals* are not only incapable of *Cogitation*, but are also void of every simple *Perception*: For whatsoever sort of *Soul* may be fancied to be in them, whether *Blood* circumsufed through the whole *Body*, as the Noble CARTESIUS maintains, or a pure *Fire* or *Flame*, as FABRI and GASSENDUS will have it; giving *Life* and *Spirit* to all the parts thereof; we must of necessity admit that this sort of *Soul* is *Corporeal*, and contains not any thing alien from the nature of *matter*; forasmuch as tho' *Blood* rarified in the *Heart*, should evaporate into *Animal Spirits*, which like a most subtile *Wind*, ascend up into the *Brain*, and are conveyed through the *Nerves* into the *Muscles*; and tho' this *Flammula* be composed of the most subtile parts, and emerging as it were out of the grosser Mass, may seem to emulate the agility, as I may so say, of *Spiritual Things*, yet nevertheless it doth not for all this cease to be material; nor do those accidental qualities advance it above the condition of a *Body*: So that if *Cogitation* be denied to *Matter*, and a thing extended be not in a capacity to be conscious of that which happens to it, that very thing will be against materiality, tho' never so subtile, and diffusing it self through any whole *Body*: For the tenuity of *Parts* takes not away the Being of the *Matter*; and whatsoever is capable of being extended, that Capacity is sufficient to give it the name of *Matter*; and to invest it with, and make it partaker of its imbecility: Who can say that that subtile *Matter* which enters the Pores of *Gold*, *Adamant*, *Steel*, or whatsoever other solid *Body*, is of a nature different from *Body*? *Accidents* change not the *Essence* of things, and the subject must of necessity remain always the same as to *Essential Properties*, let it be changed never so much, or undergo never so many new *Denominations*.

What is it that can conduce to the making up of a *Body*? All that we conceive of it, is that it may be touch'd, remov'd, and have its *Figure* alter'd,

XIX. *Whatsoever the Soul of Brutes is fancied to be, it is void of Cognition.*

XX. *Body is incapable of Cognition.*

alter'd, and that it may upon occasion take in, and give back beat; that it is *dry* or *moist*, that it gives a *sound* when it is *struck*, or else *deads* the *sound*, that it may *increase* or be *diminish'd* divers ways; and thus you have all that can happen to a *Body*. But what signifies all this to *Perception* and *Cognition*? Certainly to be *Touch'd*, *remov'd*, *Chang'd* in *Figure* or *Shape*, or be heated is quite another thing, from to perceive. Take a piece of *Wax*, give it what *Figure* or *Posture* you please, or let what *Impression* you think fit be made upon it by the most excellent *Engraver* in the *World*; turn it which way you please, shake it, move it up and down with never so much violence, put it into all forms or postures Imaginable, be sure the *Wax* will never complain of any of these ill treatments, or give the least thanks for any of the fine *Figures* impress'd upon it; since all this is done without the least *Cognition* thereof in the matter so handled.

XXI. Nothing of Body can have perception.

All this that hath been said of the *Wax*, is also to be said of any other sort of *Body* imaginable: For any one may very well think that *Wax* cannot perceive all these mutations, in regard it is not *animated*; but that if it had a *Soul* like to that of *Animals*, then surely this *Soul* would without any difficulty perceive whatever could happen in the *body* of the *Wax*; but all this comes not up to the purpose: For if this *Soul* of the *Wax* or of *Animals* were a *Spiritual Substance* like ours, I conceive it would have the faculty of knowing and perceiving the *motions* of any other *Body* near it, or intirely present: But if the *Soul* of the *Wax*, like that of *Beasts*, be a *Corporal Substance*, that is to say, be *Body* it self, one may say of that as of the *Wax*, that it may be moulded into divers *shapes*, that it may receive a world of *Figures*, that it may be capable of *cold* and *heat*, and such like qualities; but that all this together will not be sufficient to cause it to perceive.

XXII. Whether Matter be the Cause of its own Motion.

Now let us go a little back, and fetch our *Argument* more from the Root of the Business, and shew that *Matter* or *Body* is not only not capable of *Perception*, but also not so much as of producing its own *motion*; for as we have demonstrated in our *General Physicks*, *GOD* is the *Primary* and total Cause of all *motion* in the *World*, and consequently a *Body* cannot give it self any *motion* whatever.

XXIII. Matter is so undervalued, as to be reputed altogether sluggish, and rotally alien from all Action; how can it concur, say they, to the constituting of a Compound Body, if it be merely passive, and have no other motion, but from without? Do not we see the *Atoms* in our *Sublunary Region* to be moved, and spontaneously carried to and fro? Whence proceeds this impulse? What is the cause of this continual agitation? What but a certain inbred Power of *matter*, by which it determinates it self to *motion*, and according as occasion requires, agitates and winds it self? Who can deny but that the *Heavy Bodies* descend of their own accord? That a *Bent Bow*, when the obstacle is removed, springs back, and returns to its pristine State? But what invisible Agent is it that here interposeth, and comes to restore a bent *Stick* to its former place? If therefore *Matter* be capable of *action*, and hath

in it self a power of agitating, and moving to and fro; what should hinder but that it may obtain a power of perceiving, and by a certain impression of the Great Creator, being furnish'd with certain *Organs* fitted for that purpose, may *think*, *apprehend*, *imagin*, *remember* and *exercise* all other functions of an *Intelligent Nature*?

I am sufficiently assured that I have comprehended in brief whatever can be alledged against the inactivity of *Matter*. So that I have nothing more to do but to invalidate these *Reasons*, and to make good that *Matter* is only an *Unactive Mass*, and no less incapable of *Motion* than of *Cognition*. All *Philosophers* that know any thing of the *Nature* of *Matter*, know that it is only *potential*, and that it differs chiefly in this from an *Intellectual Thing*, namely, that this last is *Actual*, the other *Potential* only, that is to say, if the thing be well understood, that it is only a dead sluggish Lump, and void of all *Activity*. For this is the difference between a *thinking* and an *extended Substance*, namely, that *Cognition* is always present to the *mind*; whereas *Motion* is never contingent but to a *Body*, and that while it is impelled by an *External Agent*, and borrows the power of moving another *Body*.

But because *Aristotle's* authority hath been always held in high esteem, and all things that have been quoted or excerpted from his *Writings*, lookt upon as *Oracle*; it will not a little conduce to the establishing of our assertion to declare the said *Philosophers* Opinion in this matter: And first in his *Book of Generation and Corruption*, he acknowledges the *Matter* is bare of it self, and only *passive*, unless some *External Agent* intervenes which actuates it, and from which taking impression it cannot be hindered from both moving it self, and exciting to *motion* some other *Body*: Also moreover in the same *Book* he affirms, in several places, that to suffer, and to be moved, are proper to *Matter*; but that to move and to actuate are from a power without: Also in the Third Chapter of his First *Book of Metaphysicks*, where he more exactly inquires into the Original Cause of *Motion*, he sharply reproves the *Antients*, for that in their *Physicks* they considered *Matter* only, neglecting at the same time the *Primary Principle of Motion*; and in his *Meteorologies*, explaining his Opinion more clearly, he affirms that neither *Form* nor *Motion* do belong to *Matter*; but only so far as they are impress'd from without. Nor will it suffice to answer, that *Aristotle* spoke here only of *Matter* in common; forasmuch as he absolutely makes his Discourse of Particular *Bodies* indued with a certain *Figure*, which generally in *Physicks* are called *Bodies Natural*; and in express words and terms labours to demonstrate, that no *Natural Body* hath a *motion* from it self, and that *Animals* themselves which seem to be spontaneously moved, are indeed moved with an *external Agent*: For when in the Second Chapter of his Eighth *Book of Physicks*, he makes to himself this *Vulgar Objection*, that an *Animal* at first lying still and motionless, afterwards visibly appears to move and walk, without any appearance of any *external Movent*: The said *Philosopher* presently replies, that this is false; for we see, saith he, something of those things which are innate to the *Animal*, to be always in *motion*, but that of this

XXIV. Matter is only Potential, not Action.

XXV. Aristotle's Authority to prove that Matter is sluggish.

XXVI. The Subtilty of Matter borrows the force of its activity from the first Movent.

XXVII. The Subtilty of Matter borrows the force of its activity from the first Movent.

XXVIII. There is an intrinsic gravity in Bodies.

motion not the *Animal* it self is the *Cause*, but most probably the circumambient *Air*.

XXVI. From which places it evidently appears that ARISTOTLE thought *Matter* to be a Principle purely *Passive*, that it was from an *External Cause*, both that it was moved it self, and that it had power of moving any other *Body*; notwithstanding what is alledged of *Atoms* flying about in the *Air*, and of the *Action* they manifest by passing from one place to another: Forasmuch as the said *motion* is not to be imputed to the *Atoms* themselves, but to a certain *Subtile Matter*, which in our *Institution of Philosophy* we have made mention of, as being in continual *motion*, and entering and piercing into the *pores* of all *Bodies*; and since it is not to be doubted but that a vast quantity of this *Subtile Matter* is contain'd and dispers'd throughout in the *Air*, no wonder if such small and slender *Bodies* as *Atoms*, proceeding from neighbouring *Bodies*, are agitated up and down according to the various *motions* of the said *Subtile Matter*. By the same Reason is the experiment of the *Bended Bow* to be resolved, in regard that *Elastick Force* by which a *Bow* flies back to its former state, is not to be referr'd to the very matter of the *Bow*, but to the *Aether*, that subtilest of *Bodies*, which entering through the more open *Pores* of the *superficies*, and finding them streighter and streighter as they are more and more inward, forcibly urges its way, and makes a kind of an attempt to loosen those streightned *pores*, by a drawing together of the extremities, so to make its passage the freer.

XXVII. Now if it be demanded, upon what account then do we deny *motion* to *Matter*, if this most subtile *Aether* we speak of, be not only moved it self, but also have a power of moving, penetrating and impelling other *Bodies*? Hold a little, good Inquirer, and take notice, we do not allow this most *Subtile Matter* to be the Principle of its own *motion*, but the first Mover, namely GOD, who from the first instant of *Created Matter* imparted a various *motion* to its parts: And by the same *Action* by which he conserves *Matter*, retains in the *World* altogether the same quantity of *impressed motion*, and preserves it intire.

XXVIII. No more can the activity of *Matter* be any better defended by the objected *gravity* of *Bodies*, since it is an absurd thing to imagin that there is inbred *gravity* in *Terrestrial Bodies*, by which they are carried downward to the *Earth*, or have an inclination to be so carried; for thus to imagin what is it else, but to impute *Intellect* or *Understanding*, to things meerly passive, and to attribute to them the *Actions* of the *Will*? For in truth, there is nothing else to be understood by *Gravity*, but that the *Subtile Matter* interposed between us and the *Orb* of the *Moon*, and by a most swift *motion* roll'd about the *Mass* of the *Earth*, drives all *Bodies* towards the *Center*, and denies them any abode in the *Higher Regions*; so that could the force of this most fluid *Liquor* be taken away or removed; no *Body* would be heavy, and a *Stone* placed in the middle of the *Air*, would hang there and remain in that suspended posture, and never slide downward, unless that subtile *Agent* were at hand to drive it down towards the *Earth*: No *Body* therefore is mov'd by it self, but must be said rather to Suffer than to Act, till

such time as it is forced to remove from place to place.

This also will appear more plainly, if we consider the parts of which a *Material Substance* consists; whether they be *Homogeneous* or *Heterogeneous*: For if they be supposed to be *Homogeneous*, and to be all moved immediately by themselves; in all probability they could never rest, or be so compact one with another, as to keep together, and compose those *Bodies* which daily appear to our *Eyes*; because whereas such a *motion* is innate to the parts of *Matter*, and must necessarily flow from them, they could not possibly coalesce, but would remain distinct from each other, and refuse all consistence: Otherwise if they were able to abstain from that *motion*, and at their pleasure compose themselves to rest, what could we do less than set them free, and acknowledge that things *inanimate* are indued with Counsel and Deliberation? But if the parts of which this *Material Substance* is compild, be *Heterogeneous*, and some of them be active, as GASSENDUS thinks possible, and others stiff and void of all capacity of moving, no less confusion would arise in the *World* from this position of Parts, than if all Parts were indued with the capacity of moving, in regard that when those which are invested with this Power, cannot but impel their neighbouring Parts, and those so impelled cannot lay aside their borrowed *motion*, unless by imparting it to other contiguous and less agitated; nor these last lose any thing of their celerity, since it is inbred in them and unchangeable; it follows that the whole Frame and Machin of the *World* would be immediately shattered, not the last particle thereof ceasing from *motion*; whence the Famous Dr. MORE in his *Exchiridion Metaphysicum*, altho' he generally makes it his business to oppose the Doctrin of DESCARTES, yet in this Foundation of *Physicks*, he is forc'd to subscribe to his Opinion, whilst he thus defines a *Body* in general, a *Body*, saith he, is a *Material Substance* altogether of it self destitute of *Life* and all manner of *Motion*: Or thus, *Body* is a *Material Substance* incorporated into one by an *External Power*, and by the same manner participating *Life* and *Motion*; by which words this most Eminent Person gives to understand, that *Matter* of it self is altogether a Slug and void of *Action*.

It having been thus demonstrated, that *Corporal Things* are not indued with any moving Power, and consequently that their *motion* must proceed from elsewhere: It will be no difficult matter now to evince that they are also destitute of *Cognition*, and can by no manner of Right aspire to any kind of *Thought* or *Imagination*. For what affinity can *Extension* have with *Perception*? What acquaintance can there be between *Mind* and *Body*, except that both are equally subjected to the same *Genus* or *Kind*, namely, *Substance*, and each of them equally called *Ens per Se*? But it is sufficiently known among *Logicians*, that the *Species* of any *Supream Genus* do not agree, except in the *Essential Attributes* of the same kind, otherwise they would not deserve to be called the *Principal Species* thereof; and that highest *Genus* would more properly be called an *Interjected Genus*, dividing those *Species* from another *Superiour Genus*. But *Substance* is the *Supreme Genus*, and its

XXIX. Parts in Matter, whether Homogeneous or Heterogeneous, cannot move themselves.

XXX. As Matter is void of Motion, so its incapable of Perception.

its immediate *Species* are *Body* and *Spirit*, so that they cannot agree except in the *Essential Attributes* of *Substance*, such as are *Ens per Se*, &c. But of the number of these, neither *Perception* nor *Extension* are to be reckoned, since there are some *Substances* which perceive not, and others which are not extended; so that *Cogitation* and *Extension* belong not to *Substance* in general. Now to proceed a little further; That which appears only in *Essential Attributes*, ought to be differenc'd from all others; but *Mind* and *Body* agree not, except in *Essential Attributes*; therefore *Mind* and *Body* differ from all the rest, and are oppos'd to them in those things which have not an ingress into the Nature of *Substance*: For it implies a contradiction, that two things should be united in that very particular wherein they differ and contract an association by that wherein their opposition formally consists.

XXXI. To this Ratiocination no small light will accrew, if it be demonstrated that *Cogitation* can by no means consist with *Extension*, and that in this manner: If *Perception* may be attributed to *Extension*, it belongs to it as a thing constituting its *Essence*; or as a *Propriety* which accompanies its *Essence*; or, lastly, as a *Mode* or *Accident* which denominates it: *Cogitation* cannot as an *Essential Attribute*, agree to *Body*, for then it would follow, that all *Bodies* are indued with *Cogitation*, and consequently that not only *Brutes*, but also *Trees*, *Stones*, *Stocks*, &c. are indued with *Cognition*. Not as a *Propriety* of *Essence*, in regard since *Propriety* is applicative, *omni, soli, & semper*, to every of the kind, to that kind alone, and always: It would thence follow that the *perceptive faculty* would belong to every *material thing*, and there would be no sort of *Body*, tho' never so contemptible, to which *Cogitation* might not be attributed. Lastly, Not as a *Mode* affecting the *Substance*, in regard such is the nature of *Mode*, that tho' a *Subject* may be understood without its *Mode*, yet on the contrary, *Mode* cannot without its *Subject*; but we can clearly and distinctly apprehend *Cogitation*, at the same time secluding all *Corporeal Substance*, nay denying that there is any such thing in *Rerum Natura*. So that *Cogitation* cannot, as a *Mode*, be attributed to *Matter*, and consequently *Cogitation* is utterly a stranger to *Material Substance*.

XXXII. Some there be, who perhaps adhering to the Opinion of HENRICUS REGIUS will maintain that what we have said is only true, so long as no *Existence* yet appears; but nothing less if it be supposed to be in *Rerum Natura*; for then what should hinder but that it may be modified by *Cogitation*, and gain a new denomination by the presence thereof? For altho' perchance one should know for certain, that he carries about him in his Purse the *Effgies* of *Cæsar*, but knows not whether the *Graving* be in *Gold*, *Silver*, or other *Metal*, he may safely affirm that he hath *Cæsar's Image*, tho' no representation of *Gold* or other *Metal* occur to him at the same time. Nay, tho' a doubt should come into his *Mind*, whether any such thing as *Metal* be to be found in the *World*, yet nevertheless it cannot be thence inferred, that the *Image* of *Cæsar*, and the *Gold* or *Silver* it is graven in, are two distinct things, tho' apart one may understand them to be so. In like manner,

tho' one may possibly conceive *Cogitation* as a thing distinct from *Body*, yet we cannot rightly conclude that they are two *Substances* distinct from each other, induc'd only by this motive, that we can conceive them separately one from the other.

But this or any such like example that may be brought by our *Adversaries*, is so far from favouring them, that it rather makes against them, and strengthens our Assertion; forasmuch as not *Gold*, or any other *Metal* is the *Primary Subject* of *Cæsar's Effgies*, but *Extension*; that is to say, that the *Gold* in which *Cæsar's Effgies* is *Graven*, is not therefore susceptible of that *Image*, because it is the Nature of that *Metal* to be so; for then *Images* could be made of *Gold* only, and no other *Metal*, but because *Gold* is a *Material Substance*, that is, a thing extended, and in which the *Images* of any *Men* may be impressed or drawn. On the contrary, this *Example* makes on our side: For if upon this account, namely, because some one carries the *Image* of *Cæsar* in his *Purse*, and considers the same in his *Mind*, he cannot therefore imagine that there is such a thing as *Body* in the *World*, and consequently that the said *Image* ought to be the *Mode* of the *Body*: I find not why by the same Reason we may not infer, that *Cogitation* belongs not to *Body*, or is not an *Attribute* thereof, since we can suppose, that there is no *Body* existing in *Rerum Natura*, at the same time that we perceive we think. It appears therefore manifest in the conception of *Cogitation*, that nothing of *Matter* is concerned therein; and that *Body* whatsoever *Figure* it may receive, and howsoever agile, pure or subtile it may be supposed, cannot conduce any thing to *Perception*; for if a *Corporeal Thing* be indowed with *Perception*, and apprehends *Objects* offered, what distinction will there be between *Soul* and *Body*? After what manner will *Animals* differ from *Men*? How will *Brutes* be *Brutes* if they enjoy the use of Reason, and have the same Sense as we; if in the same manner they *Perceive*, *Imagin*, *Judge* and *Discourse*? In vain doubtless *Men* challenge to themselves Rationality, and boast of a *Spiritual Soul*, so long as there is allowed a *Matter* capable of those Functions which belong to *Incorporeal Substances*, and distinguish them from other things.

But methinks I hear Mr. HOBBS crying out, that there is no necessity I should have recourse to an *Immaterial Principle* for the producing of *Cogitation*, since motion it self, or the reaction of one part of matter against the other, or at least a due continuation of the said reaction can as well effect the same. For who finds not in himself that the *Head* is heated, and that all parts of the *Brain* are disturbed and out of order, when a *Man* is excessively taken up with serious *Contemplation*, or very eagerly confines himself to his Study for a long continuance of time? This certainly would not happen if *Sensation* or *Perception* were not the work of *Matter*, or proceeded not from the agitation and motion of its parts, which being granted, what should gainsay, but that the diversity of *Cogitations* may be allowed to arise from the diversity of the *Reactions* of *Parts* upon each other, namely, while they compress themselves divers ways, and react, and are as it were beaten back upon one another? Whereupon such will be the *Cogitation* of every *Particle*

on.

as the *motion* produced therein, and as this or that pulsation or pressure shall happen among them.

XXXV. Mr. HOBBS would make out something by this Argument if he could, first so far bring us to his Opinion, as to believe that there is nothing substantial existing in the *World* but *Matter*, and that whatsoever is produc'd, is extensive and divisible. For when as it is certain that *Men* are indow'd with *Perception*, and receive impressions of *External Things*, from *Organs* destin'd by *Nature*; were this *Hypothesis* granted, there could not in my judgment, be assigned a more proper cause of *Perception*, than *Reaction* of one part of *Matter* upon another, and variety of *Motion* excited therein: But whereas this *Hypothesis* is altogether false, and it is certain that this *World* contains something thing else besides a meer heap of *Bodies*, and that what is in no wise *Corporeal* makes up a great part thereof; Mr. Hobbes must excuse me for being of a different Sentiment, and totally averse from his Opinion. For according to this *Doctrin*, what should hinder but that *Animals* not only laid asleep in their *Dormitories*, but even their very *Carcases* after the *Vital Flame* is extinct, may be said to be sensible, and to be indued with the power of *Perceiving*, when as they are then no less capable of *Reactions* and susceptible of *Corporeal Impressions*. What should hinder but that the *Eye* of a dead *Ox* may be affirmed to see and perceive *Objects*, being so let in at the Casement of a *Window*, that the *fore part* thereof may look towards the *Floor* and several *Objects* illuminated by the *Sun*; and the *hinder part* the innermost recess, which being all dark, must admit of no other *Light* but what enters by the *Eye*, all the *Tunics* being taken away at the bottom, and to hinder the humour from falling, an *Egg-shell*, or some other *white Body* applied, by which at the same time one may behold the Image of *External Objects* no less distinctly formed therein, than they are form'd upon the *retin Tunicle* of a *living Animal*, especially if it be prest somewhat more or less, according to the distance. Well may the *Head* ake in serious *Meditations*, and some parts of the *Brain* be in an extraordinary manner disturbed, in regard such sort of *local motions* do only denote that the *Mind*, so long as it is tied to the *Body*, depends upon certain *motions* of the *Body*; and that the *action* of the *Body* intervenes our sensations. So that to make us sensible, it must be required that an *Organ* of some one of our *Senses* be disposed in some such certain way as cannot be done without *motion*: For there is a great difference between that which in our sensations hath reference to the *Body*, and that which belongs to the *Mind*. *Motion* indeed impresses an *External Object*, and the *mutation* of an *Organ* and of the *Brain* relate to *Body*, but that comprehends no *Perception*, because that *Perception* consists not in *motion*, nor in *reaction*, nor in *impression* of *Species*, but in the conscientiousness or internal *Cognition*, which of our selves we immediately perceive, when we are conscious of those things which we do, or which are performed in us: But since such a Conscientiousness is something altogether distinct from *local Motion*, the Essence of *Cognition* cannot consist in *local motion*.

But let us examin a little more closely the Nature of *Matter*, and divide it into *Monades* or the most Minute *Physical Particles*. Next I inquire whether each of these *Monades*, separate from each other, can perceive, or are capable of *Sense*, or the whole Composition only resulting from them? I cannot suppose any one so much a friend to *Atoms*, as to attribute *intelligence* to any one single *Atom*; for who can be so stupid as to believe that the least *particle* of *Matter* imaginable, can be indued with *Sense*, and perceive, and think upon impressions of *Objects* coming from without; but if the whole, consisting only of these *Monades*, perceives, and is indued with *Intelligence*, by what means, or by what artifice can it be brought to pass, that of things insensible, a thing capable of *Sense* should arise? How from the various coition of *Atoms*, which are void of all quality, an *Animal Cogitant*, that is, *Seeing*, *Hearing*, *Perceiving*, &c. can result? It is most evident that if when the *Flesh* is prick'd with a *Needle*, one *Atom* feels it not, two, three, four or more will never feel, no more than if an incision were made into the sides of a mass of *Adamants*, or other invulnerable things. And as *Fingers* connext, are separated without pain, so it is most evident that *Atoms* only conjoined with one another, may be divided without any *sense* of *Pain*: And for the better confirmation of this matter, we have *Plotinus* concurring in a high degree: If any one, saith he, shall affirm that the concurrent *Atoms* make a *Soul*, he is refuted by the consention of *Passion*, and the copulation of *Nature*; forasmuch as a thing cannot intirely be one and compatiend of *Bodies* not patient, nor admitting any union, and yet the *Soul* may be altogether compatiend to it self.

The most Famous GASSENDUS, following *Epicurus* in this matter, answers, that one *Atom* is indeed void of *Sense*, but that nothing hinders but that *Nature* commixt after a certain manner, of many *Atoms*, may be capable of *Alteration* and *Sense*, and consequently that it is no wonder if a heap of *Adamants*, and such like *Materials* is not sensible, in regard it is not so composed, nor consists of parts so affected as to obtain the power of being sensible; for he is of opinion, that sensible and insensible differ not much otherwise from one another, than a thing kindled and unkindled; and as we see, saith he, a stick of *Wood* lighted by a *Torch*, and a *Flame* created in a new *Subject*: So what hinders but that a sensible thing may be made of insensibles, and that from dead things, as I may say, living may arise?

For as *Lucretius* saith, as *Living Flesh* is formed of *Bread* or *Herbs*, which are insensible; and as from insensible *Wood*, certain particles may be produc'd, which so long as they are in fixt into the substance of the *Wood*, remain unmoved, and as it were stupid and benum'd; but upon the approach of *Fire* to them, are streightway roused and put into *motion*; and being thus disposed into a new way of proceeding, they become invested with a power of giving *Light* and *Warmth*: So it is to be understood that the *Fiery Particles*, so long as they are divided, and lie skulking as it were in the *Bowels* of *Matter*, are quite destitute of *Sense*; but when once they expand themselves, and rally into a state of *motion*, they agitate, ve-

It is re-
pugnant to
Reason,
that Sense
should arise
out of In-
sensible
things.

gitate and animate what ever *Body* falls to their Province, and impart Sense and Perception to it.

Altho' we should willingly yeild to GASSENDUS in what he asserts, and grant that the *Soul* is kindled in the *Body* like *Fire*; and that the *Sense* is that part thereof by which it is distinguished from other insensible things, yet still there would be no less difficulty to apprehend how it should come to pass, that since the *Atoms* of *Fire* or *Flame*, being divided from each other, do not perceive, or are sensible they should obtain the faculty of being sensible, or perceiving, when they come into conjunction, and are as it were associated and link'd together. For the grand *Quære* will still be, by what way, or after what manner, out of those mixt *Monades*, Perception should arise, and from their union so great a power should accrew, that those things which before were insensible, should be rendred sensible. Here GASSENDUS is at a stand, and ingenuously confesseth that he cannot conceive, how a *thing wanting Sense* should, being mixt with others, procure *sensation*, and give that perception to others, of which it is destitute it self. Indeed, saith he, we must confess there is little hope of appearance how this thing can be manifested, since either we are altogether deceived, or all human Wit is wholly at a loss to comprehend what the Contexture or Contemperation should be either of this *Flame* to entitle it to be thought the *Soul* or *Principle* of *Sense*, or of that part or *Organ*, which being animated and vegetated, the *Soul* makes use of to perceive by. True it is, that a little after he brings certain *Examples* to make out the progress, by which sensible things may arise out of insensible; first by the *Fruits* of *Trees*, which of *sour*, become *sweet*; of *unsmelling*, *odoriferous*; of *green*, *yellow*; in a space of time so imperceptible, that at the beginning nothing of that quality which succeeds can be discerned; and for the most part toward the end, nothing of that which was at the beginning; by which he labours to insinuate, that in the like progress of time, that is imperceptible, a thing insensible becomes sensible and perceptive, which was at first void of *Cognition*.

XXXIX.
Gassendus
his Exam-
ples prove
not that a
thing Sen-
sible can be
made of
Insensible.

But these *Examples* of GASSENDUS signifie little, for it is easie to be understood, that *Fruit* whilst it is ripening changes its *Savour*, and that that which was *sour* becomes *sweet*, namely, because the *Juice*, subdued by the adjutant *Heat* is refined, concocted, and strained, by which action the rough *Particles* breaking forth, the digested humour remains, which gratifies the *taste*, and produces a grateful *savour*; and for the *Colour* we may easily enough apprehend how the *Fruit* changes, and laying aside its *Green Colour* puts on a *Yellow*, that is to say, while the *Fruits* are ripening, the percolation is perfected, the parts subdued, the juice purified, which swells, froths and ferments; all which things, since they cannot be without transposition of the parts, the colour also consequently must needs be changed, and its aspect affect the *Eyes* in another manner than formerly. But we can by no means conceive that many *Atoms* joined together can beget *Perception*, and that from their various Perception a Sensitive Faculty should arise. For since *Consciousness*, as hath been before observed, is included in *Cognition* and *Sensation*, the *Atoms* or *Monades* of *Matter*

cannot obtain such a Disposition, or so enter into an Association one with another, as to produce that affection in the *Body*, as being proper to *Immaterial Substance* alone, and inseparable from it.

Besides, it is very difficult to be understood how *Cogitation* can be received into that *Corporeal Soul* which they call *Ignéous*; for either *Cogitation* is received whole, in the whole *Matter*, or whole in several *Monades* or small *Particles*: Or lastly, The several parts of *Perceptions* are in the several parts of the *Matter*. If the whole *Matter*, that is, the *Soul* of the *Brute*, admits the species of an *Object*, it appears not how the *Senses* can be distinguished in it, since each of the *Monades* must supply the place of a *Sensorium*, and the emitted *Species* be promiscuously effused; for how shall the *Ear* be deputed for the receiving of *sounds*, rather than the *Eye*, if in the whole *Soul* this sensation be received, and every particle thereof bears, and is smitten with the undulation of the *Air*? Why should the *Eye* rather than the *Nose* be assigned the *Organ* for the discovery of *Objects* without, if the whole *Soul* by a very swift perception apprehend things far distant, and in every point thereof the species of things be represented? And so in like manner of other *Senses*. But if the several parts admit the whole *Image* of the *Object*, one point of the percipient must needs behold innumerable *Species* of one and the same *Object*, and equal that *Object* by which it is exceeded almost an infinite number of *Senses*, which I think no *Man* in his right *Senses* will allow. For how can it possibly be imagined, that one *Physical Monade*, which is taken for granted to be the least particle of *Matter*, should receive the whole *Image* of any expanded *Object*, or variously tinted *Colour*? If lastly each part, of *Matter* answer to each part of *Perception*, the whole *Object* can never be discerned, in regard when each of the parts of the *Percipient* only admits each of the parts of the objected *Image*, there will remain nothing which can perceive the whole *Object*, and make the judgment thereof, no more than if three *Musicians*, singing a *Song* of three parts were intent each upon his own part only, any of them could hear the part of the other, or be able to judge of the whole *Symphony*.

The *Idea's* therefore of *Perception* and *Extension* are wholly disjunct, so that neither *Perceptions* can be the attribute of a thing extended, nor on the contrary *Extension* of a thing perceiving; neither doth it any way make for those who believe that our *Souls* die with our *Bodies*; forasmuch as if we grant *Cogitation* to *Beasts* in like manner as to *Men*, certainly we must needs determine that our *Souls* are different from the forms of *Animals*, not so much in *Species* and *Nature*, as in *Degree* and *Perfection*; for if they can remember things past, perceive things present, and provide against things to come, and propose an end to themselves, I see not what is left for *Man*, whereby he can have any *præeminence* over *Beasts*, except perhaps that he performs the Functions with greater ease, and in a far more excellent manner; so that it is to be feared, if we should attribute to *Beasts* an intellectual Memory, and a proposal of an end to any thing they do, and a certain reflexion upon any of their own actions, it would arm the

the Impious against the immortality of a Rational Soul.

XLII.
God can
create Ma-
chins which
may imi-
tate the
actions of
Brutes.

Now therefore that it is apparent and confirmed by divers Arguments, that Matter cannot be a principle of Motion, and that it is of so obtuse a Nature, that it cannot be conscious of any thing it suffers, or be able any manner of way to perceive any thing; who can be so bold as to deny that the Great Creator of all things, upon whose beck all Created Beings do depend, could have framed such sort of Machins as might resemble the same motions, and exert all manner of actions exactly like those which we see performed in Brute Animals? That GOD is able to frame such Machins is confessed by all Men, and particularly is clearly maintained and proved by the wise and learned St. Austin, in his 102^d. Epistle in these words, I wonder you should believe that the sound of the Voice, which said, Thou art my Son, could be so uttered by a Corporeal Nature only, without the mediation of Human Thought, and only by Divine Instinct; and not conclude at the same time, that the Corporeal Species of any Animal whatsoever might not be made in the same manner, as likewise a motion like to that of a Living Creature, by Divine Will, without the interposition of any Animal Spirit: For if every Corporeal Creature be at GOD's command without the Ministry of a Life-giving Soul, so far as that such sounds may be uttered as come from an Animate Body, and by which an articulate form of speaking may be conveyed to the Ear; why may not the like obsequiousness be shewn in this, that without the Ministry of a Life-giving Soul, a Figure and swift Motion, may by the same power of the Creator, be conveyed to the sight? I will not here repeat what I quoted in the Preface concerning a Machin which carried Letters to the King of Morocco. Who can but admire that a portable Dial or Watch, should by a certain figure of parts, disposition of Wheels, Spring or elastick Force of Steel, measure the times, and declare to the least part of a Minute all the Hours of the Day and Night? Who without wonder and astonishment can think of that Machin which Sir Kenelm Digby affirms he saw in the Mint of Segovia in Spain, which was contrived with that Artifice, that every part thereof had its various Offices, and was assigned for its proper Action. One part extends into its due latitude, the Mass of Gold or Silver, and gives it that thickness which the Coin requires; the next to this shapes the Plate so distended, and designs the Stamp; and having so done, transmits it thus stamp'd to another, from which it receives its Weight and due Figure according to the Stamp impress'd upon it. At length the Coin thus perfected, is conveyed into a receptacle built for that purpose, where he, whose Office it is to collect and keep the same, finds all the Money ready prepared to his Hand. Who could be otherwise than highly astonished that had seen Dædalus his Wooden Venus, which with Rowling Eyes seem'd to look upon, and take a perfect view of all Spectators, and likewise to move up and down with her Feet, and exactly to imitate all the actions of a Woman, so that she might be judged by all to be a Living Creature, and to have a free faculty of moving from place to place?

Who can but wonder that hears of the Wooden Pigeon of Archytas the Tarentin, which having Wings set on it, flew up and down like a Living Bird? No less an object of wonder was that Statue of a Man, framed by Albertus Magnus, which moved up and down with distinct Steps and Paces, and uttered Words as articulate as any Human Voice could utter. Most wonderful also is that which Historians report of the Norimberg Eagle, which was so framed by Athanasius Kircher, that it flew to meet the Emperor Maximilian, and hovering with its Wings over his Head, accompanied him all the way in his return to the City. To conclude, the Statue must not be forgotten, which being made by an Ancient Artist, and set upon a high Mountain, saluted the Sun each Morning at his Rising with a Hymn, compos'd in exact musical Harmony. Yet no Man can be so foolish as to imagin, that in such like Machins, there is any Soul or Cognition required for the performance of all these things; but on the contrary must of necessity acknowledge, that all operations of this Nature proceed from Figure, Order, and a certain magnitude of Parts. Why may we not therefore conclude the same thing of Animals, since all their parts may be so fitted and connected that the same circuit of Blood, the same vigour of Spirits may actuate them, as we find to be in a Living Dog, since those various movements, fram'd by Human Industry, are effected by the help of little Wheels and other Instruments, which are but very few in comparison of the almost infinite multitude of Bones, Muscles, Nerves, Arteries, Veins, and other Organick Parts which are in the Body of every Animal? And therefore no wonder if this sort of Machin have more admirable motions than any that can possibly be made by Human Art.

But to make out more clearly the similitude between these Automata made by the Hands of an Artist, and real Animals: Let it be supposed that GOD should compose a Machin exactly imitating the Actions and Passions, for Example, of a Dog, and place it among other Dogs, by what ways and evidences should we be able to discover the true Dog, whose movements are thought to be effected by Cognition and Design, from the Machin, whose motions and actions are all produc'd by the disposition only of its Organs, and the impulsion of Objects? Certainly I think no manner of ways, for that there might be justly assigned to both a like force, like Ingenuity, and an equal faculty of Acting, Moving and Thinking. Now to make the matter a little more manifest, let us take into examination what that Mans judgment would be, who should live confined in a desert Island, and being barred from the sight of all Animals which we call Brutes, should through the whole course of his life, see no other Creature but Man, and who at the same time should be addicted to Mechanick Arts, and to imploy his time wholly in the making of these Automata, or at least to be conversant with those who made it their business to frame Machinaments of divers sorts; as of Man, Horse, Bird, &c. Let us also suppose that these Automata did not only go up and down, eat, breath, &c. but also so far imitate all the motions of Animals as to represent their perfect Species, in so much that upon a blow

given, they should set up a Cry, and with great noise and tumult betake themselves to their Feet; nay more, should come when they were called; in a word, should do all things which Men are wont to do when they are hurried with passions, and wreath themselves into various motions: Undoubtedly this Man, setting aside all ambiguity, and uncertainty of Mind, would judge such sort of *Machins* to be real *Animals*, and that they *live, move, act, desire, think and know* as we do. As a certain Prince of the *Chineses*, when he first saw a WATCH, judged it indued, not only with Life, but also with Sense and Reason, in regard of the constancy of the motions which he observed in it, till upon the opening of the Watch, the sight of the *Wheels* wound up into motion, discovered the Artifice, and awakened him out of the error he had entertain'd.

XLV.
Whether
these Ma-
chins can
be called
Animals.

It will be doubtless replied to all this, that should GOD frame *Machins* to move thus by Springs, however they could not be called *Animals*, since an *Animal* is not a thing which merely moves and makes a noise, for so a *Machin* may easily be made to do, but that it is in the nature of an *Animal* to be sensible, and to perform all its motions by a vital and internal Principle, which hath the faculty of perceiving and being sensible, which Properties can never be allowed to a *Machin*. But the grand matter in dispute is, whether it be in the Nature of *Animals* which have not a *Spiritual Soul*, to think and perceive, and we say no: And that all we observe of *Beasts* is, that they are but *Corporeal Movements*, and so a *Machin* may be; so that to say that these Movements proceed from a principle which perceives and is sensible, is to Divine. Moreover it is impossible they should act in such a manner, at least so far as to be allowed Souls wholly *spiritual* as the Soul of Man is.

XLVI.

of those,
who from
the exter-
nal form of
the Mem-
bers of
Brutes,
imagin
they are
indued
with Cog-
nition like
us.

Hence we may see how gross their Error is, who observing that the Members of *Brutes* differ not from ours in the external form, and that their motions are like to our motions, presently infer that the same principle is common to both, and consequently that there is a Soul in us which produceth these effects, and which imparts motion to the Body, and is indowed with the faculty of thinking; so that there must needs be a Soul in *Animals* which executes the like offices, or which actuates their Members, and is a principle of Cognition in them: For say they, it is not to be doubted, but that there is great affinity between divers actions of *Animals*, which gives the youngest capacity occasion to judge that they perform their actions in like manner as we do, and by the means of the Soul, have passions alike; that they have an Appetite to things agreeable to them, and an aversion to things disagreeable; that they delight in some Images of Objects, and dread the sight of others: But the truth is, if we come to a strict examination of the matter, and inquire thoroughly what that is which we make the principle of *Animal Functions*, it will evidently appear, that we are led out of the way by a meer Childish prejudice, and that we are prepossessed with this Opinion, only by a natural and unthinking apprehension of things; for if these sorts of *Machinements* were set before our Eyes, we should find no footsteps of Reason in them, tho' never so much resembling the Species of a Dog or a Horse, or should imitate all their

actions; and hence it is to be concluded, that *Animals* are indeed nothing but meer *Machins*, destitute of all Cognition and Sense.

Why may not, you will say, the same judgment be given of *Machins*, representing our Bodies, since those also imitate Human Actions, and have motions as like as may be, to ours; and consequently as we infer that *Machins* like to *Animals* are void of Cognition, since we see the same or the like Actions in the *Automata* which are framed after their Species: By the same Argument it might be inferred, that Men also are destitute of Cognition, because their motions are altogether like to those in the *Machinements*, as to the external Figure, and it is apparent that *Apes* have all those which appear in Men.

To this I answer, that tho' those *Automata* represent the Figure of Men, and imitate as much as morally can be all our Actions, yet they are to be discerned from real Men two manner of ways; First, because they could never be indued with the faculty of speaking, so as to express their thoughts by words or signs, or to answer appositely to those things of which they might be interrogated, as Men in discourse use to; who by certain signs open their Mind to others, and discover the secrets of their Hearts: For tho' we may fancy a *Machin* made with that Artifice, as to utter, nay distinctly to pronounce certain words which may exactly answer the presentment of Objects, moving its external Organs; as for example, if it should chance to be smitten in some one part, it may act what we mean, and if it be toucht in another part with a lighter Hand, it may say we favour it, and such like expressions; yet never so as to adapt its words appositely, and in a proper stile, so as to answer congruously to all things that may be proposed to it; as we find daily Men of the meanest capacity, and sometimes those hardly in their senses to do. The Second way is, that altho' the motions of such *Machins* are orderly, and sometimes also exceed the motions of the wisest of Men, yet in many things they err, and deviate most from us in those things wherein they should chiefly imitate us. Whence it is manifest, that those sort of *Machins* are not conducted by Reason, nor indued with Cognition, but impelled to these performances by the disposition of their Organs only. Whereas Men, tho' never so stupid, nay even senseless, are able to put divers words aptly together, and of them to compose an orderly Speech, whereby they can discover their thoughts, and declare what they design in their Minds. On the contrary no *Animal* is found so perfect, and born under so favourable a Star, that he can approach towards intelligence, or perform any thing that can come near it. All which happens to *Beasts*, not through the imbecillity of their Organs, nor through the defect, nor impotence of forming words; forasmuch as we find by experience, that Magpies and Parrots are Loquacious, and utter human expression, yet cannot speak as we, that is, in such manner as that by uttering certain words, their answers can correspond to our interrogations, and manifest to us that they understand what they utter; whereas daily experience informs, that Men deaf and dumb from their Birth, (and doubtless such Men have a defect in the structure of their Organs more than *Beasts*) yet in the

What dif-
ference is
between
Men and
Brutes.

XLVIII.
The Brutes
cannot dis-
cover the
thoughts
by signs.

the same manner as we make use of *signs*; nay, and by their own ingenuity find out some ways to make known their *Conceptions*, and discover what they have in their *Minds* to those with whom they converse; which since *Brute Animals* cannot do, it is apparent that they are not only indued with a lesser power of *Cognition*, but are altogether void of *Reason*; and that they not only want *Human Cognition*, but are also destitute of whatever other way can be thought on to express themselves; in a word, that they are *Automata*, and act not by *Choice*, but by meer impulse: And here we are given to understand, how vain the Opinion is of some certain *People* of the *East-Indies*, who think that *Apes* and *Baboons*, which are with them in great numbers, are indued with understanding, and that they can *speak* but will not for fear they should be employed, and set to work.

XLVIII.

The Brutes cannot discover their thoughts by any signs.

But that *Brute Animals* are indued with no *Cognition*, may easily be demonstrated; for if they could discover to us their *Cognition* by any signs, they must of necessity do it by *Speech*, or by some other notes; accommodated to whatsoever obvious *Object*, as namely, variations of their *voice*, or some other *Actions* of their *Body*, which should be concluded on as signs of their *Cogitations*, and such signs as should not only signify naturally, but by design. But since we can apprehend no such signs in *Brute Animals*, and observe in them only natural signs of their *Passions*, and no moral or designed marks can be discerned in them; we may boldly conclude that *Beasts* are not indued with any faculty of *thinking*. Now the Reasons which induce me to assert, that there are no designed hints in *Beasts* to be discerned, are especially two. The first is, because intimations by design, when they depend only upon the will and pleasure of the thing *thinking*, and borrow their efficacy from the will thereof; it seems morally impossible but that they must be various according to the diversity of *Times*, *Places* and *Persons* concern'd, in regard the *Cognitions* and *Aims* of the thing *thinking*, can have no necessary connexion with the actions with which they correspond. The second is, that if the *Clocking* of a *Hen*, upon notice of a *Kite's* lying in *watch* for her *Chickens*, or the *Outcry* of any other *Animal* were plainly by design; it would be impossible for the *Chickens* or *Young ones*, ever to understand such sort of sounds which are uttered at pleasure, and according to the humour of the *Animals* that uttered them: For tho' the *Young Ones* of the *Swallows* mentioned by *Gassendus* upon the hearing of I know not what noise of the *Old Ones*, presently fled away, and leaving the *Tree*, where they nested, followed the *tract* of their *Parents*: For so this Eminent Person relates, viz. that walking alone in the *High-way*, and passing unde a low *Bough* of a *Holm Tree*, he spied three young *Swallows*, who sitting upon the said *Bough* as he passed by, could not choose but see him, yet never stirr'd or offer'd to flee away; whereupon passing by the third time, he reached out his *Hand*, as it were to take them, yet still they remained immoveable, no sign being given to prepare for *flight*; but when the two *Old Ones* came to the place, and uttered I know not what kind of murmuring tone, they fled in an instant, and with a swift *Wing* betook themselves

to the *Air*. If this chattering were design'd, how could the *Young Ones*, being not long hatch'd, know it? Nay, which is more, and which exceeds all belief, how comes it that *Chickens* newly broke out of their *Shells*, and other *Animals* newly yeaned from their *Dams*, send forth sounds always alike, and imitate the *Speech*, as I may so say, of their *Parents*? These things sufficiently declare that these sort of voices are inbred, and that they are taught by nature to signify and discover their Affections by certain signs.

Hence, as I said before, may be gathered how grossly those Persons are deceived, who, because they observe in *Brutes*, *Motions* like to those in *Man*, and *Organs* also alike, persuade themselves, that there is the same principle of motion in them as in us, and that they proceed alike in both from the *Soul*; so that there must be a like *Soul* assigned to *Brutes*, upon which their motions depend: Contrary to whom we plainly discern that there are in us two Principles of our motions viz. one mechanical and Corporeal, which depends only upon the disposition of the *Organs*, and a continual afflux of *Animal Spirits*; forasmuch as the *Essence* of the sensitive *Soul* consists only in the motive Power. Another spiritual and incorporeal, namely the *Mind* or the *Soul*, which we have formerly defin'd to be a *thinking Substance*, by reason that all its Nature and Property is placed in *Cogitation*. We have concluded that all motions as well in us as in *Brute Animals*, may flow from a mechanical and corporeal Principle, and consequently that there is no necessity to imagin any *Soul* in *Brutes*, besides the force of spirits and conformity of members.

The thing will more evidently appear, if we briefly, and as it were in transitu make out that all motions in *Man* are mechanically effected, that is, without any impulse of the *Soul*, but only by the help of *Organs* and *Instruments*, as may be performed in a *Machin*, which the more happily to go through with, it will not be amiss to begin from the motion of the *Blood*, because on the circulation thereof depends the animal Life, which upon the ceasing of the said circulation is extinguish'd.

Suppose therefore according to DESCARTES, that in the *Heart* of the *Soul* there is a fire, not lucid, but as it were occult, and not much unlike that which is kindled in *Aqua-fortis* by throwing a sufficient quantity of pulverised Steel, or which is to be observed in fermentations, or as some of the Moderns will have it, that a certain heat is excited by the help of the *Blood* in the *Heart*, not much different from that which ariseth from the mixture of *Oil of Tartar* and *Oil of Vitriol*. But from whatever cause this heat of the *Heart* proceeds, whether from some external calidity, or from some corrolive Salts or sulphureous mixtures acting mutually upon each other; or lastly from the *Blood*, continually circulating through it: Certain it is, that the *Blood* impregnated with heat, must needs be dilated, and affect a larger place. For the nature of heat consists in motion; and its chief property is to expand those Bodies in which it is predominant, and to augment their bulk by division of parts: As appears in *Milk*, *Oil* and other *Liquors*, which being held to the *Fire* grow turgid by degrees, and are enlarged by the con-

XLIX. There are in Man two principles of motion, Mechanical and Spiritual.

L. All motions in all Animals are explicated by a Mechanical Principle.

LI. The motion of the Heart is performed without the help of the Soul.

ceived Fervour; So that when by this latent Fire the Blood wherewith the cavities of the Heart are filled, becomes extended, and is necessitated to possess a greater space, it must pass from the right Cavity into the *Vena Arteriosa*, and from the left into the Great Artery, because these two Vessels are always filled with Blood; and their Orifices which are toward the Heart cannot be closed up. This evacuation being made, however the motion of the Heart never the more ceases, by reason that the Blood, which had been rarefied in both Ventricles of the Heart being broke out through the *Vena Arteriosa*, and the Aorta, that little Blood which still remains in those Cavities, and that which being new, slides into the said Auricles of the Heart, are like the foresaid Liquors, of which one supplies the place of a ferment to dilate and heat the other, and this is the only thing which gives motion to the Heart, and causeth it incessantly to flow, and with wonderful swiftness to be diffused through the whole Body.

LII. By the same Mechanick Operation the Blood circulates through the whole Body. But that we may the more easily conceive after what manner this Motion perseveres, and how the Blood, during Life, is carried from the Heart into the Arteries, and from them into the Veins, we must imagin that as often as the *Vena Arteriosa* receives the Blood just dilated in the right Ventricle, that very Blood propels other Blood with which it had been repleted before, and causeth it to exonerate itself of a part great thereof, and transmits it into the *Arteria Venosa* into which it flows, not only through those *Anastomoses*, which are discerned by the Eye, but also through infinite other *Spiracles* which are in the extremities of the Branches of the *Vena Arteriosa*, and which meet in the extremities of the Branches of the *Arteria Venosa*. It may at the same time be imagined, that as often as the Aorta draws the Blood, which a little before dilated it self in the left Cavity of the Heart, that Blood thrusts forward other Blood contained in that Cavity, and compels it to free it self from that burthen, by driving it into the Branches of the *Vena Cava* into which it penetrates, not only by sensible *Anastomoses*, but also by innumerable other passages, which are invisible to our Eyes. From such a disposition of the Vessels which contain the Blood, it necessarily follows, that the whole mass of Blood flows about the whole Body, and still returning to the Heart, from which, as from its original Fountain it first sprung, is agitated and forced to move in a perpetual Round. For the Arteries and Veins of the Body are like Rivulets, through which the Blood incessantly, and with wonderful speed flows, taking its course from the Veins into the Arteries through the Ventricles of the Heart, as in Animals, yet living, is manifestly seen; forasmuch as upon the cutting of a Vein, the Blood flows out in an intire Body, and the Veins by degrees become lank, that is to say, the Liquor being let out wherewith they before swell'd. The Blood therefore being impell'd from the extreme parts of the Body towards the Heart, flows through the *Vena Cava* into the right Lobe of the Heart, and then into the *Arteria Magna*, which drives it upwards, downwards and sideways into the Great Veins, thence into the lesser, and oftentimes into the very substance of the Flesh, in regard the Branches of the *Arteria Magna*, being dispersed through the whole Body,

are knit to the Branches of the *Vena Cava*; which at length carry the same Blood into the right Ventricle of the Heart, in order to begin a new Circuit.

Upon this continual Circuit of the Blood depends the Pulse of the Heart and Arteries; for since these two are no other than a Species of alteration which is perform'd by turns, and in such a measure that the Pulses of the Arteries answer to the Pulses of the Heart; it may be easily concluded, that those motions proceed both from the same principle, and consequently that that principle is no other than the very Alteration which the Blood undergoes in the Heart. Wherefore it is most rational to believe, that as often as any portion of the Blood falls into the two Cavities of the Heart, it mingles it self with another portion, which was there remaining before; which filling the inmost recesses of the Ventricles of the Heart, gains there a new degree of beat, and as hath been already hinted, gains a certain nature, as it were, of a Ferment; whence it comes to pass, that the substance of the Heart is forced to dilate and extend it self. Afterwards a greater portion, which was included in those Cavities, breaking forth through the Aorta and *Vena Arteriosa*, the Heart falls in and stretches its Longitude. And in this perpetual mutation of the Figure of the Heart its motion consists. The Diastole or Dilatation of it is when the Blood being rarefied within its Ventricles, the Mucro or point is drawn in towards the Base; the Systole or Contraction is, when the Blood being expelled, the Heart falls in, and comes to its proper shape; for the Diastole and Systole of the Heart are no other than its Intumescence and Subsidence, that is to say, as the Blood by turns thrusts forward and retires, the Heart alternately swells, and is depressed.

The Pulse of the Arteries follows the motion of the Heart, and consists chiefly in this, that by the Blood dilated in the Heart, and insinuating by a motion of Vibration through their Tunicles, they become inflat, as may be experimented in opening the Breast of an Animal, yet respiring and labouring for Life; for at the same instant wherein the Finger put to the Artery is impell'd, the Mucro or Point of the Heart is withdrawn to the Basis, and its Flaccid sides which are toward the right and left Ribs, are lifted up towards the Midia-stin-wall of the Heart; and the side of the Heart which is directed towards the Stern, is totally, but especially at the Basis erected, and so the Heart is sensibly inflat and extended, beats the Breast, and begets a sensible Pulse; but the Arteries abate of their swelling whilst the force of the Blood is remitted, that is, some part of its agitation being lost, because then the Arteries sink and return to their pristin state, which may be discerned in the Breast of an Animal yet breathing, and especially being near the last gasp; for at the same moment in which the Artery ceaseth from its impulse, the side of the Heart which is towards the Stern appears to sink, and all its substance to become soft and flaccid, from whence it is apparent, that the circulation of the Blood is attendant upon the motions of the Arteries, and that this motion is reiterated as often as new Blood makes its ingress into the Heart, and is varied according to the diversity of qualities found in the Blood, which render

LIII. Whence ariseth the Pulse of the Heart and Arteries.

LIV. Upon the motion of the Heart depends the Pulse of the Arteries.

der it susceptible of a quicker or slower motion.

LV. That the Animal Life, as also the concoction of Meats depends upon a Principle only Corporal.

If the *Animal Life* depend upon a *Mechanick Principle*, if the motion of the *Heart*, the pulsation of the *Arteries*, the flux of the *Blood*, and its circuit through the whole *Body* proceed from a corporal and mechanick Cause only, what hinders but all other motions, for example, the Concoction of *Meats*, *Nutrition*, *Respiration*, and the like, may be attributed to the same Principle; when as we see that all these things, without any of our Labour, and even Sleep, are performed by the Functions of the *Soul*, and require no immaterial Cause to their assistance? For what is there of the *Mind* or of *Spiritual Substance* that intervenes in the business of *Chylification*, whether in the first or second Concoction of the *Aliment*? What happens in *Meat* converted into *Chyle*, which may not be performed by conformation of the *Members*? The *Meat* well chewed and macerated by the *Spittle*, is conveyed into the *Stomach*; by whose means? Certainly by no other means but of the *Tongue*, and the *Oesophagus* or *Wind-pipe*; the first of which having turned the *Meat* up and down some time in the *Mouth*, and being as it were the *Hand* of the *Ventricle*, commits it to the *Mouth* of the *Oesophagus*, and by a certain force casts it in; the latter by the help of its *Fibres*, contracting it self after the manner of an *Earthworm*, swallows the ingested matter, and conveys it farther in; but in regard the *Meat* is but lightly shred by the *Teeth*, and there ought to be a further dissolution of it in the *Stomach*, so as to reduce it into *Chyle*, there is an acid and piquant humour, which issuing out of the *Arteries*, slips into the *Stomach*, and finishes the work begun in the *Mouth*. For since there are many *Branches* of the *Arteries*, which terminate in the interior *superficies* of the *Ventricle*, a great quantity of the foresaid humour distills through them, which being mingled with the *Spittle* wherewith the *Meats* are macerated, helps their digestion, and also brings it to perfection, the said *Liquor* being as it were a certain Species of *Aqua-fortis*, which getting in among the particles of the *Meats*, swallowed and eaten, help their dissolution, and makes a *Chyle* out of them. The *Meats* thus digested, slip towards the *Intestines*, where the *Chymosis* and *Hæmatosis*, or second and third Concoction may be said to be performed, because the *Gall* which flows into them, and which imparts a colour to the *Meats* as soon as ever they pass out of the *Ventricle*, puts the last hand, as we say, and brings to perfection that which only was begun by the foregoing *Liquors*.

LVI. How San- guification is made in the Body of any Animal.

The *Meat* thus dissolved into *Chyle*, as soon as it hath gently and gradually flow'd through the *Intestines*, is pressed forth, and is conducted through the *Lacteal Veins*, which running out in small but almost innumerable *Pipes*, receive the *Liquor* as it grows white, and convey it into that which is called the *Pecquetian Receptacle*, so called, because *Dr. John Pecquet* in his Book which he wrote concerning this matter, challenges to himself the first invention of it; from which Receptacle other *Chyliferous Pipes* arise, which proceeding directly upward through the *Breast* it self, conduct it onward to the *Subclavian Branches* of the *Vena Cava*: From whence the *Chyle* running at that very place into the *decurrent Blood*; and being well

mixt therewith, and passing through the *Vena Cava*, as well above as below, enters the *Heart*; where by a fermentaceous effervescence there excited by the heat of the *Heart*, it changes its colour, namely, from *White* to *Red*, whence appears the falsity of that opinion received by the *Antients*, namely, that the *Blood* is wrought in the *Liver*, and that the *Chyle* is carried through the *mesaraic Veins* in the *Mesenterium*, so into the *Vena Porta*, and from thence into the concavity of the *Liver*, where it is peculiarly fermented, and as the *Chymists* call it, digested and separated from the admixed *Choler*, and turns into a *Red Juice*; when as indeed no part of the *Chyle* at all arrives so near the *Liver*, as that it can thereby be changed into *Blood*: For how can it be, that the *Liver* should create *Blood*, and bring a redness upon the *Chyle*, when not the least part of the *Chyle* is ever conveyed thither, and it hath been sufficiently made out by innumerable dissections of *Animals*, that it passeth through the *Subclavian Branches*, and is by them infused through the shortest Trunk of the *Vena Cava* into the *Heart*.

These things have undesignedly slipped my Pen, my intent being only in this Discourse to describe in a few words the *Oeconomy* of *Animals*, and to evince, that all the functions of the *Body* may be mechanically explained. Let us therefore follow the tract of the *Blood*, and go on according as we are led by the course thereof. The *Blood* being rarified in the *Body*, and going out with a force into the *Arteries*, it cannot be otherwise but that many particles thereof must make a stop in those members which they are nearest to, and there possess the place of some parts which they thence expel, and according to the figure, situation or exility of the *Pores* which they find, cause some parts rather than others to flow into certain places, in a manner not much unlike what we see done by some sort of *Sieves*, which in regard they are contrived with holes of a different kind of bore, serve to separate from each other *Grains* of *Corn* that are of various Species: or as the same *Rain* adapts it self to *Plants* of a different kind, and in *Mustard*, grows sour; in *Rue*, bitter; and in *Liquorice*, sweet; so the *Blood* being diffused through the whole *Body*, transmutes it self into the substance of every part, and is dispens'd according to the diversity of their *Pores*, and agglutinated by a certain streight Union. I have said that the particles of the *Blood* stop in the members to which they are nearest, and possess the place of others which they thence expel, because it cannot be doubted, as experience teacheth us, but that there is a continual transpiration of sensible parts through the pores of the *Body*, and that some particles are ejected. For, if we consider the thing well, saith the Famous *Glisson*, in his *Anatomy* of the *Liver*, we breathe out almost as much again as we take in; and when any one breathes upon a Looking glass, a little Cloud is left upon it in the nature of a balmy dew: And as to what concerns the other parts, if by the inner part of the *Thumb* a little warm, a Plate of *Polish'd Silver* or *Pewter* be touch'd, the Vapour thence breathing out, will presently leave a spot upon the *Metal*: And to him that considers well, that the same expiration is made from all parts of the *Body*, *Sanctorius* his Calculation will not seem much from the purpose, who

LVII. The Nutrition of Animals is made by the Circulating of the Blood through the whole Body.

who upon trial made of his *Observations* in this matter, affirms, *that of all we eat and take in, more than a half part is consumed by insensible Evaporations*; nay, and that as much of *Aliment* is voided in a *day* through the *latent pores* of the *Skin*, as by *Stool* in fifteen.

LVIII. *Respiration is also Mechanically performed.* With the same facility *Respiration* may be ex-

plicated, by the same principle; forasmuch as the *Chest* being dilated by the help of the *Muscles*, and especially of the *Diaphragma*, the *Lungs* are enlarged or contracted; and by the means hereof we draw the *Air*, and immediately expel it again with the admixture of *Vapours*: For the *Diaphragma* is a certain *Muscle* dividing the *Breast* from the interior *Ventricle*, of a singular *Nature* and *Fabrick*, and aptly framed both for self-motion, and for impelling the *gristles* of the *Ribs* to which it adheres; whence upon its tending downward, the *Air* must of necessity enter the *Lungs* through the *Trachea*, or *Aspera Arteria* for the effecting of *respiration*; but when the *Diaphragma* ascends upwards to recover its former situation, the *Thorax* or *Chest* is contracted, by which means the *Lungs* are prest, and expel through the *Aspera Arteria*, the *Air* contain'd and kept in; and this is that which is called *Expiration*. Nor is it to be thought, as some will have it, that in *Inspiration* the *Air* enters into the *Breast* for fear of a *Vacuum*; or that it penetrates into it spontaneously, and without any compulsion; for this sort of attraction or spontaneous *Ingress* is a meer *figment*; when as the motion of *Bodies* cannot be performed but by *Pulsation*; for the external *Air* is brought into the *Lungs* for no other cause, but for that the Cavity of the *Thorax* is enlarged, and forcibly driven into the *Breast*, because when the nearest *Air*, the *Breast* being unfolded, is expell'd; and because of its thickness, cannot plentifully and speedily enough enter it; Nor, because of the subtle *Matter* intervening and dilating it, be condens'd, it follows that it must needs be driven through the *Aspera Arteria* into the *Thorax*, as we see daily in the blowing of a pair of *Bellows*, where the *Air* is propell'd into its cavity, while the sides are expanded, so that the *Diaphragma* is of all parts serving to *respiration*, the first mover; and from whence, as from the *Fountain*, the motion of all those parts ariseth and depends: To believe which I am chiefly induc'd by this Reason, (tho' I could produce many others of no less moment) namely, that upon the opening of the *Thorax*, presently the *Lobes* of the *Lung* fall in, and for a little space are deprived of all motion, while at the same time the *Diaphragma* nevertheless intermits not its motion, but contracts and extends up and down, and attracts, as *Gassendus* calls it, and moves at once the *Gristles*, and the extreme part of the *Spurious Ribs*, to which it adheres: Whence it comes to pass, that the *Air* is attracted by a wound into the cavity of the *Breast*; so that no wonder if, as the same Author relates, the Wound hath sometimes suck'd in a piece of *Candle* into it, as appears by the relation of *Bonanus* the Surgeon, who in curing an *Empyema*, near to the *Diaphragma*, when the better to make his inspection for the extracting of the putrid matter, he drew asunder the *Orifices* of the wound entering into the *Breast*, and bid the Servant hold a piece of a lighted *Wax Candle*; the said *Candle*

being not held very fast, was snatch'd away, and attracted into the Wound, and not till after eight days space, and the indurance of may grievous symptoms drawn out of the mouth of the wound with much ado; so that by this we may plainly see that it is the *Diaphragma*, which alone contributes to our *Natural Respiration*, when asleep, or ceasing from pains and labour; and that all the *Muscles*, whether of the *Abdomen* or others, do nothing but obey its motion; whereas to a violent *Respiration*, and not *Natural*, and which at pleasure we hasten, retard, restrain, intend or remit, somewhat more than the *Diaphragma* must contribute; since the *Organs* of voluntary motion are the *Muscles*, and consequently both the *Diaphragma* it self is concerned, as it is a kind of *Muscle*, and also other *Muscles* as they attract, lay open, press and urge divers parts to which the *Diaphragma* is tied, or is contiguous.

Besides the foresaid motions of *Animals*, whose *Original* and *Causes* have been already treated of, there is another called *Muscular*, to be made out; namely, that which is performed by the influx of the *Animal Spirits*, and depends altogether upon their action: Which the more clearly and easily to do, we must suppose in the first place, that by the name of *Animal Spirits*, there is nothing else to be understood, but the more vivacious and refined parts of the *Blood*, which being strained as it were through a *Sieve*, through the Branches of the *Arteries* called *Carotides*, are separated from the grosser parts, and are thence conveyed through the *Vessels* of the *Brain*; from which they are diffused through the *Nerves* into all the *Muscles*: But why the parts of the *Blood* which beat hath rarified in the *Heart*, should tend to the *Brain*, rather than elsewhere, there is no other reason to be given, than because the *Arteries* which convey them thither, proceed from the *Heart*, by the most straight Line, and are driven directly without any declination into the *Brain*; but according to *Mechanick Rules*, which are the same as the *Rules* of *Nature*, when divers things tend to one and the same place, where there is not space enough, they must betake themselves to any other where they can, because the ways are very narrow, as happens in the pores of the *Brain*, the more subtle and more quick particles alone enter the *Brain*, the rest refusing themselves through all parts of the *Body*; so that those which do enter, are to be look'd upon as most subtle winds, and purest *Flames*: In the second place we must suppose that a *Muscle* is not only fleshy, that is, of a thin, and as it were *Spongy Substance*, the more easily to receive the *Animal Spirits*, but also many times contain *Nerve*, *Ligament*, *Tendon*, *Membrane*, *Artery* and *Vein*. It consists of *Nerve*, as of a certain *Canal*, through which the *Animal Spirits* are deduc'd into it from the *Brain*, and the *Medulla Spinalis*: Of *Ligament* to render it the stronger, and be able to resist the incumbent *Members*, and to exercise its motions the freer: Of a *Tendon*, that it may perform its motion the more promptly, and regulate its actions the more strongly: Of a *Membran*, lest the foresaid parts of the *Organ* of Motion being deprived of a Covering, should be exposed to the injuries of *External Bodies*, and lest the *Animal Spirits*, being entred into its substance, should be dissipated, and evaporate by *Transpiration*: Of

LIX. That there are *Animal Spirits*, and of what parts a *Muscle* consists.

Veins

Veins and Arteries, thereby to supply it with *Aliment* and *Vital Heat*, by the influx whereof all the *Members* of the *Body* are enlivened and corroborated.

LX. Ancient *Anatomists* described the *Fabrick* of a *Muscle* by a distinction of *Head*, *Tail* and *Belly*, taking for the *Head* of the *Muscle* the *Extremity* joined to that part, at which the contraction is made; for the *Tail* of the *Muscle*, they took the end or portion inserted into that part which causeth motion; and lastly, they called the *Belly*, that intermediate part of the *Muscle*, which appears more tumid than the *mass* of *Flesh*. But we may further observe that a *Muscle* is, as the Famous *Willis* hints from the most *Learned Steno*, either *simple*, which consists of one only *Ventricle*, and two *Tendons*, of which sort there are several in the *Arm* and *Leg*, which are the *Movers* of the *Fingers* and *Toes*; but they are also frequent up and down in other parts of the *Body*; or *Composite*, which hath several *Ventricles*, upon each whereof there hangs two opposite *Tendons*, yet so, that where-ever the *Tendons* are *Composite*, that is to say, two joined together, one *Composite Tendon* may enter the middle fleshy parts, and the other surround the middle fleshy part on each side; as most apparently is seen in the *Muscle* called the *Masseter*, the *Deltoides*, and some others; in all which in like manner, as in the *simple Muscle*, two *Fleshy Fibres* (to which alone the *Motive Power* belongs) are contracted, and the opposite *Angles*, according to the insertion of the *Tendons* are enlarged, and thereupon the *Ventricles* becoming shorter, and at the same time grosser, rise into a *Tumour*.

LXI. These things thus briefly, and by the by explained, we infer that the motion of the *Muscles* is made in general, while the *Animal Spirits*, being swiftly moved, and like the parts of *Flame* shooting out from a *Brand*, being conveyed into the *Muscle* by the conduct of the *Nerves*, and there copiously laid up; as in their proper *Promptuaries*, and dilating themselves by their agility, enter into the *Carneous Fibres*, and become inflate, because then the *Muscle* contracted and expanded in *Latitude*, draws that part into which it is inserted, towards the *Head* of the said *Muscle*; but when the *Spirits* retire into another place, the contraction is at an end; and the *Muscle*, formerly more contracted, becomes longer, and is restored to its *pristin position*: So that the only cause of all the motions of the *Members* which are performed in an *Animal* is, because certain *Muscles* upon the *Spirits* emanation, are contracted, and those which answer them on the adverse part, by the departure of the said *Spirits*, are dilated and extended.

LXII. But if it be ask'd why this *Muscle* should be rather contracted, than those which are opposite to it, and all the *Fleshy Fibres* of one *Muscle* should be drawn into wrinkles, and be more tumid and rough than those of another? I answer, that it so falls out, because more *Spirits* flow to this than to the other, so that they render it shorter, grosser and broader. Not that the *Spirits* which immediately proceed from the *Brain*, are sufficient to move these *Muscles*, but because they dispose other *Spirits* which are already in these two *Muscles*, to pass out of one of them into the other; by which means that from which they pass becomes longer

and more remiss; and that which they enter into becoming soon inflate by them, is contracted, and draws along with it the *Member* to which it is knit, which may easily be conceived, as *Cartesius* observes, if it be but seriously considered; that there are but very few *Animal Spirits* which proceed from the *Brain* towards any one of the *Muscles*, but that there are always many others inclosed in that very *Muscle*, which *Spirits* are moved therein with a very swift motion. Sometimes by moving only circularly in the place wherein they are, that is, when they find no open ways to get out at, and sometimes by flowing into the opposite *Muscle*, because the *Apertures* are small in every one of these *Muscles*, by which the said *Spirits* may flow from one to the other, and are so disposed, that when as the *Spirits* which pass from the *Brain* towards one of them, have a little more force than those which pass towards the other, they open all those *Orifices* by which the *Spirits* of this may have a passage into the other, by which means all those *Spirits* formerly contained in these two *Muscles*, gain a very speedy *Conflux* into one of them, and so puff up and contract that, while the other is extended and remitted.

And that *Animal Spirits* have this efficacy, is most evidently evinc'd from their agility and mobility; forasmuch as in the twinkling of an *Eye* they pass through the whole *Body*; and having in some sort obtained the *Nature* as it were of an *immaterial Soul*, are carried with a most wonderful swift force into the *Muscles*, and in a moment induce a change of *Figure* into the *Members*. Hence *Galen* in the 13th Chapter of his *First Book De Motu Musculorum*, There is, saith he, in the *Ventricle of the Brain*, a *Spirit*, the first *Instrument of the Soul*, by which the *Soul* transmits both *sense* and *motion* through all parts of the *Body*. In the second place we see in our selves, that no action of *Life* is performed, but by the help of the *Animal Spirits*; and hence it is that a *Man* having his *Spirits* exhausted, faints and languishes: Likewise hence it is that the passage of the *Spirits* being obstructed, the *Apoplexy* and *Palsie*, nay, the *Epilepsie* and *Vertigo* also arise: Also hence it is, that by a too intense study, the *Head* is debilitated, and a great dissipation of the *Spirits* follows: In like manner as in a vehement motion of *Passion*, there is a perturbation of the same. Thirdly, The influx of *Animal Spirits* is plainly represented to the *Sense*, by a *Snail* inclosed in a *Glass Phial*, as *Henricus Regius* observes; for as soon as she begins to make her progress, first some, and then other *Spirits* with conspicuous *Bubbles*, are continually driven on from the *Tail* to the *Mid Body*, and thence to the *Head*; but as soon as the said *Snail* stops her progress, and lies still, immediately the motion of the *Bubbles* from the *Tail* to the *Head* is also stop'd. Moreover, in the motion of the *Snail* there seems to be a certain circulation of *Spirits*, passing from the *Tail* by the *Belly* to the *Head*, and returning from the *Head* by the *Back* to the *Tail*, being thence again to take their progress as before.

Now if any one should object, that there seems not to be so great a force in the *Animal Spirits* as to be able to move the whole *Body*, since in regard they are the most subtle parts of the *Blood*, how should so great a force come to be in so very

LXIII.
The Force
and Efficacy
of the *Animal Spirits*
in moving
the *Muscles*.

LXIV.
How there
should be so
great a
force in the
Spirits, as to
move the
whole *Body*.

thin a matter as to stir up and down, not only the *Leg* or *Arm* of an *Animal*, but also to Move, Govern, Heave and Carry from one Place to another the whole *Machin* of the *Body*? Who can be made to believe, that so great a *Body* as that of a *Bull* or *Elephant* can be impell'd by so thin a substance, and be disposed and excited to so swift a pace; nay and sometimes to a kind of *Dance*? I answer that this needs not seem strange at all, if we do but remember that the *Animal Spirits* have been already proved to be in the Nature of a most pure and subtle *Flame*, whose force appears no less in the *Body* of an *Animal*, than in *Fire* stirr'd up by *Gunpowder*, which being inclos'd in a *Great Gun*, or *Piece of Ordnance*, causes it, tho' a thing of that massy bulk and weight, to recoil a great way backward, and sometimes to burst; and with that force to shoot out and drive into so swift a motion a weighty *Bullet*. Since therefore an *Animal* is a sort of *Machin*, and all its motions are *Mechanically* performed, it must act according to the manner of other *Machins*; for example, *Bars*, *Wedges*, *Scales*, *Pullies*, *Cranes*, and the like, by which a small help or stress being added, things of great bulk and weight are lifted and remov'd.

LXV. There are two sorts of that *Engin* they call *Two sorts of Vectis*, saith the most learned *Gassendus*, which be-
cause they draw up Burthens by *Cords* and *Ropes*, they have the more peculiar Analogy to the *Organs of Motion in Animals*, forasmuch as one of the principal Motions is attraction, which is made by *Tendons*, as it were by *Cords*: Of these two sorts of *Vectis*, the *Trochlea* or *Pully*, than which there is nothing more known, and *Tympanum* or *Peritrochium* which is also very much in use, that is to say, when the *Axis* or *Cylinder* being fixt to it at one end, and in another part sustained by two Props upon which it may be turned, it winds about it self the *Cord* fastned to it at one end, and drawing up the Burthen by the other, is turned round by *Pegs* fixt into it all about this *Machin*. The *Latins* call a *Sucula*, a *Crane*; the *Vulgar* *Tornus*, a *Torn*. In the *Trochlea*, the Diameter of a small *Orb* supplies the place of the *Vectis*, which bearing upon a little immovable *Axis* as its *Hypomocion* or Underpropper, obtains a power of pression in that end where the *Cord* preft by the Attractor, urges most; and because the Burthen makes its stress upon no other extreme, but is tied to the uttermost *Cord*, it thence comes to pass that while that extreme gives way to the pressing power, or is lifted up; that part also of the *Cord* to which the Burthen is tied, is at the same time lifted up, and another Diameter, that is; another *Vectis* or Bar, and after that another immediately succeeds, and thus the attraction or lifting up of the Burthen is brought about; whereas in the *Tympanum* or *Sucula*, every *Scutula* or *Peg* is apparently a *Vectis*, in the extreme where of the force is incumbent from the *Hand*, deducing or drawing down; and whereas the *Fulciment* or *Prop* is allowed to be in the *Cylinder* it self, another extreme *Fulciment* must be allowed to be at the adverse part of the *Cylinder*, upon which in regard the Burthen makes no stress, but hangs upon the main *Rope*, it thence comes to pass, that while that gives way, the *Rope*, is wound about the *Cylinder*, and being still shortn'd

as it winds, lifts up the weight, and this is continued by *Pegs* or *Bars*, continually succeeding one after another: Now in an *Animal* there are not indeed such things as *Trochlea* to be seen, but to supply their place, there are so many as it were *Corrugations*, by which the *Tendons* are contracted, and the *Muscles*, themselves abbreviated as to *Longitude*. So that from them proceeds as it were a certain Series of *Trochlea*, in imitation of the *Polyspastic*, whose force is wonderfully vast; nor doth there appear any *Circumduction* or Winding about, in regard the revolved *Tendon* is shortned, nevertheless there is that which supplies the place thereof; namely, the *Contraction*, and as it were *Complication* of the *Tendon* upon it self, by the help of the *Animal Spirits*; whence it follows, that the part contracted comes nearer and nearer to the Head of the *Muscle*.

From this similitude of the *Vectis* with the *Machin* of an *Animal*, and from the manner by which we have above made out, that the functions of the *Body* are performed; it is clear enough evinc'd; that there is no necessity of a *Soul* in *Beasts*, for the producing of a Pulse of the *Heart* or *Arteries*, the *Concoction* of *Meats*, *Nutrition*, *Respiration* and *Procreation* of *Spirits*; but that they are produc'd without any *Cogitation*, and consequently that the parts of the *Body* in *Animals* are moved from place to place, in the nature of *Pneumatick* or *Hydraulic Automata*.

This hinders not but that the motions which are performed by the help of the *Muscles*, and influx of *Animal Spirits* are various, and not always excited in *Animals*; for example, that *Beasts* walk sometimes with a swift, sometimes with a slow pace, that they turn this way or that way, &c. Since this diversity of motions argues not any *Cognition* in them, as if they had any design in what they did or understood, what to Fly from, or what to Follow after, but because they are of such a Constitution and Fabrick that the *Pores* in their *Brain* are opened sometimes one way, sometime another, and their *Spirits* have a different influx into various *Fibres*, *Nerves* and *Muscles*, according as the *Organs* are moved by the *Objects*, and suggest manifold *Species* to them: For example, if a *Dog* be benum'd, or seiz'd by Cold, or any bad Weather, seeing a *Fire* a far off, he makes haste to come to it, not induc'd by any other reason, but because such an *Object* as that opens the passages of the *Brain* which terminate in the *Muscles* of the *Legs*, and so the *Animal Spirits* are transmitted to them, which causes him to approach near the said *Fire*; and being thus arrived, and finding the kind and grateful heat thereof; there ariseth thereupon such a commotion of *Spirits* in the *Brain*, that immediately they direct their course into those *Muscles*, which is the cause that he makes his stay there and lays him down to repose and cherish his benumbed *Members*; but if it chance that when he is thus laid, and inclining to *Sleep*, the *Fire* should be over-hot and scorching, or a Spark should shoot out from a burning Coal, and leap upon his Skin and burn him, this agitation of the singeing heat immediately opens those *Pores* of the *Brain* which draw down to the *Muscles* of the *Neck*, *Eyes* and *Feet*, and attend their motions; so as that he presently rouses himself, looks upon the *Fire*, and with a swift pace retires from it. Or if the Master

Animals
are meer
Automata.

LXVII.
Whence the
diversity of
motions in
Animals, if
they have
no Soul.

of the House by chance, from abroad comes home, and comes in view of the *Dog*, immediately upon sight of him, the passages of his *Brain* are open'd, as by custom so disposed, in so much that he directs his course to his said *Master*, and testifying his joy by wagging his *Tail*, fawns upon him. But if a *Stranger* enters, whose Countenance and Habit of *Body* are unknown to him, his Aspect and unwonted Scent he brings along with him, stir up the *Dog* to a contrary motion, by opening those *Muscles* which attend upon his Barking-fit, and conduce to the warfare of his *Teeth*, and stirring up of his Anger; so that all the motions which are performed by a *Dog*, are excited by *Objects*, which being received into the Sensories, dispose the *Spirits* to an Influx into several parts of the *Body*, which are adapted and conducive to move them,

LXVIII. In Man also many motions are effected without the concurrence, nay, against the consent of the Soul. The *Peripateticks* ought not to be troubled, that we attribute the motions of *Animals* to the disposition of their *Organs* only, and make out all their sensible actions without any help of the *Soul*, when as if they would seriously inspect into themselves, and consider well what is done within them, they would find the same thing altogether in themselves: For who is there that is not taught by experience, that various motions daily arise in his *Body* without any concurrence; nay, oftentimes against the *Will*, and with the reluctance of the *Soul*? In *Convulsions* or the *Colick Passion* some part of the *Abdomen* are twitch'd, whence an acute Pain arises, the *Bellows* are contracted, and the *Narvil* is drawn in: Often-times the *Intestines* by an inverse motion of the *Fibres*, are pulled upwards, the *Ureters* and *Urinary Vessels* are so impelled one against the other, that in the whole *Fit*, *Urin* is either totally supprest, or is voided very sparingly and by drops: All this while no Man certainly will maintain, that the *Soul* connives at these motions, when he that suffers such grievous *Maladies*, cannot but most earnestly with himself free; and there is no Man but must vehemently complain of *Pain* during the *Contraction*, *Inflation* or *Astriction*. The same might be demonstrated in a world of other Examples, but let these few suffice, that we may not seem to dwell too long upon a thing perspicuous enough of it self. They that fall down from any high place, fall so that their *Hands* come first to the *Earth*, so as thereby to save the *Head*; and this they do not any way consulting, but because the sight of the impendent fall, reaching to the *Brain*, directs the *Animal Spirits* into the *Nerves* in such a manner as is necessary to produce this motion, as it were in a *Machin*. Likewise if any one unexpectedly should hold up his *Hand* towards our *Eyes*, as it were offering to strike us, tho' we were sure of his *Friendship*, and well satisfied that he did it but in *Jest*, and designed nothing less than to do us a mischief, yet we should hardly refrain from shutting our *Eyes*: Which evidently shews, that this shutting of them is not any work or design of the *Soul*, since it is done against our *Will*, and our *Will* is the only, or at least principal action, but because the *Machin* of our *Body* is so compos'd, that the motion of the said *Hand* to our *Eyes*, excites another motion in our *Brain*, which draws down the *Animal Spirits* into those *Muscles* that let down and depress the *Eye-lids*.

The same thing is to be supposed of other motions of the *Body*, for upon the sight of any delicate or enticing *Meat*, not only the innermost *Jaws* are moved with a desire thereof; but the *Tongue* and *Palate* being moistned with *Spittle*, cause a certain, as it were *præmansion* or fore-chewing, as we may so call it: So that this sort of *Meat* is the occasion that the *Spirits* direct their course towards those *Muscles* which are inservient to the *Jaws*, *Tongue* and *Palate*, and contribute motion to them. The same is to be said of *Itching* and the *Veneræal Motions*, which upon the sight of any *Veneræal Object*, are excited in those parts that conduce to the performance of this Scene.

For doubtless if all the motions of our *Body* depended upon our *Will*, and we could govern our *Members* at pleasure, there would certainly be found no *Paralyticks*, or Persons troubled with a *Palsie*; none deprived of motion all the *Body* over, or in any of its parts. Forasmuch as there is no Man, in whom there is not a *Will* to move his own *Members*, and free himself from that resolution or untying of the *Nervous Parts* which takes away *Sense* and *Motion* from him. Who would suffer the use of any of the parts of the *Body* to be taken from him, if it were in his power to open the Obstructed Passages, and make way for the *Animal Spirits*, by which they may be transmitted, and may influence, plump up and actuate with vigour the *Nervous Parts*?

Now there are not only *Natural Motions* which are performed in us without the help of our *Knowledge* or our *Will*; but there are also a world of those which they call *voluntary* or *spontaneous Motions*, which are effected by the disposition only of the *Machin* of the *Body*, without any thought or design contributed thereunto by our *Soul*: For if, while we think upon any other thing, a spark of *Fire* chances to light upon our *Hand*, we presently start back with all imaginable swiftness, there needs no deliberation for so doing, our *Will* not being concerned in this motion, our *Hand* is drawn back before we can have so much as a thought thus to snatch it away.

If we have a mind to stoop for the taking up of any thing upon the *Ground*, we draw back one *Leg*, so to give us the better advantage to counterpoise the rest of the *Body*, which hereupon leans forward: If walking upon a dangerous path, we chance to slip, we immediately lift up that *Arm* which is opposite to the place where our *Body* just before inclin'd upon its fall, and by this means we give a stop to the force of the fall, and sustain our selves the better, in regard the *Arm*, thus lifted up, keeps off its whole weight from the middle of the *Body* where the center is; and by this enlightenment gains sufficient force to counterpoise the rest of the *Body* which inclined on the other side; as we see that in a *Ballance*, a small weight hung at a distance from the Center thereof, holds an *equilibrium* against another far greater which is nearer the Center.

And this we learn'd when we were but *Infants*, that weights far distant from the Center, have always so much the more force, and that the *Arm* lifted up hath the more power to sustain the weight of the *Body* when it begins to fall, and that the Center of gravity must be always under our Feet. But tho' we practise all these Rules, with the same

LXIX. If all the motions of the Body depended upon our Will, there would be no Paralyticks.

LXX. There are also certain spontaneous Motions without Design or Will.

LXXI. Of motions made to hinder us from falling.

LXXII. That motions proceed not from any Cognition or Knowledge.

exactness as the most able *Philosophers*, all the reflexions we make upon the *Laws of Motion* and of *Equilibrium* are useless and unprofitable in the *Practick*, and so far are these *Sciences* from being able to serve us upon any occasion, that they would be rather very prejudicial, were we minded to make use of them; since certain it is, that we perform better all these *motions* when we think not on them, than when we are intent upon them. We must therefore of necessity acknowledge, that whatever is acted in us, is without our *knowledge*; at least that *knowledge* we have sometimes by *reflexion*, is not at all the cause, since these *motions* prevent us in our *thoughts*; and these *thoughts* employed about them, rather hinder than help us. If then these *motions* so regular, so proportioned to their *performances*, so conformable to the *Laws* and *Rules* of the most refined *Philosophy*, can be performed so effectually and to the purpose in Man without any *Cognition* or *Knowledge*, how comes it that *Brutes* act by *Knowledge*? And why should it not rather be generally allowed what we maintain, that they are able to act by the disposition of the *Machin* of the *Body* only, according as we act by the like disposition of ours?

LXXIII. How unaptly and improperly do some *Philosophers* and *Physitians* speak, tho' seeming to utter great things, when with a *Magisterial Countenance* they pronounce that *Nature* abhors a *Vacuum*, and shews an aversion to what is disagreeable to her; that a *Medicin* chooses what *Humours* to attract, and passes by and leaves untouched others; *Nature* disposes her self to a *Crisis*, as to a *Combat*; that she *indeavours* to subdue or throw off the *Hostile Matter* of the *Distemper*, that being vanquish'd, she is reduc'd as it were to *desperation*, and as it were throws away, or lays down her *Arms*. By which *ways* of speaking, they do but fly to a pretty handsome way of concealing their *ignorance*; and that they may not seem to be put to a nonplus, and have nothing to say, they attribute to *occult Effects*, some, tho' no less *Cause*. Because, since *Appetite*, *Election*, *Will*, *Hatred*, proceed from our *Mind*, and are noother than various *modes* of thinking; we could not but be conscious of them, if they were found in us. But since we neither have a *Will* or *Aversion* to any of those things aforesaid, to which these *motions* tend, nay, are ignorant after what manner they are effected; they must maintain that these sort of *motions* are not found in us, or if they are found, that they have the *Body* only, that is, the disposition of the *Organs*, and influx of *Animal Spirits* for a *Principle*. Which how absurd it is to assert, no Man in his *Senses* can be ignorant, who knows that the *Mind* is distinguish'd from the *Body*, and that the ways of each are different one from the other. Otherwise what have we to do but to agree with the most illustrious *Verulam*, That to all *Bodies*, of whatsoever quality, destitute of *Sense*, there is inherent a certain faculty of perception, if it be true, that when *Body* is applied to *Body*, there may be apprehended in them something very *Analogous* and *Cognate* to *Election*, in admitting things agreeable, and excluding or rejecting things ungrateful. What should we do, but allow *Cognition* to *Plants*, if some of them contract a friendship with others, and covet some parts of the *Earth* to harbour in more than

others, and make choice to themselves of what *Aliment* is most agreeable to them? And if others on the contrary fly so much as the touch of Neighbouring *Plants*, are pleased with a *sandy* or a *plashy Soil*, one more than the other; and several of them have an abhorrence, some of *Cold*, some of overmuch *Heat*? What should hinder us from believing that the *Stomach* is indued with *Understanding*, if it discerns what is hurtful, from what is wholesome, and hath an *Appetite* to things only agreeable to it, and having taken *Poison*, is provoked to *Vomit*? For these *actions* belong to the *Soul*, and that thing must needs be indued with *Cogitation*, which loves and makes choice, which hath an *aversion*, which hath an *abhorrence*, which is delighted with one thing more than another, and hath an *Appetite*: So that I can by no means agree with the most Famous *Harvey* in his Opinion, that all parts of the *Body*, which by their own *motion* strive against *provocation* and *injuries*, enjoy a certain *sense* by which they are impelled to *motion*, and consequently that the *motions* and *actions* which the *Physitians* call *Natural*, are not performed without *Sense*; and that there is a certain *Latent Sense*, by which they are excited, provoked and altered; for were it so, we must consequently acknowledge that the *palpitation* of the *Heart*, *trembling*, *fainting fits*, *swooning fits* and alterations of the *Pulse* in *Magnitude*, *Celerity*, *Order* or *Harmony* which proceed from *Morbifick Causes*, altering and hurting the *Sense*, are indued with *Sense*.

Nor am I more inclinable to the Opinion of the *Peripateticks*, who attribute *Sense* to *Brute Animals*, and are perswaded that they *See*, *Hear*, *Smell*, &c. in the same manner as we do; which certainly no Man will allow, who forms to himself a true *Idea* of *Sense*, and hath attain'd so much *Judgment* as to understand what is included in the *Notion* or *Conception* of it; forasmuch as *Sense* is not distinguished from *Cogitation*, and is applicable to a thing *Spiritual* only and *Incorporeal*, from which it cannot be separated. Hence *Hippocrates* in his *Sixth Aphorism*, and *Second Section*, They, who being agrieved in any part of the *Body*, yet feel no pain, their *Mind* is certainly sick. If therefore they are not sensible when the *Mind* is sick, so as not to be intent upon the *Organs* of the *Senses*, much less can any other *Creature* be sensible of those things which beat upon the *Sense* less violently, unless the *Mind* be present; as we also find by experience in our selves. For it very often happens, that we run over with our *Eyes* the *Letters* of any *Writing*, and that our *Ears* are smitten with the *sound* of *Words*, tho' we neither *understand* nor *perceive* either the one or the other, because our *Mind* is set upon certain things, each of which nevertheless afterwards returns, and is represented to our *Cogitation*: If therefore Men who are indued with *Mind*, when they attend not, but are employed elsewhere, are not sensible; much less can *Animals* be sensible, who are *Senseless* and destitute of *Mind*. So that *Plutarch* rightly concludes in his Book *De Sagacitate Animalium*, *Mentem tantum videre & intelligere*, &c. That the *Mind* only sees and understands, and that all things else are *surd* and *blind*, in regard the passion of the *Eyes* and *Ears*, when they are smitten by *Objects*, stir up no *Sense*, if the *Cogitation* of the *Mind* be absent.

Nor

LXXIV. Nor less improperly they who attribute *Sense* to *Brutes*.

LXXV. Sense is to be distinguished by three degrees.

LXXV. Nor do *Aristotle's* own words, *Section II. Problem 33.* make less for our business; for the *Philosopher* having made an inquiry, why *Night* is more accommodated for *hearing* than *Day*, after he had quoted *Anaxagoras* his Opinion, who judged the reason to be because the *Air* in the *Day* time, heated by the *Sun*, hisses and makes a Noise, but by *Night* is silent and at rest, the *heat* being then gone; goes on with his Discourse in these words, *Quoniam Corpora interdu, &c.* because *Bodies* by *Day*, variously divide and disperse the force of *Understanding*, and put it upon divers operations, so that the *sense of hearing* plain is taken away; and by reason we act and manage all things more by *Day* than by *Night*, the *Intelligence* it self is hindered and interrupted by the affairs of the *Body*: But *Sense* when it is separated from *Intelligence*, is upon, as it were, an insensible work; whence that saying, *Mens videt, Mens audit*, the *Mind* sees, the *Mind* hears; that is, perceives *Objects* which finite the *Organs* of the *Body*, for no other things are thus perceived by the *Mind*; whence it follows necessarily, that those things which are void of *Mind*, are also destitute of *Sense*.

LXXVI. But some will start up, and cry out against this Opinion as Cruel, and will call it the utter extirpation of *Animals*. What, will they say, will you deprive all *Animals*, not only of *Intelligence*, but also of all *Sense*? O Barbarity! What can be more oppugnant to Experience, and the common Opinion of all Men? Do we not daily behold *Beasts* coming nearer and nearer to perfection, looking seriously upon visible *Objects*, and receiving sounds in at their *Ears*, by which sounds they are excited to *Labour*, to the running of *Races*, to *Meat*, to *Drink*, and other such like actions? who knows not that a *Cat*, *Dog* or *Ape* distinguish their Food by *smelling*, and hunt after that which is agreeable and grateful, and fly and eschew that which is ungrateful and noxious? How can it be that a *Spider*, sitting in the midst of his *Web*, can feel when a *Fly* is intangled in the remotest part, and yet be destitute of the *Sense* of *Touching*?

LXXVII. Our business therefore is to shew, for what reason we exclude *Sense* from *Beasts*; and how it comes to pass, that they have *Eyes*, yet see not; are provided with *Ears*, yet perceive no sounds; are not without a *Nose*, yet smell not; have the use of a *Tongue*, yet discern nothing by any different relish or *Savour*; which the better to effect, we propose a thing Note-worthy; that our *Sense* is to be distinguished into three degrees. The first degree contains that simple motion which the *Object* impresses upon the *Nerves*, or that whereby the *Organ* of the *Body* is immediately affected by external *Objects*, which can be nothing else but the agitation of the particles of the said *Organ*, the change of *Figure* and situation proceeding from this agitation: For *Sense* consists in *Motion*, and as *Aristotle* asserts in his Third Book, *De Animalibus*, Chap. 13, no motion can be had without contact. So that a *Corporeal Organ* must needs be touch'd after a *Corporeal* manner, and motion must needs be impress'd upon sensible things. When, I say, that the motion of an *Object* is impress'd upon a *Corporeal Organ*, I would not have it understood that the motion, for example, of the *Eye*, is only made there, but that it passes up to the *Brain*, from whence the *Fibres* of the *Nerves*,

like *Lutestrings* in a *Lute*, are stretch'd out to other Members. The Second Degree contains *Perception*, which is tied to that motion, whenever this impression is carried to the *Pineal Glandule*, or seat of the *Soul*. Such are the perceptions of *Pain*, *Tirillation*, *Thirst*, *Hunger*, *Heat*, *Sound*, *Savour*, and the like; which, we say, arise from the substantial Union of the *Soul* with the *Body*. The Third contains all those *Judgments* which attend those *Perceptions*, that is to say, those *Judgments* which, from the very first we have ever used to make of things without us upon occasion of the motions of a *Corporeal Organ*. Or to comprehend these three Degrees of *Sense* in fewer words. The first Degree is the affection or motion of a *Corporeal Organ*: The second the perception of that impression which is proper to a *Corporeal Organ*: The third the determination of *Judgment* to affirm, or deny any thing. And still to render the matter a little more plain, when any one beholds, for example, the *Moon*, the *Corporeal Organ*, that is to say, the *Eye* is moved, or affected by the *Light* which is reflected by the *Lunar Body*; and herein consists the first Degree: The *Mind* presently perceives the *Light* or *Colour*, and this is the effect of the second Degree. Moreover the *Mind* assigns *Colour* to the *Moon*, that is, delivers its *Judgment*, as asserting that the *Moon* is coloured, and this is the result of the third Degree.

These things thus premised, it manifestly follows, that *Animals* are void of *Sense*, properly so call'd, unless we admit for *Sense*, that *Corporeal Motion* which preceeds *Perception*; and hath reference to it, as to something begun and imperfect. For it is of *Corporeal Motion* only that *Animals* are capable; nor do we deprehend any thing to be in them, which can persuade us that they are sensible, if the word *Sense* be taken for any other than the impression of the external *Object* upon the *Organ* of the *Senses*: So that those persons that think the motion of a *Corporeal Organ* deserves the name of *Sense*, are no less absurdly persuaded, than they who maintain that the *Optick Cubicle* sees while it receives the *Species* of external *Objects*, and represents things done without. That the *Eye* of a slain *Ox* sees wherein all things are distinctly delineated, no less in than the *Retin* or *Network Tunicle* of a surviving *Ox*. That *Men* see, who, like *Hares* sleep with their *Eyes* open; and cannot be discern'd to be awake, any otherwise than by the loosning of their *Eyelids*. When as the *Optick Chamber*, the *Eye* of the dead *Ox*, the *Retin Tunicle* of a sleeping *Person*, receive the *Species* of external things; and in the same manner as they represent the *Picture* of *Objects*: So that if *Corporeal Motion* be allowed to enjoy the name of *Sense*; by the same force of Reason it may be infer'd, that it may be attributed to *Inanimate Things*.

But I can easily imagin what may be objected against this *Ratiocination*; namely, that a *Body* is the Instrument of *Sense*, whose action must needs intervene to our *Sensations*, and consequently that for producing of *Sense*, there is required an *Organ* disposed after a certain manner; that is to say, into which the *Animal Spirits* may flow, and whose motion may reach up to the *Brain*, which without motion cannot be done. All these Conditions I willingly grant, and I confess it is requisite for the making of us sensible, that an *Organ* be

LXXVIII.
How Sense may be applied to Brutes.

LXXIX.
Sense consists not in the motion of a Corporeal Organ, but in Perception.

modified by certain *dispositions*; but I only insist, that neither the *action* of an *external Object*, by which the *Organ* is moved and disposed; nor the *mutation* of *Figure* and *Situation*, which promotes that *Action*; nor that *transmission* which is made to the *Brain*, are *Senses* or *Apprehensions*; but that which immediately results in the *Mind*, which is joined to the *Corporeal Organ*, so disposed: For how can that saying of the Prophet *Isaiab* be understood, *In hearing ye shall hear, and shall not understand; and seeing ye shall see, and shall not discern*: Unless the first degree be supposed to be distinguished from the Second, and that *Corporeal Motion* may be disjoined from *Perception*, or attention of *Mind*.

LXXX.
Corporeal
Motion may
be had
without
Sense.

But what need is there to have recourse to *Holy Scripture*, to prove *Perception* to belong to the essence of *Sense*; and that the *work* of the *Mind* is required to be concerned, when we are said to *hear, see, smell, &c.* since we find it not seldom by experience in us, as namely when the *Mind* being very much taken up in *contemplating* other things, a *Man* may pass by us, and not be taken notice of, tho' our *Eyes* be open, and directed towards him, there being no obstacle in the way to hinder; and so likewise not observe his *Speech*, tho' our *Ears* be open, and immediately take in *sound*; We may also not *taste* the relish of *Meat*, tho' the *Fibres* of the *Tongue* be smitten by the *Corpuscles* of the *Meat*; and the whole plexure of the *Organ* benever so clean, and void of all clog or impediment: Lastly, we may be exempted from the *pain* of *Cold*, tho' in a rigid *Climat*, and the *Air* ready to *freeze*, through the bitterness of the *weather*. All which things sufficiently prove, that not the *Members* or *Organs*, but the *Mind* only do *see, hear, taste* and *feel*.

LXXXI.
How those
are mis-
taken, who
from exter-
nal actions
judge
Brutes to be
sensible as
we are.

Whence it is apparent how foolishly those persons reason, who because they observe *Brute Animals* to be mov'd by the *Species* of *external things*, and to feed as *Men* do on *Meats* offer'd them, to be affected with *sounds*, to be taken with the aspect of some *Objects*, and *frighted* with that of *others*, presently infer that *Beasts* also are sensible; that is, that they think and give attention to any thing that is offered; whereas indeed all those *motions* in *Animals* are performed without any concurrence of the *Soul*, and only effected by a blind impulse of *Organs* and *Animal Spirits*. This error hath grown up with us from our *Infancy*, as *Clauber- gius* observes in his *Prolegomena Logica*, by reason that at that time, and in that very moment, in which our *Corporeal Organs* were moved by *external things*, the *Mind* joined to the *Body* had still a perception of some thing, and so we taking both for one, attribute perception to the *Corporeal Organs* of the *Senses*; which the *Wise* attribute only to the *Intellect* or *Understanding*. Hence we say generally by way of familiar speech, that the *Eye sees*, that the *Ear hears*, that the *Tongue tastes*, that the *Nose smells*, that the *Hand feels*; nay, which is more, because whilst the *Body* was affected with *external things*, the *Mind* also perceived something, and thereupon presently made a judgment of something; hence we ascribe *estimation* and *judgment* to *Corporeal Organs*, to which nevertheless the *Philosopher* knew well enough that *Body* is not desired, but that besides the apprehension of the *Intellect*, the assent of the

Will is also required. For just as it often happens in other things, so doth it also in these *Acts* of *Understanding*, *Imagination*, *Perception* and *Judgment*, namely that they are often taken one for the other, and confounded together, and only for this reason, because they exist together at the same time. So because whilst the *Eye* is moved by the *Light*, the *Mind* also joined to the *Body* perceives something, and at the same time judges; therefore these three different things, viz. the *motion* of the *Body*, the *perception* of the *Mind*, and the *judgment*, are all taken by the *Vulgar* for one and the same thing, and are all express'd by that one term of *Seeing*, as when they say *I see the Sun*. But the *Wise* are far above this manner of *speaking*, as well knowing the difference between that which, in our *sensations* belongs to *Body*, and that which belongs to *Mind*; for the *motion* which an *external Object* impresseth, and the *mutation* of *Organ* belongs indeed to *Body*; but it comprehends no *Perception* or *Cogitation* which is proper to the *Mind*, and from which it cannot be separated.

This Opinion *Divine Plato* maintains in *Marsilius Ficinus*, in his *Argument* against *Thetetus*: We must note, saith *FICINUS*, that *Plato* allows no *Cognition* to *Body*, as likewise no *Life*: That which lives, is sensible; the *Soul* lives, and the *Soul* is sensible; but in the *Body* there is neither *Life* nor *Sense*; yet the works of *Life* and *Sense* are visible in it. So that those which some call the *Five Senses*, he will have to be called the *Five Organs* of *Sense*, and asserts that nothing hath any *sensibility* by these *Instruments*, but that through these, as it were, passages, each part of *Sense* is performed by one certain force of the *Soul*, which operation he calls the *Common Sense*; into which various passions have influx as *Lines* from the circumference to the Centre of a Circle. *Colours*, through the *Eyes*; *Sounds*, through the *Ears*; *Odours*, through the *Nose*; *Savours*, through the *Tongue*: Lastly, *heat, cold, moist, dry, grave, light, soft, hard, smooth, rough, rare, dense, acute and obtuse*, through the whole *Body*. That this *Soul* is sensible, not by many, but by one power, is apparent, since when we feel *heat*, we do not give this *Sense* the appellation of *Voice*; nor when we perceive any thing of a *Savour*, do we call it *Odour*. He cannot distinguish one thing from another, who knows not both. No one *Organ* performs the same things as another doth; or if the same things, not in the same manner; so that the distinction of those things which are perceived is not in the *Organs*, but in one certain power of the *Soul*, perceiving each thing, and distinguishing all things one from another. All which, since the *Soul* alone is able to effect, as the *Peripateticks* themselves cannot deny, what need is there of many *Senses*.

From which words of *Plato*, we may thus argue: If *Sense* resided in a *Corporeal Organ*, it might be said the *Eye sees*, or the *Ear hears*; but according to *Plato's* Opinion, neither the *Ear hears*, nor the *Eye sees*; nay in the *Body*, there is neither *Life* nor *Sense*; only by it the works of *Life* and *Sense* are made to appear: And it is the *Soul* as *Marsilius* saith in another place, which is in *pain* or *rejoiceth*, not the *bulk* of the *Body*; consequently there is no *Sense* in a *Corporeal Organ*.

From

LXXXII.
According
to Plato
there is no
Sense but
from the
Soul.

LXXXIII.
Corporeal
Organs
perceive
nothing.

From hence also it is clearly to be deduc'd, that *Brutes*, since they are void of *Mind*, and have nothing but *Corporeal Motion*, do not, for example, *see* like us, that is, as being sensible, or taking notice that they *see*, but only as we do when our *Mind* is elsewhere employed, or called aside, tho' the *Images* of external *Objects* are painted in our *Retin Tunicle*, and perhaps also their impressions being made in the *Optick Nerves*, dispose our *Members* to different *motions*; yet nevertheless we perceive nothing of them: In which case it appears also, that we are moved no otherwise than as *Automata*, as hath been already declared by several Examples.

LXXXIV. Wherefore if all the Freaks of the *Brain*, and all the *motions* of the *Animal Spirits*, which are caused by the *Nerves*, must needs be called *Senses*; it may be said that *Animals* have five exterior *Senses*, because there are five sorts of *Nerves* which convey the impressions of *Objects* to the *Brain*, and which dispose the *Animal Spirits* to insinuate divers ways into the *Muscles*, for the moving of the *Members*: Hence it is, for example, that *Animals* are said to *see*, when the *Light* enlightens the *Optick Nerves*, and by them the parts of the *Brain*, from whence they have their *Original*; that they *hear* when the *Air* which hath been smitten by any resounding *Body*, strikes upon the *Nerves*, which terminate in the *Ears*: That they *taste* when the *particles* of the *Viands* which they chewed, have force enough to enter the *pores* of the *Tongue*, and so excite the *Nerves*: That they *smell* when the most subtle parts of the *Body* which they inviron, being mingled with the *Air*, which causes *Respiration*, hit against the *Nerves* that terminate in the *Nose*; and that there is simply a *Sense* of *Feeling*, when any exterior object is immediately applied to some part of their *Body*, and have force enough to agitate the *Nerves* which there terminate. It is said likewise that they have *Sense* of *Pain* when the agitation of the *Nerves* is very violent, and that they have relaxation of *Pain*, when this agitation is indifferent; but all these *sentiments* are nothing else but the power which the *Animal Spirits* have to be disposed by the presence of *Objects*, to pass through the *Brain*, and through the *Nerves* into some certain *Muscles* rather than others; and by consequence that there are no *Senses* but according to the first degree, that is to say, that they have none but *Corporeal Motions*.

LXXXV. The Famous Dr. WILLIS in his *Exercitation* on concerning the *Soul* of *Brutes*, where he acknowledges a *Corporeal Soul* in *Brute Animals*, and fancies it to be of an *igneous* or *fiery Nature*, and of kin to *flame*, thinks it no absurd thing that there should be allowed in *Animals*, a power to speculate and discern the *Images* of sensible things delineated in the *Brain*, and to draw forth, according to the impressions there conceived, *Appetites* and respective *Acts* of other *Faculties*. In regard tho' the *Soul* and *Body*, taken apart may not have the same power; yet this hinders not, but that from a certain Law of the *Creation*, as he calls it, or Institution of *Almighty G O D*, an *animated Body* may be so disposed, that from *Soul* and *Body* joined together, there may result a *confluence* of such sort of *faculties*, as shall be needful for every *Animal*, for the ends and uses designed it. In

many things framed by *Human Art*, the *Workmanship* hath exceeded the *Materials*, as who would think that of *Iron* and *Brass*, the most fixt and unactive of *Metals*, an *Instrument* should be composed, whose *Orbs* imitating the *Celestial Orbs*, should observe *motions* little differing from perpetual, whose *periods* renewed by a constant vicissitude should most certainly measure the spaces of *Times*? No wonder that from a *Wind* blown into a *Pipe*, a rude and simple *Sound* should be produced, but that from a *Breath* infused into *Musical Organs*, and so variously transmitted through manifold apertures of *Valves*, or stops into such and such *Pipes*, a most grateful harmony should arise; this, I say, we cannot but admire, and confess withall, that this effect far exceeds, as well the matter of the *Instrument*, as the *Hand* of the *Musician* playing, tho' the *Musical Organ* require for the most part the skill of the said *Artist*, by whose direction the *Breath* admitted, now into some, now into other *Pipes*, performs manifold *Harmonies*, and almost an infinite variety of *Moods*. So in some *Brutes* of the more perfect kind, whose *Actions* are ordained for many and more noble uses, there ought to be attributed a certain faculty, that is, the *Brutal Soul* it self, naturally so endowed, as to be rendred knowing and active about some things necessary for it, by various accidents with which it uses daily to be affected, and afterwards is taught to know other things, and to exert far more, and more difficult *Actions*.

This similitude I easily admit, as from which much *Light* is added to the fore said *Reasons*, demonstrating, that *Brutes* are merely *Machins*, which act according to the *Laws* ordained by the *Creator*, and after the manner of a *Musical Instrument*, which by a *touch* or *breath* infused, produces most admirable *Harmony*: Forasmuch as by the circuit of the *Blood* through the whole *Body*, they effect all their *motions*. But still I am not able to comprehend how from the union of two material, and consequently insensible *substances*, *sense* and *perception* should arise: For however in *Machins* the Matter is exceeded by *Art*, and from the mixture of divers *Metals Instruments* are framed for wonderful performances, yet this argues not that Matter can ever be brought to that perfection, as to be apprehensive of things that occur to them, and to be sensible that they apprehend them. But suppose that by a certain Law of the *Creator*, there may be attributed to a *Body* instructed with *Organs*, and designed for certain uses, some power of sensibility, which cannot belong to *Body*, nor *Soul* taken apart, but only to a compound resulting from both. Yet by the leave of this most Learned Man, I would gladly know what that Principle of Sensibility is, whether some substantial Mode, by which a thing *Animate* is differenc'd from a thing *Inanimate* and insensible, by the access whereof an *Animal* is constituted? But nothing is found in an *Animal*, which can distinguish it from things *Inanimate*, excepting the *Blood*, which by an incessant Motion, is impelled into the *Veins* and *Arteries*, to nourish the parts of the *Body*. Now what activity is there in the *Blood* that it should impart sensibility to the *Body*? Is there haply a certain *Universal Soul* coævous to Matter, which actuates it, and brings it to perfection, according to its various

LXXXV.

ledge of
Brutes
disf.

dispa.

dispositions? This being granted, who will not see a necessity, that then not only *Animals*, but *Plants* also and *Stones* must have *Sense*: Forasmuch as that active and Energetick Power, by the same right may as well be infused into them by the great Founder of *Nature*; or is it some Principle Emerging from *Soul* and *Body* joined; by which an *Animal* is rendred capable of knowing the impressions of *Objects*? Surely whatever this Principle may be fancied to be, since it must need be *Material* and *Extense*, it cannot be indued with the power of *Acting*, *Thinking*, *Perceiving* and giving *Intention*. For it is not to be understood, how from *insensible things*, another *thing* should arise which is *sensible*, and *perceptive*? By what means a *corporeal thing* should produce *spiritual Acts*; and that which is *extense*, should bring forth that which is void of all *extension*?

LXXXVII. But if this most famous *Author*, while he allows The Idea of a Principle of *Cognition* to *Brute Animals*, means that their *Cognition* is nothing else but the reception of a *material Species*, or a various motion of some interior part of the *Brain*, we give our *Hand* and subscribe to his Judgment; since we acknowledge and confess, that these sorts of different motions in *Brutes* are affected by various impressions of *Objects*. But we can by no means be inducd to grant, that the *Idea* of *Local Motion* agrees with the *Idea* of *Cognition*, or that the *Perception* and the *Motion* of a *Corporeal Organ* are not distinguish'd from each other, in regard since *Body* and *Mind* are totally different in their kind, and the distinction which is between the *mode* of one *Substance*, and the *mode* of another *Substance*, is real; it must needs be that the difference between *Perception* and the *Motion* of a *Corporeal Organ* is equal, and consequently that they cannot both proceed from the same Principle.

LXXXVIII. Haply, for this cause some of the more Modern *Philosophers* deny rationality and discourse to *Brutes*, as being inconsistent with *Material Organs*, since they judge *Beasts* incapable of beholding any thing with reflection; yet cannot persuade themselves, that they do not perceive, so long as they behold *Objects*. What, say they, shall they behold *Objects* with their *Eyes*, receive *Sounds* into their *Ears*, and yet not conceive these different *Species* or *Images* painted in some part of the *Brain*? What should hinder, but that as there is allowed a double *Memory*, one *Sensitive* the other *Intellectual*; so in like manner, there may be supposed one *Sensitive Perception*, another *Intellectual*? To this, besides what hath been already urged in some former parts of this *Discourse*, there needs no other answer, but to affirm, that by admitting such a *Perception* in *Brutes*, they grant them a degree of *Perfection* equal to that of *Men*, if not greater: For wherein do they imagine *Sense* to be distinguish'd from *Reason*? Doubtless herein the *Cognition* is apprehensive of *Sense*, and simple, therefore not obnoxious to falsity: whereas the *Cognition* of *Reason* is a little more *Composite*; and it may be made out by the conclusions of *Syllogisms*, that it seems no way to argue a greater perfection, especially since they affirm the *Cognitions* of *G O D* and of *Angels* to be most simple; and only intuitive or apprehensive, and perplex'd by no intricacies of *Discourses*; so that by them, if we may so say, the *Sense* of

Animals comes nearer to the *Cognition* of *G O D*, and of *Angels*, than *Human Reason*.

As to the *Sensitive Memory*, or memory of *material things*, we easily allow it to *Beasts*, since it is fixt to a *Corporeal Organ*, and depends upon the *Vestigia* or footsteps remaining in the *Brain* after some *Image* had been impress'd upon it; forasmuch as those *Vestigia* are no other, as I have at large made out in my *Institution of Philosophy*, than certain *Paths*, which the course of the *Animal Spirits* hath left among the *Fibres* of the *Brain*, through which at first they passed, in the same manner as *folds* in *Paper* or *Linnen*, render the said *Paper* or *Linnen* the more apt to readmit the same *folds* as before, I say more apt than if no *folds* had been made there; whereby it comes to pass, that the *Fibres* of the *Brain* are indued with a *Power* of attracting and disposing the *Spirits*; so that the next time they may have egress through the same *Vestigia*, in the same manner as they had egress the first time. So that this sort of *sensitive memory*, consists in the disposition of the parts of the *Brain*, inducd from the *Objects* through the *Senses*. Which disposition, if it happen to be inverted, or destroy'd, the *Memory* immediately must of necessity be either weakned or utterly perish: As may be proved by many examples in those, who either by the blow of a *Stone*, or by the sharpness of some *Distemper*, or by a fall from a high place, have lost the use of their *Memory*, forgetting all those things which they knew before. See the *Natural History*, the last Part. Nay some there are who have had the *Vestigia* of their *Brain* so far disturb'd by the overmuch taking of *Tobacco*, as to abolish all signs of things, and to overthrow the *Characters* long since there impress'd. Whence it is plain that the *Memory* is a *Corporeal Faculty*, which by the *Vestigia* which it conserves from the *Species* of *Objects*, hath a power of exciting those *Images* anew, and of procreating the *Ideas* of things formerly done.

Nothing therefore hinders, but that *Animals* may remember,

And mindful Goats unto their Huts return.

(as *Virgil* hath it in his *Georgicks*) while the *Images* of *Corporeal Objects* recur in the same order as they entred the *Loculi* or *Cells* of the *Brain*, and stir up the same kind of motion in their *Nerves*. Yet all this while they do not perceive that they remember, nor do they, neglecting other things, make any choice of what they chiefly have need of, nor search after new things, nor call to mind former configurations, but act after the manner of *Minstrels*, who play upon the *Harp*, touch the *Chords*, and produce various sorts of *Harmony*, without any care or heed to what they are about. So the *Dog Argus* knew, and fawned upon *Ulysses* after his twenty years travel. So the *Birds* flying out of their *Nests* for food into the *Woods*, return from a far off: So *Fishes* upon signs given, run to the *Meat* thrown them in their *Ponds* and *Lakes*, and afterwards retire to their *holes*: So the *Wild Beasts* return each to their *Dens*, tho' far apart, and by their *Scent* find out their way when-ever they chance to lose it. Because the *Animal Spirits*, finding the *pores* of the *Brain* through which they for-

Memory.

formerly began their course, enter them more easily than others, by which means they excite a special motion in the *Glandula Pinealis*, whereby the same Object is again represented to them; haply for want

of these *Vestigia*, the *Tucani* are indued with little or no memory, in so much that going out of their Den, they know not the way in again, but are forc'd to dig another to repose in.

The Second Part.

A DISSERTATION

Of the want of

SENSE

AND

KNOWLEDGE

IN

BRUTES.

I.
The order
of things to
be declared
in the Se-
cond part of
this Differ-
tation.

ALTHO' it hath been made out by Reasons strong enough, that *Brute Animals* are destitute of *Sense* and *Perception*, and that nothing of *Cognition* is to be discern'd in their Operations, and consequent-ly, that a well-contriv'd *Structure* of the *Members*, and a precise direction of *Animal Spirits* through certain *Passages*, must needs be the Principle of all their *Actions*; yet in all this we cannot pretend to have done any thing to the purpose, unless we descend to particulars, and make it appear, that all the *Actions* of *Animals* may be mechanically demonstrated, and that the motions which we think proceed from a certain *Soul* in *Beasts*, are of kin to those which are produc'd in *Automata*, by virtue of a *Spring*, and disposition of *Wheels*. It is indeed a difficult Labour, yet nevertheless necessary to be undertaken, if we intend to bring the Work begun to its desired end, and make a solid superstructure to the foundations we have laid: But the better to observe a certain Order and Method in this Second Part of this Dissertation; we judge it expedient to reduce all the Operations of *Brutes* into Five Classes or Ranks. The First of them is those which are inbred in *Beasts*, to the exercise whereof they are carried by a certain innate force. The Second is of some *Actions*, which argue a sort of Craft in them, and bear some signs or semblance of *Intellect*, *Judgment* and *Discourse*. The Third is of those which insinuate the docility of *Animals*, and their apti-

tude to be instructed; implying that something of Reason shines in them as well as in us. The Fourth is of *Actions*, which discover a kind of *Mutual Speech* in *Animals*; and which seem to make a kind of necessity of allowing the use of *Language* common with us. The Fifth and Last is of some *Actions*, by which *Animals* seem to excel the cunning and sagacity of *Men*, and that there is peculiar to them a Providence, and Foreknowledge of things to come, above what falls to *Mans* share and lot to be indued with.

As to the First it is evident, that there are *Actions* proper to every *Species* of *Beasts*, and that they are so determined to certain *Operations*; that they all design and perform the same thing without any difference. *CAMELS* fly from pure Streams, and hunt after muddy and troubled Waters, in so much that when ever they go into a River to drink, if the Water be not muddy, they raise the Mud by a vehement scraping on the Ground with their Feet. *CONIES* continually dig themselves *Burrows* to lodge, and cover them with Sand, that they may not lie open, and be exposed to the rapines of the *Ferrets*. *HARTS* shot in their Side with a Dart, presently seek after the Herb *Dittany* for the curing of their Wound, and expelling the Pain with which they are afflicted. If the Root of *Valerian* be thrown before *CATS*, they run to catch it, they lick it, make much of it, and like Persons Dancing and Skipping, they run about and discover many signs of Joy and Pleasure. A *HEN* at the

ii.
Some Operations of Beasts produced by Natural Instincts

fight of a *Kite* makes a *clocking*, and as it were exhorting her *Chickens* to flight, she still advances her *Voice*, and calls them under her *Wings*.

III. The cause of all these *Actions* can be referred to nothing else but *Natural Inclination* and *Instinct*, by which *Animals* are instigated to such and such *motions*, and resolve upon what things are convenient for them: So that this, or that whole *Brutal Species* is carried with one propension, and there is the same force, and the same impulse found in all of that Kind. So every *HARE* is a like fearful, and by the method of subtilty declines all Dangers and Inconveniences of *Life*. Every *HOUND* hath a kind of Craft and Innate Industry in following after *Wild Beasts*. All *FOXES* are shrewdly cunning, and generally use the same sort of *Art* and *Method* in laying *Snares* for *Birds*. Every *APE* expresses human gestures, and with one and the same sort of imitation receives whatsoever is offered or comes in its way; whence it is evident that nothing of Reason is concern'd in any of these actions, but that *Brutes* are impelled to them by a certain necessity, and according to that familiar saying in *Schools*, they rather *suffer* than *act*. For how can a *CAMEL* know that a draught of *Water*, the purer it is, the more it causes the *Gripes* of the *Belly* in him; or that in regard of the simplicity of its *Substance*, it affords him the less *nourishment*? How knows a *CONY* that the *Ferrets* lay ambuscadoes for them, and that if they did not cover their *Hole* to keep them out, they should be expelled themselves by the *injury* of their *Teeth* and *Feet*, and whatever hostility besides? How should a *HART* know that the *Herb Dittany* is available for the drawing out of a *Dart* shot into his *Side*? A *HEN*, that a *Kite* lays wait for her *Chickens* to snatch them away and devour them? Certainly if they did, *Beasts* would be wiser than *Men*, as having the faculty to explore and find out things before they came to make trial, or have experience of them; and being able to understand occurrences, before they could arrive at the *Organs* of their *Senses*. For *BEEES*, we see, scarcely brought forth into the *Light*, begin to build *Hony-Combs*, gather *Hony*, attend their *King*, and perform all the *Offices* of their little *Commonwealth*. Young *ANTS* testify no less providence than those of more age. *CHICKENS* newly hatch'd out of the *Shell*, dread and avoid the *Kite*. The *Kite* by no other *Instructor* but natural *Instinct*, lays wait for the *Hen*. The *WOLF* from his very *Cradle*, if we may so say, with an innate hostility prosecutes the *Sheep*. The *SWALLOW* builds and covers its *Nest*: The *SPIDER* its *Web*, without any other *Teacher* but natural *Instinct*. By which it is plain, that *Animals* are not directed by Reason, but by the Conduct of Nature only, which is alike prevalent in all.

IV. And for the better conceiving that *Beasts* of every Kind ought to perform *Actions* which are proper to them, we need but consider, that they act no otherwise but by the force of their *Mechanism* or *Structure*, and by the disposition of their *Organs*: For as we ought to believe, that they are destin'd to different uses, according to the diversity of their *Species*, so we need not doubt on the other side, but that the Author of Nature

hath furnish'd every one of them with *Organs* proper for the performance of those *functions* which are most agreeable to their *Nature*; as for example, there are in *Ants*, motions very regular and very necessary to lead them in *Summer* time, to those *Objects* which they have need to make provision of against the *Winter*. *Swallows* build their *Nests* with more artifice than the skilfullest of *Men* can do: And a *Dog* in finding out his *Master* shews more sagacity than in matters of that nature is usually discerned in *Man*.

Moreover there occur to us some *Works* of Nature, which seem not possible to be performed without *Sense* and *Reason*, as hath been observed in the beginning of this *Discourse*: For how comes it to pass that *Spiders* weave their *Webs* so *Geometrically*, and *Bees* compose their *Cells* so neatly and orderly, each being appointed their several *Offices*; some to lay up the *Hony*, others to exclude the *Drones*? To which end they make some of their *Cells* oblong, the better to receive the forms of their *Bodies*; and on the other side make them open to leave egress and regress, yet at the same time it is so ordered, that not above two rows of *Cells* can be opposite one to the other, namely, one at the top, and the other at the occluded part. Besides, when in framing the *Walls* of their *Cells*, there is a necessity that the *Wax* be separated, and carried out from all parts: How do the *Bees* so contrive it, that every *Bee* taking its round with compressed *Wings*, six other *Cells* should be drawn circularly near the *Wax-Cell* towards the sides, and as many towards the top, and all for the convenience of the circular *Figure*; which is so ordered as to be touch'd by six other equal and conformable *Cells*: Furthermore, there must be a *Hexagon* or *Sixangled*, and a *Hexaedric* or six-sided *Figure*, conformable as well at the Sides as at the Top, in such manner, as while six *Circles* are contiguous about a seventh, and make a compression, this compression is to be mutual so far as till it falls into six Sides, equal to a *Semidiameter*, and common as well to the containing as the contained *Circles*.

But these and the like Operations are not to be attributed properly to *Cognition* or *Cogitation*, but to some other *intelligence*, which *Averroes* calls *Non Errant*: So as that the *Corporeal Nature* must follow the conduct of *Divine Reason*; and its *Works* be look'd upon as *Darts* or *Arrows* which are directed by a skilful *Marksmen*, to the Aim or Mark which the *Darts* or *Arrows* themselves have no suspicion or apprehension of. So that this *Natural Force* infused into every *Animal*, is the Original, and as it were the Source of all those *Motions* and admirable *Effects*, which do not only exceed all our *Efforts*, but which we can hardly attain to by our greatest application of *Wit* and *Ingenuity*: Whence the Great *DESCARTES* in his 45th *Epistle* to a certain Nobleman, I am not ignorant (saith he) that many things are performed by *Brutes*, far better than by us; but this I do not in the least wonder at, since it helps to prove that they perform them *Naturally* and as it were by *Springs*; no otherwise than a *Clock* or *Dial*, which declares the *Hours* far better than we can find it out by our exactest Judgment: And doubtless when the *Swallows* approach in Spring time, they act therein the manner

The same Nature is in all Animals of the same Species

V. After what manner Bees make their Cells so ingeniously.

VI. The whole operation of Bees proceeds not from Reason, but instinct of Nature.

VII. Whence arises this diversity of Actions in Brutes.

manner of Clocks or Dials: And whatsoever Bees perform, is of the same nature, as is also the Order which Cranes observe in flying, Apes in fighting; if at least they observe any. Lastly, the instinct by which they are carried to bury their Dead, hath nothing more to be wondered at, than the instinct of Dogs and Cats, who, going about to cover their Excrements, scrape up the Earth in order thereunto, tho' perhaps they never proceed so far as to cover them; which shews that they act unthinking, and only by instinct. But if after all this any one still remains obstinate, and will have it that Intellect and Reason must be allowed in Beasts to produce all those wonderful Operations; what hinders but that whatsoever things in Nature give occasion of admiration, may be said to proceed from Reason? Why may we not by the same reason maintain, that a Clock or Dial is indued with Intellect, as long as the Index, turning about by a Spring of Motion infixed, sometimes by a deflux of Water, sometimes by the stress of a Weight hung on, sometimes turned about by the reflex of an intorted Steel, designs the Hours? Why may not the Needle be said to be prompted by Reason to fly to the adjacent Loadstone, for the obtaining of its imbraces? The Bees therefore erect their Habitations, as HARVEY admirably expresseth it, by a Natural impulse, and as it were by a fatal necessity, or a certain mandate, working according to the Law of the Creator, but act nothing by Providence, Design or Counsel. For what in us is the Principle of Artificical Operations, and is called Art, Intellect or Providence; that in these Natural Works is meer Nature, depending upon no Mans Instruction.

VII.
Whence
arise the
diversity of
Actions in
Brutes.

But if it be required, how it comes to pass that so great a diversity of actions should be produc'd among Beasts? How each Animal should have its proper Machination, if they operate according to inbred impressions, and are impelled as it were by a certain weight? I answer, that this happens from the various disposition of the Brain, and the Organ, which according as it varies in Animals of a different Species, so it brings to pass, that an affection of the same Object is directed to different Motions: Forasmuch as nothing else can be understood by the name of Natural Instinct, than the Local Motion as of the whole, so of the minute parts indued with a certain magnitude and Figure, according to which natural things are distinguish'd, and obtain various denominations. Now those motions which follow corporeal dispositions, may be reduc'd to three Heads. The First is of those, by which Animals, through a certain inbred impulse, hate and decline those things which are hurtful and troublesome to them; as a Sheep abhors the sight of the Wolf, and immediately upon the said sight thereof, betakes it self to flight with all imaginable haste: Almost all sorts of Animals dread the Lion, and are terrified at the sight of him: On the other side, the Lion fears the Cock, and trembles both at the hearing of his Crowing, and sight of his Crest: So the Chickens fear and fly the Kite, &c. The Second is of those by which Beasts apply themselves to the propagation of their Kind, and the generating of their like; so the Silkworm weaves its Egg; so Fishes and other Animals, by a certain inbred propensity, do many things which tend to the foresaid end.

The Third is of those things by which Brutes provide for their own preservation, and sustain themselves from perishing, they go out to get their Food, they make choice of their Meats, they lay up Provision against the approaching Winter, and do several other such like actions which conduce to the said end.

The Motions of the first Kind are easily made out, when we affirm that by the sight of such Objects, certain impressions are transmitted through the Fibres of the Nerves into the Brain, which convey the Animal Spirits into the Nerves; which upon turning the Back, or moving the Thighs, are readily disposed to help on the flight; and also partly upon those Nerves which dilate or contract the Orifices of the Heart, or which agitate other parts from whence the Blood is sent into it: That this Blood being rarified, after another manner than is usual, sends into the Brain those Spirits which are adapted to the cherishing and fomenting of Terror, that is, which are apt to keep open, as also to open again those passages of the Brain which conduct them into the said Nerves: So the Sight of the Eye, from the Body of a Wolf, reflected upon the Eyes of a Sheep, hath the force of disposing the Spirits, and diffusing them into the Nerves in such a manner as is necessary for promoting the flight of the Sheep: The like may be said of Chickens flying the Kite; the Lion the Cock, and other Beasts the Lion. For it is the nature of the Brain, and of the contexture of the Fibres, into which an impression is made in the said Beasts, to produce such an affection. And that such a Disposition and Temperament is found in Beasts is sufficiently manifested by the steam exhaling from the body of a Camel, by which a Horse is so terrified, that he becomes incapable of standing a fight: Of such a Nature likewise is the smell of a Horse, that thereby an Elephant is driven into madness: The Root also of the Herb Valerian sends forth a Vapour, which works so upon Cats, that they are thereby driven into a merry Pin, and skip and frisk about like mad. In regard that such or such an affection is not grateful or ungrateful of it self, but upon this account, that there is such or such a conformation of the Organs, and contexture of the Fibres, which is found in these Animals. Nor is it haply for any other cause that the Cock awakes before light, and by his Crowing proclaims the approach of Day, than because the Sun having passed the Circle of Midnight, and having almost overtaken the Morning, puts to flight the cold Air of the Night by his approach; by which coldness the Cock being raised and awakned, is so stirred up and alarm'd, that he presently sets up his Note, and by his loud Crowing calls up mortal Men to their tasks and labours.

By the same reason may the Love of Beasts be set forth, for example, when an Object is agreeable, the Light which is reflected towards the Eyes of the Animal, strikes the Optick Nerves in such sort, that they dispose the Animal Spirits to innuinate, part into the Muscles, which have their course toward the Tail, Head, Legs, &c. part into those which serve to enlarge the Orifices of the Heart, and to press the parts of the Heart, whence the Chyle and the Blood may come in greater abundance; which not only causes the Animal Spirits

VIII.
Whence

Hatred and
or Antipa-
thy between
some Ani-
mals.

IX.
Whence
proceeds the
Love of
Beasts one
towards the
other.

to mount up to the *Brain* in the greater quantity, but also gives them a freer course into the same *Muscles*, and by this means to conserve, entertain and fortifie those *motions* which the presence of an agreeable Object hath caused.

X. So that the *Passions* of *Animals*, taken not for *Simple Faculties* but for *Actions*, are nothing else but the *emotions* of the *Brain*, caused by the presence of whatsoever Object, whether hurtful or favourable, and fortified by some particular courses of the *Animal Spirits*, which depend principally upon the disposition, which the Heart and others of the Principal Bowels put into the *Blood*.

XI. You will, possibly, have much ado to conceive that *Beasts* should do all that we see them do, after the manner of things Inanimate; as for Example, of a *Clock* which marks the Hours, and strikes by virtue of the disposition of its *Wheels*, and the force of its *Counterweights*: For tho' in *Beasts* we take notice only of their *motions*, yet the great number of those *motions* is very surprising, and it is a hard matter for any one to persuade himself that so many can be included in a *Machin*. But I will easily deliver you out of this pain, if you have the representation before you of a *Clock*, for Example, composed but of 15 or 20 pieces, which nevertheless strikes all the Hours, marks the Half-hours, the quarters, and all other parts of Time which are numberless. Now if a *Machin*, which is composed of so small a number of Pieces, is capable of so many things, how many must we imagin the *Machin* of a *Beast* capable of, which is compos'd of *Spring-Fibres*, whose number and due disposure surpasses, without compare, the structure of the exactest *Machin* that ever was made by any *Workman*.

XII. If it be answered, that there is a great difference between a *Beast* and an Artificial *Machin*, in that a *Clock* may be wound up every day; but that the *Machin*, for example, of a *Dog*, cannot be so wound up. It is evident, that all *Machins* are not wound up, or renewed after one and the same manner. *Pocket Clocks* or *Watches* have their Springs; certain *Turn-broches* or *Jacks* have the smoke of the Chimney to make them move; *Mills* have Water or Wind; *Thermometers* have heat or coldness of the Air; the *Hydrometer* divers degrees of Moisture: So likewise *Beasts* have their Aliment. So that we may well say, that their *Machins* are wound up as often as they have any thing given them to eat or drink.

XIII. But if there be no difference between *Beasts* and other *Machins*, whence comes it that a *Dog* can snatch at one bit of Bread or Meat, and reject or refuse another bit which is offered him, if he have not a *Cognition* or discerning *Sense* to accept the one and reject the other? Who can think it necessary, that there should be *Cognition* in a piece of *Iron*, to cause it to move towards the *Adamant* or *Loadstone*, and not as well to move towards a *Flint* when it is offered to it? Or who will think himself obliged to admit of *Cognition* in a *Dog*, to cause him to run away at the sight of a *Cudgel*, when it is offered to him, any more than in a piece of *Iron* shunning when the opposite *Pole* is presented, that very *Adamant* by which formerly it had been attracted.

XIV. And certainly these who believe that a *Dog* feels pain, because he cries when he is beaten, have

as little reason for their belief; since the greatest sound that can be heard when the *Organs* are touch'd in certain places, is not a sign that there is any pain in those *Organs*: So that there cannot be proposed any such action of *Beasts*, but I can produce something like it, which you must necessarily confess does happen in other subjects, which can no way be imagined capable of *Cognition*; and you need do no more but see with your *Eye*, and touch with your *Hand* the several *Organs* of *Beasts*, and their different Structures, to make you comprehend how the greatest part of their *Actions* may be performed without *Cognition*, after which you will find no great difficulty to acknowledge, that the same may be said of all the rest.

No more doubt need to be made, that a *Swallow* may without knowledge, imploy it self in building a Nest of Mud, with the greatest Artifice imaginable; may gather up heaps of Straw and Chaff to make a curious sort of Straw-work, may search about for Feathers to lay a-top, for the making of her Bed the more soft and warm, the disposing of her Eggs, and the covering and cherishing of her Young Ones after they are hatch, till such time as they are in a condition to fly, and shift for themselves, and seek their own Food; since there are many things that have not the least *Cognition*, which exactly perform that which Men cannot do with all their Ingenuity. I might here recount a world of Examples, but I shall only add, that a *Stone* hung at the end of a *Pole*, marks out the direct way to be kept for to go to the Center of the *Earth*, that the Needle of the Compass points out the *North*, that a *Fane* shews the Course of the Wind, that a *Clock* or *Dial* marks out the Hours more exactly than the Learnedest Man of the World can do. Moreover, there is not a *Goldsmith*, the cunningest of them living, who having the filing of *Iron* mingled with that of *Gold* or *Silver*, can in the dark separate the one from the other, and even by plain day-light it would cost him much time and labour to effect it; whereas a *Loadstone* performs the same in a moment, without the help of Day or any other Light. By this we may see that the exactness with which many *Beasts* perform certain operations, is not an undoubted sign that they perform them with *Cognition*: And besides, with what exactness or curiosity soever some *Beasts* may act, they have never produc'd any thing that can come near that rare skill wherewith the least Flower of the Field pushes forth its Bud, its Blossoms and its Leaves.

Nor did ever any *Bee* make Compartments in his Comb more exact and curious than those of a *Pomegranate*. And if it be so marvelous a thing to see a *Dog* seemingly sensible, when his *Machin* is wholly disposed to move after a piece of Bread, or in pursuit of a *Hare*: So that tho' we perhaps may think our selves obliged to admit of *Cognition* in him, yet it is true, that his whole *Machin*, which is infinitely more strange in its Fabrick, than it is strange to see it go when it is made, hath nevertheless been so composed, as to be without Art or *Cognition*, and to act by motion only, and the disposition of its parts: Moreover the Argument drawn from the exactness with which *Beasts* perform many different Actions, proves too much: For

XV. A Swallow shows nothing of Cognition in building her Nest.

XVI.

XVI. Nor a Bee in the contrivance of its Comb.

For we should thence be forced to conclude, that *Beasts* have more perfect *Cognitions* than *Men*, as we have said before, and that the principle of these *Cognitions* is more noble than theirs, which certainly no rational person will easily grant.

XVII.
How Brutes
are impel-
led to Gene-
ration.

But let us repeat our Discourse, interrupted by this long digression, concerning the operations of inanimate things, compared with the actions of Animals, and explain the Motions of the *Second Kind*, with the same ease as we have those of the *First*. For that *Beasts* are incited to Generation and Propagation, proceeds from the alteration made in their *Bodies*, by which their *Fibres*, and the Contextures of them are so disposed, that from thence a certain affection is derived, (especially in those *Organs* that are inservient to Generation) which is directed to the foresaid Motions. For *Lust* is a certain disposition of the *Animal Phantasia*, proceeding from the motion of the *Genital Parts*; that is, while those parts are tickled by the fervid Spirits, and impelled to Coition. So when a Proud Bitch is brought to, or comes in company of a Dog, she by her smell so disposes the unquiet Spirits in the Head of the Dog, that they make a conflux into the parts adapted for Generation to perfect the Coition. Whence that *Tentigo*, which in many Males accompanies Lust, is wont to be made by the Animal Spirits, whilst they flow down to the Fungous Nerves of the Masculine Member, and are hindered from returning by the *Prostates*, swelling with the Fervid Seed, and stopping up the Pores of those Fungous Nerves; so that Animals, when they are libidinally inclin'd, are of that disposition, as easily to be directed to those Motions which tend to Propagation, and the preserving of their Kind, as shall hereafter be more largely discours'd of concerning *Birds*.

XVIII.
What Imagination
is in Animals.

When, I say, that Lust is a certain disposition of the Animal Phantasia, I would not have it so understood, as if it were some internal Principle, from whence a certain Imagination should proceed, but only that it is a simple motion, proceeding from the course which the Animal Spirits take of themselves across the *Fibres* of the *Brain*; whence it follows, that the Imagination of Animals, taken for a simple Faculty, is no other than a power which the Animal Spirits have to flow, as of themselves, from the Brain into some certain Muscles, rather than others, for the moving of some particular Members.

XIX.
How it comes that
Brutes are
concerned
for themselves,
and the preservation
of their lives.

With the same clearness may the Motions of the *Third Kind* be made out: For Nature hath been beneficial to all Creatures, in furnishing each of them with their proper *Organs*, and impressing that habit of Body, by the help of which, and of the said *Organs*, they are enabled to stir up those Motions, by which they may the better provide for their Life, and prosecute those things which are necessary for the preservation of themselves. It is infused by Nature into all sorts of Animals, as saith the Latin Orator, to defend themselves, and take care of their Life and Body, and to decline those things which seem hurtful to them, and to search after, and endeavour to obtain all things that are necessary for the preservation of Life. Wherefore it is no wonder, if *Brutes*, with so much application, are intent upon their preservation, by building themselves places of abode; by seeking their Food, even rather than fail, by

force and rapin; by providing and laying up sustenance, by discerning and distinguishing some Meats from others, and doing such like actions as tend to sustain and keep themselves from perishing: Forasmuch as *Beasts* are so framed by Nature, that by their Meats, by their Retiring Places, &c. they are disposed to those Motions, from which they use to be prompted to Feed, and to betake themselves to their Receptacles: Whence it comes to pass, that they distinguish the Meat agreeable to them, from that which is not; and that they decline some things, and accept of others: For Example, for the curing of Diseases, and restoring to Health from any Distemper; the *Ring-Dove* and *Blackbird* make use of *Laurel*. For purging the Belly, the *Dog* hath recourse to *Grass*; the *Hen*, to the *Wall-flower*; the *Swallow* useth *Celandine* for clearing the *Sight*; the *Tortois*, *Organic* against all sorts of *Poison*: To which choice doubtless, they are only prompted by the very inspection of the Herb, because of the different temper of the Body, and the various contexture of the *Fibres*. Forasmuch as from Trees and Herbs such *Emanations* arise, as are proportionate to the *Sensorium* so affected, and not like those which flow from other sorts of *Plants*; and therefore, as *Animals*, when they are prest with Hunger, are not promiscuously allured by all sorts of Meat alike: So when they labour under any Distemper, they are not by the same impulse carried all to one and the same Herbs, but to those only, by which they are disposed, and in a sort attracted by the peculiar odour which affects them. Nor can any other reason be assigned, why the *Stork* makes use of his Bill and long Neck instead of a *Clyster-Pipe* to purge its self of all Noxious Humours; or why the *Serpent* rubs himself upon *Fennel* to heal his diseased *Eyes*, except because the ill affection of the Belly and Eyes, prompts, allures and impels to these motions; whence it plainly appears, how prodigal of Reason they are, who allow it to *Brute Animals*, and have recourse to I know not what *Soul*, which must forsooth lie latent in them, and be attributed as a principle to all their works, when as at the same time, there is no mutation to be discerned in them; things are always performed after one and the same manner; variety of place, time and age, produces no diversity in their Operations, which happens not so in Man, as being participant of Reason: There being innumerable ways and modes of Human Actions: And there is not in every Man one only action, or one propensity as in *Beasts*, but in each Man a several Inclination, some proper to one, some to another, according to the condition of the Soul; whence it comes to pass, that there is so great a diversity of Opinions in the minds of Men, so that few Men think one and the same thing, hate one and the same thing, affect one and the same thing. Of the first Class of the Actions of Animals, enough hath been said already; let us now hasten to examine the others, in which there are apprehended some appearances, not only of Perception, but also of Judgment and Ratiocination, such as are *Dubitation*, *Invention*, *Determination*, &c.

It can scarce be denied, or indeed so much as questioned, but that Animals may sometimes seem to doubt, demur, or be, as they say, at a *Non-plus*. We find that a *Horse*, when two bundles of

XX.
How it is
that Ani-
mals doubt.
8 D Hay,

Hay, or two measures of *Corn* are set before him, makes choice of one and rejects the other; and it is not unpleasant, sometimes to behold a *Cat*, when Meat a little too hot is thrown to her, at a stand whether she should refuse it, or fall to: For first touching it with a light Foot, then nicely putting her Mouth to it, she hesitates a while, with her Ears shrunk up, as it were meditating in her mind which of the two she should prefer, feasting or abstinence, till at length declining the latter, she makes choice of the first, and sticks to that resolution.

These and the like actions, which seem to argue in *Brutes* a liberty and indifference, are to be attributed only to different motions which are in the *Brain*: For different Objects produce different Motions in the Organs of the external Senses, which by the help of the Nerves being carried into the *Brain*, excite some other motions, by which the Spirits being directed variously, impel the *Conarion*, and so bring it into an *æquilibrium*, so as not to incline more to one part than another: Whence it comes to pass, that *Brute Animals* remain indifferent, and seem unresolv'd whether to take, or leave their Meat: For since these Spirits are Corporeal, they excite opposite motions in the *Glandule*, which thwarting one another keep the said *Glandule* unmoved, and suffer it not to decline to one part more than another; and this happens not only to *Brutes*, but sometimes also to *Men*, that is, to those, who, being deprived of their Senses, act without Counsel or Design. *MEDINA* makes mention of a certain Madman, who having two Apples offered him at the same time, could not resolve which to fix upon, and so in much perplexity remained a good while in suspense without tasting of either, till at length a certain Friend of his took the Apples, and presenting him with one, reserved the other till that was eaten; whence it evidently appears how different the hesitation of *Brutes* is from the suspension of Judgment. For when by Perception we discover any thing which was hid from us before, and of which we had not yet made any judgment, Our *Mind* by the help of the *Will*, that is, of that faculty which it hath of moving it self, and determining, remains doubtful, and suspends the Judgment; if it apprehends any obscurity in the thing, afterwards deliberates; and as soon as it finds the matter cleared, gives its assent, which it denies to other things which do not appear so clear and evident. But in regard *Beasts* want *Will*, and are only prompted by Corporeal Objects; no wonder they do not in reality either doubt or make choice of any thing with judgment, because not reflexion, but only a recourse of certain Images, causes the said dubitation.

XXI.
The Craft
and Sub-
tlety of
some Crea-
tures.

The Craft which most Animals make shew of, and the Wiles which they use in their Actions, are not thought to be made out with the like facility; forasmuch as so great a semblance of Reason appears in them, that some may possibly be induc'd to think, that the said Animals are led by Cognition, and act by an inspection of some end or design. But because the *Fox* excels all other *Beasts* in cunning and stratagems, and is therefore propos'd by some Writers as an example of subtilty, it will not be amiss to relate some of the Tricks and Machinations of this subtil Creature, in regard they being laid open, it will the better appear after what man-

ner the operations of other Animals are brought about. *PLINY* makes relation that the *Foxes* in *Thrace* do nothing inconsiderately, insomuch that being to pass frozen Rivers, they do not presently commit themselves to the hazardous passage of them; but first going softly, and with a light Foot, they apply their Ear and listen the better to make trial of the thickness of the Ice: For when they hear any thing of the murmur of the under-flowing Water, they stop their course, and unless any danger attend them behind, stir not a foot farther; but in case no noise be heard, nor any fear of danger be discovered, they pursue their course and get clear over. For they seem to reason with themselves after this manner: That which makes a noise is moved, that which is moved is not firm, that which is not firm must needs be fluid or liquid, that which is liquid cannot be retained or kept back, but may give way; therefore this River is not to be passed. Another subtilty is related of this Creature by the same Author, in catching and getting possession of its Prey: When-ever he beholds a flight of Birds in the Air, rowling himself in Red Sand, that he may appear all bloody, holding his Breath and lolling out his Tongue, counterfeits himself dead; by which means when the Birds come to settle upon his Body, he on a sudden snaps them, and devours them. Likewise when he is hunted, and the Dogs drive so close upon him, that he is in danger of being taken, he makes use of this stratagem: Having stail'd he besprinkles his Tail with the Urin, then shaking it all about, he endeavours to avert the Dogs by the stink thereof, thereby to free himself from the harm that attends him. The like trick he makes use of to drive the Badgers from their Kennels; as soon as he perceives them gone out, he enters in, and leaves such a stink with the Excrements he voids there, that they are forc'd to make their Lodgings elsewhere. No less Fox-craft is shewn in freeing themselves from the Fleas with which they are oft-times molested: For taking a wisp of Straw, or any sort of soft Stubble, they plunge the hinder part of the Body in cold water, from which the Fleas flying, get up to their Heads, which then they plunge in like manner in the water, upon which the Fleas make their escape into the Straw or Stubble; and by this means the *Foxes* get away and leave their Guests behind them. A greater stratagem than all these the famous *SIR KENELM DIGBY* relates of a *Fox*, who being hard pressed by the Dogs, entred into a *Warren*, and there hung upon a Rafter among the Carcases of the slain Animals, until such time as the Dogs having lost the scent, were pass'd by the place. Also of another, who urg'd by the like necessity, caught hold of a Broom Shrub which shot up over the Mouth of his Kennel, which was plac'd in the broken cleft of a Rock, and to which there was an easier access by another way, and so by an accustomed and well-known passage, slipt safe into the Hole, whilst the Dogs eager in pursuit, and not suspecting the danger of the passage, fell down among the Rocks to their destruction.

Now that the Cause of these Operations may be the better demonstrated, two things are to be supposed out of what hath been already said; First, That always some affection accompanies the sen-

XXII.
Passion al-
ways fol-
lows Appe-
tite, and
the altera-
tion of Ani-
mal Spirits
is made in
the Body.

sitive Appetite. For it cannot be otherwise to make every Animal have an Appetite or Aversion, but that some perturbation must spring up in his Body, which taking its source from the Blood and Spirits, dilates or contracts the Vessels or Ventricles of the Heart, and at the same time agitates other parts of the Body; by which it comes to pass, that according to the various reception of Spirits, some passages of the Nerves are incited to an opening or shutting, and thereupon the Animal is rendered prone to follow after or decline: Hence Brutes if they are prest with Hunger, are unquiet, and by the Nerve of the Sixth Conjugation, inordinately agitated in the Ventricle are impelled to the motions of the Members adapted to the pursuit of Aliment. Secondly, When as all the motion of the Body of an Animal is stirred up by the contacts of exteriour Objects, it comes to pass that in the Ventricles of the Brain certain Pores are opened by the transcourse of Animal Spirits, which retain a greater facility of opening themselves, than those through which the Spirits have not yet pierc'd: Whence it comes to pass, that if any Object occur, like to that at whose presence those distinct draughts are delineated, the Animal Spirits stirred up into motion, fall into the Vestigia formerly made, and after the same manner as before, move the Members of the Body. As if a Bull, for examples sake, be several times removed from a fertile into a barren and unfruitful Soil; the Stomach being stirred up with Hunger, and pricking the Membrans with an acrimonious Humour, the passages of the Ventricle are twitcht by the Spirits, which being carried to the Brain, and making their Course through paths already formed, represent to the Bull the more delicious Meat formerly fed on, and those more fertile Fields where heretofore he used to feed, and which entering the sources of the Nerves, pass into the Muscles designed for the moving of the Legs, and as it were compel them to make after their former Pastures: For tho' their Memory be not indued with any great activity, and that facility, and those draughts which are imprest in the Brain, and which the Spirits leave in the Fibres through which they are carried, may seem to perform little; yet they produce all those wonderful effects which are observed to be in Brute Animals, and induce the greatest part of Mankind to believe that they make use of Cognition, and are govern'd and prompted by some Spiritual latent Principle. Nay, if the matter were thoroughly searcht into and examined, Memory is the effective cause of most of the Actions which we negligently and without attention perform, as I have formerly hinted concerning the *Minstrels*.

Ear to the
Ice.

These things thus premised, let us return to our Foxes: As for those in Thrace, which refuse to commit themselves to the congealed Rivers till they have first made proof of the solidity of the Ice; it is certain that they do not do this by Judgment, but by the benefit of Memory; since it might possibly happen, that the noise of the Water being heard from another place under the same covering, they might notwithstanding their politick listening, fall in and suffer no small prejudice in those Bodies of theirs they take all this care of: Or that in the Winter time when they have discovered the course of the Waters, they have

been seized with cold, the Memory whereof smiting their Phantasie, deters them from swimming at that time: But as to their moving their Ear to the Ice to explore the thickness thereof, that proceeds from fear, by which the Spirits being excited, betake themselves to those Muscles which are inter-vent to the bending of the Head, and terminate at the Ear which is to be applied to the Ice: Whence it is apparent, that the Fox in this case makes no use of Ratiocination, but is impelled by Affection; is not indued by Cognition, but actuated by Passion alone to such like Motions.

But as to their lying as dead in ambush to catch by surprise the unwary Birds; as to their lifting up and setting their hinder Feet against the stem of a Tree with their Head downward and their Fore-Feet on the ground, and smiting often with their Tail against the Tree, thereby to strike a terror into the Hens, and cheat with a shew of some other Animal leaning against the Tree: As to the shooting the light of their sparkling Eyes upon the Hens, while their whole Bodies besides lie hid in the umbrage of the Night; that being inticed by the said light, they may forsake their Perches where they roost, and lighting on the ground, fall into their Clutches: All this is to be attributed not so much to their Craft as to Chance. For it might probably happen, that a Fox wearied with a long march, might lie down upon the ground and fall asleep, to whom, lying as it were dead, the Hens might very well approach without fear; which the awaking Fox perceiving, still counterfeits himself asleep, the better to take his opportunity of falling upon them unawares. The like luck hapned to a Fox mentioned by PETRARCH, which Fox when the Fishermen that carry Fish to the City, as commonly they do in a Summers Night, found lying for dead across the way, they took him up, intending to flea him for his Skin, and threw him into the Pannier of Fish, whereof when he had plentifully feasted, out leapt the Fox, and to the great astonishment and vexation of the Fishermen, got clear away with his Belly full of Fish. By the like fortune it might be, that when a Fox saw Hens roosting on a Tree, and not being able to reach them, ran round about the Tree, as seeking some place of advantage whereby to raise himself to a higher station, mean while the Prey fell into his Mouth, and he enjoyed his with without any further trouble. Whence it is probable, these tricks so happily succeeding, that afterwards upon the barking of an empty Stomach, and the instigation of Hunger, the Spirits repeat those passages of the Brain which they entered, when lying as asleep or dead upon the ground, he thereby got his Prey. Which Artifice, often repeated, becomes a custom, and fixes deep into his Memory, so that when ever after he hunts for Food and lights upon any Prey, he repeats the same series of actions, and makes use of the same stratagem, as hath formerly proved so prosperous and successful to him. The truth of it is, many actions which appear not a little strange in Beasts, at first were performed by them, by some certain casualty, which actions having afterwards been made familiar by frequent experience, passed into habits, which seemed to carry in them a great deal of Wit and Sagacity; and such in all probability was the chance of a certain Wood-Fox (mentioned by

XXIV.

How the
Fox to get
Birds, coun-
terfeits
himself as
another
Creature.

the

the famous Dr. WILLIS) who to get into his Clutches a *Turkey*, pearching upon the Bough of a *Tree*, made use of this device to catch it: He circuits about the *Tree* with a very swift and eager pace, keeping an intent *Eye* all the while upon the *Bird*, and by this means obliged him to return the like intention of aspect, which to do, he was forc'd to turn about his *Head* so often, till at length becoming giddy, and taken with a *Vertigo*, he falls from his *Pearch* into the very *Jaws* of his *Enemy*.

XXV.
How the
Foxes de-
ceive the
Hens by di-
recting
their Eyes
towards
them.

By the same reason it is that *Foxes*, by casting fixedly their *Eyes* upon the *Hens*, either seduce them, or attract them; forasmuch as it was likely enough to come to pass by chance, that while the *Foxes* were prest with *hunger*, and stood gaping after their *prey* that sat aloft, they might so long direct their *Eyes* upon the *Hens*, that they either astonish'd at the *Foxes* sparkling *Eyes*, or struck with suddain fear, might slip down, and fall into the *Jaws* of the *Insidiators*, by reason that the *Hens*, either affrighted by the continual sparkling brightness of the *Foxes* *Eyes*, or thinking themselves already taken by the *Enemy*, are seised with such a sudden astonishment and confusion, that they cease and let fall all their natural *Functions*; as if their *Bodies* had no offices to perform: By which means it happens that they first begin to totter, and immediately thereupon by the solution of the *Nerves* in their *Legs*, drop half dead upon the ground. The same thing is also observed in other *Birds*, who when the *Cats* get upon the *Boughs* of the *Trees*, and thence fix their *Eyes* upon them, as if a suddain *Vertigo* seised them, they drop down from their *Pearches* upon the ground.

XXVI.
How the
Fox pursued
by the
Dogs, comes
to dip his
Tail in
Urin.

As to the Craft of *Foxes*, when they are in danger, watering their *Tail* in their own *Urin*, and sprinkling the *Dogs* *Eyes*, this I take to proceed not from the *Foxes* cunning, but the fear that seisseth him. For it is a common thing among all *Creatures* upon the apprehension of an approaching danger, to let their *Urin* pass from them, as it were unawares; in regard the *Spirits* being then disturbed, are hindred from their wonted *Functions*, and the *Nerves* in the *Bowels* being relaxed, there follows a *profluvium* of the *Excrements*; and whereas upon the said fear they contract their *Tails*, and draw them in between their hind *Legs*, they must needs be soak'd in *Urin*, which upon the shaking of their *Tails* is sprinkled into the *Dogs* *Eyes*, and almost blinding them, hinders their pursuit.

XXVII.
How it is
that Foxes
free them-
selves from
Fleas.

Nor doth that Craft of the *Fox* to free himself when he is bitten by *Fleas*, depend upon a higher cause: For in the *Summer* time, when itching accompanied with heat is stirred up in his *Body*, to remove the same, he enters into a *River*, where first having found some refrigeration in his *Feet*, he ventures to enter deeper, and by degrees immergeth all the other parts of the *Body*; but to avoid the necessity of plunging in too deep, and the trouble of swimming, which would probably heat him afresh, he carries along with him in his *Mouth* into the *River* boughs of *Trees*, or wisps of *Hay* or *Stubble*, to which the *Fleas* flying for refuge to avoid drowning, and sticking thereupon, leave their *Landlord* clear of them. In the mean time the *Fox* finding his *Limbs* finely

cool'd and refresh'd, returns into the *Wood* from his importunate *Train*, and delivered from the vexatious itching that had so lately molested him. Whereupon afterwards mindful of the pleasure and profit he thus received in the *waters*, whenever the like occasion happens, he resolves upon the same method, betakes himself to the same actions, till at length the trick becomes familiar, and by frequent reiteration turns into a habit, because after the *Vestigia* of the *Memory* have brought back upon the *Glandule* the first Image of the thing, the *Spirits* returning by the same passages flow into the same *Muscles*, and so dispose the *Foxes* *Body* to produce the same actions he had produc'd by occasion of the Object that first excited: So that all *Arts* which *Animals* put forth on several occasions, depend upon the observation that comes into their *Memory*, of what before succeeded or not succeeded, as may be demonstrated in *Thales* his *Ass*, who when laden with *Salt*, had a *River* to pass, and by chance plunging somewhat deep in, melted the *Salt*, found himself eas'd of his burthen thereby, by which success being encouraged, he as often as he entered the said *River*, went in on purpose the farther, and rolled himself with his burthen in the *waters*, nor could he be reclaimed from this manner of acting, till in the place of the *Salt*, a Sack of *Wool* was put on his *Back*, which being made more ponderous by sucking in the *waters*, eluded his *Asinine* subtilty, and caused the Master from thenceforth to take new measures, and abolish a custom so inconvenient to him.

For when *Sense* or *Imagination* hath disposed the *Animal* *Spirits* to begin their course, the tracts thereof which are formed in the *Brain*, are so much the more deeply impress'd, as the *Action* of the *Animal* *Spirits* hath been the stronger, or hath lasted a longer time, or hath been the oftner reiterated; for such strength, duration and reiteration are the causes that these tracts are not easily to be effac'd, and that they are in such sort conserved, that they may be raised there again, a long time after. And thus you have in a few words what it is that occasions the *Memory* of *Beasts*, tho' they are not capable by *Discourse* or *Speech* to express it.

As to the trick made use of by the *Fox* to drive the *Badger* out of his *Hole*, that is to say, by staling or voiding his *Excrement*; I find not in the performance thereof, that there can be any necessity of having recourse either to *Judgment* or *Providence*, since there is nothing in it but what may be very well effected by instinct of *Nature*: For what is more natural to *Beasts*, than to defile with their *Urin* or *Dung* any place where they have continued never so small a time, if necessity at that time urgeth; so that it need not in the least be questioned, but that a *Fox* entering a *Badgers* *Den* when he is absent, may very well leave a notable stink behind him, and that through the abhorrence thereof the *Badger* may be driven to seek out for another place to *Kennel* in.

I must confess it is not so easie to make out, how a *Fox* should without *Knowledge*, so industriously defend himself from the *Hounds* following him with a great *Cry*, by intermingling himself (if what is related of him be true) among the *Carcases*, which by chance were hung up in the

XXVIII.

cause that
Beasts re-
member.

XXIX.
How it is
that the
Fox drives
the *Badger*
out of his
own *Hole*.

XXX.
Whether it
be an evi-
dence of
Reason,
that the
Fox when
he is hard
pursued by
the *Dogs*
should hang
himself up
by the *Teeb*
among dead
the *Carcases*.

the *Warren*, unless with the Illustrious DIGBY, we grant it might so happen; that the *Fox* through fear or lassitude, seeking out for a skulking hole, and not finding in that plain tract of *Earth* (such as a *Cony Borough* or *Hare Warren* useth to be) any *Bush*, *Bramble* or *Hillock*, or any other place to betake himself to, except that *Animals Gallows* (as we may call it) where such sort of *Beasts* were hung up, might be induc'd, his Phantasie so suggesting, especially when he was driven to the utmost of his Course, to intermingle himself among the said *Carcasses*, which seemed to him in a state of deep repose; and since it could be no other way effected but by hanging himself up by the *Teeth*, he put himself in that posture, and so continued till such time as the *Dogs* running under the place, overshot their *Prey*, which they little suspected to be hanging in the *Air*, and so lost the scent, which while they endeavoured to recover, he by hastning into the next *Woods* and *Cverts*, and getting away by stealth, took another Path, and thereby clearly evaded the danger and streights he had been reduc'd to.

XXXI. As to that *Fox*, who from a *Broom Bough* which he laid hold on, threw himself into his skulking Hole (the ordinary place of refuge whenever near it) being so hard prest behind by the *Dogs*, that he could not go the readier way where there was an easier passage in; on the one side, the ingress taking up his whole Phantasie, on the other side the Precipice, which he had often seen, being called to mind, it could not be otherwise but upon the concurrence of these two things, he must needs be admonish'd to use great Caution for his safety in getting into this Hole; and it was but natural for a *Creature* that was to undergo so great a danger, to catch hold upon any thing that might help him in his leap; and since there was nothing that offered it self at that instant besides the *Broom Bough*, which by chance hung over the *Hole*, he caught hold on the same with his *Mouth*, and thereby gaining an opportunity of poising himself for the better fetching of a new sort of leap, he threw himself cleverly into the said *Hole*; mean while the *Dogs* pursuing the *Chace* with the same speed and eagerness as before, were upon the brink of the Precipice before they perceived there was any danger there, in which extremity, neither being able to retreat back, nor to put a stop to their career, they fell in and perish'd in their fall. Yet all this while there is no necessity to imagine, that the *Fox* contrived this destruction for them, or brought them designedly into this destructive Path; but in the first place it was effected by his meeting with this refuge from the hard pursuit of the *Dogs*; and next he was prompted by his *Memory*, which had upon some such like case before suggested to him, how to shift for himself when-ever the necessity of declining the like danger should require.

XXXII. And here what hath been already said, induceth us not to pass by certain *Phænomena*, by which some take upon them to attribute to *Brute Animals* the faculty of *Ratiocination*, and judge them to be induc'd not only with *Cognition* and *Perception*, but with *Discourse* also. For example, when a *Dog* hath two ways to go in quest of his *Master*, he thus seems to reason with himself; my *Master* certainly went one of these two ways,

as is evident from the scent of his *Footsteps*, but he went not this way, therefore he must needs have gone this way. And when a *Dog* in pursuit of his *Prey*, comes to a threefold Path, the first and second being smelt to, and found not to be the right, he immediately without delay, or putting his *Nose* any more to the Ground, takes his progress through the third. But the real cause of these two actions is no other than the instinct which *Nature* hath infused into these sort of *Animals* to perform such and such actions.

For in regard a Scent evaporates by a continual effluvium from *Man*, *Hart*, *Buck*, *Hare*, &c. and adheres to other things, the *Dog* hunts out the scent of *Master*, *Hare*, *Hart*, &c. impress'd upon the *Vestigia* or *Footsteps*, and being not in the least moved by the scent of the traces of any other Body, no wonder if he take that way by which his *Master* or the *Hare* went. Nor is it to be objected that the *Dog* doth not this by his Scent, but only induc'd by this sort of reasoning, *The Hare hath made his escape by one of these three ways, but he is not gone this way nor that way, therefore it must needs be that he hath made his escape by the third way.* Forasmuch as this is but a meer fiction, and not the reasoning of a *Dog*, but of a *Man*: For the *Dog* is no other ways but by the scent led into that Path to which he is induc'd by his quick scented *Nose*; for when he finds it, he pricks up his *Ears*, and with great speed pursues his *Prey*, because the vapour of the scent filling his *Nose*, he hath no more to do, but to give himself the loose and follow the tract of it. Whereby it evidently appears, how different this way of *Operation* is from *Discourse* or *Ratiocination*; since the *Dog* advances not from one *Cognition* to another, nor discovers any unknown Verity by the help of another known. For such a power is capable of *Intellect*, because of its *Perception*; and of *Will*, because it applies the *Intellect* to *Inquisition*, and *Consideration* of its Object. Which Faculty seems to be instead of a consequence of a *Created Mind*. For *Brute Animals*, as LUDOVICUS VIVES observes in his Second Book *De Anima*, begin not from *A* and so pass on to *B* to know *C*, nor from *B* as conjunct and proceeding from *A*, but because *A* pleaseth not, they seek another thing, and so fall upon *B*; as when a *Dog* follows his *Master* hunting after a *Wild Beast*, he both by scent and sight discerns him to be a *Man*: If it be correspondent with the scent and aspect of his *Master*, he rests satisfied, tho' it be not the very same person; but if otherwise, leaving him, he betakes him to another, thence to another, tho' having no coherence with the former, till he lights upon him whom he seeks.

Among the subtle Wiles of *Brute Animals*, the Craft of the *Torpedo* or *Cramp-fish* uses to be made mention of. This *Creature* is skulking in muddy places, the better to lie in wait for small *Fishes* which it feeds upon, casting such a numness upon them, that as soon as ever they rise above water it easily catches them, and devours them. Moreover, the Writers of the Wonders of *Art* and *Nature*, deliver of this *Fish*, that by touching only the Line of an *Angle Rod*, let down into the *Water*, it conveys quite up to the very Hand of him that holds the Rod, such a

XXXIII. How it is that the *Torpedo* catches other *Fishes*.

benumbing quality, that be he never so strong a *Man*, he finds all the *Joints* and *Sinews* of his *Hands* and *Arms* so enfeebled, as not to be able to hold any thing in his *Hand*, and so likewise in his *Legs* and *Feet*, as not to go at least with any speed or swiftness of pace. The Cause of all which it will not be very difficult to demonstrate, if we consider that it is Natural to this and other sorts of *Fish* of a cold Nature, so to cover and as it were arm themselves with *Mud*, that the *Fishes* when they approach, are upon the emission of this Venenous quality, immediately seiz'd with such a Numness as if they were all frozen and bound in *Ice*. Forasmuch as such sort of *Spirits* are emitted from the *Body* of the *Torpedo*, as penetrating the substance of the *Fish*, or reaching the *Hands*, *Feet*, or other *Members* of those that touch, benum their *Spirits* coming forth to meet them, and consequently stupifying those parts of the *Body*, render them feeble, tremulous, and unapt for motion, and that so thoroughly, that the business is effected before the *Fish* are taken either by *Net* or *Angling-Rod*. The same may be said of the *Sepia* or *Cuttle-Fish*, who finding danger approaching from the hands of the *Fisherman*, sends forth a certain black Liquor, by which the *Water* being all ting'd, and putting on a black or sable Hue, he dexterously failing all the *Arts* of the *Fishermen* gets away safe and secure. But neither doth this Stratagem any more, than any of the rest, proceed from any Discursive Faculty or act of Reason, but from a laxation or loosning of the *Nerves* caused by *Fear*; as hath been already discours'd concerning the *Fox*, who for fear voids his *Urine*; so the *Cuttle-Fish* vomits out a Liquor much like *Ink*, from the diffusion whereof through the *Waters* proceeds the fore-mentioned Effect.

XXXIV. Neither doth it argue more of Reason, that *Beasts* stand in fear of *Men*, and usually fly and decline the sight of them as *Enemies*, since that fear proceeds from the remembrance of some damage which at some time or other they have received. For the Cause of Passions, as well in *Brute Animals* as in us, is nothing else but the Agitation by which the *Spirits* stir up the *Glandula* which is placed in the midst of the *Brain*, from the inequality of whose agitation, and the variety of parts whereof they consist, the *Spirits* themselves are diversly deduc'd into the *Muscles*, and create different Affections. Whereupon, when the *Spirits*, which constitute the *Idea* of any thing, have once form'd a way to themselves, and intruded themselves among the *filaments*, of which the substance of the *Brain* is compos'd, there is not requir'd so great a force by which they are oblig'd a second time to repeat that way, as was needful at first to prepare the said way for them; whence it comes to pass, that when the like *Species* shall be form'd upon the *Glandula*, that facility alone which they find of advancing through their first path, will suffice for them again to enter it. Wherefore, no wonder if *Brute Animals* for damages offer'd them by *Men*, or Terrors thereby incur'd, are not able for the future to look upon them, but that the *Idea* of the harm must presently occur, and they thereby be stirr'd up to flight; as we see in some *Men*, who having drunk a *Medicin* with great aversion, cannot after that eat or drink any thing that hath the like kind of taste or savour, but with great

abhorrence and aversion; nor can in like manner so much as think of the aversion usual in taking of such *Medicins*, but that the same must return again into their *Minds*. And that this is the true and genuine Cause why *Beasts* fly the sight of *Men*, may hence be confirm'd, viz. because there are many *Regions* discover'd (especially in the *New World*) where it is found by Experience, that neither *Birds* nor *Beasts* do in the same manner fear or fly the sight of *Men* as among us, who treat them more inhumanly, and suffer no place where such Creatures harbour to be at rest from our *Fowling-Pieces*, and our *Venatory Instruments*. Moreover, it is observ'd in the *Island* of *Chio* and other places, that *Partridges* never fly away, but are kept tame in great *Covies*, and oftentimes betake themselves in great numbers into thick inhabited and frequented *Towns* and *Villages*, no otherwise than as *Sheep* are fed and kept in *Folds* among us.

But there remains yet one Difficulty to be solv'd; for tho' *Beasts*, who have suffer'd injury from *Men*, may by the benefit of their *Corporeal Memory* be affrighted at the sight of *Men*, and upon discovery thereof betake themselves to flight; yet how comes it, that young *Animals* who have not seen the *Face* of *Man* before, should shrink back and be shy at the sight of what they have not yet seen? For the solution of this Difficulty, it will be sufficient to mind what hath been discours'd in my *Philosophical Institution* and *History of Nature*, concerning some *Sympathies* and *Antipathies* of *Men*, namely, that the *Image* of a thing seen being depainted in the *Brain*, is by the help of the *Animal Spirits* convey'd into the common *Sensorium*, or Seat of the *Sensus Communis*, and from thence by the mediation of the *Blood* and *Spirits*, to the *Uterus* or *Womb*, and through the *Umbilical Vein* to the *Birth* it self, in which the *Image* of the thing seen, because of its softness is strongly imprinted, which tho' in the beginning it be but small, yet by little and little the substance of the *Birth* being enlarg'd, it increaseth just as a Letter engraven with a *Penknife* in a *Pompon*, or the *Barks* of *Trees*, is dilated, and by degrees receives Increment through the *Bark*. For it cannot be doubted, but that *Brute Animals* having receiv'd damage from *Men*, or an impression of *Fear*, transmit the *Species* thereof into the *Birth*, forasmuch as by those motions their Temperament is alter'd, and the disposition of Parts inverted, which afterwards being communicated to the *Birth*, by the *Seed*, generate the same propension therein. For we see it happens very often in the *Sons* of *Mathematicians*, that they are more delighted than any other sort of *Men* in the *Drawing* of *Figures*, and designing of *Proportions*, and that they are led as it were by a certain Instinct of *Nature* to the learning of those kind of *Arts*, which undoubtedly from their Nativity they are addicted to, and that upon no other ground but from the *Imagination* of the *Parents*, which altering the Nature of the *Seed*, and inverting the Temperament of the whole *Body*, imbues the *Birth* thence springing with the same propensities.

The time now requires, that we should pass on to the third *Classis* of *Actions*, that is, of such as *Animals* attain to by Exercise and Discipline, and which seem so wonderful to those that observe and consider

XXXV.
How it comes to pass that young Animals, who never saw Men before, should fly them at first sight.

XXXVI.
How some Beasts come to be so Capable by Instruction and Discipline.

consider them, that they can hardly be otherwise persuaded, but there is *Cogitation* in these *Creatures*. The *Hawk* is taught by his *Instructor* how to hunt after *Partridges*, and other sorts of *Birds*, and with erected *Ears* receives his *Instructor's* words, and when he is let fly to catch the *Prey*, upon the *Falconers* hortatory *Outcries*, encouraging him still to a stouter prosecution of his work, he grows fiercer and fiercer, and follows the *Enemy* with an extraordinary ardour of *Spirit*. The Famous *Justus Lipsius*, in his first *Century of Epistles* to the *Hollanders*, makes mention of a *Dog* of a *British Race*, who was taught to go to *Market*, to carry the *Money*, and to bring home the *Meat*. It was thus perform'd: They hung a *Handbasket* about his Neck, with *Money* in it for so many *Joints of Meat* as there was occasion for; with this the *Dog* goes directly without stop or stay into the *Market*, to a known *Butchers- Stall*, there receives the *Meat*, and away comes the *Dog* with his *Marketing* home. *Setting-Dogs*, who have an innate *Inclination* to set upon *Partridges*, are so taught by *Art*, that upon the sight of them they are to stand unmov'd, and never till the *Sign* be given, to rise or move a *Foot*. *ARRIANUS* is Cited by *CARDAN*, as relating that he saw an *Elephant*, who having two *Cymbals* in his *Ears*, toucht them alternately with his *Snout* or *Trunk*, to a certain *Tune* that was set for that purpose, and danc'd to the Measure of the said *Tune* in Confort with others that were engaged and had a part in the said *Dance*.

XXXVII.
The Cause
of the di-
versity of
Motions
in Ani-
mals.

These Operations in *Animals* will be more clearly made out, if it be granted that the double *Nature* of *Brutes* proceeds from the different texture of the *Fibres* and quality of the *Humors*; whereby it comes to pass that some are more propense to one Motion of *Passion*, others to another, to which the unequal commotion of the *Spirits* in them doth not a little conduce. For since some of those parts of which the *Spirits* consist are more gross than others, and rais'd to a quicker Motion, the said *Spirits* pass on by a direct *Line* into the *Cavities* of the *Brain*, and from thence are led into other *Muscles*, into which they had not been led had they been endued with less force.

XXXVIII.
How a
Hawk is to
be brought
up for the
better
catching
of its
Prey.

The *Hawk* therefore being a *Creature* Voracious by *Nature*, and adapted by *Kind* to follow *Prey*, is without any difficulty taught to bring it to us, if we contribute to the improving its *Nature*, and accommodate our selves to its *Inclination*, since this whole business chiefly consists in this, namely, to keep the *Hawk* as much as may be from *Sleep*, and almost continually to be stroaking it, so to make it to become *Tame* to that degree, as scarcely to take any *Meat*, but from the *Fist*; which familiarity being for some days used, it becomes accustomed in time to fly after its *Food*, thrown at some distance from it: In the next place, to hunt after a *blind Pigeon* let loose before it, which if it catch, that being snatched out of its *Talons*, another piece of *Flesh* is cast before it, to feed upon, as given for a reward of its *Labour*; which Exercise being for some time repeated, the *Hawk* accustoms himself by degrees to fly after all *Birds* whatsoever, and when taken leaves them for the *Master*, being himself contented with a small *Reward*. Whence it is to be concluded, that all

this work consists chiefly in this, That the *Hawk*, as is inbred in him by *Nature* to do, accommodates himself to the *Art*, and follows that *Rule of feeding* which *Nature* hath prescribed potentially, but which is improv'd by the *Instruction* by us given for our advantage and pleasure, in which obsequiousness of the *Hawk* nothing of *Reason* is to be discern'd, but only the *Industry* of the *Instructor* appears.

As to those *Animals* that are capable of *Discipline*, as are *Dogs*, *Elephants*, &c. it must be consider'd, that the *Discipline* whereof they are capable depends principally on the 7th pair of *Nerves*, for from thence it is that the *Nerve Auditive* hath communication by its *Envelopement*, and, it may be, likewise by its *Fibres* with the *Branches*, which advance some to the *Exterior Ear*, others to the *Muscles* of the *Larinx*, others to other parts of the *Body*; and hence it is that *Animals*, when they hear any *Noise*, cannot but erect their *Ears*, utter their *Cries*, and move themselves after their several ways; the Reason is, because when the *Nerve Auditive* is touch'd and excited, the other *Nerves* with which it hath communication are mov'd in such sort, that the *Animal Spirits* are disposed to flow into the *Muscles*, which serve for the Moving of the *Ears* and other *Members*.

XXXIX.
How Ani-
mals are
capable of
Discipline.

This Communication of the *Nerves* of the *Hearing* with that of the *Voice*, and other parts being granted: It is evident that when we see a *Dog* ready, for Example, to catch hold of any thing, there needs no more to be done, but to shew him a piece of *Bread*, and to cry at the same time that he is in this posture, *Hold fast*, for the Noise of that *Saying* will not fail to cause the *Animal Spirits* to flow across from the *Brain* at that very time that the presence of the *Object* causeth others to flow into the *Muscles*, which serve to make the *Dog* catch hold, which being reiterated several times, the *habit* thereof may in such sort joyn the two Courses of the *Animal Spirits*, that at last the only uttering these words, *Hold-fast*, will be capable not only to excite the Courses of the *Animal Spirits*, which are answerable to one another, but also that which serves to cause the *Dog* to Catch hold without any necessity of the *Bread* being there.

XL.
How we
are to con-
ceive of
a Dogs
Catching-
hold of a
thing.

By the like Care and *Art* *Dogs* are taught to carry *Letters* and other things to any certain place, as *LIPSIUS* reports of the *Dog* at *Brussels*, who doubtless was brought to it by continual Use and Custom. There is no question, but a *Master* or *Servant* taking a *Dog* along with him to the *Shambles*, gave him *Meat* for a reward of his *Labour*, and afterwards hanging a *Hand-basket* about his Neck return'd with him to the same place, and renew'd the *Reward*; to which Service the *Dog* was so accusom'd, that whenever the said *Basket* was hung about his Neck, he made to the *Shambles* of his own accord, and having received his Burthen, return'd home. But no Man I think will attribute this action to *Judgment* or *Reason*, but only to *Assuefaction* or *Custom* gain'd by long use, which may be easily evinc'd from the Event: For if it hapned, as the same *LIPSIUS* observes, that in his way home other *Dogs* invited by the scent should come smelling about him, and set upon him to take it away, then must he be driven either to defend

XLI.
By what
Art the
Dog at
Brussels
was taught
to go to the
Butchers
and bring
home Meat.

defend the *Basket* and put the *Invaders* to flight; or if overcome by number or strength, to fall in with the rest and take his share of the *Prey*; by which it is evidently demonstrated, that the Image impress'd in his *Brain*, of carrying the *Basket* to his Master, was disturb'd by another stronger Image, namely of repelling the *Invaders*, which latter Image a third yet follow'd in order, to wit, of taking share of that *Flesh*, for the preservation whereof he had a little enter'd *Combat*, that is to say, this last Image conducting the *Spirits*, which are inservient to the Motion of the *Body* into the *Muscles*, another conformable Action objected, was produc'd, which was at the same time delineated in the *Brain*, and this could be no other, than that of partaking of the *Flesh*, which as the case then stood was represented as the most convenient and profitable for him. And not much unlike this last, was the Education of another *Dog* mention'd by *PLUTARCH*, who was so well Instructed, to represent *Arguments* and *Persons* in a *Scene*, that no *Stage-Player* could do it more neatly and exquisitely, and particularly he took upon him the person of a *Man* that took *Poyson* in a piece of *Bread*, that is to say, a Morsel of *Bread* dipt in a *Liquor* which was feign'd to be *Poyson*, upon which he counterfeited to tremble, to totter in his gate, to be taken with a deadness and heaviness, and in the end he fell, and with his Limbs stretch'd out lay for dead, then was removed and laid out as for *Burial*, as the Argument requir'd; yet after all this, when nothing less was expected, in the twinkling of an Eye, he first came to himself as it were out of a *Dream*, began to move his *Head* and *Members*, to open and roll his *Eyes* about, and lastly arose and went joyful and brisk, to shew himself to him for whom he had done all this.

XLII.
How a
Dog is
taught to
Set for
Partridges.

But to proceed farther, That some *Animals* are taught to act contrary to their own proper *Instinct*, and omit that which they seem to be impell'd to by a certain force of *Nature*, doth no more than the rest evince, that they are any way endued with *Reason*; since we see in *Men*, that divers Motions of *Fibres* or *Spirits* which represent Objects to the *Mind*, or excite certain *Affections*, do by long use, and sometimes also by accident, excite other successive Motions. For although the *Motions*, as *CARTESIUS* excellently, after his manner, affirms in his *Treatise of the Passions*, both of the *Glandule*, *Spirits* and *Brain*, which represent some certain Objects to the *Soul*, be naturally joyn'd with those which excite therein certain *Passions*; nevertheless they may by *Habit* be thence separated, and be joyn'd with others of a very different Nature; nay, this *Habit* may be acquir'd by one only Action, and that without long use. As for Example, when on a sudden and beyond Expectation some very loathsome thing shall be found in *Meat* that is eaten with a very greedy Appetite, this sudden chance may so alter the disposition of the *Brain*, that thenceforth the very sight of that *Meat* may possibly not be endur'd, which formerly was eaten with great delight, which very thing is also observ'd in *Beasts*: For tho' they are void of *Reason*, and all manner of *Cogitation*; yet all Motions of the *Spirits* and of the *Glandule*, which excite *Passions* in us, are also in them, and serve for the preserving and confirming, not as in

us of the *Affections*, but of the Motions of the *Nerves* and *Muscles*, which use to accompany them. So when a *Dog* sees a *Partridge*, he is Naturally inclined to run after it, and when he hears the sound of a *Musquet* shot off, that Sound naturally disposes to flight; yet it is an ordinary thing for a *Setting-Dog* to be so Instructed, as to stop at the sight of a *Partridge*, and on the other side, to run after any thing shot out of a *Gun* upon hearing the Report thereof; to do which they are not led by Judgment, as I said before, but by the fear of *Stripes*, or some kind of Discipline, by which the Motions of the *Spirits* and *Nerves*, joyn'd by Nature with certain impressions of Objects, are totally diverted and remove into other parts.

But that an *Elephant* should beat upon *Cimbals* tied to his *Ears*, is no great matter of Admiration, since by a small deal of Industry and Discipline he might easily be brought to it; in regard this *Animal* is of a very capacious and hot *Brain*, and consequently easily imitates those things which are proposed to it. Add hereunto, that he hath a prompt and ready *Proboscis*, capable of touching the *Cimbals* alternately, and thereby producing a certain rude, if we may so call it, *Harmony*, by which all those who were present were induced to a Dance, according to the *Laws* or *Rules* aforehand prescribed.

From these few examples it plainly appears, that Cognition is not required to the performances which we behold in Brute Animals; but that *Memory*, the *hability* of the Members of the Body and Custom suffices: Or if any one will needs call them the works of Reason or Intelligence, they may indeed be so allowed, but not of the Reason of the Animals, but of those who have instructed and taught them. Now if any one will have it, that Beasts are taught some actions by example and the imitation of others of the same Kind, and by institution; *VIVES* answers them in the above cited place. Brutes, saith he, teach their Young Ones to do that sooner, which nevertheless they would do of themselves; as a Bird teacheth her Young Ones to fly, a Cat her Kittens to hunt after Mice, that they may have the benefit of seeing them like themselves as soon as may be, that is to say, perfect in their Kind; but we teach them to do what we would have them do, which they else would either never do, or at least in another manner than we design. Nor is our Doctrin any other thing in them than meer *Assuetudine* or accustoming themselves, and that to nothing else but to some Corporeal Exercise, as to Speak, to Run, or in some manner or other to move their Body, or some part of their Body.

As to that manner of Speech or Discourse by which some Animals seem to speak to one another, and to discover thereby what their thoughts or designs are; this appears most clearly in the Hen, who according to pleasure varies, and by divers Tones makes manifest the several Affections wherewith she is impelled; for if she calls out her Chickens, she feigns the Tone of a Raven; if the Kite be hovering over her, she drawls out, and somewhat elevates her Voice; if the Chicken chances to be catcht, she as it were groans and repeats that Tone with a kind of a Sob, &c. Hence *PORPHYRIUS* imagined, that Animals had converse

Speech.

converse with each other by Speech, and that *Thales*, *Melampus*, *Tiresias* and *Apollonius Thyaneus* understood their Language, as *Virgil* relates of *Helenus*, in the Third Book of his *Aeneids*,

—Who knowst the Stars,
And Speech of Birds.

A Parrot falling out of a Window, in *Whitehall*, in the time of King *Henry VIII.* into the River *Thames*, flowing by the said Palace, began to cry out a Boat, a Boat, 20 l. for a Boat; whereupon being taken up all over by a Waterman, he was brought to the King in expectation of the promised hire, but the Parrot, then altering his Tone, cried out, Give the Knave a Shilling. A Magpie sometimes so exactly imitates the Voice of the Fowler, as thereby to impose upon the Dogs, and draw them on, while they take it to be the Voice of the Master. The same thing *PLINY* relates of the *Hyena*, who counterfeiting Human Voice among the Shepherds Cottages, and having learnt the Name of some particular Person, calls him out by the said Name, whom coming forth by Night, he sets upon and tears to pieces. *Horses*, *Dogs* and *Apes* we find understand very well the speech of Man; forasmuch as they receive all their Dictates and Commands, and accordingly execute them. An Example hereof *JUSTUS LIPSIUS* gives us in a Dog at *Lovain*, who having letters sowed up in his Collar, and understanding by the words spoken to him, whither they were to be carried, went directly to *Brussels* with them, to a certain House well known to him, and there left them.

XLVI.

How a Hen
varies her
Voice.

That certain Animals do as it were attempt and manage their Voices, and seem after a sort to utter various sounds at pleasure, is not to be supposed to proceed from Reason, and as if there were a certain Mind latent in them, by which their sounds were directed, but only from the Passions by which they are agitated: Which Passions inducing a various disposition in the Organs, are the cause that the Spirits are diversly emitted through the *Apera Arteria*, and accordingly Beasts utter their various Tones, even as we experiment in ourselves, who inflamed with Love, speak after one manner; affected with Hatred or Anger, after another. And altho' Cogitation may accompany the Motions of our Passion, that is to say, in regard we are indued with a faculty of thinking, yet it is most evident, that those Motions do no way depend upon this Cogitation, in regard they oftentimes arise against our Will, and consequently the said Motions may very well be in Brutes, nay, and possibly more vehement than in Man. Yet can it not be from thence concluded, that they are indued with Cogitation. Different is the *Pipation* of a Hen, in regard she is affected with one Passion when she falls upon her Food, with another when she sees the Kite, with another when she is taken, with another when she calls away her Chickens, with another when she goes to Roost: So that we can never enough condemn those Persons of Vanity, who in Antient Times have taken upon them to understand the Languages of Beasts, and pretended to know by their manner of Speech what they designed or acted.

Parrots indeed are taught to form articulate sounds, and by Custom are brought to pronounce many words, and yet they cannot properly be said to speak. For to Loquution or Speaking, two things are chiefly required, Motion of a Corporeal Organ, and Perception of Mind. For as in Sensibility there are three Degrees to be distinguished, as I have already hinted, viz. Motion of a Corporeal Organ, Cogitation of Mind, and determination of Will to judge; so in speaking, the first Degree is Perception of Mind; the second, Judgment and Will to discover to another that which we conceive; the third, the Motion of the Corporeal Organ. Now in some Animals there is the third Degree of Speaking, but not the second or third: Because whereas Beasts are void of Mind, they design not by those words which they utter, to discover their internal Conceptions, but only declare those things, which by long labour they have learnt of Men, and whose signification, in time, utterly slips from them: For if some Birds have been so instructed, as to give some things their right Names, and promptly to answer to Questions ask'd them, this is only to be attributed to their Memory, no to their Understanding or Reason; as particularly in that Parrot, who, falling out of a Window of the King's Palace into the River of *Thames*, called out for a Boat, since there is no doubt, but he had formerly learn'd to pronounce those words, whereby it came to pass, that the species of them being by very frequent repetition imprest in the Brain, the Spirits and Organs were determined to put forth the like sounds. As in that Magpie, which upon the sight or approach of his Mistress, used to utter the word *χαιρε*, i. e. God save you, in regard this Sound or Voice accompanied such an affection, namely the hope of some good thing for the Belly, in regard that upon the uttering of this word he had been always used to be presented by her with some or other more delicate Bit than ordinary. In like manner, all those things which Dogs, Horses, or Apes are taught, are no other than the Motions in them of Hope, Fear or Joy; in so much that there is not in the least any need of Cogitation in them for the performance of these things.

As for the Magpie, Hyena, and such like Creatures imitating Human Voice, it can be attributed to nothing else, but to the sensitive plexus or texture of the Fibres, and the disposition of their Organs. For their Bodies are so disposed, that when a human sound or accent smites their Ear, the Animal Spirits conduct it into the Muscles which are inservient to the formation of the Voice. And that the Hyena should with a Voice, much resembling human, call forth Shepherds to make a Prey of them, arises from hence; that his Stomach being empty, the species of those Animals on which he used to feed, causes the Glandule, inclining it self to impel the Spirits into that part of the Brain in which are the Vestigia or Tracts which the aspect of these Animals left; and since the Image of the Object recurs not to the Brain, but when that also recurs which accompanied it: No wonder the Hyena should feign or imitate Human Voice, being indued with a wonderful docility of Corporeal Organs, and able promptly to express what ever comes to the Ear.

Human
Speech for
the devour-
ing of
Shepherds.

XLIX.
How is it
to be under-
stood that
some Ani-
mals have
more In-
stinct than
others.

Thus when they say that these Animals have more of Instinct than others; nothing else is to be understood, but that the interior and secret disposition of the invisible parts of their Bodies, and principally of their Brain is such, that it receives more easily the different impressions of exterior Objects, and causes the Members to move in more different manners than those of other Animals.

L.
How it
comes that
Dogs, Horses
&c. obey
our Words,
and execute
our Com-
mands.

Horses, Dogs and Baboons, upon certain words or signs given, obey us, and execute our Commands; nor is it therefore just to conclude, that they are indowed with Reason and Intellect, because we find by experience, that if other signs be given them, which tho' in reality more facile, yet are not suited to their innate capacity, they take no notice of the Commands there hinted. For Examples sake, if we should command a Dog to seek out for a Handkerchief lost a Month ago in a Garden, Closet or such like place, as we usually command him to fetch a Stick, just now thrown into a Pond, the Dog, instead of speeding to the Garden or Closet, where it is signified that the Handkerchief was lost, will doubtless make directly to the Pond to look out for the Staff: Whence it plainly appears, that the Dog does not perform what he is commanded, as apprehending the Words spoken or Signs given him; but because the whole *Machin* of his *Body* hath obtain'd that *habit* and *disposition* by Labour and oft repeated Instructions, so that as soon as the Sign is given him, the *Animal Spirits* are freight carried into the *Nerves* and *Muscles*, which dispose him to the doing of this or that thing; and so no wonder if the Dog of *Lovain*, having the Letters made fast to his Collar, made freight for *Brussels*, went to the House assign'd, and having discharg'd himself of his *Letters*, return'd directly to his Master, since all things which we see done by *Beasts*, and which so much stir up Admiration in us, are the meer effects of their *Passions* and *Motions*, by which we teach them and have a curb upon them, through the long exercise, labour and use which we are at in the instructing of them.

LI.
Certain
Actions of
Animals,
wherein
they even
seem to ex-
ceed Men
in Sagacity
of Wit.

There are now remaining to be Explained those Actions of *Brutes* which constitute the fifth *Class*, namely those Actions wherein they discover so much acuteness of Wit, that they seem even to exceed in that Rationality by which *Men* are commonly differenc'd and distinguished from them. In the first place it is admirable to see how delicately and ingenuously some *Birds* proceed in making of their *Nests*. For Example, when the *Swallows* begin to be sensible of that alteration of their Condition, which desire and eagerness of Propagation is likely to bring upon them, they design their *Nests* after this manner: The biggest *Straws* and strongest of the *Chaff* being first laid as a foundation, they afterwards lay the softer and the lesser over: To this *Fabrick* they use *Mud* for a *Cement*, and daub their *Nest* all over with it, as with *Mortar*, and when this *Mud* is wanting, they fly to the next *Pond*, and there wetting the end of their *Wings* gather up *Dust*, with which as with *Mud*, they plaister up the rough places, close up the gaping Holes, and in all their *Architecture* so accommodate the dimension of their *Fabrick* to the shape of their *Body*, that they may have room to turn round so as commodiously to

hatch upon their Eggs, and in such manner to plant themselves, that they may distribute an equal force of heat to all parts. And now their *Nest* being strewed with *Chaff*, *Moss* and *Feathers* they lay their Eggs, sit upon them, hatch their *Chickens*, and feed them. Another argument of Providence in Animals is, that upon the approach of *Winter* they remove into foreign Regions, the better to consult for their advantage and subsistence. Of this sort are the *Cranes*, who every year in *Spring* time fly from *South* to *North*, and in *Autumn* fly back from *North* to *South*. The third Argument is, that some Animals preface things to come, and by a certain Cognition foretel those *Phænomena* in the Air which hang over us; as the *Heron*, when she flies very high, and soars more than usually above the Clouds, predicts future Rain. The *Kite*, on the contrary, mounting up to the highest Region of the Air, and there hovering till the Evening, proclaims fair Weather. The same thing we find by experience of other Animals; for Example, the *Cat*, the *Mole*, the *Bull*, the *Ram*, the *Dolphin*, the *Duck*, the *Cock*, &c. which either by Voice uttered, by Crowing, by Frisking about, or the like, preface various sorts of Weather.

As to the *Birds* building their *Nests* at a certain season of the year, afterwards sitting upon their Eggs, hatching their Young Ones, nourishing defending and covering them, &c. this ariseth only from the mutation of the temperature of their Body; by which the *Fibres*, and their *Contextures*, in those Organs, especially which serve to Propagation, are so dispos'd, that that affection is easily thence derived, which prompts them to build their *Nests*, brood upon their *Chickens*, feed them when hatcht, &c. For to close with the Sentiment of the most Noble DIGBY, I think there is no Man will deny but that the desire of Copulation in *Birds*, proceeds not from any impulse or design of begetting their like, but from the temperament of the Blood and Spirits, produc'd by quality of the Food wherewith they are fed, together with the Season of the Year; however, after Copulation it must of necessity follow, that the Eggs grow in the Belly of the Female, and still increasing create trouble to her, and stir up a desire in her of being at rest, and of freeing herself from the burthen she labours with. And as *Dogs* and *Cats*, when necessity urges, are wont to look about for some commodious place, not only for the bringing forth of their Young, but also for voiding their Excrements. So *Birds* when the weight of their Eggs burthens them, and renders them unapt for flight, begin to indulge themselves very much to their repose, and take much delight in soft and warm places, so that *Chaff*, *Moss*, and the like, please them with their softness, which they therefore carry to their *Nest*. But that this action is not guided by Reason, is evident even from the very manner by which it is performed: For when they light upon *Chaff*, or any other thing commodious for the Litter of their *Nests*, they do not, as I have often observ'd in several *Birds*, carry it directly to their *Nests*, but first make towards the Bough of some Tree, or the Top of some House, and there with this piece of Householdstuff in their Bill, hop up and down for some time, then leaving this place, fly to another,

LII.
With what
impulse
Birds are
carried in
building
their Nests.

another, where after a small time of some such like diversion, they at length betake themselves to their Nests; wherein if the Straws or chaffy Stalks should lie in a confused heap, they would be subject to be prickt by the sharp ends of them; whereupon they turn them up and down, till all the said sharp ends be laid smooth, and their decumbiture be softened and made easie. Which we only seeing done, and comparing the Production thereof with the Method which we our selves should use in an exercise of the like actions, may possibly allow this disposition of Chaff Stalk to be prudent and directed by Reason. But whereas it proceeds from Birds themselves, it is no other than a frequent turning this way and that, of Bodies which offend the Sense, till such time as they bring no further pain or trouble with them. As to the dawbing over their Nest with Mud, it may be ascribed to the vehement heat which predominates at that time of the Year; for hence it comes to pass, that they delight to be conversant in Mud, Water and Sand, without which all Birds would quickly sicken and be deprived, first of sight and then of Life; but the same Mud, which, because it refrigerates or cools, they carry to their Nest in their Bills and Feet; the same, I say, when it begins to grow hard and troublefom, they wipe off, and making a hole through in the place where they rest, they fly but to get that which is fresh and cool.

LIII. As to those Birds, which upon the approach of Those Birds Winter, remove from one Region to another. It is are not led by prudence, which remove from one Region to another. not to be ascribed to their Prudence or Providence, but to their Natural Inclination, by which they are easily impelled to remove from a colder to a warmer place, into which afterwards the same temperament succeeding anew, they return again, provided the said Regions be not very far distant from each other, and not uneasy in access; otherwise I am apt to believe that the said Birds would betake themselves into certain hiding Holes like *Dormice*, *Serpents* and *Insects*, and there lie dormant all the Winter, which might be proved by many instances, but it will be sufficient to mention the *Swallows*, which in the congealed Lakes of *Poland*, lie all the Winter time unmoved, and as it were, dead; but the returning heat dissipating the Frost, and the Ice dissolving into Water, they rise out of their Lakes, and betake themselves anew to their flight. Which when that *Possennus*, who went Embas-

sador into *Russia*, as *Gassendus* mentions, would not give credit to, a great flake of Ice was commanded to be brought into his Stove, in which a cluster of *Swallows* lay crouded together; which when the Ice began to melt by the heat of the place, were observed by degrees to move Feet, Wings, Head, and then the whole Body; lastly to fly out; but after some rounds of flight about the Stove, they fell down dead upon the ground, as having undergone too hasty and unwonted a change of Air. Much of the same nature is what hath been observed of other Birds, particularly in *Germany*, in Oaks and other hollow Trees, when cut down, *Kites* and *Cuckows* are found to have hid themselves there all the Winter. Something like to this may be also thought of the *Storks*, since it is yet undiscovered whence they come, and whither they betake themselves. Whence *PLINY* in his First Book, Chap. 23. *No Man discerns when they depart, tho' it is apparent that they do go; nor knows when they come, tho' we find that they do come. Both doubtless, i. e. their coming and going is done in the Night time; and tho' they are commonly seen to fly to and fro, yet they are thought never to make their first approach but by Night.* From which words it plainly appears, that the *Storks* come not from any far Region, nor go from us into any very remote parts, but so keep their way along the Ponds and Lakes, that neither their ingress nor egress can well be observ'd by us.

Lastly, As to Beasts seeming to foreknow some things, we need not for this ascribe to them any thing of *Divination*, or acknowledge any latent Rationality in them, for the making out of these presages; since they depend only upon those mutations which happen in exterior Objects; which when Animals have received into their Bodies, they are touch'd with certain affections, which dispose them to Crowing or shaking of their Wings. For there are always in the Air some forerunners of fair Weather, Tempests, Winds, &c. which when Animals foresee, it cannot be but that certain affections must arise in those Organs which dispose to the forenamed Motions: For in the vivacity of their Senses *Brutes* excel *Men*; and as those who are depriv'd of sight, hear more quick than others; so it seems that Animals being void of Mind, and destitute of all Perception, have this recompence, that they have their Senses more acute.

LIV. How some Animals seem to perceive future things.
